M Constructed Wetland

X PARK

EL - ev (3)0 name 2 Centre Point, X-PARK is an opportunity of unprecedented scale in contemporary design.

Existent - the Fresh Kills site has been an industrial byproduct of the past 50 years. The 4,000ft. landfill is the highest point in natural elevation for residents and the city.

Exalted - has been experienced little extraordinary site. Surprisingly, in my opinion it is PARK in a unique site and location.

The site presents the client/user/visitor through a simple strategy of keeping the movement and layering a sequence of various places, distances and conditions to reveal the site and interpret it on a metropolitan matrix. Planned on, our public and local process and circulation need three zones of cultural activity: the civic center, commercial center, and entertainment center.

The civic west center features are its watercourses, topography and scale. Through a system of roads and trails that traverse the hills and valleys, panels, water edges, and piers allow for experiencing the site from an elevated perspective. Its constructs over the fifty thousand.

The X PARK concept relies on the possibility of Fresh Kills becoming the city's first variety of several use programmes in phase 3 that will produce a mix of ecologies and cultures that is reserved for long-term viability of a public space of this scale for Staten Island and the City of New York.

Experience - is also a core opposition inside X PARK where the design and the symbiotic was tried in between what is not and is not. The X PARK fosters many distinct.

Environment - because of the dramatic topography, habitat will consider soils, water and utilities in X PARK are adaptive and stationary.

Economy - the X PARK will be a world of sustainable development, economically possible, and design innovation for the 21st century.

Interest - appealing for all users (fauna, flora and human). X PARK enables active and assisted recreation while respecting our ecological principles.
