## Introduction

This publication is the second in a series of *Census Briefs*, aimed at interpreting the findings of the 2010 Census with regard to New York City’s neighborhoods. It extends the earlier analysis, *Population Growth and Race/Hispanic Composition*, by examining the components of change. The two principal components are natural increase,<sup>1</sup> which is the net gain or loss when deaths are subtracted from births, and net migration, which represents the net gain or loss as a result of migration into and out of the city.<sup>2</sup> It should be noted at the outset that this text is not intended as a comprehensive accounting of change in every neighborhood of New York City; instead, it represents an effort to identify the patterns that underpin major changes in the race and Hispanic composition of the five boroughs over the last decade.

The following criteria were used to analyze changes that have occurred at the Neighborhood Tabulation Area (NTA) level:<sup>3</sup>

1. The components of population change—natural increase and net migration
2. Changes in race and Hispanic composition
3. Components of change by race and Hispanic origin
4. Changes in composition by race and Hispanic subgroups
5. Changes in the number of housing units
6. Changes in household size and type

There are two sections in this report. The first is composed of a narrative for each borough, followed by a series of 10 maps by race and Hispanic origin for illustration — five on overall change in population and five on migration. The second section is an Appendix, with five large tables containing detailed data, separated by borough, for each of the 188 NTAs. Clicking the icons at the beginning of each narrative and on the first page of each table, allows users to toggle between the text and the appendix tables.

## Population Change in Neighborhood Tabulation Areas

New York City’s population was enumerated at 8,175,000 in 2010, an increase of 167,000 or 2.1 percent since 2000. When viewed through the “components of change” lens, this gain was the result of a 475,000 person loss through net out-migration, which was more than offset by a positive natural increase of 642,100.

The Asian<sup>4</sup> population had the largest increase among major race/Hispanic groups, 32 percent, surpassing the one million mark for the first time. Their 13 percent share of the total population was due to both positive net migration and natural increase. Hispanics grew by 8 percent and accounted for a 29 percent share of all persons in the city, with most of the increase due to 302,000 more births than deaths. While the white population showed a decline of 3 percent due to low levels of natural increase and net out-migration, the decrease was much smaller than in earlier decades. This lesser rate of decline was largely due to a smaller-than-expected loss through migration, associated with an increased propensity of the city to attract young domestic migrants over the last decade. Whites still

made up about one third of the city’s population. Finally, the black population declined by 5.1 percent, mostly due to large losses through migration; their share declined slightly to 23 percent. Blacks accounted for more than one half of the city’s migration losses.

This “churning” of the population, the relationship between migration and natural increase, has always defined New York City and makes it a very dynamic place. And while it is important to make note of the numbers overall, the components of population change play out in very different ways across the city’s neighborhoods. Moreover, when examined against the backdrop of changes in race/Hispanic origin and housing/household characteristics, a deeper grasp of population change can be achieved. Such an understanding is very important to creating policies, planning programs, and designing implementation strategies for the efficient delivery of services.

## BRONX

The Bronx was the second fastest growing borough in the city, behind Staten Island, increasing its population by about 53,000 persons or 3.9 percent between 2000 and 2010. This growth was the result of a natural increase of 130,600, offset by a net migration loss of 78,100. The most significant development in the Bronx was the impressive increase in Hispanics, 97,000 or 15 percent, which accounted for 55 percent of the citywide increase. Spurred by a large natural increase, the Bronx became majority-Hispanic in 2010, at 54 percent of the total population. At the same time, the white population declined by 22 percent, a consequence of both a large net out-migration and a negative natural increase (Queens was the only other borough where the white population declined as a result of more deaths than births). As a result, the share of whites in the Bronx dropped by almost 4 percentage points to just 11 percent of the overall population. The black population was unchanged, but there was significant turnover as a positive natural increase was entirely offset by a negative net out-migration.

[View Table](#)

Most of the NTAs in the Bronx either increased in population or registered minimal changes between 2000 and 2010. One of the few NTAs that saw a population loss was *Woodlawn/Wakefield* in the north central part of the borough, where the population declined modestly, by a little over 2 percent. This drop was the outcome of a natural increase that was insufficient to offset losses through migration, most heavily among the white population. The black population remained unchanged; and there were small increases among Hispanics, especially Dominicans.

At the other end of the spectrum, the NTAs with the most growth were concentrated in a swath that runs along an axis from the extreme south-central part of the borough up through

*Willamsbridge/Olinville*. The areas of greatest growth were in *Morrisania/Melrose* and *Melrose South/Mott Haven North*, with increases of 27 and 18 percent, respectively. These areas were unique among Bronx neighborhoods in that they had both positive net migration *and* positive natural increase. It is likely that these population surges were partly due to new housing construction; between 2000 and 2010, the number of housing units increased by 24 percent in *Morrisania/Melrose* and by 17 percent in *Melrose South/Mott Haven North*. In *Morrisania/Melrose*, the population increase was most closely associated with Hispanic in-migration, especially among Dominicans, who increased their representation in this NTA by 105 percent over the decade. In the same period, the Hispanic population increased its share of the total from 51 to 58 percent. Both areas remained majority Hispanic.

*Longwood*, *Crotona Park East*, *Claremont/Bathgate*, and *East Tremont* grew in the 10 to 14 percent range over the past decade; most of the growth was due to hefty levels of natural increase and flat net migration. With the exception of *Claremont/Bathgate*, these areas had double-digit increases in housing units in addition to declines in vacant units, which made more housing available and tipped the balance of migrants slightly positive. Average household size in each of the above neighborhoods saw a decline from 2000 to 2010. In *Longwood*, for example, average household size declined by almost two tenths of a person (.18), one of the largest declines in the borough.<sup>5</sup> It recorded large growth among Hispanics, with double-digit percentage increases to an already large Hispanic base. Almost all of these NTAs showed declines in Puerto Ricans, with increases in Mexicans and very large increases in Dominicans. In the *East Tremont* NTA, the Puerto Rican population declined by 11 percent, while the Dominican and Mexican populations increased by 66 and 171 percent, respectively.

In contrast to the neighborhoods in the middle of the borough, those on the western ridge—*West Concourse*, *University Heights/Morris Heights*, *Mount Hope*, *Kingsbridge Heights*, *Bedford Park/Fordham North* and *Van Cortlandt Village*—experienced heavy losses through migration. While the size of populations in the neighborhoods of the west Bronx remained virtually unchanged from 2000, some of the largest natural-increase gains *and* greatest net migration losses took place in these neighborhoods. *Mount Hope*, for example, lost less than 2 percent of its population between 2000 and 2010; however, this relative stability was a product of an 8,200-person gain through natural increase, offset by a net outflow of 9,100 persons, which is indicative of a very large and dynamic population “churn” masked by the overall change. This “churn” involved a decline in the white population due to out-migration, offset by gains in natural increase from Hispanics, mainly of Mexican and Dominican descent.

Likewise, *Norwood*, *Bedford Park/Fordham North*, and *University Heights/Morris Heights* gained between 5,100 to 7,900 persons due to natural increase, only to be offset by a net migration of approximately equal size. While these majority-Hispanic neighborhoods became even more Hispanic, a striking turnover occurred in the form of double-digit percentage losses of Puerto

Ricans in most NTAs, combined with big double-digit percentage gains in Dominican residents. In *Norwood*, for example, the Puerto Rican population declined by 23 percent, or 2,600 persons in the past decade, while the Dominican population grew by 52 percent, adding 2,500 persons. The areas of the west Bronx were generally characterized by much lower levels of new construction than their counterparts to the east, with relatively small additions to the housing stock. Also, average household size declined by as much as .13 in neighborhoods in the western Bronx, with the exception of *Norwood*, which saw an increase of .07.

*Fordham South* and *Highbridge* both showed increases in population over the past decade, of 5 and 12 percent, respectively. In the case of *Fordham South*, it was the very high level of natural increase that trumped what were formidable net migration losses. In *Highbridge*, the large increase in population was tied to modest losses through migration, likely a product of a 15 percent increase in housing units over the last decade. In *Fordham South*, big increases in Dominican and Mexican populations boosted the percent Hispanic, even as the number of Puerto Ricans declined.

Large portions of the east Bronx and the northwestern corner of the borough continued to be demographically much older than the rest of the Bronx. Despite small increases in Eastern European immigrants, the aging of the white population continues to be a primary feature of many of these communities. As such, there were a number of neighborhoods, such as *Pelham Bay/ Country Club/City Island*, *Allerton/Pelham Gardens*, and *North Riverdale/Fieldston/Riverdale*, where natural increase was very low or negative. The same was true of *Schuylerville/Throgs Neck/ Edgewater Park* and *Spuyten Duyvil/Kingsbridge*. All of these areas have one thing in common—slow or no growth over the past decade. The loss of whites through negative natural increase and net migration was offset by big increases in Hispanics in every NTA, mostly through in-migration. Each NTA shows a marked increase in percent Hispanic over the past decade. These areas stand in contrast to their south and central Bronx neighbors, in that increases in many NTAs were reported for Puerto Ricans, as well as for Mexicans and Dominicans. While an aging population usually exhibits declines in household size, this transition produced increases in household size for most of the area, owing to the replacement of smaller European households with larger Hispanic families.

Finally, there is *Co-op City*, which is unique among Bronx neighborhoods in terms of how change has occurred over the last decade. With a negative natural increase of about 1,000, the NTA still saw a population gain of about 8 percent or 3,100 persons, the result of positive net migration on the order of 4,100 persons. Like earlier generations, movers into *Co-op City*, and to the east Bronx in general, are likely originating from other parts of the borough to the south and west. The majority of increases in the past decade have been from the in-migration of the black and Hispanic populations to the NTA, at 11 and 27 percent, respectively. Whites, on the other hand, declined as a result of negative natural increase. While the majority group in *Co-op City* continued to be black (61 percent), the percent Hispanic increased from 23 to 28, as the percent white dropped from 15 to 9 percent over the last decade.

## BROOKLYN

According to the 2010 Census enumeration, Brooklyn's population grew by 39,400 residents or just 1.6 percent between 2000 and 2010. Given a natural increase of 234,100, net migration stood at 195,000. The migration component needs to be interpreted with caution, because Brooklyn probably had a net undercount in the 2010 Census. Since migration is determined in residual fashion, an enumerated population shortfall may result in an exaggerated level of net out-migration for the borough, and in potential distortions of the reported levels of population change in several southern Brooklyn neighborhoods where problems have now been documented (see Box).

[View Table](#)

The 2010 Census enumerated New York City's population at 8,175,133. The Census Bureau, in cooperation with the Department of City Planning, had estimated the city's population to be in the range of 8.4 million persons going into the 2010 Census enumeration. We believe there has been an undercount of the city's population, at least partly due to the misclassification of housing units as vacant in two Local Census Offices responsible for conducting the enumeration in Northwest Queens and Southern Brooklyn. The huge concentration of vacant units in these two areas cannot be explained by new construction or foreclosures; nor is it consistent with other survey and administrative data. Therefore, we approach the components analysis with caution in these areas and for the population of Brooklyn and Queens overall. The City of New York has submitted a 2010 Census Count challenge based on the misclassification of housing units as vacant under the Count Question Resolution (CQR) Program. For more information, see:

[http://www.nyc.gov/html/dcp/html/census/census\\_challenge\\_2010.shtml](http://www.nyc.gov/html/dcp/html/census/census_challenge_2010.shtml)

Regarding changes in the population by race and Hispanic origin, the most notable trend was a substantial loss of black residents. Brooklyn accounted for one half of the total citywide loss of black population in the past decade due mostly to a very large negative net migration (-121,600). Brooklyn is still home to the largest black population in the city, yet their share waned by 3 percentage points to 32 percent of the borough's population. Hispanics also experienced a large outflow (60,300), which was almost entirely offset by positive natural increase resulting in negligible change for this group both in number and percent (8,400 and 1.7 percent, respectively). The share of Hispanics in the borough remained at 20 percent. At the same time, Brooklyn's white population increased by 5 percent, reversing a decades-old decline. Whites accounted for 36 percent of the borough's population. The Asian population surged by 41 percent due equally to natural increase and positive net migration. Brooklyn is home to over one quarter million Asians, whose share increased into the double digits for the first time.

While Brooklyn contains many interesting patterns of change, the most noteworthy concern the NTAs in the central part of the borough. *Flatbush, Erasmus, East Flatbush/Farragut* and immediately adjacent neighborhoods such as *Prospect Lefferts Gardens/Wingate* and *Crown Heights South* saw population losses between 4 and 10 percent, all as a result of net out-migration. And while these NTAs are still majority black, they lost black residents over the past decade, mostly through large net out-migration. Losses in black residents ranged from 6 percent in *Erasmus* to 18 percent in *Crown Heights South*. At the same time, the white population increased in several of these NTAs. In *Crown Heights South*, there was a 44 percent increase in the number of whites,

resulting in an increase of their share from 17 percent in 2000 to 26 percent in 2010. Likewise, in *Flatbush*, the white population increased by about 9 percent, raising the white percentage from 17 to 20 over the decade.

*Prospect Lefferts Gardens/Wingate* was overwhelmingly black in 2010; however, a significant net in-migration of white residents has raised the white population from 4 percent in 2000 to 10 percent in 2010. Concurrent with this trend was an increase in the number of non-family households (23 percent). As the white population has replaced black residents, these neighborhoods saw large declines in average household size, ranging anywhere from a loss of .12 in *Flatbush* to a decline of .19 in *East Flatbush/Farragut*.

### **Northern**

The fastest growing neighborhood in Brooklyn was *Bedford*, increasing its population by 11,500 (19 percent). This surge was a result of a positive natural increase and net migration, with the former outpacing the latter by a considerable margin. Moreover, *Bedford* had a 19 percent increase in housing units. Average household size decreased from 2.86 to 2.82, as non-family households recorded a 47 percent increase over the decade. Black out-migration, combined with a very large in-migration of whites, resulted in a huge shift in the race/Hispanic balance in this NTA. In 2000, the black population accounted for 69 percent of this NTA; however, by 2010, that percent had slipped below 50 percent. At the same time, whites increased their share from 4 percent in 2000 to 26 percent in 2010. And while the population in the adjacent neighborhood of *Stuyvesant Heights* did not gain as much in population (a 3 percent increase), the same dynamic was at play. Negative black migration was countered by considerable positive migration for both whites and Hispanics. As a result, the race/Hispanic distribution of this neighborhood shifted from 81 to 73 percent black, while Hispanics increased 5 percentage points to 20 percent in 2010.

The neighborhoods to the north, along the L train corridor, also saw substantial growth. *North Side/South Side* and *Bushwick South* both had double-digit gains, at 14 and 12 percent, respectively. In *Northside/Southside*, a look at the overall components indicates that net migration was greatly overshadowed by the effect of natural increase, with the latter accounting for almost all of the growth between 2000 and 2010. A more nuanced picture emerges when broken down by race. A large net migration loss among Hispanics was almost entirely offset by a large positive net migration for whites, resulting in a huge shift in the race/Hispanic composition of this area. Whites have been replacing Hispanics at a very high rate, which would be even higher if Hispanic natural increase was not offsetting their losses through migration. The decline of Hispanics over the decade occurred among Dominicans, as well as Puerto Ricans. No longer a majority of the population, Hispanics were supplanted by whites as the largest race/Hispanic group; whites increased from about one third of all residents in 2000 to more than one half in 2010.

New housing construction intensified in *North Side/South Side*. Total housing units increased by 43 percent, with most of the housing taken up by non-family households. As a consequence, the average household size in the NTA declined over the decade from 2.78 to 2.43. There were similar forces at play in *East Williamsburg*. Positive net migration, however, played a larger role in the neighborhood's population increase of 7 percent. But the same apparent replacement of Hispanics by whites was evident. Whites increased their share from 32 to 43 percent, while Hispanics decreased from 45 to 33 percent.

The population in *Bushwick South* increased by 7,500, mostly due to increases for both whites and Hispanics. Gains due to natural increase for Hispanics, in particular among Mexicans and Dominicans, contributed to a 10 percent increase in that population. This increase was concomitant with a huge increase in the white population—5,400 or 364 percent—mostly through in-migration. Hispanics still dominated the area, with the share of whites increasing over the last decade, from about 2 to 10 percent of the total. In addition, the black population decreased by 11 percent from 2000 to 2010, in large part due to a net migration loss of 4,100. In the same period, average household size decreased by .22, from 3.11 to 2.89, owing to an increase of 22 percent in total housing units, the majority of which were for non-family households.

*Bushwick North*'s population showed very little change; but there was a big “churn” among Hispanics, with a negative 10,900 net migration largely offset by a positive natural increase of 8,400. The Puerto Rican population decreased from 18,500 to 11,600 over the decade, a 38 percent decline, with Dominicans following suit to a lesser degree. At the same time, there was an 80 percent increase in the Mexican population. Mexicans outnumbered Dominicans for the first time in this neighborhood.

*Greenpoint* to the north was the only neighborhood in this section of Brooklyn that registered a population decline. The positive natural increase was not enough to offset the larger negative net migration. This loss could be attributed to the very small gain in housing units in this neighborhood compared to the neighborhoods to the south. Hispanics accounted for the majority of the net migration loss, with Puerto Ricans declining by almost one half.

### **Eastern**

*East New York* was the second fastest growing neighborhood in the borough, gaining 8,700 persons over the last decade, with most of the change due to natural increase. The black population increased by over 10 percent, through both net migration and natural increase; it is likely that blacks from other parts of Brooklyn moved to *East New York*. A big increase in housing units over the last decade added to the attraction of this neighborhood as a destination for those leaving other parts of Brooklyn. There was also an increase in the number of Hispanics, but to a smaller degree (7 percent), due to natural increase. Both Mexicans and Dominicans increased their presence in this NTA, while the number of Puerto Ricans declined (9 percent). Despite the increase in population, the average household size declined from 3.03 in 2000 to 2.94 in 2010, still well above the city average of 2.57 persons. This area also saw a 28 percent increase in non-family households.

A similar picture emerged in *Canarsie*, where there was a pronounced increase in the number of blacks as a result of positive net migration and natural increase. Blacks made up 81 percent of this neighborhood, up from 67 percent in 2000. The population growth among blacks was offset by a hefty negative net migration of whites, producing little change in overall population. And in *Flatlands*, there was a large decline in white population (30 percent), due almost entirely to net out-migration, as blacks continued to increase. This NTA was one quarter white and 61 percent black in 2000. By 2010, the composition had shifted to 18 and 66 percent, respectively.

### **Southwestern**

The population of *Borough Park* increased by more than 5 percent, but this subtle growth belies a very large population turnover. The population change was the result of 23,500 persons added through natural increase and 18,200 persons lost through net out-migration. With no real change in the number of housing units over the decade, the population increase drove up average household size, from an already large 3.38 persons per household in 2000 to 3.69 in 2010. The area remained more than three quarters white.

In neighboring *Sunset Park East*, growth was in excess of 9 percent. Almost 17,000 persons were added through natural increase, partially offset by a net migration loss of more than 10,600 persons. This dynamic has led to a very large shift in race/ethnic composition, with losses among whites and Hispanics, and a significant increase in the Asian population. Asians were in the majority in *Sunset Park East* at 52 percent in 2010, up from 35 percent of the population in 2000. Most of this increase was among the Chinese, who added 14,300 persons to the population, a jump of 72 percent over the last decade. Modest housing unit increases paired with a big increase in population, spurred a steep climb in average household size from 3.37 in 2000 to 3.62 in 2010.

The Hispanic population was still in the majority in *Sunset Park West*, at about two thirds of the total, unchanged from 2000. The pattern of change in this NTA was one of net migration losses paired with a large natural increase, producing a gain of about 3 percent in total population. The most significant change was the shift in the makeup of Hispanic groups. While there was a decline in the number of Puerto Ricans (36 percent) and Dominicans (20 percent), there was a very large increase in the Mexican population (70 percent). For the first time, Mexicans outnumbered Puerto Ricans in the *Sunset Park West* NTA, making this the second largest settlement of Mexicans in the city. (The largest settlement was in *North Corona* in Queens.)

To the south, the neighborhoods of *Bensonhurst East* and *West*, *Dyker Heights*, and *Bath Beach* also saw gains in population, on the order of 5 to 8 percent. Overall net migration appeared to be small in its effects, owing to the fact that almost as many people came to these areas as left. The real story

was about the components of change by race/ethnicity. White declines were large in these areas—anywhere from 16 to 21 percent—as a product of both negative natural increase and net out-migration. At the same time, the Asian population surged in *Bath Beach* (68 percent) and increased by 58 and 57 percent in *Bensonhurst East* and *West*, respectively. Growth in the Chinese population accounted for the bulk of Asian increases. Over 17,000 Chinese were added to the two *Bensonhurst* neighborhoods over the decade. In 2000, whites were in the majority; however, by 2010, this was no longer the case, with Asians making up over one third of the population. The change in the Asian population was driven by a large net in-migration. Still, the data on average household size showed considerable increases in each NTA, in the range of one to two tenths of a person. This change is consistent with the larger size of Asian in-migrant households, compared to the aging European households they replaced.<sup>6</sup>

The number of Hispanics also increased in these NTAs over the decade, although not to the same degree as Asians. The pattern of change was similar, with positive net migration overshadowing natural increase, not surprising given that Hispanics are largely new to these areas. Indications have been that Mexicans, Puerto Ricans, and other Hispanic groups were increasing, along with Central Americans, especially in *Bensonhurst West*. All told, these NTAs were less than 10 percent Hispanic in 2000 and were in the range of 13 percent in 2010.

## MANHATTAN

The population of Manhattan increased over the past decade by 48,700 or 3.2 percent. Among the four boroughs that lost population through net migration (Staten Island was the exception), Manhattan's losses were modest in both absolute and relative terms as this borough continued to be a magnet for domestic migrants. As a result, positive natural increase was able to offset losses through migration, producing an increase in total population. Whites and Asians, however, were the only race/Hispanic groups to post gains in population in this borough. While the city overall saw a decline in the white population of 3 percent, in Manhattan the white population increased by 8 percent. This increase was due in equal parts to positive natural increase and net migration, with the latter heavily influenced by a sustained in-migration of younger persons who live in non-family households. In 2010, whites accounted for almost one half of the borough's population (48 percent). Asians also experienced strong growth (24 percent) with a shift in settlement patterns away from the long-established enclave of Chinatown. As with whites, there has been an influx of younger Asians in non-family arrangements. Blacks, on the other hand, saw their numbers drop by 13 percent, the largest relative loss of any borough, due almost entirely to a negative net migration. Their share of the borough dropped from 15 to 13 percent. In addition, Manhattan lost Hispanic population (3 percent), the result of net out-migration, mostly in the northern sections of the borough.

[View Table](#)

### **West Side**

*Battery Park City/Lower Manhattan* was the fastest growing neighborhood in the city, registering an increase of 19,600 persons or 98 percent since 2000. The increase in housing units was equally formidable, with a total increase of some 12,500 units, more than doubling the available stock over the decade. The draw of this new housing was apparent, in that some 16,700 of the 19,600 increase in population was the result of migration to this NTA. While all race/Hispanic groups increased, the most sizable changes occurred among whites (12,200), followed by Asians (4,600) and Hispanics (1,800). The area remained about two thirds white, with Asians rising to one fifth of the population. The increased presence of families in the area was reflected in an increase in average household size between 2000 and 2010; however, at 1.84 persons per household in 2010, the area was still characterized by a large number of non-family households (66 percent).

To the north, *Soho/Tribeca/Civic Center/Little Italy* grew by 16 percent over the decade due to both natural increase and positive net migration, with the latter being responsible for about 40 percent of the growth. There was also a 23 percent increase in total housing units in this NTA. Net migration was negligible or negative for blacks, Hispanics, and Asians, but positive for whites, who increased their share of this NTA from 59 to 66 percent over the decade. While family households did

increase, the presence of non-family households grew at a much greater pace (27 percent compared to 13 percent). Non-family households accounted for 60 percent of all households. As a consequence, average household size dropped below two persons per household in 2010.

With very large increases in the number of housing units, the *Hudson Yards/Chelsea/Flatiron/Union Square* NTA was second only to *Battery Park City/Lower Manhattan* in growth. Very high levels of positive net migration were responsible for 12,500 of the 14,300 individuals added to the population. The influx of whites and Asians, especially Asian Indians, Chinese, and Koreans, was large over the past decade. Non-family households continued to account for the majority of households, resulting in an average household size among the lowest of any NTA in the city, at just 1.65 persons.

Continuing north, *Clinton* largely mirrored this trend, with a large net in-migration as a component of change and a population increase of 13 percent over the decade. Like its neighbors to the south, the influx of white and Asian populations fueled much of the growth. Asian Indians, Chinese, and Koreans all saw triple-digit percentage increases. About three quarters of all households in *Clinton* were non-family in both 2000 and 2010, with a very low average household size that remained unchanged over the decade at 1.65 persons.

*Lincoln Square* to the north provided an interesting contrast to its neighbors to the south, which grew mostly through migration. Here, positive net migration was greatly overshadowed by positive natural increase, which was responsible for 5,200 of the 6,300-increase in total population. Gains in natural increase in the white population, as well as the Asian population (which also experienced positive net migration), supported most of the growth in the past decade. With a modest gain in the number of housing units (8 percent), coupled with an increase in the number of family households (22 percent), average household size increased from 1.61 to 1.74 between 2000 and 2010. *Lincoln Square*, however, was still characterized by a preponderance of non-family households 63 percent of all households in 2010 (down from 68 percent in 2000).

### **East Side**

*Chinatown* to the south recorded a 9 percent loss in population. The 6,100 persons gained through natural increase were not enough to offset the net outflow of 10,700. While still more than 60 percent Asian, the Asian majority in Chinatown has begun to wane. With a loss of 15 percent among Asians (due mostly to out-migration) and a net gain among whites (due to net in-migration), the percentage white in this NTA has increased from 11 to 16 percent over the last decade. Housing unit change was negligible. Reflecting a decline in family households and an increase in non-family households, there was a huge decline in average household size, from 2.79 to 2.46 persons, a drop of about three tenths of a person.

The *East Village*, *Gramercy* and *Stuyvesant Town/Cooper Village* NTAs all experienced modest growth over the past decade, in the 6 to 10 percent range. The components of change behaved in a

similar fashion in each of these areas: negligible natural increase combined with positive net migration of the white and Asian populations. Growth in total housing units was also negligible. Average household size was very low in these areas, especially in the *East Village* (1.67) and *Gramercy* (1.57). While still below two persons per household, average household size rose in *Stuyvesant Town/Cooper Village* from 1.75 to 1.98 between 2000 and 2010.

To the north, *Murray Hill/Kips Bay* and *Turtle Bay/East Midtown* grew modestly at 5 and 3 percent, respectively, for a combined increase of 3,800 persons. These areas differed from their neighbors to the south in that positive natural increase was the driving force behind their population gains as opposed to net migration. Both neighborhoods have remained largely white over the decade, with the percentage share declining slightly in both NTAs, as a growing Asian population gained presence. While the increase in total housing units was negligible, household size remained low but increased to 1.66 persons per household in *Murray Hill/Kips Bay* and to 1.59 in *Turtle Bay/East Midtown*. And households in these areas remained predominantly non-family.

### **Upper Manhattan**

There was significant growth in *Central Harlem North/Polo Grounds* and *Central Harlem South*, with the former increasing by 8 percent and the latter by 11 percent, for an increase of 9,600 persons between the two NTAs. Both neighborhoods had positive net migration and natural increase, but the dynamics revealed in the components of change differ by race and Hispanic origin. Out-migration of black residents was largely responsible for a black population decline of 14 percent in *Central Harlem South* and 10 percent in *Central Harlem North/Polo Grounds*. In *Central Harlem South*, the migration loss of 5,600 blacks was almost completely offset by a net migration gain of 5,000 whites. This NTA was almost three quarters black in 2000; and by 2010, that proportion had fallen to 56 percent. Whites, on the other hand, have increased their share from 4 percent to 16 percent over the same time period.

In *Central Harlem North/Polo Grounds*, the dynamic was similar, but with Hispanics added to the mix through both migration and natural increase. In fact, there was a greater influx of Hispanics into this NTA than there was of whites, driven mostly by increases in Dominicans (76 percent) and Puerto Ricans (33 percent). While the presence of Mexicans was negligible in 2000, their number had tripled to 1,500 by 2010. Hispanics now make up almost one quarter of the population, up from 16 percent in 2000; whites were at 6 percent, up from just 1 percent in 2000; and blacks were down to 67 percent from 80 percent in 2000. The number of housing units increased in both NTAs, but particularly in *Central Harlem South* (8 percent). There was also a significant decline in average

household size in this NTA, from 2.33 to 2.26 in 2010, which is in line with a rising number of non-family households that are likely associated with in-migrants.

The largest population losses in Manhattan occurred in the northern neighborhoods of *Washington Heights South* (10 percent) and *Washington Heights North* (9 percent). The losses in both NTAs were due to large net out-migration, especially among Hispanics. The Hispanic net loss through migration numbered 17,500 in the South and 14,100 in the North; were it not for significant natural increase among Hispanics, the losses would have been much greater. Most of the net migration loss was among Dominicans, who recorded declines ranging from 12 to 23 percent in all of the northern Manhattan NTAs (*Washington Heights North*, *Washington Heights South*, *Manhattanville*, *Hamilton Heights*, and *Marble Hill/Inwood*). Puerto Ricans showed a similar pattern, with losses in most NTAs; but the Mexican population, while comparatively small, displayed increases in these same places.

In contrast, there was positive net migration for whites, which was responsible for virtually all of their growth in *Manhattanville*, *Hamilton Heights*, *Washington Heights South*, *Washington Heights North*, and, to a smaller degree, in *Marble Hill/Inwood*. In addition, there were sharp drops in the number of blacks, particularly in *Hamilton Heights* and *Manhattanville*, mostly due to net migration. In 2010, blacks accounted for just one third of the total population in *Hamilton Heights* compared to 42 percent in 2000. Increases in non-family households occurred across all of these NTAs, accompanied by declines in the number of families, especially those with children under 18 years of age. In *Washington Heights South*, the percent of all households that were non-family went from 33 to 39 percent, while the percent non-family for *Washington Heights North* increased from 37 to 42 percent. Declines were also evident in average household size. For example, in *Washington Heights South*, there was a sharp decline in average household size over the decade, from 3.10 to 2.87. Similarly, average household size declined from 2.77 to 2.59 in *Washington Heights North*.

## QUEENS

According to the 2010 Census, the number of persons enumerated in Queens remained unchanged over the past decade at about 2.23 million. If one were to believe the census count, the natural increase of 158,300 persons would result in a net migration loss of some 157,000 persons or about 7 percent of the population. Such a loss would be reflected in other data, which is not the case (see earlier Box). Therefore, the strategy in this analysis of Queens is to focus on the majority of neighborhoods where the Census did a fairly accurate job enumerating the population, while pointing out the selected northwestern neighborhoods where census operations may have gone awry.

Between 2000 and 2010, the Asian population rose by 31 percent. Queens became home to almost half of New York City's Asian population and accounted for about one half of the total increase in Asians citywide. At the same time, white residents declined by 16 percent, a product of losses through *both* net migration and natural increase (with the former being five times larger than the latter). Thus, it should come as no surprise that Asian-for-white replacement was a major feature of change in the borough. Hispanics increased by 10 percent in the borough and also replaced white residents in many neighborhoods. The black loss in Queens was close to the city average at 6 percent and mostly the result of net out-migration. While many southeast Queens neighborhoods remained majority black in 2010, increases in Asian and Hispanic populations have begun to tilt the race/Hispanic composition in some areas. The distribution of population by race in this borough is converging, with whites and Hispanics accounting for equal shares of the total (28 percent), followed closely by Asians (23 percent) and blacks (18 percent).

[View Table](#)

### ***Southeast***

The neighborhoods of southeast Queens lost significant population due to net out-migration in the past decade. Natural increase was not large enough in most cases to offset net out-migration resulting in population losses in *Cambria Heights* (11 percent), *Queens Village* (9 percent), *Laurelton* (7 percent), *Baisley Park* and *St. Albans* (3 percent), *Hollis* (2 percent), and *Springfield Gardens North* (less than 1 percent). Much of the loss in each NTA was associated with net black out-migration, with the largest losses occurring in *Queens Village* (6,500) and *Baisley Park* (6,800). Declines in white population were also responsible for the population dips in these NTAs.

While all areas remained majority-black in 2010, two NTAs in the northern part of this cluster—*Queens Village* and *Hollis*—experienced an increase in Asian population (28 and 36 percent,

respectively), due to both positive natural increase and net in-migration. By 2010, Asians had a 16 percent share of *Queens Village* and an 11 percent share of *Hollis*. The most prominent subgroups were Asian Indian, Filipino, and Bangladeshi, along with a small but increasing number of Pakistanis in *Queens Village*. Declines in total housing units were seen in most of these NTAs, with some of the largest taking place in *Queens Village*. Vacancies increased in most areas, which is consistent with the fact that southeast Queens had more foreclosures than any other part of the city.

In contrast to the losses in most parts of Southeast Queens, *South Jamaica* had a double-digit gain in population (11 percent). This rise was due mostly to natural increase, given that net migration was close to zero overall. However, an analysis of net migration by race reveals considerable population turnover. Blacks registered a loss of 6 percent mostly because of net out-migration. At the same time, the Asian and Hispanic populations increased, primarily due to net in-migration. While still the large majority, the black share of *South Jamaica* has declined from 85 percent in 2000 to 72 percent in 2010. The number of Hispanics more than doubled with virtually all groups showing increases, including Puerto Ricans and Central and South Americans. Asian Indians and Bangladeshis figured most prominently in the Asian increase. Some of this in-migration was most likely spurred by a 10 percent increase in housing units over the decade. Household size remained in the same range in 2000 and 2010 (3.19), well above the city average.

The population also grew in *Jamaica*, but the rate was subdued at just 4 percent. This NTA had higher levels of net out-migration, especially among black and Hispanic residents. Black residents declined by 15 percent over the decade, but Hispanics managed a small increase (5 percent) due to natural increase. The biggest change, by far, was seen among Asians (mostly Bangladeshi and Asian Indian of Guyanese nationality), whose numbers increased by 75 percent to 13,100. While both natural increase and net migration were positive, most of the increase was due to the latter. The Asian share in this neighborhood increased from 14 to 24 percent over the decade. With only a small change in the number of housing units, the added population was accommodated through an increase in an already large average household size, from 3.27 in 2000 to 3.33 in 2010.

### **Northeast**

The neighborhoods of northeast Queens appear to have undergone little or no change in population size over the last decade. *Whitestone, Auburndale, Bayside/Bayside Hills, Glen Oaks/Floral Park/New Hyde Park, Oakland Gardens, Douglas Manor/Douglaston/Little Neck, and Fresh Meadows/Utopia* all recorded changes that were in the range of plus or minus 2 percent. (*Ft Totten/Bay Terrace/Clearview* and *Bellerose* were exceptions, with the former recording a decline of 4 percent and the latter an increase of 3 percent.) These small changes masked larger shifts in the population that were the result of a negative natural increase in every NTA, a consequence of an older, largely white European population. When coupled with net out-migration, the outcome was a large loss of whites. At the same time, Asians displayed big population increases, due both to natural increase and net migration, with the latter being a more formidable component than the former.

Of the nine NTAs in northeast Queens, eight were majority-white in 2000; however by 2010, only three remained majority-white while three turned majority Asian. No race group held a majority in

the remaining NTAs. Fresh Meadows, for example, was almost 50 percent Asian. Chinese growth was a major factor in a number of these areas, especially in *Bayside/Bayside Hills*, *Douglas Manor/Douglaston/Little Neck*, *Oakland Gardens*, *Whitestone*, and *Auburndale*. In *Bellerose* and *Glen Oaks/Floral Park/New Hyde Park*, the Asian Indian population was driving population change.

Overall, only small changes in the number of housing units occurred in these areas, with average household size similar in 2000 and 2010 in most places. Average household size increased substantially, however, in *Fresh Meadows/Utopia* (.16), *Bellerose* (.13) and *Auburndale* (.09). These NTAs stood out in that the number of one person households with a head aged 65 years and over declined the most, implying a higher level of replacement with new households containing larger Asian families.

The second fastest growing neighborhood in Queens, behind *Hammels/Arverne/Edgemere*, was the northern neighborhood of *College Point*. Fueled by both positive natural increase and positive net migration, this NTA increased by 13 percent. This occurred despite a significant loss of whites (33 percent) due primarily to negative net migration. As a consequence, the share of the white population fell from 54 percent in 2000 to 32 percent in 2010. In the same period, the Asian population increased its share 12 percentage points, to just less than 30 percent of the total population. Hispanics have also increased their presence in *College Point*, with a large and growing number of South Americans whose share rose by 11 percentage points. Housing units increased by 10 percent over the decade, while average household size increased by .19, from 2.83 to 3.02.

*Flushing* grew to a much lesser degree (4 percent) than *College Point*, but there was huge population turnover. There were significant losses of 26 to 41 percent among whites, blacks, and Hispanics. For whites, negative natural increase combined with large net migration losses produced a decline in population, while net migration losses were largely responsible for declines among the black and Hispanic populations. Over the same period, 8,400 of the total 13,500 Asian increase was due to gains through migration. Indications were that Asian Indians and Koreans have lost significant population throughout the decade in *Flushing*. The loss was offset by huge increases in the already large Chinese population, which almost doubled by adding 17,000 to an existing 17,700 persons. As a result, the Asian population grew by 17 percent, increasing its share of the total population from 52 percent in 2000 to about 69 percent in 2010. Average household size has remained virtually the same, as total housing units increased by 11 percent over the decade, much of it the result of new construction.

### **Northwest**

The neighborhoods of northwest Queens have undergone significant shifts in population over the past decade. *Corona* and *North Corona* were two of the fastest growing neighborhoods in the borough, increasing their population by about 5,000 each (between 10 and 11 percent). *North Corona* had one of the highest levels of natural increase in the borough (10,000), but this gain was

tempered by the loss of 5,100 persons through net migration. Most of the increase was due to gains in Hispanics, in particular Mexicans, who added almost 8,000 persons for an increase of 116 percent. At the same time, there has been a precipitous 46 percent decline in Dominicans—from 15,100 to 8,200. Much was similar in *Corona*, where 5,300 Mexicans were added for a gain of 157 percent. Hispanics made up two thirds of the total population in the *Corona* NTA, and 85 percent of the *North Corona* NTA, increasing 12 and 7 percentage points, respectively, over the decade. At the same time, there was out-migration of the black population from these two NTAs, declining by 2,200 (22 percent) in *Corona* and by 2,100 (45 percent) in *North Corona*. As a result of these shifts in population, average household size in *Corona* increased from 3.21 to 3.37 and, in *North Corona*, increased from 4.04 to 4.34 (which is among the highest household size of any NTA in the city).

In *East Elmhurst*, the population grew by 9 percent over the last decade, but this measurement does not capture the pronounced shift from black to Hispanic, which continued to occur in this NTA. Over the last decade, the black population declined by 43 percent, while the Hispanic population grew by 67 percent. Virtually the entire black decline was the result of net migration losses, while the Hispanic increase was the result of a mix of positive natural increase and a net migration gain. Moreover, the increase in Hispanics was a function of growth among Mexicans and South Americans, and, to a lesser degree, Central Americans. Almost none of the change was due to an increase in the Dominican population, which remained essentially the same between 2000 and 2010. By 2010, the Mexican population was almost as large as the Dominican population in this NTA. Like other NTAs in this area, average household size jumped from 3.24 to 3.48, a very large increase to an already large number.

*Elmhurst* had even greater natural increase (12,000) than neighboring *North Corona*; however, this growth was almost completely offset by net out-migration, resulting in a negligible population change between 2000 and 2010. The Hispanic population of *Elmhurst* saw a small loss over the decade because of a large net out-migration only partially offset by natural increase. While still the largest Hispanic subgroup, South Americans declined by 17 percent (from 23,800 in 2000 to 19,600 in 2010). At the same time, Mexicans have increased by more than 50 percent in this NTA. Small positive net migration along with large positive natural increase spurred an increase in Asians, most heavily among the Chinese, but including a mix of Bangladeshis and Filipinos. Asian Indians and Koreans showed a decline in *Elmhurst*.

Neighboring *Jackson Heights* declined by 5,200 persons over the past decade, a loss of 5 percent. Much of this loss occurred among the white population, as over 5,000 whites left the area through a mix of negative natural increase and net out-migration. Hispanics, the dominant group in the area, showed little change over the decade; but, as with *Elmhurst*, a growing Mexican population has been replacing South Americans. Asians have also seen significant increases—mainly Bangladeshis—as their population increased by over 200 percent.

The loss of population in *Astoria* and *Steinway* implies a huge net migration loss that may have been caused by the misclassification of housing units as vacant (see earlier Box). Using the reported 2010 Census numbers would imply an out-migration of some 15,600 persons in *Astoria*, which represented about 18 percent of the population (and was only partially offset by a natural increase of 5,300 persons). A similar account was present in *Steinway*, where migration losses were disproportionately high and may stem from problems with the data collection. Suffice it to say that the distribution of population by race and Hispanic origin did not change to any great degree, with the possible exception of white residents, who increased over the decade, perhaps due to increases in the number of Eastern European immigrants and young domestic in-migrants. Household size declined, and the number of non-family households rose in these two NTAs.

The largest number of new housing units in Queens was found in the neighborhoods of *Hunters Point/Sunnyside/West Maspeth*, which collectively added over 4,000 new housing units, a 16 percent increase. However, the number of vacant units also increased significantly, resulting in overall population growth of just 2 percent. The area maintained an even mix of whites and Hispanics, each at 35 percent of the total; Asians made up most of the remaining share. Growth in whites through in-migration and growth in Asians due to natural increase contributed to much of the overall population increase throughout the decade. Hispanics recorded declines, losing 1,800 persons or 8 percent of their population. Average household size declined over the decade from 2.51 to 2.37 in 2010, as the NTA recorded a 20 percent gain in non-family households.

### **Southwest**

In southwestern Queens, the neighborhoods of *Ozone Park*, *South Ozone Park*, *Richmond Hill*, *Lindenwood/Howard Beach*, and *Woodhaven* saw modest changes in population, ranging from a loss of 7 percent (*Lindenwood/Howard Beach*) to an increase of 5 percent (*Woodhaven*). They all had one thing in common—a loss of white population through both negative natural increase and net out-migration, with the latter being responsible for most of the losses. With the help of natural increase, most of the replacement has been by Hispanic and Asian migrants. As this shift occurred, average household size tended to increase due to the larger family sizes of these groups.

Although the population size of *Richmond Hill* went virtually unchanged over the past decade, shifts by race were notable. From 2000 to 2010, whites in *Richmond Hill* declined by 37 percent, while big increases occurred among black (22 percent) and Asian (38 percent) residents. All of the black population increase was due to natural increase, while Asians were the only group to gain through both natural increase and net migration. The share of whites in the neighborhood declined from 18 to 11 percent between 2000 and 2010. The Asian population grew from 20 percent of the total population in 2000 to 27 percent in 2010. These changes were accompanied by an increase in average household size, from 3.42 to 3.55.

### ***The Rockaways***

The neighborhood of *Hammels/Arverne/Edgemere* was the fastest growing neighborhood in Queens (17 percent). While the increase was a result of both in-migration and positive natural increase, it was a large positive in-flow (the largest in the borough) that led the way. Over the decade, there was an increase of 3,700 persons due to net in-migration. Although whites lost population through negative natural increase, they gained through net migration, producing little change overall. The black population still made up more than half the share of the population and continued to increase over the decade, with all of the gain attributable to natural increase. In contrast, Hispanics (and to a lesser degree Asians) were growing mostly because of net in-migration. All Hispanic groups gained; but the Dominicans had the largest gains, adding 1,000 people for an increase of 143 percent. This NTA also had an increase of 2,200 housing units in the past decade and increases in family and non-family households at 19 and 24 percent, respectively.

*Far Rockaway/Bayswater* saw growth (4 percent) over the past decade, with gains largely a product of natural increase, especially among Hispanics. Net migration was negative, with blacks showing the highest rates of net loss through migration. Natural increase was not enough to offset this loss, resulting in an overall black population loss. Among Hispanics, increases were apparent for Central Americans, and to a lesser degree, Dominicans. Total housing units increased over the decade by 7 percent, adding over 1,100 units, with family and non-family households registering increases.

## STATEN ISLAND

Staten Island was the fastest growing borough in the city, increasing its population by 5.6 percent. Judging from the small net migration gain (2,200), it is tempting to conclude that the effects of migration have been inconsequential for the borough. While this may be true from an absolute numbers standpoint, nothing could be farther from the truth when the components of change are examined by race and Hispanic origin. Declines through migration among whites were more than offset by net migration gains for Hispanics and Asians.

The Hispanic population was the fastest growing group in Staten Island, increasing by 27,500 or 51 percent. Positive natural increase (10,900) and net migration (16,600) both played a role. Hispanics accounted for 17 percent of the borough's population in 2010, up from 12 percent in 2000. The Asian population also posted a strong gain of 40 percent, with over one half of that increase due to positive net migration. At the same time, among whites, there was a very large net outmigration over the decade (19,800) and a very small level of natural increase, resulting in a 5 percent population loss. While still majority-white, the borough's white share dropped 7 percentage points to 64 percent of the population. And Staten Island was the only borough to report an increase in black population, of 12 percent, due to natural increase.

[View Table](#)

### North Shore

The population in *Mariner's Harbor/Arlington/Port Ivory/Graniteville* and *Port Richmond* increased over the past decade by 13 and 12 percent, respectively. While natural increase accounted for most of this change, the data on net migration revealed significant population turnover. Whites displayed net out-migration from these areas, with little or no natural increase to offset these losses. In contrast, Hispanics, and to a lesser degree, Asian residents displayed impressive levels of net in-migration. The black population grew as a result of natural increase, particularly among new immigrants from sub-Saharan Africa. These two neighborhoods accounted for one half of the increase in the borough's black population.

From 2000 to 2010, the share of the white population has declined from 37 to 24 percent in *Mariner's Harbor/Arlington/Port Ivory/Graniteville* and from a majority (57 percent) to 40 percent in *Port Richmond*. In the former NTA, the Hispanic population, mainly of Mexican and Puerto Rican descent, increased through a mix of positive natural increase and net migration. Total housing units increased by 12 percent over the decade, as family and non-family households both showed significant increases of 10 and 18 percent, respectively. The Mexican population was also responsible for much of the Hispanic growth in *Port Richmond*, increasing by 2,200 or 166 percent.

This shift became evident as the neighborhood recorded a .22 increase in average household size, growing from 2.88 in 2000 to 3.10 persons in 2010.

Moving east along the North Shore, the neighborhood of *West New Brighton/New Brighton/St. George* stood out among North Shore communities because it displayed significant net out-migration. The NTA still grew because natural increase more than offset the losses through migration, but the gain in population was modest (4 percent) by comparison. The white population declined by 19 percent, mostly because of negative net migration, while Hispanics increased (44 percent) due to significant positive natural increase and net in-migration. The white share of this NTA declined by almost 8 percentage points to 26 percent of the total, as Hispanics, mainly of Mexican descent, increased their share from 24 percent in 2000 to 34 percent in 2010.

While still majority-white, *New Brighton/Silver Lake* and *Westerleigh* lost white population over the last decade through net out-migration. In *New Brighton/Silver Lake*, this loss was compounded by negative natural increase among whites, leading to a loss among whites of 11 percent; in *Westerleigh*, the white population declined by 10 percent. At the same time, black, Hispanic, and Asian residents have increased in both areas, mostly through net in-migration *and* positive natural increase in *New Brighton/Silver Lake* and net in-migration in *Westerleigh*. Although there were increases in Hispanics from a number of countries, the increases among Mexicans and Puerto Ricans were pronounced. Changes in the number of housing units were modest, and there was a moderate uptick in average household size.

*Grymes Hill/Clifton/Fox Hills* and *Stapleton/Rosebank* increased by 13 and 10 percent, respectively. In both areas, there were net migration losses for blacks as well as whites, with increases a product of Hispanic and Asian growth. In *Stapleton/Rosebank*, the Hispanic increases were larger, the result of a big influx of Mexicans, who increased from 740 people to more than 2,400 over the past decade. Large increases were also evident among the Chinese in both neighborhoods. Housing unit increases occurred in *Grymes Hill/Clifton/Fox Hills* and *Stapleton/Rosebank* by 12 and 9 percent, respectively.

### **Mid- Island**

*New Dorp/Midland Beach* and *Old Town/Dongan Hills/South Beach* were the only neighborhoods in the mid-island cluster that gained significant population over the decade. Population increases were due mainly to positive net migration, for a gain of 8 percent overall in each NTA. Hispanic and Asian net in-migration, combined with white declines, have slowly changed the racial composition of these areas, which were still overwhelmingly white. Were it not for the substantial influx of foreign-born whites from Russia in *Old Town/Dongan Hills/South Beach*, losses through net out-migration and negative natural increase would undoubtedly have led to further declines in the white population. This shift has increased the average household size of each NTA by .05 persons, as total housing units increased by about 8 percent in each neighborhood.

Little change in population occurred in *Todt Hill/Emerson Hill/Heartland Village/Lighthouse Hill* and *Oakwood/Oakwood Beach*, with changes in population size near zero. White net out-migration resulted in population losses in both NTAs. Small but meaningful upticks in the Hispanic and Asian populations reduced the white majority slightly. The Hispanic population stood at about 10 percent in both NTAs in 2010, up from 7 percent in 2000.

Change in the total population of *New Springville/Bloomfield/Travis* was negligible between 2000 and 2010, but the shifts by race and Hispanic origin were marked. With no gains through natural increase to offset net migration losses over the decade, the white population declined by 11 percent between 2000 and 2010. Whites were 64 percent of all persons, down from 73 percent in 2000. Hispanics and Asians had large increases over the past decade, at 46 and 31 percent, respectively, and together made up close to 30 percent of all residents in this neighborhood. Blacks increased in *New Springville/Bloomfield/Travis* by about 20 percent, from 1,400 to 1,700 persons and constituted about 4 percent of the population. Unlike areas to the north, where increases were marked for Mexicans, Hispanic increases in *New Springville/ Bloomfield/Travis* occurred among a wider cross-section of subgroups, including Puerto Ricans. While the Chinese and Asian Indian subgroups made up the majority of Asians in the area, the number of Chinese increased at a much faster pace than the Asian Indians, 87 and 4 percent, respectively. Significant aging of the population, most likely among whites, is indicated by the increase in non-family households with heads age 65 and over.

### **South Shore**

*Charleston/Richmond Valley/Tottenville* was the fastest growing neighborhood on the island, registering a 27 percent increase over the last decade. More than on the North Shore, where growth was driven more heavily by natural increase, the growth in this neighborhood was largely through positive net migration. This NTA gained almost twice as many persons as a result of net in-migration as were added due to natural increase. This was especially the case for whites, who continued to be the predominant group, with an 85 percent share in 2010. Hispanics were the most sizable group after whites, and, as with whites, their increases were most closely associated with net in-migration. There was a 28 percent increase in housing units over the last decade, adding some 1,800 units to the stock in this NTA. Average household size remained about the same at 2.86 persons.

In contrast, *Great Kills* and *Arden Heights* showed little or no change in population over the last decade, with the former actually registering a decline. Whites, however, declined in both areas due to relatively high net migration losses. Gains among other groups were modest at best, resulting in relatively low levels of population turnover. Thus, the areas remained predominately white in 2010—88 percent in *Great Kills* and 81 percent in *Arden Heights*. Both NTAs experienced only modest increases in the number of housing units, which when combined with increases in non-family households (especially one person households with heads aged 65 and over), produced sizable declines in average household size. While direct evidence is difficult at best to come by, it is reasonable to suggest that the white net migration losses in these two NTAs have shown up as white net migration gains in the NTAs further south.

## Conclusion

Any attempt to identify the components of change by race and Hispanic origin in the plethora of neighborhoods that comprise New York City is a complex undertaking. Nonetheless, this analysis highlights the demographic data that characterizes the race/Hispanic shifts, which have taken place over the past decade. Several overarching themes have emerged.

The Bronx became majority-Hispanic, with several areas in the south central part of the borough where new housing has been developed increasing in population due to *both* natural increase and net migration, a pattern that has not been seen in this borough for several decades (and in contrast to the pattern of many neighborhoods to the west, where growth through natural increase is offset by net migration losses). An aging white population, which has been augmented to a small extent by immigrants from Eastern Europe, continues to give way to increases in Hispanics throughout the borough. At the same time the Hispanic population is becoming less Puerto Rican and more Dominican, Mexican, Central and South American.

In Brooklyn, the loss of black population in the north central neighborhoods of the borough, largely through migration, has been a central focus. Were it not for natural increase and the propensity of some black households to move into neighborhoods on the eastern/southeastern periphery of the borough, losses of black population would have been even more substantial. Increases in younger, white households—almost totally a product of domestic migration—have moved into a number of northern and central Brooklyn neighborhoods. And the Asian movement across the southern part of the borough has continued to fill the vacuum left by older European whites, who have exited the population through death or migration. A new area with a distinctive demographic identity has developed in central-to-southern Brooklyn, stretching from Prospect Park down to Brighton Beach, where an increasingly diverse group of immigrants from South Asia, Israel, Russia, and China, as well as a host of Arab nations, have settled.

In Manhattan, the relative loss of black population, a product of net out-migration from neighborhoods to the north, was the largest of any borough. While Hispanic losses were recorded in Manhattan—much of them a product of migration out of Washington Heights—they were dampened by the movement of Hispanics into northern portions of Central Harlem. Asians and whites increased in Manhattan; most of the growth was associated with younger non-family households moving into the borough, especially into lower Manhattan outside of Chinatown.

In Queens, it was the Asian-for-white replacement that was most noteworthy, largely a product of new in-migration to the neighborhoods of northeastern Queens. In addition, Asian and

Hispanic population gains are changing the race/Hispanic mix in southeastern Queens, where black out-migration has left a vacuum in a number of neighborhoods. Northwestern Queens continued to be the epitome of diversity, with a rich mix of ethnic groups, the most recent from Mexico, Central America, Eastern Europe, and the Indian subcontinent.

Finally, Staten Island was the only borough to experience an increase in black, Hispanic, and Asian populations, resulting in increased race/Hispanic mixes in many areas, particularly on the North Shore. Even with an influx of Russians, the white population is aging and showing net out-migration in most neighborhoods, especially on the North Shore and in Mid-Island. This void is being filled primarily by Hispanic and Asian migrants, though a variety of groups are represented. Migration from southern Brooklyn to Staten Island has historically occurred, and as the composition of southern Brooklyn changes so will Staten Island. Persons who trace their ancestry to Mexico, China, and a number of Arab nations, among others, will increasingly come to occupy the neighborhoods of Staten Island.

This brief provides a snapshot of the effects that migration patterns have had on the racial and Hispanic make-up of New York City's neighborhoods. It is important to recognize, however, that the trends depicted herein are only one part of a much larger story, which must be told using data that go beyond what natural increase and net migration can reveal. This larger picture will be the focus of the third *Census Brief* and will make use of data from the American Community Survey (ACS), the replacement for what was called the census long form. Actual flows of people into, out-of, and between the five boroughs of New York City, along with their origins, destinations, and socioeconomic characteristics, will be the highlight of this next brief, providing a perspective that enhances our understanding of how migrants continue to change the neighborhoods of New York.

## Endnotes

---

<sup>1</sup> Data on births and deaths were provided by New York City Department of Health and Mental Hygiene.

<sup>2</sup> Net migration is determined as a residual by subtracting natural increase from the change in total population. While it provides an idea of what the net effect of migration is on a population, it provides no information as to the size or other characteristics of flows into or out of an area. Also, because net migration is calculated as a residual, it is subject to errors in the enumeration that render the total population count too high or too low.

<sup>3</sup> NTAs, or Neighborhood Tabulation Areas, are aggregates of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names do not definitively represent neighborhood boundaries.

<sup>4</sup> Throughout this analysis, race groups are exclusive of Hispanics, who are included as a separate group. For ease of discussion, white nonhispanic is referred to as "white," black nonhispanic as "black," and "Asian nonhispanic," as "Asian."

<sup>5</sup> With more than 3.1 million occupied housing units in New York City, changes in the number of persons per household (i.e., average household size) can have a large impact on the total change in population. For example, between 2000 and 2010, average household size in Brooklyn declined by .06 of a person, from 2.75 to 2.69 persons per household. When this drop is applied to the 917,000 households in Brooklyn, it resulted in a decline of about 55,000 residents over the decade. (Brooklyn's small gain in population of 1.6 percent was the result of an increase in housing units). Thus, what looks like small changes in average household size can have sizable effects on the populations of neighborhoods. In this analysis, changes in average household size of .05 to .09 are considered sizable, while any change of one tenth of a person (.10) or more is considered large.

<sup>6</sup> Since enumeration problems in these areas probably resulted in a reported population undercount, it is likely that these effects are understated; for example, increases in Asian population and in average household size are likely larger than reported here.

\* Neighborhood Tabulation Areas, or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods

NOTE: Census tract boundaries changed between Census 2000 and Census 2010. In order to compare data between the two periods, data in 2000 census tract boundaries were converted into 2010 census tract boundaries. Where data were available, 2000 census block boundaries were used to convert data into 2010 census tract boundaries. In the case of Hispanic and Asian subgroups data block level data were not available; therefore 2000 census tract boundaries were used in the conversion. Because two different methods were used to convert 2000 census data into 2010 census tract boundaries, slight differences may occur between NTA totals across tables.

\*Neighborhood Tabulation Areas, or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods

NOTE: Census tract boundaries changed between Census 2000 and Census 2010. In order to compare data between the two periods, data in 2000 census tract boundaries were converted into 2010 census tract boundaries. Where data were available, 2000 census block boundaries were used to convert data into 2010 census tract boundaries. In the case of Hispanic and Asian subgroups data block level data were not available; therefore 2000 census tract boundaries were used in the conversion. Because two different methods were used to convert 2000 census data into 2010 census tract boundaries, slight differences may occur between NTA totals across tables.

\*Neighborhood Tabulation Areas, or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods

\*\*Includes Taiwanese

NOTE: Census tract boundaries changed between Census 2000 and Census 2010. In order to compare data between the two periods, data in 2000 census tract boundaries were converted into 2010 census tract boundaries. Where data were available, 2000 census block boundaries were used to convert data into 2010 census tract boundaries. In the case of Hispanic and Asian subgroups data block level data were not available; therefore 2000 census tract boundaries were used in the conversion. Because two different methods were used to convert 2000 census data into 2010 census tract boundaries, slight differences may occur between NTA totals across tables.

\*Neighborhood Tabulation Areas, or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods

Note: Census tract boundaries changed between Census 2000 and Census 2010. In order to compare data between the two periods, data in 2000 census tract boundaries were converted into 2010 census tract boundaries. Where data were available, 2000 census block boundaries were used to convert data into 2010 census tract boundaries. In the case of Hispanic and Asian subgroups data block level data were not available; therefore 2000 census tract boundaries were used in the conversion. Because two different methods were used to convert 2000 census data into 2010 census tract boundaries, slight differences may occur between NTA totals across tables.

\*Neighborhood Tabulation Areas, or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods

NOTE: Census tract boundaries changed between Census 2000 and Census 2010. In order to compare data between the two periods, data in 2000 census tract boundaries were converted into 2010 census tract boundaries. Where data were available, 2000 census block boundaries were used to convert data into 2010 census tract boundaries. In the case of Hispanic and Asian subgroups data block level data were not available; therefore 2000 census tract boundaries were used in the conversion. Because two different methods were used to convert 2000 census data into 2010 census tract boundaries, slight differences may occur between NTA totals across tables.
