Acknowledgements

The following individuals at the New York City Department of Health and Mental Hygiene (NYC DOHMH), the federal Agency for Toxic Substances and Disease Registry (ATSDR), and Research Triangle Institute (RTI) International all made important contributions to the success of the World Trade Center Health Registry (WTCHR) and the completeness and quality of the data collected.

Robert Brackbill, PhD, MPH of ATSDR and assigned to the NYC DOHMH served as the Principal Investigator for the WTCHR. James E. Cone, MD, MPH, NYC DOHMH, was the Senior Consultant. Sharon Campolucci, RN, MSN, ATSDR, served as Project Officer. Jay Sapp, MS, ATSDR, served as Statistician. Deborah Walker, PhD, was NYC DOHMH's Project Director. Lisa Thalji, MA, served as RTI's Project Director, and Paul Pulliam was RTI's Associate Project Director.

Other key ATSDR project staff were Ginger Gist, PhD (Technical Consultant), Nelda Godfrey (Grants), Carolyn Harris (Associate Project Officer), Jill Smith (Media), and Judy Smith (Alternate Project Officer). Other key NYC DOHMH project staff were Greg Butler (Media), Renato DaSilva (Outreach), Laura DiGrande, MPH (Research Scientist), Sid Dinsay (Media), Erin Gregg (Project Coordinator), Jessica Morris (Community Relations), Megan Perrin, MPH (Research Scientist), Eleanor Peters (Outreach), Alison Pulizzi (Health Media and Marketing) and David Wu, MS (Computer Specialist). Other key RTI task leaders were Mary Allen (Field Data Collection), Elizabeth Dean, MA, (Instrumentation), Melissa Dolan, PhD, (Outreach and List Building), Amy Kowalski (NYC Site Office), Randy Lucas, MS, (Data Systems), Amanda Meehan (Mailouts), Joe Murphy, MA, (Methodologist), Eric Peele (Programming), Jackie Rose (Financial Analysis), Suzanne Triplett (Telephone Data Collection), Alice Turner (Tracing), and Harvey Zelon (Data Collection).

Special thanks to Thomas R. Frieden, MD, MPH, Commissioner, NYC DOHMH; Lorna Thorpe, PhD, Deputy Commissioner, Division of Epidemiology, NYC DOHMH; Kelly Henning, MD, Special Advisor to the Commissioner, NYC DOHMH; Henry Falk, MD, MPH, Director, Coordinating Center for Environmental Health and Injury Prevention, CDC; David Williamson, PhD, Director, Division of Health Studies, ATSDR; and Pauline Thomas, MD, University of Medicine and Dentistry of New Jersey (formerly Assistant Commissioner, Surveillance, NYC DOHMH); for their leadership, guidance and advice during this project. Finally, we would like to thank the RTI telephone and field interviewers whose persistence and professionalism yielded health interviews with over 71,000 individuals.

Chapter 1: Introduction

1. Overview of the Data File User's Manual

This manual provides documentation to familiarize data users with the design, methodology, data collection, and data processing of the World Trade Center Health Registry (WTCHR). Following this introductory chapter, Chapter 2 summarizes the instrument development process and content. Chapter 3 details the approach used to recruit the WTCHR cohort. Chapter 4 covers the methods used to collect data from registrants and the results of the data collection effort. Chapter 5 describes how data were processed, and Chapter 6 guides data users through key elements of using the data file, including questionnaire flags, indicators, and derived variables. Appendix A provides the baseline questionnaire, and Appendix B provides the baseline codebook and details of derived variables.

Data reported in this manual reflect the WTCHR questionnaire data files as of November 2005. The following two RTI reports, cleared through the ATSDR technical review process, present methodological and statistical details beyond the scope of this manual:

- *Sample Building and Denominator Estimation*
- *Explanation and Calculation of Outcome Rates*

These reports are expected to be posted to the WTCHR website (www.wtcregistry.org) in early 2006. For more information please contact the WTCHR Principal Investigator.

1.1 Overview of the World Trade Center Health Registry (WTCHR)

Immediately following the World Trade Center (WTC) terrorist attacks of September 11, 2001, the New York City Department of Health and Mental Hygiene (NYC DOHMH) and other environmental health experts became concerned about several potential health issues of the exposed populations. First, it was not immediately known what environmental toxins were released from the collapsed buildings and ensuing fires, and how such toxins or irritants would affect the health of residents and office workers in the vicinity, and first responders. Second, there was equal concern about the mental health needs of the population attacked as well as those responding to the disaster. Additionally, there were concerns about the injuries suffered by survivors and responders.

The NYC DOHMH proposed that a registry of persons exposed to the dust, airborne particulates, and fumes from the fires and the events of 9/11/2001 was necessary to document the populations' post-9/11/2001 baseline physical health and mental health status, and would be an investment in researchers' ability to understand any long term health effects of the disaster and its aftermath. In January 2002, NYC DOHMH drafted a protocol for a WTCHR and submitted a request for funding to the Centers for Disease Control and Prevention (CDC). The federal Agency for Toxic Substances and Disease Registry (ATSDR) consulted with NYC DOHMH and contributed its extensive experience in developing protocols for health investigations of populations exposed to toxic substances. NYC DOHMH and ATSDR worked collaboratively to finalize the protocol for the WTCHR. In July 2002, ATSDR secured funding from the Federal Emergency Management Agency (FEMA) for the initiation of the WTCHR.

Registries have been used for over 30 years to study the extent of health problems from exposures to environmental contamination and disasters. A registry, unlike most epidemiological studies, allows

participation of all exposed persons willing to enroll. Registries can enable long-term evaluation of health effects, and subjects for more structured studies may be selected from the registry cohort.

After careful planning and expert consultation on the development of the scientific approach, the WTCHR began data collection on September 5, 2003. Data collection continued through November 20, 2004. Over 71,000 persons were enrolled in the WTCHR.

Health and behavioral re-surveys of the population will be conducted periodically (approximately every 2-3 years), and registrant records will be matched periodically to death and cancer registries and to hospitalization records.

1.2 Objectives and Design

The World Trade Center Health Registry was established so that health experts can systematically evaluate the long-term health consequences of the attacks of 9/11/2001, inform those individuals at risk, and improve preparedness for future emergencies. The WTCHR has a number of features that make it a unique resource for health experts around the country who wish to conduct additional studies involving carefully selected sub-populations from the WTCHR and, where appropriate, that include physical exams and laboratory tests.

Features of the WTCHR include:

- A large, diverse population (> 71,000 enrollees) of whom 91% consented at the time of enrollment to be contacted in the future about 9/11/2001-related studies
- Inclusion of groups not well studied by others
- Accessibility to outside researchers
- A large proportion of enrollees provided email addresses
- Availability of comprehensive denominator and coverage information
- Comparison data available for NYC residents.

The WTCHR is designed to:

- identify and register individuals who were within close proximity of the disaster on 9/11/2001, or who lived, worked or attended school near the disaster, or who worked or volunteered at the WTC site, at the Staten Island Recovery Operations, or on the barges transporting WTC materials;
- assess the occurrence of acute injuries, acute respiratory problems, and chronic or long-term health and mental health effects associated with exposure to the events of 9/11/2001 or its aftermath;
- follow registrants over time to determine whether there is an increase in the development of significant health problems, such as respiratory ailments, work-related disabilities, or mental health outcomes;
- generate hypotheses for future and follow-up studies;
- provide a source for selection of individuals for other scientifically relevant studies;
- plan and target public information and health education in relation to the WTC disaster and its aftermath; and

- provide information that will be useful for devising preventive measures to reduce injuries and fatalities and informing public policy in future natural or human-made events.

1.2.1 Populations Included in the World Trade Center Health Registry

To achieve these objectives, target populations were selected for the WTCHR based on the following criteria: exposure to the actual event; exposure to the immediate aftermath of the attack; ongoing exposures related to rescue, recovery and clean-up of the WTC site or living, working, or attending school in the lower Manhattan area. The World Trade Center Health Registry targeted the following populations that met the exposure criteria described above:

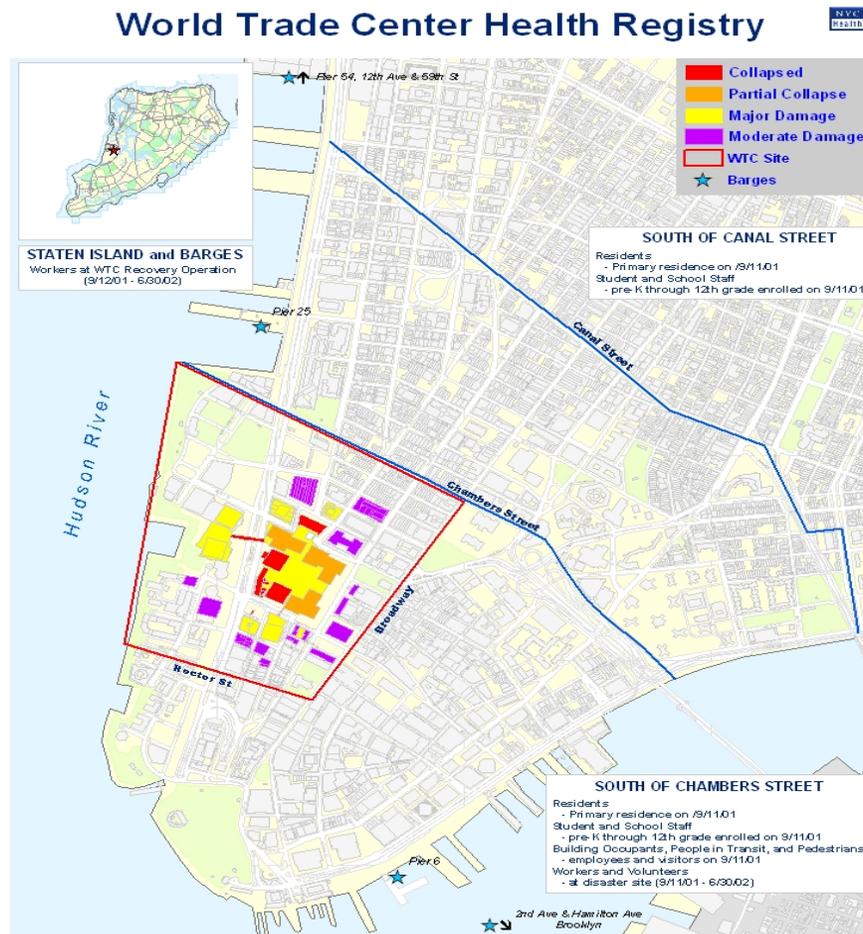

- 1. Workers and volunteers involved in rescue, recovery, clean-up, or other disaster-related activities at the WTC site and/or at the Staten Island Recovery Operations or on transport barges for at least one shift anytime from September 11, 2001 through June 30, 2002:**
Workers at the WTC disaster site may have been exposed to potentially toxic contaminants at levels sometimes exceeding regulatory limits and with unknown synergistic effects; faced risks of physical injury from falls, burns and other safety hazards; and have experienced trauma from the loss of colleagues and other disturbing experiences. At the Staten Island Recovery Operations or on the barges transporting materials, workers may have also been exposed to potentially toxic contaminants at levels exceeding regulatory limits in the course of their work of sifting or moving materials, including remains, from the WTC disaster site. *Throughout this manual, we refer to this sample type as “workers and volunteers.”*
- 2. Persons whose primary residence was south of Canal Street on September 11, 2001:**
Residents, including adults and children, of lower Manhattan on September 11, 2001 whose primary residence was close to the disaster site may have had an increased risk of exposure to potentially toxic contaminants if they were at home at any time between September 11, 2001 and December 31, 2001. Many residents were also displaced from their homes, had concerns about toxic exposures, and had potential exposure to traumatic events and/or rescue and clean-up efforts. *Throughout this manual, we refer to this sample type as “residents.”*
- 3. Students who were enrolled in a nursery school/daycare, elementary, middle, or high school south of Canal Street on September 11, 2001 and staff persons employed in a nursery school/daycare, elementary, middle, or high school south of Canal Street on September 11, 2001:**
Many students and school staff associated with schools (pre-K-12) south of Canal Street were near a cloud of dust and debris, had to be evacuated, were exposed to the fumes and particulate material of the fire, or were potentially exposed to traumatic events. Many staff who were employed in a school south of Chambers Street on September 11, 2001 were already eligible for the WTCHR as building occupants, people in transit, or pedestrians south of Chambers Street. Similarly, many staff in schools north of Chambers Street were eligible as people in transit or pedestrians south of Chambers Street (if they were on their way to work and were at some point during their commute south of Chambers Street anytime between the time of the first plane impact and noon on September 11, 2001). Because WTCHR staff attempted to enroll children in all schools (preK-12th grades) south of Canal Street, it was deemed appropriate to also attempt to enroll all staff in schools (preK-12th grades) south of Canal Street. *Throughout this manual, we refer to this sample type as “students and school staff” and as “students and staff.”*
- 4. Persons present south of Chambers Street in Manhattan on September 11, 2001 any time between the first plane impact and noon (this includes persons who were in collapsed or damaged buildings, people in other buildings, and people in transit or outdoors):**

Occupants in buildings, and people in transit or pedestrians in and near the WTC on the morning of September 11, 2001 had a high risk of potential or actual injury from burns, falling or exploding debris, glass, and trampling; exposure to a variety of potentially toxic contaminants; and potential exposure to traumatic events. ***Throughout this manual we refer to this sample type as “building occupants, people in transit, and pedestrians” and “building occupants.”***

Among the 71,437 registrants who completed interviews, approximately 25% are eligible in more than one of the sample types above. Each registrant completing an interview was placed in one or more of the four sample types based on his or her responses. The four sample types were ranked and registrants were assigned to the highest ranked sample type for which they were eligible. The order of sample types in the ranking was: workers and volunteers; residents; students and school staff; and building occupants. Sample types with the highest potential for continuing exposure were ranked the highest (i.e., workers and residents), whereas sample types that had substantial overlap with other sample types were ranked lower (i.e., many students were also residents).

The four sample types are divided into two groups. Group 1 is considered higher priority because they are among those considered to be the most highly exposed to the environmental effects of the disaster and generally consist of those individuals in greatest physical proximity to the WTC site either on September 11, 2001 or during the subsequent clean-up. Group 1 consists of all workers and volunteers involved in rescue, recovery, or clean-up at the WTC site, the Staten Island Recovery Operations, or on the barges for at least one shift any time between September 11, 2001 and June 30, 2002; people whose primary residence was south of Chambers Street on September 11, 2001; students and school staff enrolled or employed in schools or day cares south of Canal Street on September 11, 2001; and persons working in one of the 35 buildings or the 3 structures damaged or destroyed on September 11, 2001. Group 2 consists of people whose primary residence was south of Canal Street but north of Chambers Street on September 11, 2001; and building occupants, people in transit, or pedestrians who were south of Chambers Street on September 11, 2001, but not in the 35 damaged or destroyed buildings or the 3 damaged or destroyed structures on September 11, 2001. ***Figure 1*** shows a map of lower Manhattan with the Chambers Street and Canal Street boundaries identified in relation to the WTC site and the location of the 35 damaged or destroyed buildings and the 3 damaged or destroyed structures. The damaged structures include the Winter Garden, North Bridge, and South Bridge.

Figure 1: Map of Target Area for World Trade Center Health Registry

1.2.2 Populations Excluded from the World Trade Center Health Registry

The World Trade Center Health Registry excludes the following populations:

1. Persons who perished on September 11, 2001 as a result of the attacks:

The primary goal of the WTCHR is to assess the long-term physical and mental health of survivors of the WTC disaster, responders and people who lived or attended school near the WTC site.

2. Persons who were employed south of Chambers Street on September 11, 2001 but who were not present on the morning of September 11, 2001 between the time of the first plane impact and noon:

A priority of the WTCHR is to include populations that had the highest likelihood of being exposed to either the psychological trauma of the disaster or to materials released by the plane crashes and building attacks. Many people who were south of Chambers Street on the morning of September 11, 2001 experienced enveloping dust and debris clouds after the buildings collapsed as well as the trauma of seeing people killed or injured and subsequent evacuation. It is recognized that people who were not present on September 11, 2001 and who returned to their place of work south of Chambers Street after September 11, 2001 were exposed to smoke and fumes. However, these persons did not have the range of exposures that other eligibility groups had.

3. Spouses and children of persons who perished on September 11, 2001 as a result of the attacks:

We recognize the additional anguish and potential mental health effects for families of those who were killed on September 11, 2001. However, the primary goal of the WTCHR is to assess the impact on populations that were exposed to the physical as well as the psychological elements of the disaster. Some studies and remediation efforts were initiated soon after the disaster focusing on these highly vulnerable individuals, including, for instance, studies on the emotional and psychological impact of the WTC disaster on children (Hoven et al, 2005).

4. Persons who live or work outside of lower Manhattan who were exposed to dust clouds and fumes resulting from the WTC disaster:

Data suggest that lower Manhattan was the area most heavily affected by the events of September 11, 2001, in terms of both physical and mental health exposures. The WTCHR did not enroll persons outside of lower Manhattan who were exposed to dust clouds and fumes resulting from the disaster primarily due to limitations of resources. Information about the effects of exposure on those populations in lower Manhattan that had the highest exposure to the events of September 11, 2001 may be generalized to other populations who also may have been exposed to the dust clouds and fumes, but exposed to a lesser degree.

1.3 Guidelines for External Researchers

Researchers may submit an application to request WTCHR de-identified data or request DOHMH to send information to WTCHR enrollees about participating in their study. Guidelines for External Researchers, including an application, are available on the NYC DOHMH WTCHR website: <http://www.wtcregistry.org>. Researchers may also contact the NYC DOHMH WTCHR program directly at (212) 442-1585.

Chapter 2: Instrumentation

2. Instrumentation

The data collection instrument for the WTCHR survey is designed to determine eligibility of potential registrants; to collect baseline data on exposure, and physical and mental health; and to collect demographic and contact information. The instrument accommodates both inbound calls from and outbound calls to potential registrants. An abbreviated version of the survey was used for eligibility screening purposes during high-volume inbound call situations. Callers screened during high volume call periods and determined to be eligible were called back for a complete interview.

The interview also includes scripts for collecting the registrant's consent to the interview, consent to be informed of future research, and consent to receive future health information on other topics from the NYC DOHMH. The questionnaire was translated into three languages in addition to English: Spanish, Mandarin, and Cantonese. Interviews were conducted in these four languages. For other languages, interviewers used a language translation service to conduct the interview in the language of the registrant. See the baseline questionnaire in Appendix A.

2.1 Instrument Development

The WTCHR instrument was developed through an iterative process in which revisions were made as a result of a formal questionnaire appraisal and cognitive interviewing.

2.1.1 Questionnaire Appraisal

Survey methodologists employed RTI International's Question Appraisal System (QAS) in order to evaluate potential problems with the WTCHR questionnaire. The QAS is a structured, standardized instrument review methodology that assists a survey design expert in evaluating questions relative to the tasks they require of respondents, specifically with regard to how respondents understand and react to survey questions. The QAS allows the reviewer to evaluate the structure and effectiveness of the questionnaire form itself. It is a coding system (i.e., item taxonomy) that describes the cognitive demands of the questionnaire and documents the question features that are likely to lead to response error. These potential errors include errors related to comprehension, task definition, information retrieval, judgment, and response generation (Willis and Lessler, 1999). After the QAS results were submitted, a round of questionnaire changes were made before finalizing the version of the instrument used for cognitive interviewing.

2.1.2 Cognitive Interviews

The instrumentation process included a cognitive interview pilot test of the WTCHR draft interview. Cognitive interviewing is a pretest methodology that makes use of "think-aloud" interviewing and other question probing techniques. A "think aloud" interview is one in which the respondent is instructed to tell the interviewer everything he or she is thinking about while answering a survey question. Think aloud techniques are supplemented with concurrent (during the interview) or retrospective (in a debriefing interview after completing the survey) probes. Cognitive interviewing provides detailed information on questionnaire design issues such as the degree to which questions are comprehended, memory search strategies used, the ability of respondents to make calculations and judgments, and the coverage of the response domain by the response options provided. *Table 1*

provides details on the cognitive interviews conducted for the WTCHR. Cognitive interviews were conducted in all four primary interview languages.

Table 1: Cognitive Interviews by Sample Type and Language

	Workers/ Volunteers: WTC Site Workers	Workers/ Volunteers: Staten Island Recovery Operations and Barge Workers	Residents: South of Chambers	Residents: Chambers to Canal	Students/ Staff: School Staff	Students/ Staff: School Students	Building Occupants*: Damaged Buildings	Building Occupants: Other Buildings & Areas	Total Interviews
English Interviews	4	3	6	1	2	4	9	12	41
Spanish Interviews	2							2	4
Cantonese Interviews				1				1	2
Mandarin Interviews								1	1
Total	6	3	6	2	2	4	9	16	48

* Includes building occupants, people in transit, and pedestrians

In addition to the 48 cognitive interviews, 21 timing interviews were conducted by telephone to estimate the questionnaire length and the duration of individual sections.

2.2 Determining Eligibility

The WTCHR interview begins with an assessment of language and the need for a proxy, as well as collection of the respondent's name and age. The section determining the respondent's eligibility follows a brief consent script. Eligibility is determined by whether a respondent meets at least one of the following criteria for each of the four sample types.

Workers and Volunteers:

- Working at least one shift at the World Trade Center site providing rescue, recovery, clean-up, construction, support or volunteer services between September 11, 2001 and June 30, 2002
- Working at least one shift at the World Trade Center Recovery Operations on Staten Island or on a barge between September 12, 2001 and June 30, 2002

Residents:

- Primary residence in lower Manhattan south of Canal Street on September 11, 2001

Students and School Staff:

- Enrolled in a day care, preschool, elementary, middle, or high school in Manhattan south of Canal Street on September 11, 2001
- Employee in a day care, preschool, elementary, middle, or high school in Manhattan south of Canal Street on September 11, 2001

Building Occupants, People in Transit, and Pedestrians:

- Present in transit (e.g. on a subway or bus), on the street or in a building south of Chambers Street anytime between 8:46 AM (the time of the first plane impact) and 12:00 PM on September 11, 2001

If the respondent was deemed eligible according to any of these criteria, a more detailed consent was administered and then the full interview was conducted. Individuals deemed ineligible were thanked for their time, and then the interview was concluded.

2.3 Content Areas of the WTCHR Instrument

The WTCHR instrument includes several series of questions specifically tailored to each eligibility group, health questions, and demographic, contacting, and locating questions. Each section of the questionnaire is briefly described in **Table 2** below.

Table 2: Content of the WTCHR Questionnaire

Questionnaire Section	Content	Applies To
Eligibility	Eligibility determination questions, informed consent	All respondents
Deceased	Basic demographic information on deceased registrants	Deceased registrants
Student	Enrollment in school on September 11, 2001 and return to school after the event	Students
School Staff	Employment in school on September 11, 2001, and return to school after the event	School staff
Occupant/Transit/Passerby	Location in building(s) or in transit or on the street on the morning of September 11, 2001	Building Occupants, People in Transit, and Pedestrians
Exposure	Proximity to dust cloud, duration in dust cloud and traumatic events witnessed on morning of September 11, 2001	Living registrants
Worker	Days worked and type of activity at the WTC site or at the WTC Recovery Operation on Staten Island or a barge between September 11, 2001 and June 30, 2001	Workers/Volunteers
Resident	Date returned and days spent in home (if evacuated), and how and when home was cleaned after September 11, 2001	Residents
Physical Health	Physical health symptoms and conditions before and after September 11, 2001	Living registrants
Mental Health	Mental health symptoms and probable conditions since September 11, 2001	Living registrants
Demographics	Basic demographic information	Living registrants
Contact and Locate	Information for contacting registrants in the future	Living registrants

2.4 Translation of the WTCHR Instrument

In addition to the English version, the WTCHR instrument was translated into three languages. Portions of the instrument were pre-tested in all four languages as part of the cognitive interviewing. Of the total completed interviews for WTCHR, 95% were completed in English, 1.9% in Spanish, 1.5% in Cantonese, and almost 1% in Mandarin, and 0.4% in other languages through the real-time interpretation service.

Chapter 3: Recruitment

3. Recruitment Methods for the WTCHR

To maximize the number of registrants identified and enrolled, the WTCHR used a multi-pronged recruitment strategy including public health outreach, collection of lists of eligible persons, and self-identification through a toll-free number and website. This recruitment approach allowed potential registrants to be identified from multiple and varied sources, thus maximizing WTCHR enrollment coverage. Key elements of the WTCHR recruitment approach included partnerships with other key agencies and organizations, contacting eligible entities to request lists of eligible persons and their contact information, developing motivational messages to present the WTCHR to the public and to encourage eligible persons to enroll, media campaigns to build awareness and communicate the messages, public forums to engage community leaders and potential registrants, and establishing a hotline to respond to inquiries in multiple (English, Spanish, Mandarin and Cantonese) languages and an informational and pre-enrollment website. Specific details on the methods of recruitment for the WTCHR are described in the following sections.

3.1 Outreach and Media Campaign

Outreach and media campaigns were initiated during the enrollment phase of the WTCHR to build awareness of the program, encourage cooperation among those contacted for an interview, and encourage self-identification for enrollment. The primary goals of the community outreach campaign were to inform the target populations of the existence of the WTCHR, to motivate these populations to enroll, and to promote the project to other eligible persons. Additionally, the outreach campaign needed to reach hard-to-find individuals who might not appear on lists (e.g., undocumented workers, students who graduated since 9/11/2001, highly mobile construction workers), and to be accessible to diverse ethnic and cultural groups.

The plan for outreach was flexible and multi-faceted. A key component of the WTCHR outreach strategy was participation in public forums. Targeted efforts were needed to inform key organizations of the WTCHR and address their concerns. Responding to and meeting with eligible organization members was a significant aspect of outreach on the WTCHR. Forums to describe the WTCHR and answer questions were held with the constituents of both small and large organizations, from parent-teacher associations to tenant associations to large unions. In many cases, leaders of community-based organizations and businesses served as important intermediaries to gain cooperation from their constituents. These leaders promoted the WTCHR through placement of outreach materials, emails, mailings, and providing community space for informational outreach booths or private space for interviewing eligible members.

Another component of the outreach strategy was a media campaign. The WTCHR received periodic media attention through newspaper, radio, and television spots, and announcements throughout the enrollment period, primarily following NYC DOHMH and ATSDR press releases. A variety of WTCHR outreach materials, including posters, brochures, and palm cards, were developed, tested, and distributed to the target populations. All outreach materials were available in English, Chinese and Spanish and included the toll-free number and the website address. Although outreach campaign materials communicated a uniform, consistent message about the WTCHR, the types of materials and modes of information dissemination were tailored to the diverse sample types eligible for enrollment. **Table 3** provides examples of the focused outreach strategies utilized.

Table 3: WTCHR Outreach Strategies by Sample Type

Sample Type	Strategies for Information Dissemination
Workers and Volunteers	Subway, bus, newspaper, radio and ferry advertisements; Emails or faxes sent to members; Newsletter and trade magazine articles; Presentations at roll calls (e.g. Sanitation and NYPD) and to company officials; Electronic bulletin to responders on public health networks; Visits to police and fire houses; Web banner for organization website; Registration packets distributed to employees/members; Paycheck inserts; Placement of posters/brochures
Residents	Subway, bus, newspaper, radio and ferry advertisements; Information tables in building lobbies and at health fairs, farmers markets, film festivals; Presentations to community groups and tenant organizations; Placement of posters/brochures in restaurants, dry cleaners, pharmacies, physician offices, grocery stores, and other businesses; Informational letters sent to home addresses
School Students and Staff	Subway, bus, newspaper, radio and ferry advertisements; Presentations to PTA, principals; Backpack letters sent home with students; Registration packets sent by NYC Department of Education; Information tables before/after school and at sporting events; Placement of posters/brochures in schools and day cares
Building Occupants, People in Transit, and Pedestrians	<p>Building Occupants of 35 Damaged or Destroyed Buildings or 3 Damaged or Destroyed Structures:</p> <p>Subway, bus, newspaper, radio and ferry advertisements; Email sent to employees; Newsletter articles; Registration packets distributed to employees; Paycheck inserts; Presentations to board members and building tenants; Web banner for company website; Placement of posters/brochures in buildings</p> <p>Occupants of other buildings, people in transit, and pedestrians south of Chambers Street:</p> <p>Subway, bus, newspaper, radio and ferry advertisements; Information tables at health fairs, farmers markets, film festivals; Placement of posters/brochures in restaurants, dry cleaners, pharmacies, physician offices, grocery stores, and other businesses</p>

3.2 Self-identification

To maximize the number of eligible enrollees, the WTCHR established a toll-free number (i.e., 1-866-NYC-WTCR) and public website (<http://www.wtcregistry.org>) to encourage potential registrants to enroll. The hotline was designed and equipped to handle multiple languages, with English, Spanish, Mandarin and Cantonese operators and a connection to a language translation service for other languages available. The website was created in English, but included informational pages in Chinese and Spanish. These methods of self-identification helped to enroll over 49,000 registrants. At the end of the enrollment period, a total of 29,381 persons completed interviews resulting from inbound calls and an additional 20,817 persons completed interviews that were initiated by web self-registrations.

Information about the toll-free number and website was included on all public health outreach and registrant materials (e.g., subway posters, brochures, palm cards, lead letters, emails, press releases etc.). The public website was opened prior to data collection and included a link to a pre-enrollment contact form where potential enrollees provided their name, address, and telephone number. The pre-enrollment page on the website was only accessible in English. The toll-free number and website were available throughout the duration of the WTCHR. Individuals who called the toll-free hotline were screened for eligibility, and, if eligible, were administered the baseline health survey. Persons who self-identified through the website were contacted by telephone, screened for eligibility, and administered the survey if eligible.

The WTCHR toll-free number and website were initiated for data collection and continue to serve a variety of purposes. Inbound callers utilize the toll-free number to ask questions about the WTCHR or other 9/11/2001-related issues and resources, or to update their contact information. The public website

serves as a repository for current project information, including outreach materials, press releases, quarterly health reports, a copy of the baseline questionnaire, and links to other health resources. The website also provides a page for registrants to update their contact information and a forum for individuals to ask questions or provide feedback about the project.

3.3 Obtaining Lists of Names

The public outreach effort was coordinated with an effort to develop comprehensive lists of potential registrants. Building the sample of individuals eligible for the WTCHR, referred to as “list building”, was a critical step in establishing the WTCHR. Lists of eligible individuals in four broad categories—workers and volunteers; residents; students and school staff; and building occupants—were collected. During the WTCHR enrollment period, a total of 232 lists, representing 135,553 unique potential registrants, were obtained and processed. There were 144 lists of workers and volunteers, 3 lists of residents, 9 lists of students and school staff; and 76 lists of building occupants that were imported into the pre-registrant database, respectively. A total of 21,239 completed interviews resulted from list cases, and an additional 800 completed interviews resulted from FDNY cases of individuals who self-identified by completing a self-registration form listing their names and contact information for interviews at a later date.

To develop a sample of residents, lists of potentially eligible residents were obtained. Lists of residents living in the catchment areas on 9/11/2001 were provided primarily from sample files purchased from Genesys Sampling Systems. These lists were supplemented by two lists received from targeted tenant organizations in buildings within the eligibility boundaries. A total of three lists were obtained for residents.

The remaining sample of workers and volunteers, students and school staff, and building occupants was built by directly requesting information from appropriate entities. As part of the list building process, staff contacted representatives of eligible entities to explain the purpose of the WTCHR, confirm eligibility of potential registrants, and obtain a list of names with mailing addresses of potential registrants to send informational materials. Unique call scripts were used for organizations within each sample type in order to confirm eligibility. For example, contacts with businesses sought to confirm 9/11/2001 address, while contacts with rescue/recovery groups sought to confirm work at the WTC site between 9/11/2001 and 6/30/2002.

WTCHR materials were sent to each entity to attempt to secure their cooperation. After packets of WTCHR materials were received, list building staff recontacted representatives of these entities to request that a list of all potentially eligible persons, including current contact information, be submitted. In addition to requesting a list, list building staff also confirmed the total number of persons eligible for the WTCHR, because that number may differ from the number of individuals for whom contact information was available on a list provided.

Contact information and relevant notes for all entities was captured in a List Building System developed specifically to organize WTCHR contacting efforts. The process for identifying eligible organizations and entities to be contacted for lists differed by sample type, as follows:

3.3.1 Workers and Volunteers

The creation of a list of the various rescue, clean-up, and volunteer organizations who worked at the WTC site and/or Staten Island Recovery Operations or on the barges required a number of data sources. Responders to the WTC disaster comprise a diverse and geographically dispersed group. While many companies are on lists of credentialed or documented responder organizations, many are

not. Many of the organizations contacted are well known, including FDNY, NYPD, NYC Department of Sanitation, NYC Department of Design and Construction, Port Authority of New York and New Jersey, FEMA, American Red Cross, Salvation Army, and the construction companies responsible for the four quadrants of the WTC site. In collaboration with city, state, and federal agency officials, as well as union officials, lists of additional responding organizations and subcontractors were compiled. Because many of the workers involved in 9/11/2001 efforts have been targeted for other research studies, WTCHR project staff collaborated with other study investigators to further identify groups eligible for WTCHR participation. Internet data sources were also used to identify rescue/recovery teams that traveled to New York from other parts of the nation. A total of 670 rescue, recovery, clean-up worker organizations and agencies, and volunteer agencies were contacted, and a total of 144 lists were obtained.

3.3.2 Students and School Staff

Public and private school data for the 2000-2001 school year are publicly available from the National Center for Education Statistics (NCES). Public school enrollment and staff data are available for all public schools in the WTCHR catchment area from the NCES's Common Core of Data (CCD) (<http://nces.ed.gov/ccd>). Private school data came from the Private School Survey (PSS) (<http://nces.ed.gov/surveys/pss>). Each school in the eligible ZIP codes in lower Manhattan was mapped to determine whether or not it fell within the WTCHR catchment area. Preschools and day care centers within the WTCHR catchment area were identified through information from the NYC Bureau of Day Care. These data sources were the primary means used to identify public and private schools and preschools to be contacted for lists of eligible students and staff.

Five private schools and 22 day cares and preschools were identified and contacted directly. Nine of these schools and daycares provided lists.

The fourteen public schools identified were not contacted through list building. Instead, parents and guardians of children in the 14 eligible public schools were contacted through a mailout to parents and guardians conducted by the NYC Department of Education on behalf of the WTCHR. RTI supplied the WTCHR materials to the NYC Department of Education, which created a database of eligible parents and printed address labels. Over 12,000 letters were mailed to parents of students enrolled in public schools south of Canal Street on 9/11/2001. Additionally, a letter describing the WTCHR was sent home with students in public schools where the principal gave consent and agreed to distribute those materials.

3.3.3 Occupants of Damaged and Destroyed Buildings and Structures

Occupants of buildings south of Chambers Street were eligible for inclusion in the WTCHR. To identify building occupants who might be eligible for the WTCHR, list building efforts were targeted to those organizations in one of the 35 buildings and 3 structures identified by the New York City Department of Buildings as damaged or destroyed after the 9/11/2001 attacks and collapse of the WTC towers. The original research protocol for the World Trade Center Health Registry identified 35 buildings or structures as damaged or destroyed per the New York City Department of Buildings. This list of buildings was appended after the publication of the FEMA Building Performance Study resulting in a total of 38 damaged or destroyed buildings or structures. The additional addresses of 45 Park Place, 395 South End Avenue, and the WTC Concourse, were added to the WTCHR building list and businesses associated with these addresses were pursued. **Table 4** lists the 35 building addresses and 3 structures (i.e., one concourse, and two pedestrian bridges) and their status. The damaged structures are the Winter Garden, and South Bridge. North Bridge was destroyed. While the subsequent FEMA report includes identification of 55 damaged or destroyed buildings, the WTCHR

concentrated on those buildings originally identified by the NYC Department of Buildings and used the FEMA report to categorize the severity of damage to the buildings included in the WTCHR. The categorization of the buildings and structures listed in **Table 4** was conducted by the Federal Emergency Management Agency (FEMA, 2002).

The primary source of businesses to be contacted for the WTCHR is a sample list purchased from Genesys Sampling Systems. This list contains every business in the Genesys business database with an address at a damaged or destroyed building as of September 10, 2001. Genesys provided contact information for a total of 906 businesses.

To maximize coverage for businesses, two additional lists of organizations were obtained. The first was a list of 587 businesses that the Downtown Alliance derived from Dun & Bradstreet listings as of August 2001. There was significant overlap between this list and the Genesys list, but it provided some unique records and improved the coverage of businesses. Similarly, the New York Metropolitan Transportation Council (NYMTC) published a report titled "Post September 11th Impacts: Inventory of Affected Businesses." The businesses listed in this report lost space in the World Trade Center and adjacent properties that were destroyed or damaged on September 11, 2001. Some, but not all, of the damaged or destroyed buildings identified for the WTCHR are included in the NYMTC report. The NYMTC report identifies 879 businesses in the 38 damaged or destroyed buildings and structures, but there is significant overlap with the Genesys and Downtown Alliance lists. Since many businesses are included on two or three of the above list sources, duplicates were eliminated when they occurred across lists.

Publicly available data on the Internet was used to supplement business identification and contacting efforts. The Wall Street Journal, Crain's, Forbes, and WorldTradeAftermath.com were consulted as secondary sources of business information and were used to compile WTC building tenant lists. A total of 862 unique businesses were contacted by the WTCHR, out of the 1,212 total of uniquely identified businesses in the 35 damaged or destroyed buildings and 3 damaged or destroyed structures, and 76 lists were obtained.

The list building process is described in more detail in the Sample Building and Denominator Estimation report available on the WTCHR website (www.wtcregistry.org) in early 2006. For more information please contact the WTCHR Principal Investigator.

Table 4: List of Collapsed or Damaged Buildings and Structures

Status According to FEMA WTC Building Performance Study 2002	Collapsed or Damaged Buildings and Structures¹
Collapse	WTC 1/North Tower
Collapse	WTC 2/South Tower
Collapse	WTC 3
Collapse	WTC 7
Collapse	North Bridge
Collapse	St. Nicholas Greek Orthodox Church
Partial Collapse	WTC 4
Partial Collapse	WTC 5
Partial Collapse	WTC 6
Partial Collapse	WTC Concourse
Major Damage	West Street Building/Coal and Iron Exchange
Major Damage	Bankers Trust/Deutsche Bank/130 Liberty
Major Damage	Fiterman Hall
Major Damage	Verizon Building
Major Damage	2 WFC/Tower B
Major Damage	3 WFC/Tower C Annex
Major Damage	NYFD Ladder 10
Major Damage	120 Cedar St
Major Damage	Winter Garden
Major Damage	Green Exchange Building
Major Damage	45 Park Place
Major Damage	Engineering Building
Moderate Damage	South Bridge
Moderate Damage	Bankers Trust/Deutsche Bank/123 Washington
Moderate Damage	Bank of New York
Moderate Damage	RR Donnelly and Sons Company
Moderate Damage	WFC 1/Tower A
Moderate Damage	110 Liberty St
Moderate Damage	Century 21 Department Store
Moderate Damage	Federal Office Building/Post Office
Moderate Damage	Gateway Plaza
Moderate Damage	110 Greenwich St
Moderate Damage	114 Greenwich St
Moderate Damage	One Liberty Plaza
Moderate Damage	Marriott Hotel
Moderate Damage	Millennium Hotel
Moderate Damage	110-120 Church St
Moderate Damage	Trinity and US Realty Buildings

¹ Many of the collapsed or damaged buildings have multiple street addresses, though only one address is provided in this table.

Chapter 4: Data Collection Methodology and Results

4. Pre Data Collection Activities

4.1 Tracing

The process of tracing was initiated if the list or pre-enrollment contact data provided insufficient information for contacting a potential registrant. Tracing was critically important for locating individuals who had moved since the time that their contact information had been last updated. Beginning in August 2003, the Genesys files for residents were the first files on which tracing was performed.

Tracing was conducted in two steps. First, available information from sample lists was submitted to vendors who matched this information with publicly available databases; this is referred to as “batch tracing”. Second, intensive tracing was applied to potential registrants in target populations for which a telephone number was lacking after batch tracing or for which a call had been attempted but the potential registrant was not located. In intensive tracing, trained tracing staff would attempt to locate a potential registrant through a series of individual, intensive locating steps. We describe each of these tracing steps in further detail below.

Batch tracing, sought to: 1) decrease the number of cases that required individual, intensive tracing, 2) decrease the cost of intensive tracing by providing tracing staff with the maximum amount of contacting information available for subsequent locating steps, and 3) maximize the number of cases that could be interviewed over the telephone rather than in person. Batch tracing was conducted on all cases using two steps: National Change of Address (NCOA) and Telematch. NCOA is a database consisting of change of address data submitted to the U.S. Postal Service. The postal service update of over one hundred million records takes place every two weeks and address updates are stored for three years. Telematch is a computerized residential telephone number service consisting of over 75 million current listings.

Batches of contacting information for potential registrants were submitted first to NCOA to obtain an updated address (if the potential registrant had filed a change-of-address with the U.S. Postal Service). The WTCHR database was updated with any new information, and then records were submitted to Telematch for a telephone number update. New information obtained through batch tracing was appended to records for each potential registrant without overwriting existing information.

The second component of tracing was intensive tracing. Intensive tracing steps were implemented for subgroups likely to have the highest levels of exposure (Group 1): workers and volunteers; residents south of Chambers Street; students and school staff; and building occupants of the 35 damaged or destroyed buildings and 3 damaged or destroyed structures. Particular cases routed to intensive tracing were those that lacked a telephone number after batch updates or cases for which a call had been attempted by an interviewer but the potential respondent was not located. In this intensive effort, tracing staff reviewed the contacting information associated with a particular registrant, other cases likely from the same household, locating efforts by interviewers, and prior tracing searches. If this review did not yield viable contacting information for a registrant, the tracer would perform a series of real-time searches of the contacting information available in consumer credit bureau databases that might help locate the particular registrant. Additionally, tracers would search a series of proprietary databases for contacting information that includes information culled from public and financial

records. Other sources that tracers used include Directory Assistance, reverse directories, residential sources, specialized directories, and other consumer databases.

After intensive tracing yielded viable contacting information for a potential registrant, a tracer would attempt to contact the relevant household to confirm the contacting information. Both intensive tracing and tracing confirmation calls were conducted in the major languages used for data collection: English, Spanish, Cantonese, and Mandarin. Of the 25,881 potential registrants who required intensive tracing, viable contacting information was identified for 84.5%.

4.2 Notification Letters

All sampled cases obtained from a list were sent a lead letter prior to telephone contact. The lead letter explained the purpose, goals and sponsorship of the WTCHR. It also provided the toll-free number and website address.

4.3 Interviewer Training

All interviewers were required to complete a two-hour home study course prior to attending a two-day project specific training class. Persons new to interviewing also attended a one-day training on general interviewing techniques. Bilingual Spanish, Mandarin and Cantonese interviewers received one additional day of training focusing on questionnaire administration in their specific language. A total of 415 telephone interviewers, and 97 field interviewers attended the two-day sessions over the course of the data collection period. During the two-day training class, interviewers were trained on study protocols, questionnaire administration, and refusal avoidance. Interviewers completed classroom exercises and mock interviews.

Given the sensitivity of the WTCHR and the variety of languages spoken by potential registrants, two special training modules were developed.

Interviewers received training on how to handle difficult situations that might arise during interviews, such as when respondents reacted emotionally to questions that reminded them of their experiences on September 11, 2001. Interviewers were taught to recognize verbal, aural, and for in-person interviews, physical signs of emotional or mental distress. If the respondent exhibited minimal symptoms of stress such as changes in tone and volume of voice or hesitancy to answer questions, the interviewer would offer a break in the interview and provide information about a mental health referral service that the respondent could contact. If the respondent showed signs of moderate or agitated levels of distress, the interviewer could end the interview or transfer the caller directly to a mental health referral service. In the most severe cases, interviewers were to involve their supervisor and contact emergency assistance, keeping the respondent on line.

Interviewers were also trained to identify the most common languages spoken in lower Manhattan and to request translation assistance for languages other than English, Spanish, Mandarin or Cantonese. Language Line, a language interpretation service, assisted with identifying the language spoken by the potential registrant if the determination could not be made by the interviewer.

At the end of project training, interviewers were required to complete a certification test prior to contacting potential registrants. Project certification included a test of the most frequently asked questions about the WTCHR and administration of the questionnaire. Interviewers who failed were either given additional retraining and coaching or terminated. All interviewers participated in refresher trainings throughout the data collection period based on feedback identified from quality control monitoring of interviews as well as review of data frequencies.

4.4 Interviewing Methods

Enrollment in the WTCHR was launched on September 5, 2003 and continued through November 20, 2004. Data were collected by telephone using computer-assisted telephone interviewing (CATI), and in-person using computer-assisted personal interviewing (CAPI). Telephone interviewing was conducted in RTI call centers housed in lower Manhattan and in North Carolina. In-person interviews were completed in all five boroughs of New York City, and in parts of New York, New Jersey, and Connecticut. Of the 71,437 completed baseline interviews, 67,528 or 94.5% were completed by telephone, and 3,909 or 5.5% were completed in-person.

4.4.1 Telephone Interviewing

Telephone interviewers began calling list cases five days after the lead letter was mailed, and for web self-registrants, one day following web registration. Inbound calls from potential registrants were answered within one minute on average. However, if as a result of media releases or other public outreach efforts, the volume of incoming calls exceeded the call center's capacity to respond to these calls within a three-minute wait time, a "triage mode" for calling volume was implemented. To respond directly to as many calls as possible during this high call volume period, the amount of time an interviewer spent on any given call was reduced. Interviewers administered informed consent and the eligibility section of the questionnaire, scheduled callbacks with eligible registrants, and thanked those determined as ineligible. Triage periods ranged from two to three hours at a time. For outbound calls to potential registrants the mean number of call attempts was 10.7, and the median number of call attempts was 6. The maximum call attempts ranged up to 40 calls for a small proportion of cases.

Interviewer introductory scripts varied depending on whether the case was from a list or was self-identified, if the registrant was known to be deceased after September 11, 2001, or if it was known that a proxy interview was necessary. In general, interviewers explained who they were and why they were calling, administered informed consent prior to collecting eligibility information, and then attempted to screen the potential registrant for eligibility. If the registrant was eligible, the interviewer administered informed consent specific to collecting the baseline questionnaire, and proceeded to administer the health survey. If the eligible registrant was not able to complete the health survey at that time, the interviewer probed for the best day and time to schedule a call back. If the eligibility screening questions determined the registrant to be ineligible, the interviewer explained that we were enrolling only people who met specific eligibility criteria and thanked them for their time.

In order to ensure that as many potential registrants as possible were identified, all eligible registrants living south of Canal Street who reported more than one person living in his or her household on September 11, 2001 were asked to complete a household roster. Upon completing the interview with the eligible resident, interviewers attempted to enroll the other eligible household members at the time of the call, and scheduled call backs as necessary. Additional contact information was also collected for adults who were eligible but who were not currently residing at the September 11, 2001 address. If a telephone number was provided, interviewers attempted to contact the potential registrant. Any cases with incomplete contacting information were submitted for tracing, and subsequently routed to telephone interviewing once new contacting information was obtained. A total of 16,130 potential registrants were identified using the household roster method, but 4,209 of them were identified as being duplicate cases, meaning that they had already been identified as a potential registrant through another sample building method. Of the 11,921 new potential registrants identified through this method, interviews were completed with 7,011.

4.4.2 Field Interviewing

Field interviewing began in March 2004 and continued through October 2004. Field interviewers administered the same interview and followed the same interview process as outlined above in 4.4.1 with the exception of conducting the interviews in person with a laptop. Two categories of cases were identified as priorities for field interviewing: persons without telephones and Group 1 sample types for which the WTCHR attempted to increase response rates. Field interviewers also conducted field interviews at some outreach events in lower Manhattan.

4.4.3 Proxy Interviews

For minors under 18 years of age at the time of the interview, proxy interviews were conducted with a parent or guardian. Proxy interviews for adults were conducted if the eligible registrant was: (1) deceased after September 11, 2001, (2) mentally incompetent or (3) seriously physically disabled. In these instances, a parent or guardian, adult family member or another knowledgeable person provided consent, and completed the interview on behalf of the registrant. Potential registrants who were on active military duty, incarcerated, or out of the country for the duration of the data collection period were not actively pursued, and hence most did not enroll in the WTCHR. Note that these later three groups of potential registrants were treated as “not eligible” in the WTCHR coverage and response rate calculations.

4.4.4 Languages of Administration

Due to the prevalence of persons who speak languages other than English in the target populations, the WTCHR used a language protocol to handle interviews in these other languages. The first part of the protocol dealt with identifying the three most commonly spoken languages other than English in the New York City area, which were identified as Mandarin, Cantonese, and Spanish. The instrument was translated into these three languages. Bilingual telephone and field interviewers conducted the interview in each of these three languages using a translated version of the web-based interview instrument.

The second component of the protocol involved registrants who spoke a language other than English, Spanish, Cantonese, or Mandarin. Interviewers were trained to identify the most common languages spoken in lower Manhattan and to request translation assistance for languages other than English, Mandarin, Cantonese and Spanish. Language Line, a vendor who provided real-time translation services in up to 150 languages, assisted with identification of the language spoken by the potential registrant if the identification could not be made by the interviewer. Telephone interviewers screened respondents for eligibility and then conducted the interview through an interpreter. **Table 5** displays the number of completed interviews in each language, including proxy interviews, based on the language identified at the beginning of each interview, and how English, Spanish, Cantonese, Mandarin, and other language interviews are distributed by sample type.

Table 5: Completed Interviews by Language by Sample Type¹

Total Interviews Completed In:	Workers/ Volunteers # of Interviews	Residents # of Interviews	Students/ School Staff # of Interviews	Building Occupants # of Interviews²	Total # of Interviews	% of Completed Interviews
English	29,637	11,077	1,522	25,799	68,035	95.2%
Spanish	775	193	40	342	1,350	1.9%
Cantonese	18	839	105	95	1,057	1.5%
Mandarin	18	515	67	80	680	1.0%
Other	217	30	2	66	315	0.4%
Total	30,665	12,654	1,736	26,382	71,437	100.0%

¹ Data reported in this table are based on the WTCHR questionnaire data files as of November 2005. The four sample types above reflect the sample ranking process described in Section 1.2.1. A total of 25% of registrants are eligible for more than one sample type based on interview data.

² Includes building occupants, people in transit, and pedestrians.

4.4.5 Methods for Increasing Response Rate and Maximizing Coverage

An overarching approach to identifying and enrolling potential registrants was the use of multiple, tailored strategies to spur enrollment and participation in the specific populations of interest. Each exposure group and type of potential registrant presented unique considerations and challenges that had to be effectively addressed in order to maximize enrollment. The ability to be flexible, adaptable and responsive to the range of awareness, attitudes, and concerns of these different groups was crucial.

These multi-pronged strategies included a variety of tailored letters, email to non-respondents, and door-to-door canvassing in parts of lower Manhattan. Some strategies, for example a letter with eligibility postcard, were only offered during the final months of enrollment as the need for some eligibility information versus none became more critical. For instance, the Port Authority list of building occupants included a high percentage of ineligible persons. Prior to contacting individuals on this list for an interview, postcards were sent to them, with a request to return the postcard with eligibility status noted. A proportion of the potential registrants who received these postcards returned them with an indication that they were not eligible for the WTCHR, thereby preventing the need for further contact. The following list describes the key strategies to reduce non-response and maximize enrollment for the WTCHR:

- Letters with an eligibility postcard to non-responding inbound, list, and web-self-registrants. Potential respondents were asked to return the postcard if they were not eligible. The removal of these ineligibles helped to better identify the sample population;
- Email to non-responding potential registrants;
- Thank you email to completed registrants, requesting outreach to other potential registrants;
- Increased call attempts for hard-to-reach potential registrants;
- Door-to-door canvassing in lower Manhattan late in the enrollment period to encourage residents to enroll;

- Letters to potential registrants responding to four types of refusals. (Refer to section 4.4.6 for a description of each letter.)

Scripted messages for potential registrants' answering machines were developed and adapted over time. Initial messages that were left on answering machines of potential registrants provided the WTCHR's toll-free number and website address, and indicated that an interviewer would call back. Subsequent messages stressed the urgency for the potential registrant to call the toll-free number and enroll before the end of the enrollment period. The elapsed time between interviewer follow-up to an answering machine message was also altered, and ranged from four days initially to one day in the final month.

To further maximize participation, field interviewers were deployed at certain outreach events to enroll registrants on the spot and conduct interviews in a private location. For example, interviewers were on hand during outreach activities at various buildings that included businesses, agencies or other groups that participated in the relief efforts or where people lived or worked in close proximity to the WTC site. In other instances, interviewers attended presentations to various constituency groups and were available to enroll registrants immediately following the event.

4.4.6. Refusal Categorization

Refusals from potential registrants occurred for a variety of reasons that were categorized by reason and strength of the refusal. This information was used to develop tailored approaches to address the concern raised by the potential registrant, and to determine subsequent steps. Four letters were developed to respond to the most common concerns expressed by potential registrants: the potential registrant was "too busy or not interested;" the potential registrant hung up during the introduction; the potential registrant indicated that they did not wish to be contacted for the WTCHR; and "the study is too sensitive." Respondents were sent one of these letters depending on the nature of their documented reason for refusal.

The majority of the refusals received were "soft refusals," that is the potential registrant conveyed his or her concern in a non-threatening manner. Interviewers attempted up to two contacts with the potential registrant to address their concerns about participation and ask them to reconsider enrollment. Hostile refusals, including threats of legal action and other statements that indicated to the interviewer or project staff that the registrant was adamant about not enrolling, were not contacted a second time. They were finalized as nonresponse.

4.4.7 Quality Control of Interviewing

Quality control protocols were integrated into all technical and operational aspects of the WTCHR. Standard operating procedures reflecting industry best practices were used for quality control of activities including, but not limited to sample building, interviewing, and data processing. As necessary, project-specific quality control protocols were developed to supplement standard processes, or address areas of innovation. The following points describe the primary data quality control processes deployed on the WTCHR.

- *Monitoring of Telephone Completed Interviews.* To ensure that WTCHR interviewers maintained the highest standards of data quality, 10% of the total cases worked by telephone interviewers were monitored. Bilingual quality control staff monitored interviews in Spanish, Mandarin, and Cantonese, and supervisory staff monitored interviews conducted through interpreters as well.

- *Quality Circle Meetings.* During data collection, in-person biweekly meetings were held with telephone interviewers to review concerns or problems identified during monitoring sessions or data review. These meetings also addressed protocol, process or instrument related questions, and served as a forum for brief retraining sessions. Quality circle meetings were also conducted with groups of field interviewers by telephone.
- *Verification of Field Completed Interviews.* For cases completed in-person by field interviewers, quality control staff re-contacted registrants via telephone to confirm the interview took place. Overall, 10% of all field completed interviews were verified. For cases with no working telephone number, a verification form and business reply envelope was mailed to the registrant's household.
- *Data Review.* Review of questionnaire frequencies and related cross-tabulations was conducted to ensure that skip patterns were implemented correctly, and to identify any questions that contained high rates of item nonresponse. Verbal and written feedback was provided to interviewers to continuously improve the quality of the data collected, and periodic retraining sessions were held as necessary. Each evening reports were generated to provide project staff with information that related case status to various questionnaire items, reflecting a higher-level, overarching view of data quality and consistency.

4.5 Data Collection Results

The WTCHR makes available to data users a variety of rates that measure the WTCHR's outcomes and the types of data available for analyses. These include outcome rates calculated overall, by sample type, and by unique groups, such as the Port Authority list. **Table 6** presents the final WTCHR outcome rates. Definitions of key terms are included as footnotes to the table. Further information on coverage, enrollment rates, and definitions of the variables used for these calculations are found in the report "*World Trade Center Health Registry Calculation of Outcome Rates,*" which may be downloaded from: <http://www.wtcregistry.org>.

4.5.1 Summary of Outcome Rates

Table 6 indicates that the enrollment rate, the proportion of the true eligible population for which an interview was completed for the WTCHR is 17.4%. Among the 71,437 registrants who completed interviews, 25.3% are eligible in more than one sample type. The "*World Trade Center Health Registry Explanation and Calculation of Outcome Rates*" available at the link identified in section 4.5 provides further information on the proportion of registrants who were eligible in more than one sample type.

All sample group rates (i.e. Group 1, Group 2) are based on enrollment for each sample group regardless of membership in multiple groups. Enrollment is highest for Group 1 residents (37.3%) and lowest for Group 2 building occupants, and people in transit, and pedestrians (11.0%).

The overall coverage rate for the WTCHR, defined as the total number of eligible registrants in the sample frame compared to the true eligible population is 32.9%. Overall coverage is highest for Group 1 residents (66.2%) and lowest for Group 2 building occupants, people in transit, and pedestrians (12.3%). Because Group 2 building occupants, people in transit, and pedestrians were self-identifiers, it is expected that coverage would likely be relatively low for this sample group and type.

The overall eligibility rate for the WTCHR, defined as the number of eligibles among those who were contacted and agreed to participate, is 76.9%. The eligibility rate is highest for Group 2 building occupants, people in transit, and pedestrians (98.5%) and lowest for Group 1 building occupants

(40.8%). It is expected that eligibility would be highest for groups and sample types consisting of self-identifiers such as the Group 2 building occupants, people in transit, and pedestrians because there was substantial information available through the media and on the WTCHR website about eligibility for the WTCHR. The Group 1 building occupants include many cases originating from the Port Authority list.

Table 6: World Trade Center Health Registry Outcome Rate Report¹

Component/Rate	Group 1					Group 2			Unknown Group ²	Total Residents	Total Building Occupants	Total Overall
	Workers/Volunteers	Residents	Students/Staff	Building Occupants	Group 1 Total	Residents	Building Occupants ³	Group 2 Total				
Total Preregistrants	51,899	16,355	2,608	84,435	155,297	16,834	20,933	37,767	4,880	34,087	105,368	197,944
Total Eligibles	32,705	7,832	1,833	7,940	50,310	4,680	19,974	24,654	898	13,410	27,914	75,862
Completed Interviews	30,665	7,511	1,736	7,905	47,817	4,327	18,477	22,804	816	12,654	26,382	71,437
True Eligible Population ⁴	91,469	20,157	9,971	47,228	168,825	28,948	167,496	196,444	0	49,106	214,723	365,269
Eligibility Rate ⁵	87.1%	81.6%	92.3%	40.8%	73.4%	88.7%	98.5%	96.5%	.	85.0%	70.3%	76.9%
Contact Rate ⁶	81.0%	74.6%	85.5%	60.0%	72.3%	47.4%	98.1%	75.5%	.	61.8%	72.5%	73.8%
Cooperation Rate ⁷	83.8%	75.5%	84.4%	75.4%	79.4%	61.2%	91.3%	82.9%	.	70.7%	81.3%	80.5%
Response Rate ⁸	67.8%	56.3%	72.2%	45.2%	57.4%	29.0%	89.6%	62.6%	.	43.7%	58.9%	59.4%
Coverage Rate ⁹	49.4%	66.2%	24.1%	37.0%	49.4%	51.6%	12.3%	18.6%	.	59.0%	20.9%	32.9%
Enrollment Rate ¹⁰	33.5%	37.3%	17.4%	16.7%	27.2%	15.0%	11.0%	11.5%	.	25.5%	12.0%	17.4%

¹ Data reported in this table are based on WTCHR questionnaire data files as of November 2005. The four sample types above reflect the sample ranking process described in Section 1.2.1 A total of 25% of registrants are eligible for more than one sample type based on interview data.

² For an explanation of unknown group cases, see “*World Trade Center Health Registry Explanation and Calculation of Outcome Rates*” available at the link identified in section 4.5.

³ Includes building occupants, people in transit, and pedestrians.

⁴ Cells for the true eligible population account for group and sample type overlap through hierarchy of sample group and type. The highest priority group and type combination under the hierarchy is Group 1 Workers. For more information, please contact the WTCHR Principal Investigator to obtain a copy of the WTCHR report on outcome rates.

⁵ The eligibility rate serves as an indicator of list providers’ and self-identifiers’ accuracy in identifying eligible participants. It is equivalent to the number of eligibles among those who were successfully contacted and agreed to participate.

⁶ The contact rate measures the proportion of all cases in which an eligible member of the sample was reached by the survey.

⁷ The cooperation rate is the proportion of all cases interviewed of all eligible units ever contacted.

⁸ The response rate is the number of completed interviews divided by the number of interviews plus the number of non-interviews plus cases of unknown eligibility. Its value is equal to the product of the contact and cooperation rates, which for the WTCHR is equivalent to AAPOR Response Rate 4 (RR4). (American Association of Public Opinion Research, 2000)

⁹ The extent to which the sample frame covers the true eligible population is referred to as the coverage rate. For the total number of eligible registrants in the sample frame compared to the true eligible population.

¹⁰ The enrollment rate measures the proportion of the true eligible population for which an interview was completed.

The eligibility rate for this list is exceptionally low and this contributes to the overall low eligibility rate for Group 1 building occupants because the list includes many persons who no longer worked at the World Trade Center or were not present on the morning of 9/11/2001.

The overall contact rate for the WTCHR is 73.8%, that is, 73.8% of the estimated eligibles in the sample frame were contacted. This overall contact rate is highest for Group 2 building occupants, people in transit, and pedestrians (98.1%) and lowest for Group 2 residents (47.4%).

The overall cooperation rate for the WTCHR is 80.5%, that is, of the estimated eligibles who were contacted, interview data are available for 80.5%. The overall cooperation rate is highest for Group 2 building occupants, people in transit, and pedestrians (91.3%) and lowest for Group 2 residents (61.2%).

The overall response rate for the WTCHR is 59.4%.¹ Response rates by Group are 57.4% for Group 1 and 62.6% for Group 2. Response rate is highest for Group 2 building occupants, people in transit, and pedestrians (89.6%) and lowest for Group 2 residents (29.0%).

4.5.2 Outcomes by Methods of Enrollment

In addition to tracking potential registrants by sample group (Group 1 vs. Group 2) and sample type as outlined in **Table 6**, RTI tracked method of enrollment into the WTCHR by designating cases as falling into the following categories: list, website self-registrant, and inbound caller. The cases originating from lists came from various businesses, organizations, and sample vendors. The cases originating from self-registrations came through the self-registration website, and the inbound cases were potential registrants who called in to complete the interview. **Table 7** displays the number and proportion of completed interviews by method of enrollment, sample type, and group.

4.5.3 Outcomes of Contacting the Port Authority List

In May 2004, NYC DOHMH provided RTI with a Port Authority (PA) list of 95,442 persons who had been issued a security badge to one or more of the seven World Trade Center buildings at any time during the past five years. Due to the nature of this list, a large proportion of individuals on the list were not expected to meet the WTCHR eligibility criteria, and the screening of individuals from the list for their eligibility determined that this was true. The overall eligibility rate for this list was low (27%), based on interviews completed after screening for eligibility.

Before potential registrants identified on the Port Authority list were contacted, the WTCHR had to determine the best way to maximize contact with these individuals. Of the 95,442 persons on the Port Authority list, 46,650 individuals were not pursued for data collection because their record had insufficient information for contacting through telephone or mail. Due to budget and time constraints, we selected 30,470 individuals with the most complete locating information to contact via telephone. All of the 48,792 Port Authority cases which had an address received an advance mailing with an eligibility postage-paid postcard, along with a request to return this postcard and note whether or not the registrant was eligible.

¹ For the calculation of outcome rates for surveys, RTI's standard is the American Association for Public Opinion Research's (AAPOR) *Standard Definitions: Final Disposition of Case Codes and Outcome Rates for Surveys* (AAPOR, 2000).

Table 7: Completion Counts by Group and List Source Report¹

	Group 1					Group 2			All				
	Workers	Residents	Students/ Staff	Building Occupants	Total	Residents ²	Building Occupants	Total	Workers	Residents	Students/ Staff	³ Building Occupants	Total
Self-Registrants	7,540 10.6%	1,405 2.0%	396 .60%	2,766 3.9%	12,107 16.9%	734 1%	7,976 11.2%	8,710 12.2%	7,540 10.6%	2,139 3.0%	396 .6%	10,742 15.0%	20,817 29.1%
Inbound	11,738 16.4%	4,061 5.7%	1,042 1.5%	2,278 3.2%	19,119 26.8%	3,132 4.4%	7,130 10.0%	10,262 14.4%	11,738 16.4%	7,193 10.1%	1,042 1.5%	9,408 13.2%	29,381 41.1%
List Building	11,387 15.9%	2,045 2.9%	298 .4%	2,861 4.0%	16,591 23.2%	1,277 1.8%	3,371 4.7%	4,648 6.5%	11,387 15.9%	3,322 4.7%	298 .4%	6,232 8.7%	21,239 29.7%
All	30,665 42.9%	7,511 10.5%	1,736 2.4%	7,905 11.1%	47,817 66.9%	5,143 7.2%	18,477 25.9%	23,620 33.1%	30,665 42.9%	12,654 17.7%	1,736 2.4%	26,382 36.9%	71,437 100%

¹ Data reported in this table are based on the WTCHR data files as of November 2005. The four sample types above reflect the sample ranking process described in Section 1.2.1. A total of 25% of registrants are eligible for more than one sample type based on interview data.

² Group 2 residents include residents located on or north of Chambers Street, but south of Canal Street.

³ Includes building occupants, people in transit, and pedestrians

Of the eligibility postcards mailed and returned, 2,340 cases were determined to be ineligible. The cases from the Port Authority list decrease the overall response rate due to their atypically low eligibility rate, compared with cases identified from other sample sources. When the Port Authority cases are excluded from the sample, the overall response rate rises from 59.4% to 66%.

Chapter 5: Data Preparation and Processing

5. Data Processing of Registrant Interviews

5.1 Data File Preparation

Registrant interviews were collected in a computer-assisted web interview programmed using Microsoft Active Server Pages (ASP) and stored in a Microsoft SQL Server database. During data collection, interview data were merged into a single database each day. Once an interview was recorded as being complete, an edit program was run on the data, mirroring the web interview logic, to identify anomalies and flag them for human review. Subsequent to this edit process, data were delivered to NYC DOHMH on a weekly basis, with a final delivery following the completion of data collection.

5.2 Data Quality Control

Concurrent to the periodic data deliveries as well as after the completion of data collection, a number of quality control activities were performed on the data. These activities included analysis by a data editing system, a review of response frequencies and inter-item consistency checks, and the monitoring of daily reports that reflected relationships between case status and the data collected.

5.2.1 Data Editing

The web interview was programmed to route the path through the interview based, as appropriate, on prior responses, and thereby skip questions that should not have been asked of a registrant. Additionally, the web interview was programmed with logical consistency and range checks. To verify the accuracy of the data collected by the programmed instrument and to detect any data anomalies, a data editing system was developed which mirrored the web interview logic. Data was analyzed by this data editing system daily and prior to the weekly delivery of data by RTI International to NYC DOHMH. Any anomalies that were detected by the data editing system were reviewed and reconciled as a part of ongoing quality control. Any reconciliation to data was recorded in an audit table that tracked the history of changes to the data file.

5.2.2 Data Review

As described in Chapter 4, review of questionnaire frequencies and related cross-tabulations was conducted to ensure that skip patterns were implemented correctly, and to identify any questions that contained high item non-response rates. Questionnaire items that contained open-ended or other specify verbatim fields were also reviewed for completeness and accuracy in coding. Additionally, any items that were flagged by the data editing system were reviewed so that feedback could be provided to data collection staff as necessary.

5.2.3 Processing of Lists of Potential Registrants

Chapter 3 of this manual describes in detail the recruitment methods by which lists of potential registrants were obtained. A total of 232 lists were received in either hardcopy or electronic format. Lists received in hardcopy format were data entered. Lists received electronically were formatted into an Excel template. After data were formatted into the standard template, project staff performed manual review of the template compared to the hardcopy or the electronic file received to ensure that

data were aligned in the proper fields. The list data were converted to Comma Separated Value (.csv) with DMBS Copy Software. After conversion of the file, programmers performed a second review to ensure that the data were aligned properly, and imported the file for subsequent production activities including tracing and data collection.

5.2.4 De-duplication of Multiple Entries for a Potential Registrant in the Sample

A major concern of working with such a large a database of names from such a small geographic area is sample frame duplication. Kish (1965) describes a sample frame as “perfect if every element appears on the list separately, once, only once, and nothing else appears on the list.” Coverage error occurs when some persons are omitted from the list or frame used to identify members of the study population (Groves, 1989). It also occurs when the same person is included in the sample frame more than once or when the person is included in error. Because of the multitude of sample types and list sources, it was expected that many sample members would be included in the frame more than once. For instance, if a person was identified as a resident living south of Chambers Street on the purchased residential list file and was also identified by an employer in one of the 35 damaged or destroyed buildings or 3 damaged or destroyed structures near the WTC complex, that person’s name would appear twice on the sample frame.

Since potential respondents could be identified by multiple lists and sources, including web self-registration and inbound calls, accounting for duplicates was necessary to reduce respondent burden that would have resulted from contacting the same person multiple times and to minimize costs associated with unnecessary multiple contacts. In addition, it was necessary to perform de-duplication to ensure data quality. For persons identified but not interviewed, there would have been no feasible way to determine whether records were duplicated without an automated approach due to the large size of the sample population. Without this automated approach to de-duplication, many more incomplete interviews would have been recorded and coverage error associated with duplication would have increased.

The de-duplication process used for the WTCHR compared locator (name, address, phone, Social Security Number) and demographic information between cases in the sample database. ChoiceMaker Technologies developed a batch matching program to evaluate every new record in the sample database relative to existing records in the table. In this process, locator and demographic fields were parsed and standardized. Once the fields were standardized, key matching fields (name, birth date, SSN, etc.) were used to identify a set of cases that were potential matches to the new record. For each of the cases in the set, clues were applied to determine two probabilities – match and differ. New cases with high match probabilities relative to an existing case were determined to be duplicates. New cases with high differ probabilities relative to all existing cases were determined to be unique. The thresholds for match and differ determination were parameters that were modified as necessary during the enrollment period. Records with intermediate match probabilities between the match and differ thresholds were marked for human review. During human review, the reviewer viewed all cases in a potential match compound and made hard match/differ decisions for the new case relative to each existing case in the compound.

Chapter 6: Data File Contents

6. Guide to the Data File and Codebook

The WTCHR data file is provided in the format of a Microsoft SQL Server database file. The database file allows the full WTCHR database to be restored with all data and database objects to any Microsoft SQL Server. The data file was created for use with SAS analytic software.

6.1 Basics for Analyses: Questionnaire and Sample Indicators

The WTCHR baseline questionnaire is attached in Appendix A. Note that the questionnaire identifies all questions asked of registrants in the interview. The codebook in Appendix B displays data frequencies and other information about each item in the questionnaire and each derived variable. Questionnaire items are displayed according to the sequence in the instrument. The codebook indicates a number of the data elements that have values with small cell sizes that have been suppressed or recoded to protect the confidentiality of registrants.

Several indicator variables are key to understanding responses to the WTCHR interview. These include the variables PROXY, IFMS, and INCOMING. The variable PROXY indicates whether the interview was with the subject (most living registrants over the age of 17) or with a proxy (used for deceased registrants, minors, and other registrants incapable of completing the interview themselves). IFMS indicates whether the case's final status was as a field interview or as a telephone interview. INCOMING indicates whether the case's final status was as an inbound or outbound call. **Table 8** lists key sample flag variables.

While **Table 8** lists key sample flag variables, it may be important to some researchers to distinguish between the higher and lower priority groups within two of the sample types: residents and building occupants, people in transit, and pedestrians. See Section 1.2.1 for a description of the higher priority "Group 1" and lower priority "Group 2" groups.

Table 8: Key Sample Flag Variables

Sample Flag Variable	Description	Displayed As
resident_e	Registrant lived in eligible area south of Canal Street on September 11, 2001	0=No 1=Yes
occ_trans_e	Registrant was physically in eligible area south of Chambers Street in Manhattan between the time of the first plane impact and noon on September 11, 2001	0=No 1=Yes
worker_e	Registrant worked as a rescue, recovery, clean-up or volunteer at the WTC site for at least one shift anytime between September 11, 2001 and June 30, 2002, or at the WTC Recovery Operation on Staten Island or on a barge for at least one shift anytime between September 12, 2001 and June 30, 2002	0=No 1=Yes
student_e	Registrant was enrolled in a school (preK-12) south of Canal Street on September 11, 2001	0=No 1=Yes
staff_e	Registrant was employed in a school (preK-12) south of Canal Street on September 11, 2001	0=No 1=Yes

NYC DOHMH maintains data on the prioritization within each of these sample types. Specifically, data is available upon request to distinguish:

- Registrants whose primary residence was south of Chambers Street on September 11, 2001 (res_only_priority_group = 1), those living north of Chambers Street/south of Canal Street (res_only_priority_group = 2), and those living on or north of Canal Street in zip codes overlapping the Canal Street boundary (res_only_priority_group = 0)
- Registrants who were occupants of one of the 38 buildings or structures destroyed or damaged on September 11, 2001 (occ_only_priority_group = 1) and all other building occupants, people in transit, or pedestrians who were south of Chambers Street on September 11, 2001 (occ_only_priority_group = 2).

For two sample types, preregistrants were further stratified into higher and lower priority groups for the purposes of targeting and evaluating sample building activities such as list procurement and outreach. For residents, Group 1 included residents as of September 11, 2001 at addresses located south of Chambers Street; Group 2 included residents located on or north of Chambers Street but south of Canal Street. A third resident group, Group 0, was defined upon recognition of the inclusion of respondents living on/or north of Canal Street in zip codes overlapping the Canal Street boundary. For building occupants, Group 1 included occupants of the 38 damaged or destroyed buildings/structures in and around the WTC site who were present on the morning of September 11, 2001. Group 2 included other building occupants, people in transit, and pedestrians who were present south of Chambers Street on September 11, 2001, other than those in the 38 damaged or destroyed buildings and structures.

Two derived variables: resident_pg and occ_trans_pg reflect the number of completed interviews by specific sample type priority group. Values for resident_pg were confirmed by address information within the instrument. Values for occ_trans_pg were confirmed through the use of the instrument's free-text variables describing the location of individuals on the morning of September 11, 2001.

6.2 Derived Variables

Derived variables are generated from responses from two or more questionnaire items, recodes of variables to avoid disclosure of identifying information, or categorizations of free text responses. Most of the derived variables may be used as classification variables or independent variables in data analysis. There are several different types of derived variables in the WTCHR data file. Information on derived variables is included in Appendix B beginning on page 59. The types of derived variables are listed below.

- *Interview Characteristics:* Includes type of interview (self-interview, living proxy, or deceased proxy), source of interview (field, outbound telephone, or inbound telephone) language of interview, and whether the interview was with a foreign registrant
- *Eligibility Groups:* Includes variables identifying eligibility in summary groups (workers and volunteers, residents, students and school staff, and building occupants, people in transit, and pedestrians) as well as an indicator of overall eligibility
- *Demographics:* Includes age calculated from date of birth, age on September 11, 2001 calculated from date of birth, and race combined with Hispanic ethnicity
- *Building Survivor Characteristics:* Includes indicators of being in a damaged or destroyed building or structure, and the FEMA characterization rating of the building or structure

- *Rescue/recovery groups*: Identifies key worker groups of the New York City Fire Department (FDNY), Police Department (NYPD), Department of Sanitation, Department of Design and Construction, as well as non-NYC fire department personnel
- *Resident Location*: Includes census tract and block of residential address on September 11, 2001, as well as distance in feet of residence from World Trade Center towers. These variables were created using ArcView geographic information systems. To protect the confidentiality of registrants, these variables are only included in the restricted access WTCHR data file. For further information on the procedures required to obtain such data and the corresponding GIS coordinates, please contact the WTCHR Principal Investigator.
- *Health Symptoms and Health Symptom Denominators*: Includes new or worsening symptoms after 9/11/2001 and ever having particular symptoms
- *Health Conditions and Health Condition Denominators*: Includes post-9/11/2001 diagnosed conditions and ever having particular conditions
- *Mental Health Condition*: Includes overall scoring on PDI, probable PTSD and child mental health indicators

6.3 Guide to the Hardcopy Codebook

The hardcopy codebook in Appendix B supplies a comprehensive description of the WTCHR data file. For each variable in the WTCHR data file—including both questionnaire and derived variables but excluding identifying contact and locate information—the codebook provides a summary of the related information, including a description, question wording, and the type of response available along with their frequency and percent. The codebook also provides missing data frequencies sorted by the following reserve codes:

- *Don't Know (-1)*: The respondent reported not knowing an answer to the question.
- *Refused to Answer (-2)*: The respondent refused to answer the question.
- *Valid Missing Data (-9)*: Data for the item are missing due to skip patterns.
- *Invalid Missing (-3)*: Data for the item are missing due to incomplete interview or improper skip patterns.

In addition to the reserve codes, for potentially identifying items the term “Suppressed” is indicated. For open-ended items that require coding for further analysis, “Data Present” is indicated.

[CONTINUE WITH O1 IF OUTBOUND CALL. ELSE SKIP TO I3.]

O1

[ASK IF CATI FRONT END DETERMINED SUBJECT IS DECEASED. ELSE SKIP TO O2.]

I'm very sorry for your loss. I'm calling on behalf of the New York City Department of Health and Mental Hygiene. I'm calling to talk to you about a research study called the World Trade Center Health Registry. I work for RTI, a company hired to help with the study. The Registry is a list of people who were affected by the disaster on September 11th, 2001. About 200,000 people may join the list. We plan to maintain the study data for up to 20 years.

I'm calling because [SUBJECT] was identified on a list of rescue and recovery workers, schools, businesses, and residences in the World Trade Center area. [SUBJECT] may have been at the disaster, or lived, worked, or went to school in the area at the time of the disaster. (He/She) may have also helped with the clean-up. [SUBJECT] may still be eligible for the Registry. We want to be sure to collect information about people who were at or near the disaster but who are now deceased, because it's important to gather information on **everyone** who was exposed in order to have an accurate and complete registry.

[SKIP TO I8.]

O2

[ASK IF SUBJECT NOT DECEASED (PROXY OR SUBJECT INTERVIEW).]

I'm calling on behalf of the New York City Department of Health and Mental Hygiene. I'm calling to talk to you about a research study called the World Trade Center Health Registry. I work for RTI, a company hired to help with the study. The Registry is a list of people who were affected by the disaster on September 11th, 2001. They will be interviewed from time to time so that we can learn if there are any health problems related to the disaster. About 200,000 people may join the list. We plan to maintain the study data for up to 20 years.

We are calling [you /SUBJECT] because [you/SUBJECT] may have been at the disaster or lived, worked, or went to school in the area at the time of the disaster. You may have also helped with the clean-up. We recently sent a letter telling you about the Registry.

[SKIP TO I8.]

I3

Are you calling to register yourself or someone else?

- 1 SELF
- 2 SOMEONE ELSE
- 3 BOTH

I5

[ASK IF I3=3]

Let me start with you and then we'll go back to the other people you are calling in for.

I6

[ASK IF I2=2]

I am authorized to collect information from parents or legal guardians of registrants under 18, and from appropriate proxies if the registrant is deceased or otherwise physically or mentally incapable of completing the interview. Does the person you are calling in for meet these criteria?

NOTE: PROXY INTERVIEWS ARE ONLY FOR SUBJECTS WHO ARE DECEASED, UNDER 18, MENTALLY INCOMPETENT, OR SERIOUSLY PHYSICALLY DISABLED.

- 1 YES
- 2 NO
- DK/REF

I7

[ASK IF I6=2 OR DK/REF]

I'm sorry, I won't be able to complete the interview with you then. If that person will call us at 1-866-NYC-WTCR , we will happy to register him/her.

Thank you for your time.

[CLOSE OUT INTERVIEW.]

I8

To determine if (you are/ the subject is) eligible for the registry, I need to ask you just a few questions. Responding to these questions is voluntary; you may refuse to answer any of these questions, if you like. All of your answers will be kept private. If you decide not to enroll in the Registry we will not keep your information. (Your/The subject's) name will not be connected with your answers in any way. Let's get started.

[SKIP TO PHON]

E24

[ASK IF P6 IS BEFORE 9/12/01.]

We sincerely appreciate your willingness to talk with us about the World Trade Center Health Registry, and we are very sorry for your loss. We are not collecting information at this time on persons who died on or before September 11th, 2001 or on victims who died on 9/11 in the attacks. Thank you again for your time.

[CLOSE OUT INTERVIEW. SKIP TO CS6.]

E25

[ASK IF DOB IS AFTER 9/11/01]

We sincerely appreciate your willingness to talk with us about the World Trade Center Health Registry. We are not collecting information at this time on persons who were born after September 11th, 2001. Thank you again for your time.

[CLOSE OUT INTERVIEW. SKIP TO CS6.]

E26

[ASK IF NOT ELIGIBLE.]

REMINDER: THIS SCRIPT MUST BE READ VERBATIM FOR ALL INBOUND AND OUTBOUND CALLS. YOU MAY ADD A PERSONALIZED THANK YOU AFTER READING THE ENTIRE SCRIPT VERBATIM.

We sincerely appreciate your willingness to talk with us about the World Trade Center Health Registry. At this time, we are asking that people who were in the closest proximity to the WTC site on 9/11 enroll. Studying this group will allow us to best assess the long-term health effects of 9/11. While [you are/SUBJECT is] not one of the persons we are asking to join the Registry at this time, we believe that the information collected through the Registry will benefit all persons in the New York City area who were affected by the World Trade Center disaster, not just those whom we ask to complete the full interview. Thank you again for your time.

If you would like to sign up for email updates important to the health of all New Yorkers, you can log on to the New York City Department of Health & Mental Hygiene website at www.nyc.gov/health/email and select the updates, including the Registry, you'd like to receive.

[CLOSE OUT INTERVIEW. SKIP TO CS6.]

E27

[ASK IF ELIGIBLE AND NOT TRIAGE MODE.]

Based on your responses, [you are/SUBJECT is] eligible to enroll in the Registry. Let's go on with the interview.

P11

[IF SUBJECT IS DECEASED, SKIP TO P11b.]

The survey will take about 30 minutes. The questions will ask about where [you were/SUBJECT was] on September 11th, 2001, and how often [you were/SUBJECT was] in the area around the World Trade Center site in the months afterwards. The survey also may ask questions about [your/SUBJECT's] home, place of work, or school. It also asks about [your/SUBJECT's] health before and after September 11th, 2001.

Answering these questions is voluntary; you may refuse to answer any of these questions, if you like. There are no risks to being in the survey, but some of the questions might make you feel sad or anxious. You can stop or take a break at any time. You can also ask for a phone number to a hotline if you would like to learn about places that may be able to help you.

All of your answers will be kept private. If you decide not to enroll in the Registry we will not keep [your/SUBJECT's] information. [Your/SUBJECT's name will not be connected with your answers in any way. [You/SUBJECT] will not lose any rights or benefits that you would otherwise get.

We plan to keep the study data for up to 20 years. During this time, the New York City Department of Health and Mental Hygiene may want to contact [you/SUBJECT] to participate in other studies. They may also want to send [you/SUBJECT] health information in the mail. [Your/SUBJECT's] participation now does not mean [you/SUBJECT] have to participate later, or receive the health information.

I would be glad to answer any questions you have about the study or give you the name and number of a person to call if you have questions about your rights as a person in a research study. Do you have any questions before we get started?

(If you have questions about your rights as a study participant, please call Dr. D. Saha at the New York City Department of Health and Mental Hygiene at 212-788-4483. If you have questions about the World Trade Center Health Registry, please call Dr. Robert Brackbill toll free at 1-877-NYC-DOH7 (1-877-692-3647).)

P11b

[ASK IF DECEASED.]

The survey will take about 5 minutes. We will ask you some background questions about [SUBJECT].

Answering these questions is voluntary; you may refuse to answer any of these questions, if you like. There are no risks to being in the survey, but remembering the events of 9/11 might make you feel sad or anxious. You can ask for a phone number to a hotline if you would like to learn about places that may be able to help you.

All of your answers will be kept private. If you decide not to enroll in the Registry we will not keep [your/SUBJECT's] information. [Your/SUBJECT's] name will not be connected with your answers in any way.

We plan to keep the study data for up to 20 years.

I would be glad to answer any questions you have about the study or give you the name and number of a person to call if you have questions about your rights as a person in a research study. Do you have any questions before we get started?

(If you have questions about your rights as a study participant, please call Dr. D. Saha at the New York City Department of Health and Mental Hygiene at 212-788-4483. If you have questions about the World Trade Center Health Registry, please call Dr. Robert Brackbill toll free at 1-877-NYC-DOH7 (1-877-692-3647).)

P12

[IF DECEASED, SKIP TO P13. ASK ONLY IF PROXY.]

WHY IS A PROXY BEING INTERVIEWED?

SUBJECT NAME	PROXY NAME
Person 1 Name	None
Person 2 Name	None
Person 3 Name	Person 1 Name

NOTE: Hyperlinked name will start interview for that subject or proxy.

SP6

[ASK IF NO NAMES ARE SELECTED] Thank you for your time. I'd like to call back later to complete the remaining (interview/interviews).

SKIP TO CALL.

BRK.

ARE YOU SURE YOU WANT TO BREAK OFF THIS INTERVIEW?

1 YES [SKIP TO PHON]
2 NO [RETURN TO LAST QUESTION]

PHON

So that I can call back to complete the interview, I'd like to record a home, work, and cell phone number if available. Please note that since our main call center is in North Carolina, the number that will show up on caller ID begins with the North Carolina area code 919.

HOME PHONE: () _____
 WORK PHONE: () _____
 CELL PHONE: () _____

CALL

Would it be best that I call back on a weekday before 5:00 PM, a weekday after 5:00 PM, on the weekend, or anytime nights and weekends?

- 1 WEEKDAY BEFORE 5:00 PM
- 2 WEEKDAY AFTER 5:00 PM
- 3 WEEKEND
- 4 ANYTIME NIGHTS AND WEEKENDS
- 5 OTHER

CS6

REMINDER: THIS SCRIPT MUST BE READ VERBATIM FOR ALL INBOUND AND OUTBOUND CALLS – INCLUDING THE 1-800 NUMBER. YOU MAY ADD A PERSONALIZED THANK YOU AFTER READING THE ENTIRE SCRIPT VERBATIM.

(That's the end of our interview.) Thank you very much for participating in the World Trade Center Health Registry. If you know of anyone else who might be eligible to be part of the World Trade Center Health Registry, please give them our toll-free number, 1-866-NYCWTCR (1-866-692-9827) and encourage them to call us.

[R SHOULD HANG UP NOW.]

IO1

(Please bear with me for a couple of seconds while I close out this interview and prepare for the next.) DID THE RESPONDENT DEMONSTRATE ANY SIGNS OF EMOTIONAL DISTRESS?

IF THIS INTERVIEW WAS BROKEN OFF TO MAKE AN IMMEDIATE LIFENET REFERRAL, COUNT SIGNS OF EMOTIONAL DISTRESS PRIOR TO AND AFTER THE BREAKOFF.

- 1 YES
- 2 NO [END INTERVIEW]

IO2

PLEASE MARK ALL SIGNS OF DISTRESS DISPLAYED.

IF A BREAKOFF DUE TO LIFENET REFERRAL WAS REQUIRED AND THIS IS THE SECOND TIME THIS QUESTION HAS BEEN ASKED, PLEASE ADD TO THE ANSWERS ALREADY DISPLAYED BELOW.

- 1 CHANGES IN TONE OF VOICE
- 2 CHANGES IN VOLUME
- 3 CHANGES IN ACE OF RESPONSES TO QUESTIONS
- 4 CHANGES IN USE OF LANGUAGE, INCLUDING INAPPROPRIATE LANGUAGE
- 5 CHANGES IN FOCUS ON QUESTIONS AND RESPONSES
- 6 RESPONSES THAT DO NOT RELATE TO THE QUESTIONS ASKED
- 7 HESITANCY IN RESPONDING
- 8 REFUSAL TO RESPOND
- 9 SOBBING AND CRYING SOFTLY
- 10 OPEN WEEPING
- 11 OTHER VERBAL SIGNS OF DISTRESS
- 12 AGITATION
- 13 TAPPING HANDS AND FEET
- 14 FIDGETING IN SEAT
- 15 STANDING UP
- 16 WALKING AROUND
- 17 LEAVING THE AREA
- 18 OTHER NON-VERBAL SIGNS OF DISTRESS

IO3.

WHAT LEVEL OF DISTRESS DID YOU ASSOCIATE WITH THE SIGNS DISPLAYED?

IF A BREAKOFF DUE TO LIFENET REFERRAL WAS REQUIRED, PLEASE REPORT THE HIGHEST LEVEL OF DISTRESS DISPLAYED DURING ALL PORTIONS OF THE INTERVIEW (BOTH BEFORE AND AFTER THE BREAKOFF).

- 1 LEVEL 1 – MILD
- 2 LEVEL 2 – MODERATE
- 3 LEVEL 3 – SEVERE

IO4. PLEASE MARK ALL ACTIONS TAKEN DURING THE INTERVIEW.

IF A BREAKOFF DUE TO LIFENET REFERRAL WAS REQUIRED AND THIS IS THE SECOND TIME THIS QUESTION HAS BEEN ASKED, PLEASE ADD TO THE ANSWERS ALREADY DISPLAYED BELOW.

- 1 OFFERED TO TAKE BREAK, BUT DID NOT
- 2 TOOK A BREAK
- 3 STOPPED INTERVIEW
- 4 MADE A LIFENET REFERRAL
- 5 CALLED LIFE NET
- 5 CALLED 911

IO5. DO YOU HAVE ANY OTHER COMMENTS ABOUT THE EMOTIONAL DISTRESS DISPLAYED AND YOUR RESPONSE TO THE SITUATION? (IF YOU CALLED LIFENET, PLEASE ENTER THE CALL NUMBER THAT THEY GAVE YOU)

IF A BREAKOFF DUE TO LIFENET REFERRAL WAS REQUIRED AND THIS IS THE SECOND TIME THIS QUESTION HAS BEEN ASKED, PLEASE ADD YOUR COMMENTS TO THE TEXT ALREADY DISPLAYED BELOW.

[END INTERVIEW]

Variable: ssn
Description: Social Security Number
Stem: Next, I'd like to get your Social Security Number. This information will only be used in case we need to contact you again in the future, or to match our data to other health registries, which may provide very important information about the long-term health effects of 9/11. Giving us your Social Security Number is voluntary. What is your social security number?

NOTE: THE FOLLOWING PROBE MUST BE READ BEFORE ATTEMPTING TO GET THE LAST 4 DIGITS OF SSN: (The privacy of your answer is protected by a Federal Certificate of Confidentiality. This means researchers cannot be forced to disclose personal information about you (for example, by subpoena or court order.) Giving us your Social Security number is completely voluntary and there is no penalty for not disclosing it.)

World Health Center Health Registry Derived Variables

Derived variables were created from the World Trade Center Health Registry data in the following circumstances:

- When values were collapsed to avoid disclosure (for example, language of interview)
- When questions were asked in an easy-to-answer form which required recombination (for example, age on 9/11, new or worse cough after 9/11)
- When free-text responses (i.e., other, please specify) required classification (for example, New York City Fire Department)
- When a complex combination of data occurred (for example, age on 9/11, probable current serious psychological distress)
- When external data were used to standardize classification (for example, building damage categorization according to assessments made by FEMA)
- When external programs were used to standardize classification (for example, census tracts created using geo-processing).

This document contains short descriptions of how each variable was derived. Missing values have the same codes as collected data. The derived variables fall into the following categories:

	<u>Page</u>
1. Interview Characteristics	60
2. Eligibility Groups	62
3. Demographics	63
4. Building Survivor Characteristics	66
5. Rescue and Recovery Groups	67
6. Resident Location	69
7. Physical Health Symptoms	70
8. Physical Health Symptom Denominators	73
9. Physical Health Conditions	75
10. Physical Health Conditions Denominators	78
11. Mental Health Screenings	80

1. Interview Characteristics

Derived Variable: complete_int

Label: Type of completed interview

Baseline Variables Used: injury_cut, dec_ssn

Description: This variable distinguishes between three different types of completed interviews. Interviews are defined as complete when data on eligibility and exposure was collected. The cut-off for completed interviews for a registrant living at the time of the interview (by proxy or not) was determined to be INJURY_CUT, the first variable after the eligibility and exposure sections. The cut-off for proxy for a registrant deceased at the time of the interview (by proxy only) is DEC_SSN (the social security number for deceased registrants).

Label	Value	Frequency	Percent	Cumulative Frequency	Cumulative Percent
Completed self interview	1	68337	95.66%	68337	95.66%
Completed proxy interview (child/incapacitated)	2	2940	4.12%	71277	99.78%
Completed proxy interview (deceased)	3	160	0.22%	71437	100.00%
DON'T KNOW	-1	0	0.00%	71437	100.00%
REFUSED TO ANSWER	-2	0	0.00%	71437	100.00%
[VALID MISSING]	-9	0	0.00%	71437	100.00%
[INVALID MISSING]	-3	0	0.00%	71437	100.00%
TOTAL				71437	100.00%

Derived Variable: priority_group

Label: Priority Group

Baseline Variables Used: worker, resident, student/staff, occupant

Description: Indicates priority level of recruitment. Group 1, actively traced respondents includes WTC site and Staten Island workers, residents south of Chambers Street, occupants of the 35 damaged and destroyed buildings and 3 structures, and students and staff of schools south of Canal Street. Group 2 comprises other residents south of Canal Street and occupants of buildings and pedestrians who were south of Chambers on September 11. These respondents were recruited through self-identification. Group 1 status trumps Group 2 status for respondents who are eligible in multiple categories.

Label	Value	Frequency	Percent	Cumulative Frequency	Cumulative Percent
0	0	816	1.14%	816	1.14%
1	1	47818	66.94%	48634	68.08%
2	2	22803	31.92%	71437	100.00%
DON'T KNOW	-1	0	0.00%	71437	100.00%

[INVALID MISSING]	-3	0	0.00%	71437	100.00%
TOTAL				71437	100.00%

Derived Variable: language2

Label: Language of interview

Baseline Variables Used: language, language_sp

Description: Restricted access variable due to confidentiality issues. Denotes the language in which the interview was administered. English, Spanish, Cantonese, and Mandarin interviews were conducted with a native-tongue interviewer. Interviews in other languages were conducted using a simultaneous translation service.

Label	Value	Frequency	Percent	Cumulative Frequency	Cumulative Percent
[RESTRICTED]		71437	100.00%	71437	100.00%
TOTAL				71437	100.00%

Derived Variable: source

Label: Source of interview

Baseline Variables Used: listsourceid

Description: This variable collapses LISTSOURCEID to determine the method of registration. It groups together all registrants whose names originated from lists provided by businesses, organizations, and other entities, and distinguishes them from those who registered through the WTC Health Registry website and those who registered by directly calling the WTC Health Registry telephone number provided for enrollment.

TOTAL				71437	100.00%

Derived Variable: Resident_pg
Label: Priority group among residents
Variables Used: Resident_e, address on 911 variables
Description: Denotes the stratification of registrants into higher and lower priority groups for the purposes of targeting and evaluating sample building activities (i.e. list procurement, outreach). For residents, Group 1 included residents as of September 11, 2001 at addresses located south of Chamber Street; Group 2 included residents located on or north of Chamber but south of Canal Street; A third resident group, Group 0, was defined upon recognition of the inclusion of respondents living on or north of canal in zip codes overlapping the Canal boundary or in other NYC boroughs.

Label	Value	Frequency	Percent	Cumulative	
				Frequency	Percent
0: North of Canal or other NYC borough	0	1176	1.65%	1176	1.65%
1: South of Chambers	1	8170	11.44%	9346	13.09%
2: South of Canal; North of Chambers	2	5319	7.45%	14665	20.54%
[VALID MISSING]	-9	56772	79.47%	71437	100.0%
TOTAL				71437	100.00%

Derived Variable: Occ_trans_pg

Label: Priority group among occupants/commuters/passersby

Variables Used: Occ_trans_e; FEMArating

Description: Denotes the stratification of building occupants, commuters, passersby into higher and lower priority groups for the purposes of targeting and evaluating sample building activities (i.e. list procurement, outreach). For occupants, Group 1 included individuals who were present in the 38 damaged or destroyed buildings/structures on the morning of September 11, 2001. Group 2 included occupants, employees, commuters, visitors and passersby who were present south of Chambers Street on September 11, 2001, other than those in 38 damaged or destroyed buildings/structures in and around the WTC site.

Label	Value			Cumulative	Cumulative
		Frequency	Percent	Frequency	Percent
1: 38 damaged/destroyed building occupants	1	10265	14.37%	10265	14.37%

Derived Variable: census_race

Label: Combined race/ethnicity

Baseline Variables Used: hispan, race, racesp, dec_ethnicity, dec_race, dec_race_sp, language

Description: Composite of race/ethnicity categorized according to methods used in 2000 Census SF1 documentation appendix of race codes (<http://www.census.gov/prod/cen2000/doc/sf1.pdf>). Registrants who responded "Yes" to HISPAN were classified as Hispanic or Latino regardless of response to RACE or RACE_SP. Non-Hispanic registrants were coded according to the combination of checklist answers in RACE and free-text responses from RACE_SP. LANGUAGE was used if data was missing in other variables.

Label	Value	Frequency	Percent	Cumulative Frequency	Cumulative Percent

4. Building Survivor Characteristics

Derived Variable: build_code2
Label: Damaged or destroyed buildings and structures
Baseline Variables Used: build_transit, build_code, build_name, build_address
Description: Combined drop-down lists with free-text. Includes registrants who answered affirmative for BUILD_TRANSIT: "On September 11th, 2001 were you in a building south of Chambers Street between the time of the first plane impact and noon?" and from responded in BUILD-CODE, BUILD_NAME, and BUILD_ADDRESS variables in which the specified building was one of 38 damaged and destroyed buildings/structures targeted by the WTCHR for list building and recruitment. Because of confidentiality issues, cells with frequencies less than 25 are not reported (denoted by "-") and are available based upon review of request.

TOTAL

Derived Variable: femarating
Label: Characterization of damaged and destroyed buildings and structures
Baseline Variables Used: build_code2 (derived), build_transit, build_code, build_name, build_address
Description: Summarizes 38 damaged or destroyed buildings/structures targeted for list building and recruitment by severity of damage according to FEMA's Building Performance Study. The full report can be found at <http://www.fema.gov/library/wtcstudy.shtm>. Note that responses of "World Trade Center" or "World Financial Center" without specification of the particular building were coded as 6 (WTC unspecified).

5. Rescue and Recovery Groups

Derived Variable: fdny_scan

Label: New York City Fire Department personnel involved in disaster rescue, recovery, cleanup operations

Baseline Variables Used: responder, si_worker, worker_cat, worker_catrsp, worker_cat_si, worker_cat_sisp, business_911

Description: Incorporates drop-down list and free-text to flag registrants who indicated they worked for the New York City Fire Department in rescue, recovery, cleanup or other disaster-related activities at the WTC, Staten Island, or barge sites between September 11th, 2001 and June 30th, 2002. FDNY workers must have answered affirmative to RESPONDER or SI_WORKER. FDNY workers must have also answered '1' (FDNY) or '3' (FDNY-EMS) for WORKER_CAT or WORKER_CAT_SI or indicated their employer was FDNY in the free-text variables WORKER_CATSP, WORKER_CAT_SISP or BUSINESS_911.

7. Physical Health Symptoms

Derived Variable: cough_nw

Label: New or worsening persistent cough after 9/11/01

Baseline Variables Used: cough, cough_after, cough_ever

Description: Health symptom outcome determined by combining affirmative responses in two variables: COUGH (Since 9/11, have you had persistent cough?) and COUGH_AFTER (Did your persistent cough get worse after 9/11?). COUGH_AFTER was included if COUGH_EVER (Before 9/11, did you have persistent cough?) was answered affirmative. If COUGH_EVER was negative, only COUGH (Since 9/11) applied to the derived variable. Note -1 and -2 (DK and REF) in the baseline variables are recoded as -3 Invalid.

Derived Variable: skin_nw
Label: New or worsening skin irritation or rash after 9/11/01
Baseline Variables Used: skin_rash, skinrash_after, skinrash_ever
Description: Health symptom outcome determined by combining affirmative responses in two variables: SKIN_RASH (Since 9/11, have you had skin rash or irritation?) and SKINRASH_AFTER (Did your skin rash or irritation get worse after 9/11?). SKINRASH_AFTER was included if SKINRASH_EVER (Before 9/11, did you have skin rash or irritation?) was answered affirmative. If SKINRASH_EVER was negative, only SKIN_RASH (Since 9/11) applied to the derived variable calculation. Note -1 and -2 (DK and REF) in the baseline variables are recoded as -3 Invalid.

8. Physical Health Symptom Denominators (useful for point prevalence estimations in SUDAAN)

Derived Variable: cough_den

Label: Denominator for new or worsening cough after 9/11

Baseline Variables Used: cough, cough_ever

Description: Denominator for health symptom outcome COUGH_NW. The value of 1=Yes in COUGH_DEN represents the total number of eligible respondents that gave valid answers for COUGH (1=YES or 2=No) and COUGH_EVER (1=Yes or 2=No). The frequency for value=1 in the derived variable represents a denominator useful for point prevalence estimations in SUDAAN.

Label	Value	Frequency	Percent	Cumulative Frequency	Cumulative Percent

Derived Variable: depression_den

Label: Denominator for new or worsening depression after 9/11

Baseline Variables Used: depression, depress_ever

Description: Denominator for health symptom outcome DEPRESSION_NW. The value of 1=Yes in DEPRESSION_DEN represents the total number of eligible respondents that gave valid answers for DEPRESSION (1=YES or 2=No) and DEPRESS_EVER (1=Yes or 2=No). The frequency for value=1 in the derived variable represents a denominator useful for point prevalence estimations in SUDAAN.

Label: Newly diagnosed emphysema since 9/11
Baseline Variables Used: emphysema, emphysema_before
Description: Health condition diagnosed after 9/11. EMPHYSEMA_NEW is affirmative (1=YES) if EMPHYSEMA (Have you ever been told by a doctor or health professional that you have emphysema?) is not equal to 2 (No) and EMPHYSEMA_BEFORE (Did a doctor or health professional first tell you that you had emphysema before or after 9/11) is equal to 1 (Before 9/11). Note -1 and -2 (DK and REF) in the baseline variables are recoded as -3 Invalid.

10. Physical Health Conditions Denominators (useful for point prevalence estimations in SUDAAN)

Derived Variable: asthma_den
Label: Denominator for diagnosed asthma since 9/11
Baseline Variables Used: asthma_before
Description: Denominator for health condition ASTHMA_NEW. Respondents that indicated they were ever diagnosed with asthma in ASTHMA_BEFORE (1=before 9/11 and 2=after 9/11) are coded as 1 (Yes) in this new variable. The frequency for value=1 in the derived variable represents a denominator useful for point prevalence estimations in SUDAAN.

11. Mental Health Screenings

Derived Variable: pdi_sum
Label: Sum of mental health questions relating to current, probable psychological distress
Baseline Variables Used: sad, nervous, restless, hopeless, lethargic, worthless
Description: Summary score using the psychological distress screening scale (K6-PDI). Note this summary score only includes subjects who gave answers to all 6 questions.

Derived Variable: child_ptsr_sum

Label: Sum of mental health questions relating to current, probable post-traumatic stress response for children

Baseline Variables Used: child_thought, child_sleep, child_nightmares, child_notthink, child_avoid, child_keepaway, child_future, child_concentrate

Description: Summary score using a shorter version of the PCL-CV. Note these questions have been adapted from the PCL so adult proxies could answer on behalf of child subjects. For this reason, DOHMH uses the term "response" in place of "disorder". Note this sum only includes subjects who answered all 8 questions.
