3314.4.4.3 Capacity. Each scaffold, and its components, shall be capable of supporting, without failure, its own weight and at least four times the maximum intended load applied or transmitted to it. Where applicable, scaffolds and their connections to the building or structure shall be designed to meet the anticipated loads during construction or demolition work, including wind loads as prescribed in Chapter 16. Each suspension rope, including connecting hardware, used on nonadjustable suspended scaffolds shall be capable of supporting, without failure, at least six times the maximum intended load applied or transmitted to the rope.

3314.4.4.4 Stable and secure. The scaffold and all materials and equipment located on

or used from the scaffold shall be kept stable and secure at all times to prevent the scaffold from losing balance, overturning, or collapsing, and to prevent any object from falling from the scaffold.

3314.4.4.5 Dislodgement. Material and equipment susceptible to dislodgment shall not be stored on a scaffold while work is not being performed.

3314.4.4.6 Winds. Where sustained winds or wind gusts at the site exceed 30 miles per hour, the use and operation of scaffolds located on the roof of a building, exterior to a building or structure, on a working deck, or in an area with an unenclosed perimeter shall cease. If the manufacturer or designer of the scaffold recommends work to cease at a lower wind speed, such recommendation shall instead apply. Wind speed shall be determined based on data from the nearest United States weather bureau reporting station, or an anemometer located at the site, freely exposed to the wind, and calibrated in accordance with ASTM D5096-02.

3314.4.4.7 Use during installation, repairs, maintenance, adjustments, or removal. Only personnel, materials, and uses authorized by the person responsible for supervising the installation, repair, maintenance, adjustment, or removal of a scaffold shall be located on and using the scaffold during such work.

3314.4.4.8 Non-combustible construction. With the exception of the planking, the following scaffolds shall be constructed of non-combustible materials:

1. Exterior scaffolds exceeding 75 feet (22 860 mm) in height.
2. Interior scaffolds exceeding 21 feet (6.4 mm) in height.
3. All scaffolds used in the alteration, repair, or partial demolition of buildings in Occupancy Groups I-1 to I-4.

3314.4.5 Training. Only those who are qualified to install, adjust, maintain, repair, use, or remove a scaffold, and are trained in accordance with the requirements of this section, shall perform such work or supervise such work. No person shall knowingly permit or cause an individual who does not have the experience and training required by this section to install, adjust, modify, repair, use, or remove a scaffold.

3314.4.5.1 Training for supported scaffold installers, adjusters, repairers, maintainers, inspectors, or removers. Workers who install, adjust, repair, maintain, inspect, or remove a supported scaffold that is 40 feet (12 192 mm) or more in height, including the person supervising such, shall, at a minimum, have completed a department-approved training program or course that is at least 32 hours long and shall complete a department-approved 8-hour refresher program or course every 4 years thereafter. Workers who install, adjust, repair, maintain, or remove a sidewalk shed that provides a base for a supported scaffold that is 40 feet (12 192 mm) or more in height, including the person supervising such, are subject to the above requirements.

Exceptions:

1. The installation, adjustment, maintenance, repair, or removal of a supported scaffold performed by an employee of a public utility, including the person supervising such, where such supported scaffold is located within the interior of a structure owned or operated by such utility, and when such utility has a training safety program or course of not less than 32 hours for its employees who perform such scaffold work.
2. Where existing supported scaffold deck planking or guardrails are being relocated to a different level of the scaffold in accordance with the design, such may be performed by individuals who have completed the training required by Section 3314.4.5.2.

3314.4.5.2 Training for supported scaffold users. Individuals who use a supported scaffold, including the person supervising such, shall, at a minimum, have completed a department-approved training program or course that is at least 4 hours long and, every four years thereafter, retake the 4-hour training program or course.

Exceptions:

1. Employees of a public utility performing work while using a supported scaffold, including the person supervising such, provided that such employees are trained to be able to recognize the hazards associated with the type of supported scaffold being used and to understand the procedures to control those hazards.
2. A registered design professional who has not completed the training may use a supported scaffold to perform inspections provided the registered design professional does not perform construction, maintenance, repair, or demolition work from the scaffold.

3314.4.5.3 Training for suspended scaffold supervisors. Individuals who exercise supervisory responsibility in accordance with the requirements of Sections 3314.4.1 through 3314.4.4 for the installation, adjustment, repair, maintenance, use, or removal of a suspended scaffold shall, at a minimum, have completed a department-approved training program or course that is at least 32 hours long and, four years following completion of the 32-hour program or course, and every four years thereafter, complete a department-approved 8-hour refresher program or course.

Exception: Individuals supervising the installation, adjustment, modification, repair, use, or removal of a non-adjustable suspended scaffold.

3314.4.5.4 Training for suspended scaffold installers, adjusters, repairers, maintainers, users, inspectors, or removers. Individuals who install, adjust, repair,

maintain, use, inspect, or remove a suspended scaffold shall, at a minimum, have completed a department-approved training program or course that is at least 16 hours long and, four years following completion of the 16-hour program or course, and every four years thereafter, complete a department-approved 8-hour refresher program or course.

Exceptions:

1. A registered design professional who has not completed the training may ride on a suspended scaffold to perform inspections provided the registered design professional does not perform construction, maintenance, repair, or demolition work from the scaffold, or operate the scaffold, and provided the registered design professional is familiar with the use of the scaffold, safety equipment, and emergency procedures.
2. Individuals who install, adjust, repair, maintain, use, or remove a non-adjustable suspended scaffold, including the person supervising such use.
3. A person who possesses a valid challenge examination certificate issued prior to January 1, 2014 need not take a new 16-hour initial program or course but shall be required to complete the 8-hour refresher program or course every 4 years, beginning from the date of enactment of this code.

3314.4.5.5 Course providers. Training programs or courses required by this section shall be conducted by a registered New York State Department of Labor apprenticeship training program or by an educational institution or school chartered, licensed or registered by the New York State Department of Education or by a provider approved by the department and presented by an instructor acceptable to the commissioner.

3314.4.5.6 Course curriculums. All training programs or courses required by this section shall be based on the scaffold requirements of this chapter and shall include, but not be limited to, instruction on the type of scaffold the training covers and associated hazards, common causes of scaffold accidents and steps to avoid such accidents, scaffold components, scaffold connections to a structure, scaffold inspection, the maximum intended load and load-handling capacities of scaffolds, and the prevention of overload conditions. Curriculums for scaffold users shall be focused on the proper use of the scaffold. Curriculums for scaffold installers, adjusters, maintainers, repairers, and removers shall be focused on the proper execution of such work. Curriculums in excess of eight hours in length shall include a significant portion of hands-on training.

3314.4.5.7 Evaluation. Successful completion of a training program or course that is more than 4 hours in length shall be based upon a written performance evaluation. For courses that are 16 hours or greater in length, successful completion shall also be based upon passage of a hands-on performance evaluation.

3314.4.5.8 Certificate card. Successful completion of the training program or course

shall be evidenced by a wallet size certificate card issued by the training provider and acceptable to the commissioner. Such certificate card shall be readily available to the commissioner upon request and shall contain, at a minimum, the name and photograph of the individual to whom it was issued, as well as any other information required pursuant to rules promulgated by the commissioner for a department approved training course.

3314.4.5.9 Grace period. For individuals who fail to complete the required refresher program or course within any 4 year period, a refresher program or course shall be considered timely if completed within 1 year after the expiration date of the last previously completed initial or refresher program or course. During such period, such individual shall not perform or supervise any activity for which the lapsed training is required to perform or supervise such activity until such individual has successfully completed such refresher program or course. Where more than 1 year has lapsed, such individual shall be required to successfully recomplete the initial training program or course.

3314.4.6 Adjustments. Scaffolds, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold installed at a site shall be adjusted under the supervision of a competent person designated by the contractor or licensee who installed the scaffold. Individuals who perform adjustments, and the person supervising such, shall be trained in accordance with Section 3314.4.5. Following the adjustment, the scaffold shall be inspected in accordance with Section 3314.4.3.6.

Exception: Where a sidewalk shed provides the base for a supported scaffold, the sidewalk shed shall be adjusted in accordance with the requirements of Section 3307.6.

3314.4.7 Repairs. Scaffolds, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold installed at a site shall be repaired under the supervision of a competent person designated by the equipment owner. Individuals who perform repairs, and the person supervising such, shall be trained in accordance with Section 3314.4.5. Following the repair, the scaffold shall be inspected in accordance with Section 3314.4.3.6.

Exceptions:

1. Where a sidewalk shed provides the base for a supported scaffold, the sidewalk shed shall be repaired in accordance with the requirements of Section 3307.6.
2. Components and attachments may be replaced under the supervision of a competent person designated by the contractor or licensee who installed the scaffold.

3314.4.8 Maintenance. Scaffolds, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold installed at a site shall be maintained in a good condition by a qualified person designated by the scaffold controlling entity. Individuals maintaining a scaffold shall have been trained in accordance with Section 3314.4.5.

Individuals who maintain an adjustable suspended scaffold hoist shall also have been trained and authorized by the manufacturer of the scaffold hoist. A description of the maintenance shall be recorded, signed, and dated by the person who performed the maintenance and kept with the inspection checklist or report required by Sections 3314.4.3.4 or 3314.4.3.5.

Exceptions:

1. Where a sidewalk shed provides the base for a supported scaffold, the sidewalk shed shall be maintained in accordance with the requirements of Section 3307.6.
2. A description of the maintenance is not required for a non-adjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed.

3314.5 Platform construction. Platforms on all working levels of a scaffold shall be fully planked or decked between the front uprights and the guardrail system supports in accordance with Sections 3314.5.1 through 3314.5.6.

Exception: Platforms used solely as walkways or used solely by workers installing or removing the scaffold shall be planked to the extent necessary to ensure the safety of the public and property.

3314.5.1 Platform spacing. Each platform unit shall be installed so that the space between adjacent units and the space between the platform and the uprights is no more than 1 inch (25 mm) wide except where a qualified person can demonstrate that a wider space is necessary.

3314.5.2 Maximum span for wood plank. All lumber used in scaffolds or their supports shall be at least equal in strength and quality to construction grade lumber in accordance with Section 2301. See Table 3314.5.2 for the maximum span for scaffold planks.

TABLE 3314.5.2
MAXIMUM PERMISSIBLE SPANS FOR
2-INCH PLANK USED ON SCAFFOLDS

<u>MATERIAL</u>	<u>FULL THICKNESS UNDRESSED LUMBER</u>			<u>LUMBER OF NOMINAL THICKNESS</u>		
	<u>25</u>	<u>50</u>	<u>75</u>	<u>25</u>	<u>50</u>	<u>75</u>
<u>Working Load (psf)</u>	<u>25</u>	<u>50</u>	<u>75</u>	<u>25</u>	<u>50</u>	<u>75</u>
<u>Permissible Span (ft)</u>	<u>10</u>	<u>8</u>	<u>6</u>	<u>8</u>	<u>6</u>	<u>5</u>

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 47.88 Pa,
1 foot = 304.8 mm.

3314.5.3 Minimum overhang. The end of a platform shall extend over the centerline of its

support a minimum of 6 inches (152 mm) unless cleated or otherwise restrained by hooks or equivalent means.

3314.5.4 Maximum cantilever. The maximum cantilever shall be as follows.

3314.5.4.1 Ten feet or less. The end of a platform 10 feet (3048 mm) or less in length shall not extend over the centerline of its support more than 12 inches (305 mm) unless the platform and its tiedown are designed by a qualified person or the platform has guardrails to prevent access to the cantilevered end.

3314.5.4.2 More than ten feet. The end of a platform more than 10 feet (3048 mm) in length shall not extend over the centerline of its support more than 18 inches (457 mm) unless the platform and its tiedown are designed by a qualified person or the platform has guardrails to prevent access to the cantilevered end.

3314.5.5 Platform tiedown. All platforms shall be tied down or otherwise positively restrained by hooks or equivalent means to prevent dislodgment in all directions.

3314.5.6 Platform deflection. Platforms shall not deflect more than 1/60 of the span when loaded.

3314.6 Footings and anchorage. The footings and anchorage for every scaffold shall be sound and rigid, capable of carrying the maximum load without excessive settlement or deformation and secure against movement in any direction. Supports such as barrels, boxes, loose brick, loose stone, or other unstable materials shall not be used.

3314.6.1 Safe points of anchorage. Safe points of anchorage include structural members of a building. Window washing anchors, window frames, mullions, handrails, standpipes, vents and other piping systems, electrical conduit, counterweights or similar elements shall not be used as anchors or braceback points.

Exception: Window washing anchor points that are part of the base building structure may be utilized as an anchor or braceback point for a scaffold, subject to the approval of the commissioner. The anchor points shall be inspected by a registered design professional prior to use to verify their ability to support all loads imposed. At the end of the job, the anchor points shall be restored to their original condition, any damage repaired, and inspected by a registered design professional to verify such. A report verifying such restoration and inspection shall be prepared by the registered design professional and submitted to the department.

3314.6.2 Lifeline anchorage. Lifeline anchorage shall be fastened to a fixed safe point of anchorage, shall be independent of the scaffold, and shall be protected from sharp edges and abrasion.

3314.6.3 Lifelines and suspension ropes. Lifelines, tiebacks, and suspension ropes shall each be attached to a different point of anchorage.

3314.6.4 Scaffolds supported on structure. Loads from supported and suspended scaffolds imposed on an existing roof or floor or similar structure shall:

1. Not be concentrated so as to cause stresses in excess of the allowable values designated for the applicable material described in this code; or
2. Be distributed with dunnage or shoring so as to prevent such load from exceeding the allowable values designated for the applicable material described in this code.

3314.7 Outrigger beams. Outrigger beams shall be made of structural metal or equivalent strength material and shall be restrained to prevent movement.

3314.7.1 Overhang. The overhang of outrigger beams shall not exceed that specified by the design and the inboard length of beam shall be at least one and one-half times the outboard length unless otherwise designed by a registered design professional.

3314.7.2 Placement. Outrigger beams shall be placed so that the suspension ropes will hang vertically.

3314.7.3 Outrigger beam end of suspension ropes. Suspension ropes shall be securely fastened to the outrigger beams by steel shackles, thimbles, or equivalent means.

3314.7.4 Load end of wire suspension ropes. The load end of wire suspension ropes shall be equipped with proper size thimbles and secured by eyesplicing or equivalent means.

3314.8 Guardrail system and debris netting. The open sides and ends of scaffold platforms shall be provided with a guardrail system that meets the requirements of Section 3314.8.1 and debris netting that meets the requirements of Section 3314.8.2.

Exceptions:

1. A guardrail system and debris netting are not required while the scaffold is being installed or removed but shall be in place before the scaffold is used.
2. A guardrail system and debris netting is not required along the edge of a scaffold facing a building or structure, provided the distance from the edge of the scaffold platform to the face of the building or structure is:
 - 2.1 For an outrigger scaffold, 3 inches (80 mm) or less;
 - 2.2 For a scaffold used in conjunction with plastering and lathing operations, 18 inches (460 mm) or less; or
 - 2.3 For all other scaffolds, 14 inches (360 mm) or less.

3. Notwithstanding the provisions of Sections 3308.6.1.4 and 3314.9.4, debris netting is not required along the perimeter of a scaffold provided such perimeter is set-back from all adjoining property and areas that remain open to the public at a distance that is equal to or greater than half the height of scaffold.
4. Notwithstanding the provisions of Sections 3308.6.1.4 and 3314.9.4, debris netting is not required for a scaffold which does not require a design in accordance with Section 3314.3.

3314.8.1 Guardrail system. Where required by Section 3314.8, the guardrail system for a scaffold shall meet the requirements of Section 3308.7.1 through 3308.7.7.

Exceptions: For the purposes of this section:

1. The term “floor” in Section 3308.7.1 through 3308.7.7 shall mean “platform.”
2. The height of the toprail, as prescribed in Section 3308.7.2, may be as low as 38 inches (965 mm) in a guardrail system utilized in connection with a scaffold, and such toprail may deflect to a height of not less than 38 inches (965 mm) when designed in accordance with exception number 1 to Section 3308.7.3.
3. Alternate guardrail systems under exception number 1 to Section 3308.7.3 may be designed by the designer of the scaffold or the manufacturer of the scaffold to be capable of withstanding, without failure a force of at least:
 - 3.1 For toprails or equivalent members, a force applied in any downward or horizontal direction at any point along its top edge of at least 100 pounds (445 n) for guardrail systems installed on single-point adjustable suspended scaffolds or two-point adjustable suspended scaffolds, and at least 200 pounds (890 n) for guardrail systems installed on all other scaffolds.
 - 3.2 For midrails, screens, mesh, intermediate vertical members, solid panels, or equivalent members, a force applied in any downward or horizontal direction at any point along the midrail or other member of at least 75 pounds (333 n) for guardrail systems with a minimum 100 pound (445 n) toprail capacity, and at least 150 pounds (666 n) for guardrail systems with a minimum 200 pound (890 n) toprail capacity.
 - 3.3 For toeboards, a force of at least 50 pounds (222 n) applied in any downward or horizontal direction at any point along the toeboard.
4. When intermediate supports, such as ballisters or additional rails are used, they shall not be more than 19 inches (483 mm) apart.

3314.8.2 Debris netting. Where required by Section 3314.8, the scaffold shall be enclosed with a debris netting consisting of a wire screen comprised of not less than number 18 gage

wire mesh, or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm). Such netting shall be securely attached to the scaffold and shall enclose all open sides, ends, and bottom of the scaffold for the full height of all platform levels where work is occurring, or when on the upper level of a supported scaffold or when on a suspended scaffold, to the height of the toprail. The effect of wind on the netting shall be accounted for in the design of the scaffold, where such design is required by Section 3314.3.

Exception: Netting is not required to protect the bottom of the scaffold platform provided the netting is securely fastened to the scaffold deck and the scaffold platform planks are laid tight or the deck of the scaffold is solid.

3314.9 Supported scaffold. Supported scaffolds shall meet the requirements of Sections 3314.9.1 through 3314.9.4:

3314.9.1 Height-to-base ratio. A supported scaffold with a height-to-base ratio (including outriggers supports, if used) of more than four to one (4:1) shall be restrained from tip-ping by guying, tying, bracing or equivalent means as follows:

1. Guys, ties or braces shall be installed at locations where horizontal members support both inner and outer legs.
2. Guys, ties, or braces shall be installed according to the manufacturer's recommendations, or as designed in accordance with Section 3314.3, or at a minimum, the first guy, tie or brace shall be installed at a horizontal member and not more than a distance 4 times the least plan dimension from the base support and be repeated vertically at locations of horizontal members every 20 feet (6096 mm) or less thereafter for scaffolds 3 feet (914 mm) wide or less and every 26 feet (7925mm) or less thereafter for scaffolds greater than 3 feet (914 mm) wide. The top guy, tie, or brace shall be placed no further than four times the least plan dimension from the top. Such guys, ties, or braces shall be installed at each end of the scaffold and at horizontal intervals not to exceed 30 feet (9144 mm) measured from one end (not both) towards each other.
3. Guys, ties, braces, or outriggers shall be used to prevent tipping of supported scaffolds in all circumstances where an eccentric load, such as a cantilevered work platform, is applied or is transmitted to the scaffold.

3314.9.2 Foundation. Supported scaffold poles, legs, posts, frames and uprights shall bear on base plates and mud sills or other adequate firm foundation to distribute the weight of the scaffold into the ground, structure, or sidewalk shed upon which it rests.

3314.9.3 Plumb. Supported scaffold poles, legs, posts, frames, and uprights shall be plumb and braced to prevent swaying and displacement. The tolerance shall not exceed L/100, where L is the distance measured from the ground or grade elevation to the first X-brace or bottom of the first bearer or frame horizontal member.

3314.9.4 Supported scaffolds at the edge. Supported scaffolds located on a floor, working deck, or roof and located within a distance from the edge of the roof or an unenclosed perimeter that is equal to or less than 1.5 times the height of the scaffold shall:

1. Be positively anchored or tie-backed, and with all wheels or rollers secured by rope, cable, or chocking at the wheels in order to prevent movement; and
2. Have all sides of the scaffold facing an unenclosed perimeter or the edge of a roof within a distance that is equal to or less than 1.5 times the height of the scaffold provided with guardrails and debris netting in accordance with Section 3314.8; or
3. Have all material and equipment susceptible to dislodgement, and not being actively held by a person, secured in a manner to prevent dislodgement by wind or accidental impact.

Exception: The above requirements shall not apply where vertical safety netting that meets the requirements of Section 3308.5, or an approved alternate system, extends to cover the full height and width of all unenclosed perimeters within a distance from the scaffold equal to or less than 1.5 times the height of the scaffold.

3314.10 Suspended scaffold. Suspended scaffolds shall meet the requirements of Sections 3314.10.1 through 3314.10.11.

3314.10.1 Suspended elements to be kept vertical and parallel. Suspended scaffolds shall be installed and used in such a manner that the ropes or similar suspension elements are vertical and/or in a plane parallel to the wall at all times.

Exception: Ropes or similar suspension elements do not have to be vertical and/or in a plane parallel to the wall provided such occurs in accordance with design drawings prepared by a registered design professional. Such design drawings shall be based on an investigation of the support surface and anchorage of the scaffold conducted by such registered design professional. A signed, sealed, and dated report prepared by the registered design professional documenting such investigation shall accompany the design drawings.

3314.10.2 Support. All suspended scaffold support devices, such as outrigger beams, C-hooks, parapet clamps, and similar devices shall be supported by surfaces capable of supporting at least 4 times the load imposed on them by the scaffold operating at the rated load of the hoist. The support shall be inspected prior to installation in accordance with the requirements of Section 3314.4.3.1.

3314.10.3 Outrigger beam location. Outrigger beams shall be placed perpendicular to the face of the building or structure.

Exception: Where a licensed rigger or registered design professional can demonstrate to

the commissioner's satisfaction that it is not possible to place an outrigger beam perpendicular to the face of the building or structure, the outrigger beam may be placed at a different angle, provided opposing angle tiebacks are used.

3314.10.4 Outrigger beam stabilization. The inboard ends of the suspended scaffold outrigger beam shall be stabilized by bolts or other direct connections to the floor or roof deck, or they shall have their inboard ends stabilized by counterweights.

Exception: Multipoint adjustable suspended scaffolds shall not be stabilized by counterweights.

3314.10.5 Outrigger beam installation. Outrigger beams shall be installed with all bearing supports perpendicular to the beam centerline and shall set and maintain the web in a vertical position. The shackle or clevis with which the rope is attached to the outrigger beam shall be placed directly over the centerline of the stirrup.

3314.10.6 Counterweight material. Counterweights shall be made of a nonflowable material. Sand, gravel and similar materials that can be easily dislocated shall not be used.

3314.10.7 Counterweight securement. Counterweights shall be secured by mechanical means to the outrigger to prevent accidental dislodgment.

3314.10.8 Counterweight removal. Counterweights shall not be removed from an outrigger beam until the scaffold is disassembled.

3314.10.9 Horizontal tieback location. Horizontal tiebacks shall be installed perpendicular to the face of the building or structure, or opposing angle tiebacks shall be installed. Single tiebacks installed at an angle are prohibited.

3314.10.10 Support devices. Suspended scaffold support devices, such as C-hooks, cornice hooks, roof hooks, roof irons, parapet clamps or other similar devices shall meet the following requirements:

1. Support devices shall be made of steel, wrought iron or materials of equivalent strength.
2. Such devices shall be supported by bearing blocks.
3. Support devices shall be secured against movement by tiebacks installed perpendicular to the face of the building or structure or by opposing angle tiebacks installed and secured to a structurally sound point of anchorage as prescribed in Section 3314.6.
4. Tieback rope shall be at least equal in strength to the suspension rope.

3314.10.11 Securing suspended scaffolds. At the end of the shift, the suspended scaffold

shall be cleared of all equipment and material susceptible to dislodgement and shall be lowered to the street or deck of the sidewalk shed, or shall be secured to the roof or building in accordance with design drawings required by Section 3314.3.3.

3314.11 Suspension rope. When winding drum hoists are used on a suspended scaffold, they shall contain not fewer than four wraps of the suspension rope at the lowest point of scaffold travel. When other types of hoists are used, the suspension ropes shall be long enough to allow the scaffold to be lowered to the level below without the rope end passing through the hoist, or the rope end shall be configured or provided with means to prevent the end from passing through the hoist.

3314.11.1 Repaired rope. The use of repaired wire rope as suspension rope is prohibited.

3314.11.2 Rope replacement. Ropes shall be replaced or removed if any of the following conditions exist, and as otherwise prescribed by rule of the department:

1. Any physical damage that impairs the function and strength of the rope.
2. Presence of kinks that might impair the tracking or wrapping of the rope around the drums or sheaves.
3. Presence of abrasion, corrosion, scrubbing, flasttening or peening causing the loss of more than one-third of the original diameter of the outside wires.
4. Heat damage caused by a torch or any damage caused by contact with electrical wires.
5. Evidence that the secondary brake has been activated during an overspeed condition and has engaged the suspension rope.

3314.11.3 Shielding. Suspension ropes shall be shielded from heat-producing processes.

3314.11.4 Corrosive substances. When acids or other corrosive substances are used on a scaffold, the ropes shall be shielded, treated to protect against corrosive substances, or made of a material that will not be damaged by the corrosive substance being used.

3314.11.5 Suspended scaffold welding precautions for arcing prevention. Precautions shall be taken to prevent the possibility of arcing through the suspension wire rope during welding operations.

3314.11.5.1 Insulated thimble. An insulated thimble shall be used to attach each suspension wire rope to its hanging support. Excessive suspension wire rope and any additional independent lines from grounding shall be insulated.

3314.11.5.2 Insulating material. The suspension wire rope shall be covered with insulating material extending at least 4 feet (1219 mm) above the hoist. If there is a tail

line below the hoist, it shall be insulated to prevent contact with the platform. The portion of the tail line that hangs free below the scaffold shall be guided or retained or both so that it does not become grounded.

3314.11.5.3 Protective covers. Each hoist shall be covered with insulated protective covers.

3314.11.5.4 Grounding conductor. In addition to a work lead attachment required by the welding process, a grounding conductor shall be connected from the scaffold to the structure. The size of the connector shall be at least the size of the welding process work lead, and this conductor shall not be in series with the welding process or the work piece.

3314.11.5.5 Disconnected grounding lead. If the scaffold grounding lead is disconnected at any time, the welding machine shall be shut off or the welding lead shall be removed from the scaffold.

3314.11.5.6 Welding rod or lead. An active welding rod or uninsulated welding lead shall not be allowed to make contact with the scaffold or its suspension system.

3314.11.6 Wire rope clips. When wire clips are used on suspended scaffolds there shall be a minimum of three wire rope clips installed a minimum of six rope diameters apart. The clips shall be retightened to the manufacturer's specifications after initial loading. U-bolt clips shall not be used at the point of suspension. When U-bolt clips are used, the U-bolt shall be placed over the dead end of the rope and the saddle shall be placed over the live end of the rope.

3314.12 Wood pole scaffolds. Wood pole scaffolds shall meet the requirements of Sections 3314.12.1 through 3314.12.9.

3314.12.1 Standard designs. All wood pole scaffolds 40 feet (12 192 mm) high or less shall be constructed in accordance with the minimum nominal sizes and maximum spacings shown in Tables 3314.12.1 (1) through 3314.12.1 (6). Wood pole scaffolds more than 40 feet (12 192 mm) high shall be designed in accordance with Section 3314.3.

<u>Guardrails</u>			<u>2" x 4"</u>		

Note: For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.88 Pa.

Note for Table 3314.12.1 (5): ^a Total base dimension in both directions to be at least 25 per cent of height.

3314.12.2 Erection and removal. When a new working level is desired, the existing planks shall be left undisturbed until the new working level is framed. As the platform level is abandoned with the progress of the work, all members other than the planking, railing and toeboards shall be left intact. When removing a scaffold, the sequence of removing the members shall be the reverse of that used in erection.

3314.12.3 Materials and construction for wood pole scaffolds. Wood pole scaffold materials and construction shall comply with the following requirements:

1. All lumber used in wood pole scaffolds or their supports shall be at least equal in strength and quality to construction grade lumber in accordance with Section 2301.
2. All lumber and timber shall be fastened at the various joints with sufficient nails or bolts of a suitable size to produce a secure joint capable of withstanding the design load. Table 3314.12.3 provides minimum requirements for size and number of nails. All nails shall be driven full length.
3. Any other suitable material, or dimensions other than those indicated, may be used for wood pole scaffold construction provided it is at least equivalent in strength and

suitability to the comparable wood scaffold it is designed to replace, and approval of the commissioner has been obtained.

TABLE 3314.12.3

<u>6</u>		<u>3</u>
<u>8</u>		<u>4</u>
<u>10</u>		<u>5</u>
<u>12</u>		<u>5</u>

3314.12.4 Poles. Wooden scaffold poles shall be plumb and the foot ends shall be secured against lateral movement. Where wood poles are spliced, the squared end of the upper section shall bear uniformly on the squared end of the lower section and the two ends shall be rigidly fastened together with two or more wood splice plates, each at least 4 feet (1219 mm) in length. The plates shall be placed at right angles to each other, shall overlap the abutting ends of the pole equally, and shall have a combined sectional area not less than 50 percent of the cross sectional area of the pole. Splicing of adjacent poles shall be staggered. Splices shall be close to ledgers, but so located as not to interfere with the fastenings.

3314.12.5 Bracing. Wood pole scaffolds shall be braced and stayed to prevent movement away from the building. Diagonal or equivalent bracing shall be provided to prevent the poles from moving in a direction parallel to the building face and shall be so installed that every spliced section of every pole is braced to adjacent poles.

3314.12.6 Planking. Planking shall comply with Items 1 through 3.

1. Where planks are butted end to end, parallel putlogs or bearers shall be provided not more than 8 inches (203 mm) apart so that the butted ends rest on separate putlogs or bearers. Ends shall be nailed or cleated.
2. Where platform planks are used with overlapping ends, the ends of both the upper and lower planks shall overlap the putlog or bearer by at least 6 inches (152 mm).
3. Planks shall be laid close together and shall be of sufficient length to extend over three bearers.

3314.12.7 Connections. Ledgers shall not be spliced between poles but shall overlap the

poles at each end by at least 4 inches (102mm). Where ledgers lap each other, bearing-blocks attached to the pole shall be provided to support the ledger.

3314.12.7.1 Braces. The ends of all wooden braces shall overlap the nailed fastenings by an amount sufficient to prevent the ends of the braces from splitting.

3314.12.8 Putlogs for single pole scaffolds. All putlogs shall be set with the greater dimension vertical and shall be long enough to project beyond the outer edge of the poles by at least 12 inches (305 mm). Putlogs shall be supported on the ledger and located against the side of the poles and fastened to either the pole or the ledger. The other end of the putlog shall rest in the wall of the building, with at least a 4 inch (102 mm) bearing, and shall not be notched or cut down, except for light duty scaffolds, which may be notched or cut down to fit into a space made by the removal of a brick. In such cases, the notch shall be made on the top of the putlog just deep enough to permit it to be inserted in the hole in the wall.

3314.12.9 Bearers for independent pole scaffolds. Bearers shall be set with their greater dimensions vertical, and shall be long enough to project over the ledgers beyond the outer row of poles by at least 12 inches (305 mm) and beyond the inner row of poles by at least 2 inches (51 mm). Bearers shall be supported on the ledgers, located against the sides of the poles and fastened to the ledgers.

3314.13 Fabricated frame scaffolds. Fabricated frame scaffolds shall meet the requirements of Sections 3314.13.1 through 3314.13.3.

3314.13.1 Bracing. Frames and panels shall be braced by cross, horizontal or diagonal braces or a combination thereof, which secure vertical members together laterally.

3314.13.2 Vertical joining. Frames and panels shall be joined together vertically by coupling or stacking pins or equivalent means. Where uplift can occur, the frames or panels shall be locked together vertically by pins or equivalent means.

3314.13.3 Frame scaffold brackets. Brackets used to support cantilevered loads shall be seated with side-brackets parallel to the frame and end-brackets at 90 degrees (1.57 rad) to the frames shall not be bent or twisted from these positions and shall be used only to support light duty loads as defined in Section 3302.1, unless the design provisions of Section 3314.3 have been met.

3314.14 Outrigger scaffolds (thrust out). Outrigger scaffolds (thrust out) shall not be used for loading in excess of 50 pounds per square foot (244.1 kg/m²) (medium duty).

3314.14.1 Outrigger beams. The fulcrum point of the beam shall rest on a secure bearing at least 6 inches (152 mm) in each horizontal dimension. The beam shall be secured against movement and shall be securely braced against tipping at both the fulcrum point and the inboard end.

3314.14.2 Inboard supports. The inboard ends of outrigger beams shall be securely fixed to

resist all vertical, horizontal and torsional forces. Pull-out tests for adhesive and expansion anchors, if used, shall be approved by the commissioner.

3314.15 Two-point adjustable suspended scaffolds. Two-point adjustable suspended scaffolds shall meet the requirements of Sections 3314.15.1 through 3314.15.7.

3314.15.1 Width and support. Two-point adjustable suspended platforms shall be at least 20 inches (508 mm) but not more than 36 inches (914 mm) in width unless designed by a registered design professional. Each end of the platform shall be supported by a stirrup or hanger that meets the requirements of Section 3315.15.2, and the platform shall be securely fastened thereto. Not more than two hangers or stirrups shall be used to support one scaffold.

3314.15.2 Hangers or stirrups. Hangers or stirrups shall be of steel or wrought iron. Each such hanger shall be formed to properly fit the platform and the hoist mechanism. The hanger or stirrup shall be placed at least 6 inches (152 mm) but not more than 18 inches (457 mm) from the end of the platform unless the manufacturer specifies otherwise.

3314.15.3 Fiber suspension rope. The use of fiber rope shall be limited to light duty two-point adjustable suspended scaffolds. Fiber rope shall be at least equivalent in strength and suitability to ³/₄ -inch (19mm) grade #1 unspliced manila rope.

3314.15.3.1 Corrosive substances. Fiber rope susceptible to damage from corrosive substances shall not be permitted for or near any work involving the use of corrosive substances.

3314.15.3.2 Upper block. Fiber rope shall not be used where the upper block is more than 100 feet (30 480 mm) or ten stories above the ground or roof setback.

3314.15.3.3 Fit. All blocks shall fit the size of rope they carry, and shall be constructed so as not to chafe the rope.

3314.15.4 Combination. Two or more two-point adjustable suspended scaffolds shall not be combined into one by bridging the distance between them or by any other form of connection.

3314.15.5 Number of workers. Not more than two workers shall be permitted to work on one scaffold at one time except where the scaffold is designed to hold more. Written permission from the commissioner shall be required for more than two workers on the scaffold.

3314.15.6 Device to raise, lower, and hold the scaffold. Every two-point adjustable suspended scaffold shall be equipped with a device to raise, lower or hold the scaffold in position.

3314.15.7 Platforms. The platforms of every two-point adjustable suspended scaffold shall be ladder-type, plank-type, beam-type, light-metal type, or another type acceptable to the commissioner.

3314.16 Corner and angle scaffolds. Corner and angle scaffolds shall comply with the requirements of Sections 3314.16.1 through 3314.16.4.

3314.16.1 Motors. As many motors as needed shall be provided to maintain the stability of the platform under all operating conditions.

3314.16.2 Maximum number of people. The number of people allowed on a corner or angle scaffold shall not be more than the number of motors required to keep the scaffold stable, unless otherwise designed by a registered design professional.

3314.16.3 Additional information. In addition to the information required by Section 3314.3, corner and angle scaffolds shall also contain load capacity and distribution charts and a certification from the registered design professional that he/she has reviewed the manufacturer's design calculations and testing or prepared sufficient calculations of his/her own and found them to conform to this code.

3314.16.4 Inspection. The equipment setting for corner and angle scaffolds shall be inspected by the department prior to its use. Additional inspection by the department shall be required each time the equipment is moved to a different position.

3314.17 Multiple-point adjustable suspended scaffolds. Multiple-point adjustable suspended scaffolds shall comply with the following:

1. All multiple-point adjustable suspended scaffolds shall be supported by wire ropes. The use of fiber ropes is not permitted;
2. Provision shall be made to prevent supports from slipping off the ends of outrigger beams;
3. Platform bearers shall be of metal; and
4. During raising or lowering, the levels of the various sections of the scaffolds shall be kept uniform and the differential height between sections shall be minimized.

3314.18 Manually propelled, free-standing scaffolds. All manually propelled free-standing scaffolds shall meet the following requirements:

1. Work platforms shall be tightly planked for the full width of the scaffold, except for necessary entrance openings. Planks shall be secured in place;
2. Platforms shall have a guardrail system;
3. Where a ladder is used to approach a platform, the ladder shall be secured to the scaffold;
4. Handholds shall be provided for safe passage from the ladder to the platform;

5. Unless temporarily braced to an adjacent structure, the ratio of the platform height to the least base dimension shall be such as to assure stability, but in no case shall such height be more than four times the least base dimension;
6. Provisions shall be made to prevent the scaffold from falling during movement from one location to another;
7. While the scaffold is in use, it shall rest upon a stable footing and shall stand plumb. The casters or wheels shall be locked in position; and
8. While the scaffold is being moved, no person shall be permitted to ride on it, and all tools, equipment and material shall be removed.

3314.19 Mast climber. Mast climbers shall be designed, constructed, permitted, installed, adjusted, maintained, repaired, used, operated, inspected, and removed in accordance with rules promulgated by the commissioner.

§14. Section BC 3315 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC 3315 STRUCTURAL RAMPS, RUNWAYS AND PLATFORMS

3315.1 Ramps and runways. Ramps and runways (including elevated walkways) shall comply with the requirements of Sections 3315.1.1 through 3315.1.[5]6.

3315.1.1 Construction. All runways and ramps shall be constructed, braced and supported to resist lateral displacement and all vertical loads, including impact.

3315.1.2 For motor vehicle use. Runways and ramps for the use of motor vehicles may consist of an earthfill or may be structurally supported. Such runways and ramps shall have a clear width of not less than 12 feet (3658 mm) with timber curbs at least 8 inches by 8 inches (203 mm by 203 mm) placed parallel to, and secured to, the sides of the runway or ramp. The flooring of structurally supported ramps shall consist of no smaller than 3 inch (76 mm) planking full size, undressed, or equivalent material, with spans designed for the loads to be imposed.

3315.1.3 For use of workers. Runways and ramps for the use of workers shall be at least 1 foot 6 inches (457 mm) in clear width. Where used for wheelbarrows, handcarts, or hand-trucks, runways and ramps shall be at least 3 feet (914 mm) in clear width. Flooring shall consist of at least 2-inch (51 mm) planking spanning as permitted by Table 3314.5.2, laid close, butt-joined and securely fastened.

3315.1.4 Slope limitations. Ramps shall have a slope not steeper than one in four. If the slope is steeper than one in eight, the ramp shall be provided with cleats spaced not more than 14 inches (356 mm) apart and securely fastened to the planking to afford a foothold.

Spaces in the cleats may be provided for the passage of the wheels of vehicles. The total rise of a continuous ramp used by workers carrying material or using wheelbarrows, hand-carts, or hand-trucks shall not exceed 12 feet (3658 mm) unless broken by horizontal landings at least 4 feet (1219 mm) in length.

3315.1.5 Guardrail required. [All runways and ramps located more than 5 feet (1524 mm) above the ground or floor shall be provided with a standard guardrail and standard toeboard that meets the requirements of Section 3307.8 on open sides.] A guardrail meeting the requirements of Section 3308.7.1 through Section 3308.7.7 shall be provided:

1. On all edges of the runway or ramp that are located more than 5 feet (1524 mm) above the ground or floor; and
2. Along any portion of the runway or ramp that abuts motor vehicle traffic.

For the purposes of this section, the term “floor” in Section 3308.7.1 through 3308.7.7 shall mean “runway or ramp.”

3315.1.6 Netting required. Where it is possible for the public to pass under, or next to, runways or ramps, the space between the top rail and the [standard] toeboard shall be enclosed with a wire screen composed of not less than no. 18 steel wire gage [with a maximum ½ inch (12.7 mm) mesh.], or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm).

3315.2 Platforms. Platforms shall comply with the requirements of Sections 3315.2.1 through 3315.2.[2]3.

3315.2.1 Planking. Platforms used as working areas, or for the unloading of wheelbarrows, hand-trucks, or carts shall have a floor consisting of at least 2-inch (51 mm) planking spanning as permitted by Table 3314.5.2. Platforms for the use of motor trucks shall have a floor of at least 3-inch (76mm) planking, full size, undressed or equivalent materials with spans designed for the loads to be imposed. Planking shall be laid close and shall be butt-joined and securely fastened.

3315.2.2 Guardrail required. [Every platform more than 5 feet (1524 mm) above the ground or above a floor shall be provided with a standard guardrail and standard toeboard that meets the requirements of Section 3307.8, except that the side of the platform used for the loading or unloading of vehicles may be protected by a timber curb at least 8 inches by 8 inches (203 mm by 203 mm) for motor trucks or 4 inches by 4 inches (102 mm by 102 mm) for wheelbarrows and hand-trucks in lieu of the standard guardrail and standard toeboard.] A guardrail meeting the requirements of Section 3308.7.1 through Section 3308.7.7 shall be provided on all open sides of platforms located more than 5 feet (1524 mm) above the ground or floor. For the purposes of this section the term “floor” in Section 3308.7.1 through 3308.7.7 shall mean “platform.”

Exception: In lieu of a guardrail, the side of the platform used for the loading or unloading of vehicles may be protected by a timber curb at least 8 inches by 8 inches

(203 mm by 203 mm) for motor trucks or 4 inches by 4 inches (102 mm by 102 mm) for wheelbarrows and hand-trucks.

3315.2.3 Netting required. Where it is possible for the public to pass under, or next to, platforms, the space between the top rail and the [standard] toeboard shall be enclosed with a wire screen composed of not less than no. 18 steel wire gage [with a maximum ½ inch (12.7 mm) mesh.], or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm).

3315.3 Special requirements where power buggies are used. Runways, ramps, platforms, and other surfaces upon which power buggies are operated shall meet the following minimum requirements:

1. They shall be designed by a qualified person.
2. They shall be able to sustain, without failure, at least four times the maximum live load for which they are intended.
3. The minimum width, inside of curbs, for any ramp, runway, or platform shall be 2 feet (610 mm) wider than the outside width of any power buggy operated thereon without passing, and 3 feet (914 mm) wider than twice such buggy width in the places where passing occurs.
4. All runways shall be essentially level transversely.
5. Curbs shall be furnished along all buggy traffic paths that are nearer than 10 feet (3048 mm) horizontally to any unenclosed area, shaft, or other open space into which or through which a fall of more than 12 inches (305 mm) from such surface is possible, except as set forth in numbered Item 7.
6. Where curbs are not required because the buggy is operated on a surface not over 12 inches (305 mm) above another surface, the lower surface shall be strong enough to sustain the loaded vehicle in the event of a fall thereon.
7. Curbs may be omitted at actual dumping points more than 12 inches (305mm) above other surfaces if the edge over which dumping occurs is provided with bumpers or other means that will effectively stop the buggy from running over the edge while dumping.
8. Curbs must be at least 7 inches (178 mm) high, securely fastened, and capable of resisting side impact, and shall be equivalent to at least 2 inch by 8 inch (51 mm by 203 mm) plank set on edge against uprights securely fastened and braced at not more than 4-foot (1219mm) intervals.

§15. Section BC 3316 of the New York city building code, as added by local law number 33 for the year 2007, is amended by adding a new section 3316.9 to read as follows:

3316.9 Rigging. The attachment and detachment of articles from hoisting equipment used to hoist or lower articles on the outside of a building shall be in accordance with the requirements of Sections 3316.9.1 through 3316.9.3.

3316.9.1 Supervision. The hoisting or lowering of any article on the outside of any building in the city shall be performed by or under the direct and continuing supervision of a licensed rigger.

Exceptions:

1. In lieu of a licensed rigger, the hoisting or lowering of a sign may be performed by or under the direct and continuing supervision of a licensed sign hanger.
2. Suspended scaffold operations shall meet the requirements of Section 3314.
3. In lieu of a licensed rigger, the hoisting or lowering of articles on the outside of a building may be performed by or under the supervision of a competent person designated by the contractor using the equipment provided the following conditions are met:

3.1 The hoisting or lowering occurs in conjunction with:

3.1.1 The construction of a new building;

3.1.2 The full demolition of an existing building;

3.1.3 The vertical or horizontal enlargement of an existing building; or

3.1.4 The alteration, maintenance, or repair of a façade of a major building where a site safety plan is required by Section 3310.3.

3.2 All individuals involved in the work are certified or trained in accordance with Section 3316.9.2, where such certification or training is required;

3.3 The hoisting or lowering does not meet the definition of industrial rope access;

3.4 The article being hoisted or lowered is not a boiler or tank;

3.5 The article being hoisted or lowered is not related to the assembly, jumping, or disassembly of a tower or climber crane; and

3.6 Where the hoisting or lowering meets the definition of a critical pick, such critical pick is:

3.6.1 Performed in accordance with a plan developed by either a:

3.6.1.1 Licensed master rigger; or

3.6.1.2 Registered design professional who has demonstrated knowledge or experience with safe loads and computation thereof, types of rigging, size and strength of ropes, cables, blocks, and any other rigging equipment to be used during the critical pick; and

3.6.2 Immediately prior to the pick, onsite verification is made to ensure conformance with the plan by either:

3.6.2.1 The licensed master rigger who developed the plan;

3.6.2.2 The registered design professional who developed the plan; or

3.6.2.3 A registered design professional employed by and working under the direct supervision of the registered design professional who developed the plan.

4. Where the hoisting or lowering is performed under the direct and continuing supervision of a licensed rigger, a specialty crew who is not in the direct employ of the licensee or business of the licensee may be utilized, provided:

4.1 The work requires a specialty trade, including but not limited to work with hazardous materials or chemicals;

4.2 The crew is in accordance with rules promulgated by the commissioner; and

4.3 The members of the crew are approved by the commissioner.

3316.9.1.1 Supervisor. The individual supervising the hoisting or lowering in accordance with Section 3316.9.1 shall:

1. Be present at the site during all times articles are being attached or detached;
2. Have the ability to communicate with all individuals involved with such work; and

3. Be in the line of sight of either the:

3.1 Attaching operation;

3.2 Detaching operation, or

3.3 The hoisting equipment.

3316.9.2 Certification or training. All individuals who attach or detach articles from the hook of hoisting equipment in conjunction with the hoisting or lowering of an article outside of a building, the supervisor of such individuals, and signalpersons communicating with such individuals, shall, eighteen months after the effective date of this section, either:

1. Possess a valid certification for both rigging and signaling from an organization acceptable to the commissioner and accredited by the National Commission for Certifying Agencies (NCCA) or the American National Standards Institute (ANSI). The certification shall be valid for a term of no more than five years before it has to be renewed and shall cover areas including, but not limited to, the inspection and use of rigging hardware, basic rigging techniques, signaling, and hazards associated with rigging. The certification for a supervisor shall, in addition to the foregoing, include calculations and problem solving with respect to rigging; or
2. Have completed an initial department-approved training course, and four years following the completion of the initial training course, and every four years thereafter, complete a department-approved refresher course. The courses shall be in accordance with the following:
 - 2.1 The initial training course for individuals who attach or detach articles from the hook of hoisting equipment and signalpersons communicating with such shall be, at a minimum, 16 hours long, with the refresher course, at a minimum, 8 hours long. The initial training course for a supervisor shall be, at a minimum, 32 hours long, with the refresher course, at a minimum, 16 hours long.
 - 2.2 The training course shall be conducted by a registered New York State Department of Labor apprenticeship training program or by an educational institution or school chartered, licensed or registered by the New York State Department of Education or by a provider approved by the department and presented by an instructor acceptable to the commissioner.
 - 2.3 Training courses and refresher courses shall cover areas including, but not limited to, the inspection and use of rigging hardware, basic rigging techniques, signaling, and hazards associated with rigging. The training course and refresher course for a supervisor shall, in addition to the foregoing, include calculations and problem solving with respect to rigging. The training course and refresher course, both for crew members and supervisors, shall include a significant portion of hands on training.
 - 2.4 Successful completion of the initial training course and refresher course shall be based upon passage of a written and a practical exam.

2.5 Successful completion of the initial training course and refresher course shall be evidenced by a wallet size certificate card issued by the training provider and acceptable to the commissioner. Such certificate card shall be readily available to the commissioner upon request and shall contain, at a minimum, the following information:

2.5.1 The name of the individual to whom it was issued;

2.5.2 A photograph of the individual to whom it was issued; and

2.5.3 Any other information required pursuant to rules promulgated by the commissioner for a department approved training course.

2.6 For individuals who fail to complete the required refresher course within any 4 year period, a refresher course shall be considered timely if completed within 1 year after the expiration date of the last previously completed initial or refresher course. During such period, such individual shall not perform or supervise any activity for which the lapsed training is required to perform or supervise such activity until such individual has successfully completed such refresher course. Where more than 1 year has lapsed, such individual shall be required to successfully recomplete the initial training course.

Exceptions: Training or certification is not required for:

1. Individuals working under the direct and continuing supervision of a licensed rigger or sign hanger.
2. The loading or unloading a material delivery truck provided the material is loaded or unloaded only between the ground and the truck, or vice versa, and also provided that the material is not raised more than 12 feet (3658 mm) above the bed of the truck during the loading or unloading process.
3. The use of hoisting equipment that has a manufacturer's rated capacity of 2,000 pounds (907 kg) or less.

3316.9.3 Industrial rope access. Any person using industrial rope access methods to descend or ascend outside a building, including the individual supervising such, must be certified by either the Society of Professional Rope Access Technicians ("SPRAT") or the Industrial Rope Access Trade Association ("IRATA"), or an equivalent acceptable to the department. Only hand tools, securely attached to a person, may be carried by such person during the use of industrial rope access methods. Any other tools or equipment must be separately hoisted or lowered.

Subpart 35 (Chapter 35 of the New York City Building Code)

§1. Chapter 35 of the New York city building code, as added by local law number 33 for the year 2007, is REPEALED, and a new Chapter 35 is added to read as follows:

CHAPTER 35
REFERENCED STANDARDS

SECTION BC 3501
GENERAL

3501.1 General. This chapter lists the standards that are referenced in various sections of this document. The standards are listed herein by the promulgating agency of the standard, the standard identification, the effective date and title and the section or sections of this document that reference the standard.

3501.2 Subsequent additions, modifications, or deletions. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the *Administrative Code*.

3501.3 Applicability. The application of the referenced standards shall be as specified in Section 102.4.

A 653—07	Specification for Steel Sheet, Zinc-coated Galvanized or Zinc-iron Alloy-coated Galvannealed by the Hot-dip Process	2211.2.2, 2211.2.2.1, 2304.9.5.1

A 653 G-90—07	Specification for Steel Sheet, Zinc-coated Galvanized or Zinc-iron Alloy-coated Galvannealed by the Hot-dip Process	Table 1507.4.3(1), Table 1507.4.3(2)
A 690—07	Standard Specification for High-strength Low-alloy Nickel, Copper, Phosphorus Steel H-Piles and Sheet Piling with Atmospheric Corrosion Resistance for Use in Marine Environments	1809.7.1
A 706—05a	Specification for Low-alloy Steel Deformed and Plain Bars for Concrete Reinforcement	1704.4.1, 1903.5.2, 2107.4, 2108.3
A 722—07	Specification for Uncoated High-strength Steel Bar for Prestressing Concrete	1810.7.2.1, 1810.8.1
A 755—03	Specification for Steel Sheet, Metallic-coated by the Hot-dip Process and Prepainted by the Coil-coating Process for Exterior Exposed Building Products	Table 1507.4.3(1), Table 1507.4.3(2)
A 792/A 792M—06a	Specification for Steel Sheet, 55% Aluminum-zinc Alloy-coated by the Hot-Dip Process	Table 1507.4.3(1), Table 1507.4.3(2)
A 875/A 875M—06	Standard Specification for Steel Sheet Zinc-5 percent, Aluminum Alloy-coated by the Hot Dip Process	Table 1507.4.3(2)
A 913—04	Specification for High-strength Low-alloy Steel Shapes of Structural Quality, Produced by Quenching and Self-tempering Process (OST)	1809.7.1
A 924—07	Standard Specification for General Requirements for Steel Sheet, Metallic-coated by the Hot-dip Process	Table 1507.4.3(1)
A 992/A 992M—06a	Standard Specification for Structural Shapes	1809.7.1
B 42—02(e2001)	Specification for Seamless Copper Pipe, Standard Sizes	909.13.1
B 43—98(2004)	Specification for Seamless Red Brass Pipe, Standard Sizes	909.13.1
B 68—02	Specification for Seamless Copper Tube, Bright Annealed (Metric)	909.13.1
B 88—03	Specification for Seamless Copper Water Tube	909.13.1
B 101—02	Specification for Lead-coated Copper Sheet and Strip for Building Construction	1404.5.3, Table 1507.4.3(1), Table 1507.2.9.2
B 209—06	Specification for Aluminum and Aluminum Alloy Steel and Plate	Table 1507.4.3(1)
B 251—02(e01)	Specification for General Requirements for Wrought Seamless Copper and Copper-alloy Tube	909.13.1
B 280—03	Specification for Seamless Copper Tube for Air Conditioning and Refrigeration Field Service	909.13.1
B 370—03	Standard Specification for Copper Sheet and Strip for Building Construction	1404.5.2, Table 1507.2.9.2, Table 1507.4.3(1)
B 695—03	Standard Specification for Coatings of Zinc Mechanically Deposited on Iron and Steel	2304.9.5.1, 2304.9.5.3
C 5—03	Specification for Quicklime for Structural Purposes	Table 2507.2
C 22/C 22M—00(2005)e01	Specification for Gypsum	Table 2506.2
C 27—98 (2002)	Specification for Standard Classification of Fireclay and High-alumina Refractory Brick	2111.5, 2111.8
C 28/C 28M—00 (2005)	Standard Specification for Gypsum Plasters	Table 2507.2
C 31—06	Practice for Making and Curing Concrete Test Specimens in the Field	Table 1704.4, 1905.1.3, 1905.6.3.3, 1905.6.3.3.1, 1905.6.3.8, 1905.6.4.2, 3305.3.5.6
C 33—03	Specification for Concrete Aggregates	721.3.1.4, 721.4.1.1.3
C 34—03	Specification for Structural Clay Load-bearing Wall Tile	2103.2
C 35—01 (2005)	Specification for Inorganic Aggregates for Use in Gypsum Plaster	Table 2507.2
C 36/C 36M-03	Specification for Gypsum Wallboard	Figure 721.5.1(2), Figure 721.5.1(3), Table 2506.2, Table 2508.1
C 37/C 37M-01	Specification for Gypsum Lath	Table 2507.2
C 39—12a	Test Method for Compressive Strength of Cylindrical Concrete Specimens	1905.6.3.3.3, 1913.5.2, 1913.10.3
C 42—13	Standard Test Method for Obtaining and Testing Drilled Cores and Sawed Beams of Concrete	1913.5.1, 1913.10, 1913.10.1
C 55—06e01	Specification for Concrete Brick	Table 721.3.2, 2103.1, 2105.2.2.1.2
C 56—05	Specification for Structural Clay Nonload-bearing Tile	2103.2
C 59/C 59M—00 (2006)	Specification for Gypsum Casting and Molding Plaster	Table 2507.2
C 61/C 61M—00 (2006)	Specification for Gypsum Keene's Cement	Table 2507.2
C 62—05	Specification for Building Brick (Solid Masonry Units Made from Clay or Shale)	2103.2, 2105.2.2.1.1
C 67—07	Test Methods of Sampling and Testing Brick and Structural Clay Tile	721.4.1.1.1, 2104.5, 2105.2.2.1.1
C 73—05	Specification for Calcium Silicate Face Brick (Sand-lime Brick)	Table 721.3.2, 2103.1, 2103.2
C 79—04a	Specification for Treated Core and Nontreated Core Gypsum Sheathing Board	Table 2506.2
C 90—06b	Specification for Loadbearing Concrete Masonry Units	Table 721.3.2, 2103.1, 2105.2.2.1.2
C 91—05	Specification for Masonry Cement	Table 2507.2
C 94—07	Specification for Ready-mixed Concrete	110.3.1, 1905.1.3, 1905.6.3.8, 1905.8.2
C 126—99 (2005)	Specification for Ceramic Glazed Structural Clay Facing Tile, Facing Brick, and Solid Masonry Units	2103.2
C 129—11	Standard Specification for Nonloadbearing Concrete Masonry Units	2103.1
C138—08	Standard Test Method for Density (Unit Weight) Yield and Air Content (Gravimetric) of Concrete	1905.6.3.6
C 140—07	Test Method Sampling and Testing Concrete Masonry Units and Related Units	721.3.1.2, 2105.2.2.1.2
C143—12	Standard Test Method for Slump of Hydraulic-cement Concrete	1905.6.3.6
C 150—07	Specification for Portland Cement	Table 1904.4.2, Table 2507.2
C 172—04	Practice for Sampling Freshly Mixed Concrete	Table 1704.4, 1905.6.3.2
C173—12	Standard Test Method for Air Content of Freshly Mixed Concrete by the Volumetric Method	1905.6.3.6
C 199—84 (2005)	Test Method for Pier Test for Refractory Mortars	2111.5, 2111.8, 2113.12
C 206—03	Specification for Finishing Hydrated Lime	Table 2507.2
C 208—95 (2001)	Specification for Cellulosic Fiber Insulating Board	Table 1508.2, 2303.1.5
C 212—00 (2006)	Specification for Structural Clay Facing Tile	2103.2
C 216—07	Specification for Facing Brick (Solid Masonry Units Made from Clay or Shale)	2103.2, 2105.2.2.1.1, Table 720.1(2)
C 231—10	Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method	1905.6.3.6
C 260—06	Standard Specification for Air-entraining Admixtures for Concrete	1905.3.4
C 270—07	Specification for Mortar for Unit Masonry	2103.8, 2108.3
C 315—07	Specification for Clay Flue Liners and Chimney Pots	2111.8, 2113.11.1, Table 2113.16(1)
C 317—00(2010)	Standard Specification for Gypsum Concrete	1914.1

C 330—05	Specification for Lightweight Aggregates for Structural Concrete	721.1.1, 1905.1.4
C 331—05	Specification for Lightweight Aggregates for Concrete Masonry Units	721.3.1.4, 721.4.1.1.3
C 406—06e01	Specification for Roofing Slate	1507.7.5
C 442/C 442M—04	Specification for Gypsum Backing Board and Coreboard and Gypsum Shaftliner Board	2506.2
C 472—99 (2004)	Specification for Standard Test Methods for Physical Testing of Gypsum, Gypsum Plasters and Gypsum Concrete	2506.2
C 473—06a	Test Method for Physical Testing of Gypsum Panel Products	2506.2
C 474—05	Test Methods for Joint Treatment Materials for Gypsum Board Construction	2506.2
C 475/C 475M—02(2007)	Specification for Joint Compound and Joint Tape for Finishing Gypsum Wallboard	2506.2
C 476—10	Specification for Grout for Masonry	2102
C 494—13	Standard Specification for Chemical Admixtures for Concrete	1905.3.4
C 503—05	Specification for Marble Dimension Stone (Exterior)	2103.4
C 511—09	Standard Specification for Mixing Rooms, and Water Storage Tanks Used in the Testing of Hydraulic Cements and Concretes	1905.6.3.3.2
C 514—04	Specification for Nails for the Application of Gypsum Board	Table 720.1(2), Table 720.1(3), 2506.2
C 516—02	Specifications for Vermiculite Loose Fill Thermal Insulation	721.3.1.4, 721.4.1.1.3
C 547—06	Specification for Mineral Fiber Pipe Insulation	Table 720.1(2), Table 720.1(3)
C 549—06	Specification for Perlite Loose Fill Insulation	721.3.1.4, 721.4.1.1.3
C 552—03	Standard Specification for Cellular Glass Thermal Insulation	Table 1508.2
C 557—03e01	Specification for Adhesives for Fastening Gypsum Wallboard to Wood Framing	2506.2
C 568—03	Specification for Limestone Dimension Stone	2103.4
C 578—07	Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation	Table 1508.2
C 587—04	Specification for Gypsum Veneer Plaster	Table 2507.2
C 588/C 588M—01	Specification for Gypsum Base for Veneer Plasters	Table 2507.2
C 595—07	Specification for Blended Hydraulic Cements	1904.4.2, Table 2507.2
C 615—03	Specification for Granite Dimension Stone	2103.4
C 616—03	Specification for Quartz Dimension Stone	2103.4
C 618—99	Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use as a Mineral Admixture in Concrete	Table 1904.4.2
C 629—03	Specification for Slate Dimension Stone	2103.4
C 630/C 630M—03	Specification for Water-resistant Gypsum Backing Board	Table 2506.2, 2509.2
C 631—95a (2004)	Specification for Bonding Compounds for Interior Gypsum Plastering	Table 2507.2
C 635—00*	Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings	808.1.1.1, R101.1, R102.1, R102.2, R102.3, O102.1
C 636—96*	Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-in Panels	808.1.1.1, R101.1, R103.1, R103.2, R103.3, R103.4, R103.5, R103.6, R103.7, R103.8, R103.9, R103.10, R103.11, R103.12, R103.13, R103.14
C 645—07	Specification for Nonstructural Steel Framing Members	Table 2506.2, Table 2507.2
C 652—05a	Specification for Hollow Brick (Hollow Masonry Units Made from Clay or Shale)	2103.2, 2105.2.2.1.1
C 685—11	Standard Specification for Concrete Made by Volumetric Batching	1905.8.2
C 728—05	Specification for Cellulosic Fiber Insulating Board	Table 1508.2
C 744—05	Specification for Prefaced Concrete and Calcium Silicate Masonry Units	Table 721.3.2, 2103.1
C 754—04	Specification for Installation of Steel Framing Members to Receive Screw-attached Gypsum Panel Products	Table 2508.1, Table 2511.1
C 836—06	Specification for High-solids Content, Cold Liquid-applied Elastomeric Waterproofing Membrane for Use with Separate Wearing Course	1507.15.2
C 840—07	Specification for Application and Finishing of Gypsum Board	Table 2508.1, 2509.2
C 841—03	Specification for Installation of Interior Lathing and Furring	Table 2508.1, Table 2511.1
C 842—05	Specification for Application of Interior Gypsum Plaster	Table 2511.1, 2511.3, 2511.4
C 843—99 (2006)	Specification for Application of Gypsum Veneer Plaster	Table 2511.1
C 844—04	Specification for Application of Gypsum Base to Receive Gypsum Veneer Plaster	Table 2508.1
C 845—96	Specification for Expansive Hydraulic Cement	Table 1904.4.2
C 847—06	Specification for Metal Lath	Table 2507.2
C 887—05	Specification for Packaged, Dry Combined Materials for Surface Bonding Mortar	2103.9
C 897—05	Specification for Aggregate for Job-mixed Portland Cement-based Plasters	Table 2507.2
C 920—05	Standard Specification for Elastomeric Joint Sealants	Table 2506.2
C 926—98a (2005)	Specification for Application of Portland Cement Based-plaster	2510.3, Table 2511.1, 2511.3, 2511.4, 2512.1, 2512.1.2, 2512.2, 2512.6, 2512.8.2, 2512.9, 2513.7
C 931/C 931M—04	Specification for Exterior Gypsum Soffit Board	Table 2508.1, Table 2506.2, 2508.2

C 933—05	Specification for Welded Wire Lath	Table 2507.2
C 946—91 (2001)	Specification for Practice for Construction of Dry-stacked, Surface-bonded Walls	2103.9, 2109.2.2
C 954—04	Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 inch (0.84 mm) to 0.112 inch (2.84 mm) in Thickness	2211.2.2.3, Table 2506.2, Table 2507.2
C 955—06	Standard Specification for Load-bearing Transverse and Axial Steel Studs, Runners, Tracks, and Bracing or Bridging, for Screw Application of Gypsum Panel Products and Metal Plaster Base	Table 2506.2, Table 2507.2
C 956—97	Specification for Installation of Cast-in-place Reinforced Gypsum Concrete	1914.1
C 957—06	Specification for High-solids Content, Cold Liquid-applied Elastomeric Waterproofing Membrane with Integral Wearing Surface	1507.15.2
C 960—04	Specification for Predecorated Gypsum Board	Table 2506.2

C 989—99	Specification for Ground Granulated Blast-furnace Slag for Use in Concrete and Mortars	Table 1904.4.2
C 1002—04	Specification for Steel Self-piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs	Table 2506.2, Table 2507.2
C 1007—04	Specification for Installation of Load Bearing (Transverse and Axial) Steel Studs and Related Accessories	Table 2508.1, Table 2511.1
C 1019—05	Test Method of Sampling and Testing Grout	2105.2.2.1.1, 2105.2.2.1.2, 2105.2.2.1.3
C 1029—05a	Specification for Spray-applied Rigid Cellular Polyurethane Thermal Insulation	1507.14.2
C 1032—96	Specification for Woven Wire Plaster Base	Table 2507.2
C 1047—05	Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base	Table 2506.2, Table 2507.2
C 1063—06	Specification for Installation of Lathing and Furring to Receive Interior and Exterior Portland Cement-based Plaster	2510.3, Table 2511.1, 2512.1.1
C 1064—12	Standard Test Method for Temperature of Freshly Mixed Hydraulic-cement Concrete	1905.6.3.6
C 1088—07a	Specification for Thin Veneer Brick Units Made from Clay or Shale	Table 720.1(2), 2103.2
C 1157—00	Performance Specification for Hydraulic Cement	Table 1904.4.2
C 1167—03	Specification for Clay Roof Tiles	1507.3.4
C 1177/C 1177M—06	Specification for Glass Mat Gypsum Substrate for Use as Sheathing	Table 2506.2
C 1178/C 1178M—06	Specification for Coated Mat Water-resistant Gypsum Backing Panel	Table 2506.2, 2509.2
C 1186—07	Specification for Flat Nonasbestos Fiber Cement Sheets	1401.10, 1405.16.1, 1405.16.2
C 1492—03	Standard Specification for Concrete Roof Tile	1507.3.5
C 1240—00E1	Specification for Silica Fume for Use as a Mineral Admixture in Hydraulic-cement Concrete, Mortar and Grout	Table 1904.4.2
C 1261—07	Specification for Firebox Brick for Residential Fireplaces	2111.5, 2111.8
C 1278/C 1278M—06	Specification for Fiber-reinforced Gypsum Panels	Table 2506.2
C 1280—04	Specification for Application of Gypsum Sheathing	Table 2508.1, 2508.2
C 1283—07	Practice for Installing Clay Flue Lining	2113.12
C 1288—99 (2004)	Standard Specification for Discrete Nonasbestos Fiber-cement Substrate Sheets	2509.2
C 1289—07	Standard Specification for Faced Rigid Cellular Polyisocyanurate Thermal Insulation Board	Table 1508.2
C 1314—07	Test Method for Compressive Strength of Masonry Prisms	2105.2.2.2, 2105.3.1, 2105.3.2
C 1325—04	Standard Specification for Nonasbestos Fiber-mat Reinforced Cement Substrate Sheets	2509.2
C 1328—05	Specification for Plastic (Stucco Cement)	Table 2507.2
C 1371—04a(2010)e1	Standard Test Method for Determination of Emissivity of Materials Near Room Temperature Using Portable Emissometers	1504.9
C 1386—07	Specification for Precast Autoclaved Aerated Concrete (AAC) Wall Construction Units	2102.1, 2103.3, 2105.2.2.1.3
C 1395/1395M—04	Specification for Gypsum Ceiling Board	Table 2506.2
C 1396/C 1396M—06a	Specification for Gypsum Board	Table 2506.2, Table 2508.1
C 1405—07	Standard Specification for Glazed Brick (Single-fired, Solid Brick Units)	2103.2
C 1492—03	Standard Specification for Concrete Roof Tile	1507.3.5
C 1549—09	Standard Test Method for Determination of Solar Reflectance Near Ambient Temperature Using a Portable Solar Reflectometer	1504.9
C 1629/C 1629M—06	Standard Classification for Abuse-resistant Nondecorated Interior Gypsum Panel Products and Fiber-reinforced Cement Panels	403.2.3.1, 403.2.3.2, 403.2.3.4
C 1658/C 1658M—06	Standard Specification for Glass Mat Gypsum Panels	Table 2506.2
D 25—99(2005)	Specification for Round Timber Piles	1809.5.1, 1809.5.4, 2303.1.1
D 41—05	Specification for Asphalt Primer Used in Roofing, Dampproofing and Waterproofing	Table 1507.10.2
D 43—00	Coal Tar Primer Used in Roofing, Dampproofing and Waterproofing	Table 1507.10.2
D 56—05	Test Method for Flash Point by Tag Closed Tester	307.2
D 86—07a	Test Method for Distillation of Petroleum Products at Atmospheric Pressure	307.2
D 93—07	Test Method for Flash Point by Pensky-Martens Closed Cup Tester	307.2
D 225—04	Specification for Asphalt Shingles (Organic Felt) Surfaced with Mineral Granules	1507.2.5
D 226—06	Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing	1404.2, 1507.2.3, 1507.3.3, 1507.5.3, 1507.6.3, 1507.7.3, Table 1507.8, 1507.8.3, 1507.9.3, 1507.9.5, Table 1507.10.2
D 227—03	Specification for Coal-tar-saturated Organic Felt Used in Roofing and Waterproofing	Table 1507.10.2
D 312—00 (2006)	Specification for Asphalt Used in Roofing	Table 1507.10.2
D 448—03a	Standard Classification for Sizes of Aggregate for Road and Bridge Construction	1507.12.3, 1507.13.3
D 450—07	Specification for Coal-tar Pitch Used in Roofing, Dampproofing and Waterproofing	Table 1507.10.2
D 635—06	Test Method for Rate of Burning and/or Extent and Time of Burning of Self-supporting Plastics in a Horizontal Position	2606.4, H107.1.1, H117.4
D 692—09	Standard Specification for Coarse Aggregate for Bituminous Paving Mixtures	1917.2
D 1073—11	Standard Specification for Fine Aggregate for Bituminous Paving	1917.2
D 1143—07	Test Method for Piles Under Static Axial Compressive Load	1804.4.1.3, 1812.4.1
D 1227—95 (2007)	Specification for Emulsified Asphalt Used as a Protective Coating for Roofing	Table 1507.10.2, 1507.15.2
D 1557—02e01	Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lb/ft ³ (2,700 KN m/m ³))	1804.2.2
D 1586—99	Specification for Penetration Test and Split-barrel Sampling of Soils	1613.5.5, 1802.5
D 1587—00	Standard Practice for Thin-walled Tube Sampling of Soils for Geotechnical Purposes	1802.5
D 1761—06	Test Method for Mechanical Fasteners in Wood	1716.1.1, 1716.1.2, 1716.1.3
D 1863—05	Specification for Mineral Aggregate Used on Built-up Roofs	Table 1507.10.2
D 1929—96 (2001)e01	Test Method for Determining Ignition Properties of Plastics	402.16.4, 1407.11.2.1, 2606.4
D 1970—01	Specification for Self-adhering Polymer Modified Bituminous Sheet Materials Used as Steep Roof Underlayment for Ice Dam Protection	1507.2.3, 1507.2.4, 1507.2.9.2, 1507.3.9, 1507.5.7, 1507.8.8, 1507.9.9
D 2113—08	Standard Practice for Rock Core Drilling and Sampling of Rock for Site Investigation	1802.5

D 2178—04	Specification for Asphalt Glass Felt Used in Roofing and Waterproofing	Table 1507.10.2
D 2216—05	Test Method for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass	1613.5.5
D 2487—06	Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)	Table 1610.1, 1802.3
D 2626—04	Specification for Asphalt Saturated and Coated Organic Felt Base Sheet Used in Roofing	1507.3.3, Table 1507.10.2
D 2822—05	Specification for Asphalt Roof Cement	Table 1507.10.2
D 2823—05	Specification for Asphalt Roof Coatings	Table 1507.10.2
D 2843—99 (2004)e01	Test for Density of Smoke from the Burning or Decomposition of Plastics	2606.4
D 2898—04	Test Methods for Accelerated Weathering of Fire-retardant-treated Wood for Fire Testing	1505.1, 2303.2.4, 2303.2.6
D 3019—94 (2007)	Specification for Lap Cement Used with Asphalt Roll Roofing, Nonfibered, Asbestos Fibered, and Nonasbestos Fibered	Table 1507.10.2
D 3161—06	Test Method for a Wind Resistance of Asphalt Shingles (Fan Induced Method)	1507.2.7, 1507.2.7.1, Table 1507.2.7.1(2)
D 3200—74 (2005)	Standard Specification and Test Method for Establishing Recommended Design Stresses for Round Timber Construction Poles	2303.1.11
D 3201—07	Test Method for Hygroscopic Properties of Fire-retardant-treated Wood and Wood-based Products	2303.2.7
D 3278—04e01	Test Methods for Flash Point of Liquids by Small Scale Closed-cup Apparatus	307.2
D 3462—04	Specification for Asphalt Shingles Made from Glass Felt and Surfaced with Mineral Granules	1507.2.5
D 3468—99 (2006)e01	Specification for Liquid-applied Neoprene and Chlorosulfonated Polyethylene Used in Roofing and Waterproofing	1507.15.2
D 3679—06a	Specification for Rigid Poly (Vinyl Chloride) (PVC) Siding	1404.9, 1405.14
D 3689—90 (1995)	Method for Testing Individual Piles Under Static Axial Tensile Load	1808.4.2.1, 1812.4.2
D 3737—07	Practice for Establishing Allowable Properties for Structural Glued Laminated Timber (Glulam)	2303.1.3
D 3746—02	Test Method for Impact Resistance of Bituminous Roofing Systems	1504.7
D 3747—79 (2007)	Specification for Emulsified Asphalt Adhesive for Adhering Roof Insulation	Table 1507.10.2
D 3909—97b (2004)e01	Specification for Asphalt Roll Roofing (Glass Felt) Surfaced with Mineral Granules	1507.2.9.2, 1507.6.5, Table 1507.10.2
D 3957—06	Standard Practices for Establishing Stress Grades for Structural Members Used in Log Buildings	2303.1.10
D 3966—07	Standard Test Methods for Deep Foundations Under Lateral Loads	1808.4.3, 1808.4.3.3
D 4022—07	Specification for Coal Tar Roof Cement, Asbestos Containing	Table 1507.10.2
D 4272—03	Test Method for Total Energy Impact of Plastic Films by Dart Drop	1504.7
D 4434—06	Specification for Poly (Vinyl Chloride) Sheet Roofing	1507.13.2
D 4479—07	Specification for Asphalt Roof Coatings - Asbestos-free	Table 1507.10.2
D 4586—00	Specification for Asphalt Roof Cement, Asbestos-free	Table 1507.10.2
D 4601—04	Specification for Asphalt-coated Glass Fiber Base Sheet Used in Roofing	Table 1507.10.2
D 4637—04	Specification for EPDM Sheet Used in Single-ply Roof Membrane	1507.12.2
D 4869—05e01	Specification for Asphalt-saturated (Organic Felt) Underlayment Used in Steep Slope Roofing	1507.2.3, 1507.5.3, 1507.6.3, 1507.7.3, 1507.8.3, 1507.9.3
D 4897—01	Specification for Asphalt-coated Glass Fiber Venting Base Sheet Used in Roofing	Table 1507.10.2
D 4990—97a (2005)e01	Specification for Coal Tar Glass Felt Used in Roofing and Waterproofing	Table 1507.10.2
D 4945—00	Test Method for High-strain Dynamic Testing of Piles	1808.4.1.4
D 5019—07	Specification for Reinforced Nonvulcanized Polymeric Sheet Used in Roofing Membrane	1507.12.2
D 5034—09	Standard Test Method for Breaking Strength and Elongation of Textile Fabrics (Grab Test)	3308.6.3
D 5035—11	Standard Test Method for Breaking Force and Elongation of Textile Fabrics (Strip Method)	3308.6.3
D 5055—05	Specification for Establishing and Monitoring Structural Capacities of Prefabricated Wood I-Joists	2303.1.2
D 5096-02—11	Standard Test Method for Determining the Performance of a Cup Anemometer or Propeller Anemometer	3314.4.4.6
D 5456—05a	Specification for Evaluation of Structural Composite Lumber Products	2303.1.9
D 5516—03	Test Method of Evaluating the Flexural Properties of Fire-retardant-treated Softwood Plywood Exposed to the Elevated Temperatures	2303.2.5.1
D 5643—06	Specification for Coal Tar Roof Cement, Asbestos-free	Table 1507.10.2
D 5664—02	Test Methods for Evaluating the Effects of Fire-retardant Treatment and Elevated Temperatures on Strength Properties of Fire-retardant-treated Lumber	2303.2.5.2
D 5665—99a (2006)	Specification for Thermoplastic Fabrics Used in Cold-applied Roofing and Waterproofing	Table 1507.10.2
D 5726—98 (2005)	Specification for Thermoplastic Fabrics Used in Hot-applied Roofing and Waterproofing	Table 1507.10.2
D 6066—11	Standard Practice for Determining the Normalized Penetration Resistance of Sands for Evaluation of Liquefaction Potential	1813.2
D 6083—05e01	Specification for Liquid Applied Acrylic Coating Used in Roofing	Table 1507.10.2, 1507.15.2
D 6162—00A	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	1507.11.2
D 6163—00 E01	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Materials Using Glass Fiber Reinforcements	1507.11.2
D 6164—05	Specification for Styrene Butadiene Styrene (SBS) Modified Bituminous Sheet Metal Materials Using Polyester Reinforcements	1507.11.2
D 6222—02e01	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using Polyester Reinforcements	1507.11.2
D 6223—02	Specification for Atactic Polypropylene (APP) Modified Bituminous Sheet Materials Using a Combination of Polyester and Glass Fiber Reinforcements	1507.11.2
D 6298—05	Specification for Fiberglass Reinforced Styrene-Butadiene-Styrene (SBS) Modified Bituminous Sheets with a Factory Applied Metal Surface	1507.11.2
D 6305—02e01	Practice for Calculating Bending Strength Design Adjustment Factors for Fire-retardant-treated Plywood Roof Sheathing	2303.2.5.1
D 6380—03	Standard Specification for Asphalt Roll Roofing (Organic Felt)	1507.2.9.2, 1507.3.3, 1507.6.5
D 6509—00	Standard Specification for Atactic Polypropylene (APP) Modified Bituminous Base Sheet Materials Using Glass Fiber Reinforcements	1507.11.2
D 6694—07	Standard Specification for Liquid Applied Moisture Cured Polyurethane Coating Used in Spray Polyurethane Foam Roofing Systems	1507.15.2

D 6754—02	Standard Specification for Ketone Ethylene Ester Based Sheet Roofing	1507.13.2
D 6757—07	Standard Specification for Underlayment Felt Containing Inorganic Fibers Used in Steep-slope Roofing	1507.2.3
D 6841—03	Standard Practice for Calculating Design Value Treatment Adjustment Factors for Fire-retardant-treated Lumber	2303.2.5.2
D 6878—06a	Standard Specification for Thermoplastic Polyolefin Based Sheet Roofing	1507.13.2
D 6947—07	Standard Specification for Liquid-applied Moisture Cured Polyurethane Coating Used in Spray Polyurethane Foam Roofing System	1507.15.2
D 7158—07	Standard Test Method for Wind Resistance of Asphalt Shingles (Uplift Force/Uplift Resistance Method)	1507.2.7.1, Table 1507.2.7.1(1)
E 84—07	Test Methods for Surface Burning Characteristics of Building Materials	402.16.4, 402.11, 703.4.2, 719.1, 719.1.1, 719.1.2, 719.4, 802.1, 803.1, 803.1.1, 803.1.2, 803.1.4, 803.1.4.1, 806.5, 1407.9, 1407.10.1, 2303.2, 2603.3, 2603.4.1.13, 2603.5.4, 2604.2.4, 2606.4, 2613.3, K1-2.14.2.1.1, K1-2.15.8, K4-2.14.2.1
E 90—04	Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements	1207.2, 1207.2.1
E 96—00	Test Method for Water Vapor Transmission of Materials	202
E 108—07a	Test Methods for Fire Tests of Roof Coverings	1505.1, 2603.6, 2610.2, 2610.3
E 119—07	Test Methods for Fire Tests of Building Construction and Materials	703.2, 703.2.1, 703.2.3, 703.3, 703.5, 704.12, 705.7, 705.8.5, 707.6, 712.3.2, 713.3.1, 713.4.1.1, 714.1, 714.4, 715.2, 715.4.5, 716.5.2, 716.5.3, 716.6.1, 716.6.2.1, Table 720.1(1), 1407.10.2, 2103.2, 2603.4, 2603.5.1
E 136—04	Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C	703.4.1, 719.1.1
E 328—86	Methods for Stress Relaxation for Materials and Structures	
E 330—02	Test Method for Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference	1715.5.2
E 331—01	Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference	1403.2
E 336—05	Standard Test Method for Measurement of Airborne Sound Insulation in Buildings	1207.2
E 408—13	Standard Test Methods for Total Normal Emittance of Surfaces Using Inspection-meter Techniques	1504.9
E 492—04	Test Method for Laboratory Measurement of Impact Sound Transmission Through Floor-ceiling Assemblies Using the Tapping Machine	1207.3
E 605—93 (2006)	Test Method for Thickness and Density of Sprayed Fire-resistive Material (SFRM) Applied to Structural Members	1704.11.4.1, 1704.11.4.2, 1704.11.4.3, 1704.11.5
E 648—06a	Standard Test Method for Critical Radiant Flux of Floor-covering Systems Using a Radiant Heat Energy Source	804.2, 804.3
E 681—04	Test Methods for Concentration Limits of Flammability of Chemical Vapors and Gases	307.2
E 736—00 (2006)	Test Method for Cohesion/Adhesion of Sprayed Fire-resistive Materials Applied to Structural Members	704.13.3.2, 1704.11.6
E 814—06	Test Method of Fire Tests of Through-penetration Firestops	702.1, 713.3.1.2, 713.3.2, 713.4.1.1.2
E 970—00	Test Method for Critical Radiant Flux of Exposed Attic Floor Insulation Using a Radiant Heat Energy Source	719.3.1
E 1007—97	Test Method for Field Measurement of Tapping Machine Impact Sound Transmission Through Floor-ceiling Assemblies and Associated Support Structures	1207.3
E 1300—04e01	Practice for Determining Load Resistance of Glass in Buildings	2401.1, 2402.2, 2404.3, 2404.3.3, 2404.3.4, 2404.3.5
E 1354—04a	Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter	402.12.1
E 1592—01	Test Method for Structural Performance of Sheet Metal Roof and Siding Systems by Uniform Static Air Pressure Difference	1504.3.2
E 1602—03	Guide for Construction of Solid Fuel-burning Masonry Heaters	2112.2
E 1918—06	Standard Test Method for Measuring Solar Reflectance of Horizontal and Low-sloped Surfaces in the Field	1504.9
E 1966—01	Test Method for Fire-resistant Joint Systems	702.1, 714.3
E 1980—11	Standard Practice for Calculating Solar Reflectance Index of Horizontal and Low-sloped Opaque Surfaces	1504.9
E 2072—10	Standard Specification for Photoluminescent (Phosphorescent) Safety Markings	1024.4
E 2174—09	Standard Practice for Onsite Inspection of Installed Fire Stops	1704.2.7.1
E 2273—07	Standard Practice for Specimen Preparation and Mounting of Site-fabricated Stretch Systems to Assess Surface Burning Characteristics	1408.4.1
E 2307—04e01	Standard Test Method for Determining Fire Resistance of Perimeter Fire Barrier Systems Using Intermediate-scale, Multistory Test Apparatus	714.4
E 2393—10a	Standard Practice for On-site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barriers	1704.2.7.2
E 2404—07a	Standard Practice for Specimen Preparation and Mounting of Textile, Paper or Vinyl Wall or Ceiling Coverings to Assess Surface Burning Characteristics	803.1
E 2568—07	Standard Specification for PB Exterior Insulation and Finish Systems	1408.2
E 2570—07	Standard Test Methods for Evaluating Water-resistive Barrier (WRB) Coatings Used Under Exterior Insulation and Finish Systems (EIFS) or EIFS with Drainage	1408.4.1.1, 1704.13.2
E 2573—07	Standard Practice for Specimen Preparation and Mounting of Site-fabricated Stretch to Assess Surface Burning Characteristics	803.1
E 2634—08	Standard Specification for Flat Wall Insulating Concrete Form (ICF) Systems	1903.9
E 2751—12	Standard Practice for Design and Performance of Supported Laminated Glass Walkways	2405.1.1
F 547—01	Terminology of Nails for Use with Wood and Wood-based Materials	Table 2506.2
F 1346—91 (2003)	Performance Specification for Safety Covers and Labeling Requirements for All Covers for Swimming Pools, Spas and Hot Tubs	3109.3.2.1, 3109.4, 3109.5.1.8, 3109.6

F 1667—05	Specification for Driven Fasteners: Nails, Spikes, and Staples	Table 720.1(2), Table 720.1(3), 1507.2.6, 2303.6, Table 2506.2
F 2090—01a (2007)	Specification for Window Fall Prevention Devices with Emergency Escape (Egress) Release Mechanisms	1405.13.2
F 2200—05	Standard Specification for Automated Vehicular Gate Construction	3110.3
F 2208—08	Standard Safety Specification for Residential Pool Alarms	3109.3.2.1
G 152—06	Practice for Operating Open Flame Carbon Arc Light Apparatus for Exposure of Nonmetallic Materials	1504.6
G 154—05	Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials	1504.6
G 155—05a	Practice for Operating Xenon Arc Light Apparatus for Exposure of Nonmetallic Materials	1504.6

Subpart 36 (Appendix D of the New York City Building Code)

§1. Section D102.2.4 of Appendix D of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

D102.2.4 Structural fire rating. The fire-resistance rating of bearing walls, floors, roofs and their supporting structural members shall comply with Table 601 of Chapter 6, but in no event shall such rating be less than 1 hour.

Exceptions: The following buildings or building elements may be constructed with fire-resistance rating in accordance with Table 601:

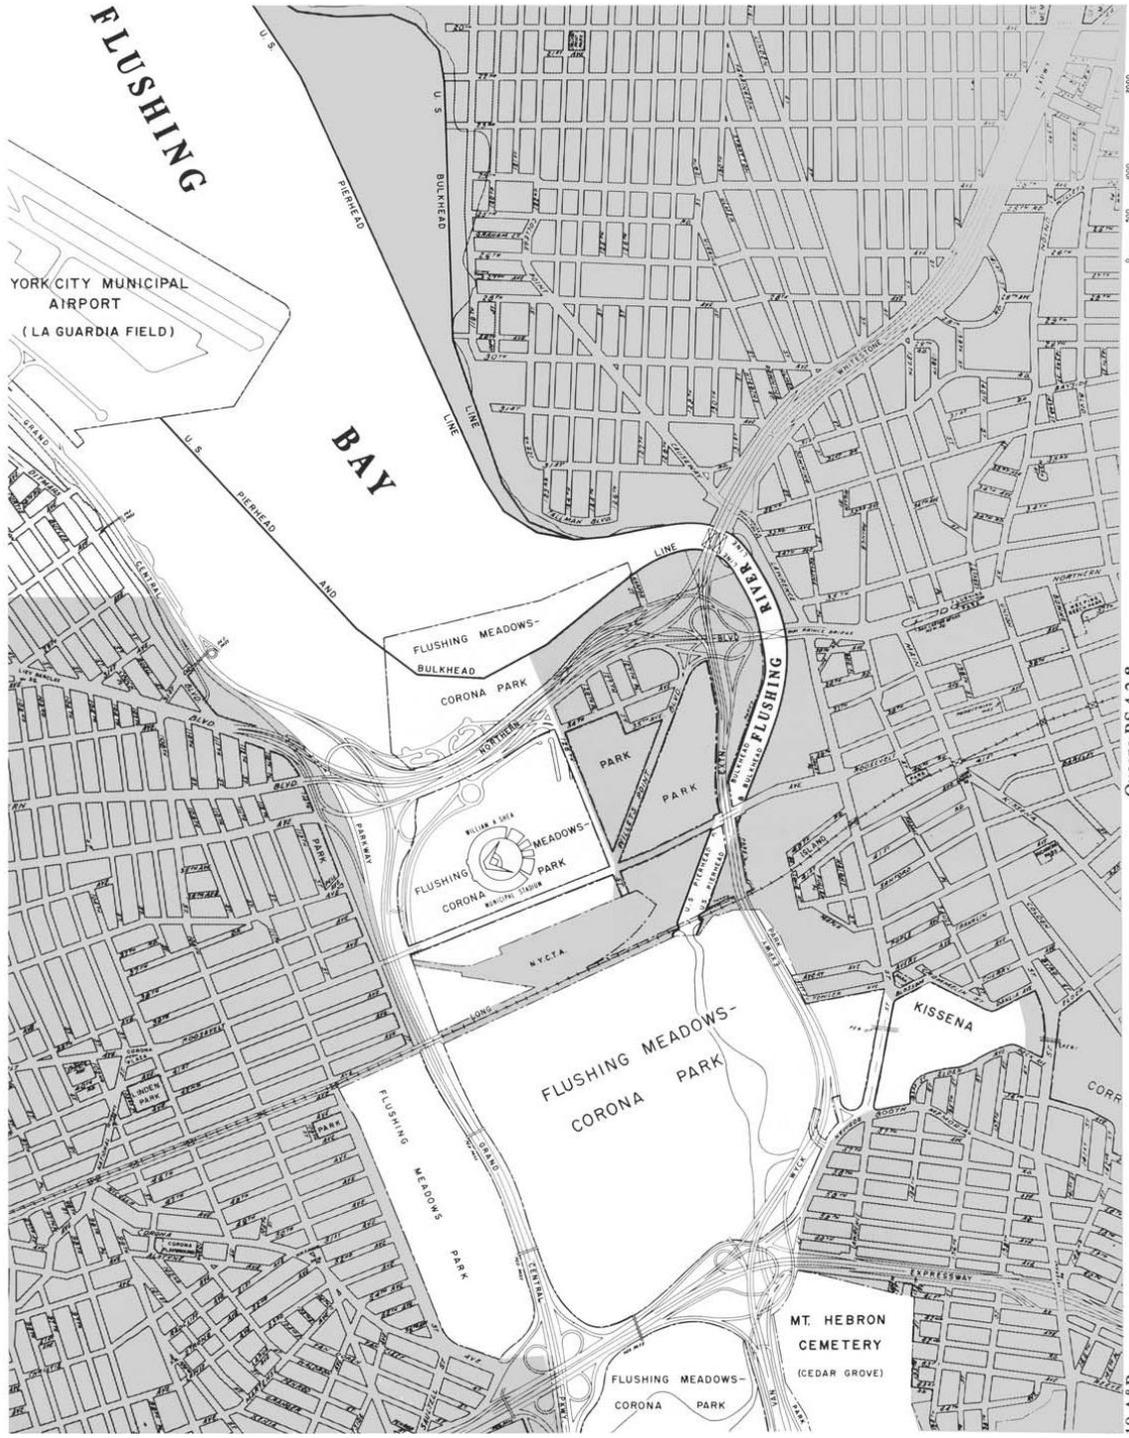

1. Buildings of Type IV construction.
2. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. Automobile parking structures.
4. Buildings surrounded on all sides by a permanently open space of not less than 30 feet (9144 mm).
5. Partitions complying with Section 603.1[(8)], Item 11.

§2. Section D105.1 of Appendix D of the New York city building code, as added by local law number 33 for the year 2007, is amended by adding new Items 11 and 12, to read as follows:

11. Temporary fences, sidewalk sheds, signs, and other safeguards installed in accordance with Chapter 33.

12. One- or two-family detached, zero lot line or semi-detached dwellings of three stories in height and 2,500 square feet (232 m²) or less in area located within Zoning Districts R-1 through R-5 within Lower Density Growth Management Areas as defined by the *New York City Zoning Resolution* may be constructed or reconstructed of construction Type VA where such buildings are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, or if damaged for any cause only the damaged portions shall be required to be reconstructed to conform to Type VA construction where such buildings are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. In addition, no portion of a one- or two-family detached, zero lot line or semi-detached dwellings located within Zoning Districts R-1, R-2 or R-5 within Lower Density Growth Management Areas shall exceed a maximum building height of 35 feet above the grade plane.

§3. Figure D106.1(2) of Appendix D of the New York city building code is amended to add fire district map “10 A&B” to follow fire district map “9 C&D”, as follows:

Queens RS 4-2-8

10 A&B

Subpart 37 (Appendix E of the New York City Building Code)

§1. Sections E104.3, E104.3.2 and E104.3.3 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, are amended and a new section E104.3.4 is added to read as follows:

E104.3 Communication features. Communication features complying with Chapter 7 of ICC A117.1 shall be provided in accordance with Sections E104.3.1 through [E104.3.3] E104.3.4 of this code.

E104.3.2 Group I-3. In Group I-3 occupancies at least 2 percent, but no fewer than one of the total number of general holding cells and general housing cells equipped with audible emergency alarm systems and permanently installed telephones within the cell, shall comply with Section [E104.3.3] E104.3.4.

E104.3.3 Dwelling units and sleeping units. Where *dwelling units* and *sleeping units* are altered or added, the requirements of Section E104.3 shall apply only to the units being altered or added until the number of units with accessible communication features complies with the minimum number required for new construction.

E104.3.4 Notification devices. Visual notification devices shall be provided to alert room occupants of incoming telephone calls and a door knock or bell. Notification devices shall not be connected to visual alarm signal appliances. Permanently installed telephones shall have volume controls and an electrical outlet complying with ICC A117.1, including Section 309 (Operable Parts), located within 48 inches (1219 mm) of the telephone to facilitate the use of a TTY.

§2. Section E105.1 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, is REPEALED.

§3. Sections E105.2, E105.3, and E105.4 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, are renumbered to be, respectively, sections E105.1, E105.2 and E105.3.

§4. Section E105.5 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

[**E105.5] E105.4 Mailboxes. Where mailboxes are provided in [an interior location] facilities not subject to Section 1107.3.1, but required to be accessible pursuant to the Americans with Disabilities Act, at least five percent, but not less than one, of each type shall comply with ICC A117.1. [In residential and institutional facilities, where mailboxes are provided for each dwelling unit or sleeping unit, mailboxes complying with ICC A117.1 shall be provided for each unit required to be an Accessible unit.]**

§5. Sections E105.6 and E105.7 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, are renumbered to be, respectively, sections E105.5 and E105.6.

§6. Section E106.2 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

E106.2 Wheelchair-accessible telephones. Where public telephones are provided, wheelchair-accessible telephones complying with ICC A117.1, including Section 704 (Telephones) [and], shall be provided in accordance with Table E106.2.

Exception: Drive-up-only public telephones are not required to be *accessible*.

§7. Section E107.2 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

E107.2 Designations. Interior and exterior signs identifying permanent rooms and spaces shall be tactile. Where pictograms are provided as designations of interior rooms and spaces, the pictograms shall have tactile text descriptors. Signs required to provide tactile characters and pictograms shall comply with Sections 703.3 and 703.5 of ICC A117.1.

Exceptions:

1. Exterior signs that are not located at the door to the space they serve are not required to comply.
2. Building directories, menus, seat and row designations in assembly areas, occupant names, building addresses and company names and logos are not required to comply.
3. Signs in parking facilities are not required to comply.
4. Temporary (seven days or less) signs are not required to comply.
5. In detention and correctional facilities, signs not located in public areas are not required to comply.

§8. Section E112.4 of appendix E of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

E112.4 Standards.

DOJ 36	Americans with Disabilities	E109.2.4
CFR Part 1192	Act (ADA) Accessibility	
	Guidelines for Transportation	
	Vehicles (ADAAG).

Justice, 1991

ICC A117.1-[2003] 2009 Accessible and Usable Buildings and Facilities E101.2, et al.

Subpart 38 (Appendix F of the New York City Building Code)

§1. Section F101.1 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

F101.1 Scope. The provisions of this appendix provide rodent-proofing design and construction requirements for the resistance of rodent ingress and infestation. For rodent extermination provisions related to demolition operations, see Section [3306.9.13] 3306. The *New York City Health Code*, the *New York City Housing Maintenance Code*, and the *New York City Sanitation Code* may contain additional provisions, as enforced by the New York City Department of Health and Mental Hygiene, the New York City Department of Housing Preservation and Development, and the New York City Sanitation Department.

§2. Section F102.2 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

F102.2 Floors on grade. Unless otherwise specified in this code, floors on grade, including but not limited to cellar floors and crawl space floors, shall be constructed of a minimum 2 inch [thick] (51 mm) thick continuous concrete slab. Gaps shall not be permitted between the slab and the abutting foundation walls or columns, except where expansion joints, thermal breaks, and control joints are located. All openings, including but not limited to, annular spaces around pipes, electric cables, and conduits in the slab shall be protected by closing such openings with cement mortar, concrete masonry, metal plates or screening designed to prevent the passage of rodents.

§3. Section F102.4.1 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

F102.4.1 Openings within 2 feet of ground level. Operable windows and other openings providing required or voluntary natural ventilation located with any portion within 2 feet (610 mm) above outside ground level immediately below such opening shall be covered for their entire height and width of the operable portion with hardware cloth of at least 0.035 inch [wire] (0.89mm) wire or heavier. The openings in the hardware cloth shall not exceed ¼ inch (6.4 mm).

§4. Section F102.4.2 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

F102.4.2 Rodent-accessible openings. Operable windows and other openings providing required or voluntary natural ventilation in the exterior located within 2 feet (610 mm) of exposed pipes, wires, conduits and other appurtenances, shall be covered with wire cloth of at

least 0.035 inch [wire] (0.89 mm) wire. The openings in the hardware cloth shall not exceed ¼ inch (6.4 mm).

Exception: In lieu of wire cloth covering, said pipes, wires, conduits and other appurtenances shall be blocked from rodent usage in accordance with one of the following:

1. Installation of solid sheet metal collars 0.024 inch [thick] (0.61 mm) thick or heavier. Such collars shall be fastened around the pipes, wires, conduits or other appurtenances, projecting a minimum distance of 12 inches (305 mm) beyond and on either side of the pipes, wires, conduits or appurtenances.
2. Installation of solid sheet metal guards fastened securely to the exterior wall, projecting 12 inches (305 mm) perpendicularly from the exterior wall for the length of the opening plus 2 feet (610 mm) beyond each end of the opening.

§6. Section F102.5 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

F102.5 Exterior wall ventilation openings. Exterior wall ventilator openings located with any portion within 2 feet (610 mm) of outside ground level shall be covered for their height and width with perforated sheet metal plates no less than 0.070 inch [thick] (1.8 mm) thick, expanded sheet metal plates not less than 0.047 inch (1.2 mm) thick, cast iron grills or grating, extruded aluminum load-bearing vents or with hardware cloth of 0.035 inch (0.89 mm) wire or heavier. The openings therein shall not exceed ¼ inch (6.4 mm).

Subpart 39 (Appendix G of the New York City Building Code)

§1. Section BC G102 of the New York city building code, as added by local law number 33 for the year 2007, section G102.1 as amended by local law number 99 for the year 2013, and sections G102.2.1, G102.2.2, G102.3.1.1, and G102.3.2.1 as added by local law 96 for the year 2013, is amended to read as follows:

SECTION BC G102 APPLICABILITY

G102.1 General. This appendix, in conjunction with the *New York City Construction Codes*, provides minimum requirements for development located, in whole or in part, in areas of special flood hazard and shaded X-Zones within the jurisdiction of New York City, including:

1. **Subdivisions.** This appendix shall apply to the subdivision of land;
2. **Utilities.** This appendix shall apply to the installation of utilities;
3. **Group U buildings and structures.** This appendix shall apply to placement and replacement of Group U buildings as defined in Section 312;

4. Site improvements. This appendix shall apply to site improvements, including but not limited to, temporary or permanent storage of materials, mining, dredging, filling, grading, paving, excavations, operations and other land disturbing activities;

[4.] **5. Prefabricated buildings and manufactured homes.** This appendix shall apply to placement and replacement of prefabricated buildings and manufactured homes;

[5.] **6. Post-FIRM construction.** This appendix shall apply to post-FIRM construction;

[6.] **7. Alterations to post-FIRM construction.** This appendix shall apply to repair, reconstruction, rehabilitation, or additions to post-FIRM construction;

[7.] **8. Substantial improvement of pre-FIRM construction.** This appendix shall apply to substantial improvement of pre-FIRM buildings and structures, including restoration after damage, as if hereafter erected;

[8.] **9. Horizontal enlargements of pre-FIRM construction.** This appendix shall apply to horizontal enlargements of pre-FIRM buildings and structures to the extent of such horizontal enlargement, including but not limited to additions, decks, carports, or similar appendages. The existing portions of the structure shall not be required to comply, unless otherwise required because the alteration is deemed a substantial improvement; and

[9.] **10. Other alterations to pre-FIRM construction.** This appendix shall apply to alterations or repairs to pre-FIRM buildings and structures, including installation of new components, materials, finishes and equipment, that increase the degree of noncompliance with this appendix. The following alterations or repairs, other than substantial improvements, shall not be deemed as an increase in the degree of noncompliance:

[9.1.] **10.1.** Where the alteration or repair comprises the replacement of pre-FIRM components, materials, finishes or equipment;

[9.2.] **10.2.** Where the alteration or repair comprises the installation of new components, materials, finishes or equipment in a space within the structure where similar pre-FIRM components, materials, finishes or equipment already exist; and

[9.3.] **10.3.** Where such alteration is a change in use, occupancy or how such space is used, provided that such change would not increase the degree of noncompliance with requirements of this appendix. The conversion of any space below the design flood elevation from nonhabitable space into habitable space shall be deemed an increase in the degree of noncompliance.

G102.2 Establishment of areas of special flood hazard. The following flood hazard map and supporting data are adopted as referenced standards and declared to be a part of this appendix:

1. FEMAFIS 360497.
2. FEMA FIRMs 360497.

G102.2.1 Preliminary flood insurance study and rate maps. Until such time that the department by rule adopts revised FEMA FIS 360497 and FEMA FIRMs 360497 with a final effective date later than May 1, 2014, the following flood hazard maps and supporting data are also adopted as a referenced standard and declared a part of this appendix.

1. FEMA PFIS 360497.
2. FEMA PFIRMs 360497.

G102.2.2 Effect of preliminary flood insurance study and rate maps. Notwithstanding any other provision in this appendix to the contrary:

1. All references in this appendix to elevations in FEMA FIS 360497 and FEMA FIRMs 360497 shall be deemed to refer to the greater of (i) the elevations identified in the FEMA FIS 360497/FEMA FIRMs 360497 or (ii) the elevations identified in the FEMA PFIS 360497/FEMA PFIRMs 360497. In comparing elevations, the elevations identified in FEMA FIS 360497 and FEMA FIRMs 360497 that are expressed in relation to the National Geodetic Vertical Datum (NGVD) shall be converted to the North American Vertical Datum (NAVD).
2. All references in this appendix to areas of special flood hazard as delineated on FEMA FIRMs 360497 shall be deemed to refer to the area of special flood hazard as delineated on FEMA PFIRMs 360497 except that, where a structure is located in an area of special flood hazard as delineated on FEMA PFIRMs 360497 and in a more restrictive area of special flood hazard as delineated on FEMA FIRMs 360497, such structure shall be deemed to be located in the more restrictive area of special flood hazard as delineated on FEMA FIRMs 360497.

G102.3 Letters of map change. Map changes to FEMA FIRMs 360497 shall be administered in compliance with Sections G102.3.1 [and G102.3.2] through G102.3.3.

G102.3.1 Letters of map amendment (LOMA). Where FEMA FIRMs 360497 indicates that a structure or tax lot is within a delineated area of special flood hazard, but the pre-FIRM ground elevations adjacent to the structure or throughout the tax lot are at or above the base flood elevation, the commissioner shall deem such structure or tax lot as being within the area of special flood hazard and shall not approve plans except in compliance with this appendix, unless a letter of map amendment (LOMA) is issued by FEMA removing such structure or tax lot from the area of special flood hazard.

G102.3.1.1 Letters of map amendment (LOMAs) during pendency of PFIRMs. Until such time that the department by rule adopts revised FEMA FIS 360497 and FEMA FIRMs 360497 with a final effective date later than May 1, 2014, the commissioner shall not deem issuance of a LOMA by FEMA as removing such structure or tax lot from the area of special flood hazard unless the elevations specified in the LOMA equal or exceed the applicable corresponding elevations on the FEMA PFIS 360497/FEMA PFIRMs 360497.

G102.3.2 Letter of map revision based on fill (LOMR-F). Where FEMA FIRMs 360497 indicates that a structure or tax lot is within a delineated area of special flood hazard, but post-FIRM compacted fill is proposed to be added adjacent to the structure or throughout the tax lot to an elevation at or above the base flood elevation, the commissioner shall deem such structure or tax lot as being within the area of special flood hazard and shall not approve plans except in compliance with this appendix, unless a conditional or final letter of map revision based on fill (LOMR-F) is issued by FEMA removing such structure or tax lot from the area of special flood hazard. Buildings constructed with basements below the Base Flood Elevation on filled land shall maintain a minimum setback distance of 20 feet, at or above the Base Flood Elevation, from the edge of the Special Flood Hazard Area to the nearest wall of the basement, regardless of the design approach used. The commissioner shall promulgate rules establishing procedures for processing letters of map revision based on fill (LOMR-F).

G102.3.2.1 Letters of map revision based on fill (LOMR-Fs) during pendency of PFIRMs. Until such time that the department by rule adopts revised FEMA FIS 360497 and FEMA FIRMs 360497 with a final effective date later than May 1, 2014, the commissioner shall not deem issuance of a LOMR-F as removing such structure or tax lot from the area of special flood hazard unless the elevations specified in the LOMR-F equal or exceed the applicable corresponding elevations on the FEMA PFIS 360497/FEMA PFIRMs 360497.

G102.3.3 Certificates of occupancy. Certificates of occupancy shall indicate that the structure or tax lot is subject to a letter of map amendment (LOMA) or letter of map revision based on fill (LOMR-F) as per Section [G106.3] G106.5.

§2. Section BC G104 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC G104 PERMITS

G104.1 Permit required. Any person, owner or authorized agent who intends to conduct any development, as applicable pursuant to Section G102.1, within an area of special flood hazard, shall first apply to the commissioner and shall obtain the required permit in accordance with Section 28-105.1 of the Administrative Code, notwithstanding any exemption pursuant to Section 28-105.4 of the Administrative Code.

G104.2 Permit application requirements. The applicant shall file an application in writing on a form furnished by the commissioner. The commissioner shall not approve such application unless the applicant submits all plans, details, data and documents demonstrating that the development complies with Section G104 and all other provisions of this appendix.

G104.3 Site plan. The permit application shall include a site plan. The site plan shall include plans and drawings, shall be sealed by a registered design professional and shall include the following information and any other data as may be required by the department:

1. A delineation of the flood hazard areas, including identification of the base and design flood and elevations;
2. If applicable, the location of the regulatory floodway;
3. For all proposed structures, spot ground elevations at building corners and in 20-foot (6096 mm) or smaller intervals along the foundation footprint, or 1-foot (305 mm) contour elevations throughout the building site;
4. Proposed locations of water supply, sanitary sewer, and utilities;
5. Drainage patterns and facilities; and
6. Foundation design details, including but not limited to:
 - 6.1. Proposed elevation of the lowest floor including basement (for flood zone purposes) of all structures;
 - 6.2. For [a] crawl spaces[,], and enclosed parking, storage[,], and building access [and other] that are wet floodproofed [enclosures] below the design flood elevation, location and total net area of foundation openings in accordance with ASCE 24;
 - 6.3. For dry floodproofed [enclosures] spaces in buildings or structures that are nonresidential (for flood zone purposes), the proposed elevation to which the enclosure will be dry floodproofed in accordance with ASCE 24; and
 - 6.4. Any proposed fill and excavation details.

Exception: Applications for subdivisions shall comply with Section G302.

G104.4 Water course alteration. The permit application shall include, if applicable, a description of the extent to which any watercourse will be altered or relocated as a result of proposed development, and any documentation required by Section G103.6.

G104.5 Certifications. The permit application shall include the applicable certifications in accordance with Sections G104.5.1 through G104.5.3.

G104.5.1 A-Zones. For construction in A-Zones, the permit application shall include the following certifications, as applicable:

- 1. Wet floodproofing certification.** For wet floodproofed enclosures below the design flood elevation, construction documents shall include a certification by the applicant that the design provides for the automatic entry and exit of floodwaters for equalization of hydrostatic flood forces in accordance with Section [2.6.1.2] 2.6.2, ASCE 24.
- 2. Dry floodproofing certification for nonresidential buildings.** For dry floodproofed buildings and structures that are nonresidential (for flood zone purposes), construction documents shall include a certification by the applicant that the dry floodproofing is designed in accordance with ASCE 24.
- 3. Utility certifications.** For all applications involving utility or mechanical work, including applications where such work is to be filed in a separate, related application, construction documents shall include a certification by the applicant that “all heating, ventilation, air conditioning, plumbing, electrical and other services facilities and equipment within the structure or site will be located or constructed so as to prevent water from entering or accumulating within the components during conditions of flooding in accordance with ASCE 24.”

G104.5.2 V-Zones and coastal A-Zones. For construction in V-Zones and Coastal A-Zones the permit application shall include the following certifications, as applicable:

- 1. Structural design certification.** Construction documents shall include a certification by the applicant that the “entire structure is designed in accordance with ASCE 24, including that the pile or column foundation and building or structure to be attached thereto is designed to be anchored to resist flotation, collapse and lateral movement due to the effects of wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16 of the *New York City Building Code*.”
- 2. Breakaway wall certification.** Where breakaway walls are provided, construction documents shall include a certification by applicant that “the breakaway walls meet the load requirements of Section [5.3.2.3] 5.3.3 of ASCE 7, are designed in accordance with ASCE 24, and are of an open lattice-type construction only.”
- 3. Utility certifications.** For all applications involving utility or mechanical work, including applications where such work is to be filed in a separate, related application, construction documents shall include a certification by the applicant that “all heating, ventilation, air conditioning, plumbing, electrical and other services, facilities and equipment within the structure or site will be located or constructed so as to prevent water from entering or accumulating within the components during conditions of flooding, in accordance with ASCE 24.”

G104.5.3 Floodway encroachment certification. For any floodway encroachment, including fill, new construction, substantial improvements and other development or land-disturbing activity, the applicant shall submit a certification, along with supporting technical data, demonstrating that such development will not cause any increase of the level of the base flood in accordance with the requirements of Section G103.5.

G104.6 Validity of permit. The issuance of a permit under this appendix shall not be construed to be a permit for, or approval of, any violation of this appendix or any other provision of this code. The issuance of a permit based on submitted documents and information shall not prevent the commissioner from requiring the correction of errors. The commissioner is authorized to prevent occupancy or use of a structure or site which is in violation of this appendix or other provisions of this code.

G104.7 Permit expiration. A permit shall become invalid if the proposed development:

1. Is not commenced within 180 days after its issuance; or
2. If the work authorized is suspended or abandoned for a period of 180 days after the work commences.

G104.8 Permit reinstatement. Permit reinstatements for a permit that has expired pursuant to Section G104.7 shall be requested in writing. The commissioner is authorized to grant [, in writing, one or more extensions of time, for periods not more than 180 days each subject to the limitations of Section 28-105] such reinstatement, provided that the work shall comply with all of the requirements of this appendix, including any revised FEMA FIRMs 360497 in effect at the time the application for reinstatement is made, and provided further that the applicant shall pay all reinstatement fees as required in Article 112 of Title 28 of the *New York City Administrative Code*.

G104.9 Permit suspension or revocation. The commissioner is authorized to suspend or revoke a permit issued under this appendix wherever the permit is issued in error or on the basis of incorrect, inaccurate or incomplete information, or in violation of this code, in accordance with Section 28-105.

§3. Section BC G105 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC G105
PROGRESS AND SPECIAL [INSPECTIONS] INSPECTION REQUIREMENTS

G105.1 General. [Special] Progress and special inspections shall be performed in accordance with this section. All work applications, regardless of the scope of work, shall be subject to the progress and special inspection requirements of Sections G105.2 thru G105.4.

G105.2 All work applications other than new buildings and substantial improvements.

All work applications other than new buildings and substantial improvements, [regardless of the extent of the scope of work,] shall be subject to the following special inspection:

1. **Flood zone compliance special inspection.** Prior to sign-off of work, a [registered design professional] special inspector or special inspection agency shall inspect during the course of construction and certify that: “the structure was constructed” or “alterations were performed,” “with methods and practices that minimize flood damage and that are in accordance with approved plans, and with any applicable provisions of Appendix G of the *New York City Building Code* and ASCE 24.”

G105.3 New buildings and substantial improvements. [In addition to the flood zone compliance inspection required by Section G105.2, all] All applications for new buildings or substantial improvements shall be subject to the following [special] inspections:

1. **Elevation progress inspection.** Upon placement of the lowest floor, including the basement (for flood zone purposes), an engineer or licensed professional surveyor shall inspect the site and verify the elevation of such lowest floor. The inspection report verifying the elevation shall be submitted to the [commissioner] department prior to further vertical construction. The commissioner shall be permitted to issue a stop work order if such inspection report is not submitted.
2. **Flood zone compliance special inspection.** Prior to sign-off of work, a special inspector or special inspection agency shall inspect during the course of construction and certify that: “the structure was constructed” or “alterations were performed,” “with methods and practices that minimize flood damage and that are in accordance with approved plans, and with any applicable provisions of Appendix G of the *New York City Building Code* and ASCE 24.”
3. **Final elevation [inspection] required items.** [The final elevations shall comprise either of the following,] Prior to the sign-off of the flood zone compliance special inspection, the special inspector or special inspection agency shall verify that the following required items have been submitted to the department, as applicable:

[2.1.] 3.1. Elevation certificate. [Prior to sign-off of work, an engineer or licensed professional surveyor shall submit to the commissioner a certification of the elevation of the lowest floor, including the basement (for flood zone purposes). Such certification] The elevation certificate shall be made utilizing FEMA Form [81-31 entitled] 086-0-33 titled, “Elevation Certificate[.]”, and shall be signed by an engineer or surveyor.

[2.2.] 3.2. Dry floodproofing certificate. [Prior to sign-off of work, an engineer or licensed professional surveyor shall submit to the commissioner a dry floodproofing certificate. Such certification] The Dry floodproofing certificate shall be made utilizing FEMA Form [81-65 entitled] 086-0-34

titled, “Floodproofing [Certification.] Certificate,” and shall be signed by an engineer.

[G105.3.1] G105.4 Flood shield inspection. Where floodshields or other flood control devices are installed as part of a dry floodproofing system in buildings and structures that are nonresidential (for flood zone purposes), [a registered design professional] the special inspector or special inspection agency responsible for the flood zone compliance special inspection shall inspect the shields or devices in their stored positions or locations, witness their activation or transportation to their installed positions, and witness their deactivation or transportation back to their stored locations. The [registered design professional] special inspector or special inspection agency shall also confirm the installation of signage required by ASCE 24, Section 6.2.3, Item 3.

[G105.4 Reserved.]

G105.5 Reserved.

G105.6 Reserved.

G105.7 Reserved.

§4. Section BC G106 of the New York city building code, as added by local law number 33 for the year 2007, and section G106.4 as amended by local law 95 for the year 2013, is amended to read as follows:

SECTION BC G106 CERTIFICATES OF OCCUPANCY

G106.1 Applicability. This section shall apply to post-FIRM construction and substantial improvements where the work results in the issuance of a new or amended certificate of occupancy.

G106.2 [Spaces] Enclosed areas subject to flooding in A-Zones. The certificate of occupancy shall describe all [nondry] wet floodproofed [spaces] enclosed areas below the design flood elevation as “subject to flooding[,]” [including but not limited to] Such wet floodproofed [spaces] enclosed areas shall be usable solely for parking, storage, building access or crawl spaces.

G106.3 [Spaces] Enclosed areas subject to flooding in V-Zones and Coastal A-Zones. The certificate of occupancy shall describe all [spaces] enclosed areas below the design flood elevation as “subject to flooding[,]” [including but not limited to spaces] Such enclosed areas shall be usable solely for parking, storage[,] and building access[or crawl spaces].

G106.4 Dry floodproofed spaces. The certificate of occupancy shall describe any dry floodproofed spaces as “dry floodproofed.” For such buildings containing dwelling units, patient care areas (for flood zone purposes) or spaces intended to be used by persons for

sleeping purposes, the certificate of occupancy shall also provide notations as required by Section G304.1.2, Item 2.2.5. Where flood shields or other flood control devices are installed, the certificate of occupancy shall also provide notations describing these features.

G106.5 Letters of map change. Where applicable, the certificate of occupancy shall indicate that “the structure is exempted from the area of special flood hazard pursuant to FEMA Letter of Map Amendment (LOMA) # (_____)” or that “the structure is exempted from the area of special flood hazard pursuant to FEMA Letter of Map Revision Based on [Fill] Fill (LOMR-F) # (_____)” or that “the structure is exempted from the area of special flood hazard pursuant to FEMA Letter of Map Revision (LOMR) # (_____).”

§5. Section BC G107 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC G107 VARIANCES

G107.1 General. The Board of Standards and Appeals shall hear and decide requests for variances from the requirements of this appendix. The Board of Standards and Appeals shall base its determination on technical justifications, and has the right to attach such conditions to variances as it deems necessary to further the purposes and objectives of this appendix.

G107.2 Conditions for variance.

G107.2.1 Historic structures. The Board of Standards and Appeals is authorized to issue a variance for the repair or rehabilitation of a historic structure provided that:

1. The application has received approval from the Landmark Preservation [Committee] Commission and/or the New York State Historical Preservation Office, as applicable;
2. The proposed repair or rehabilitation will not preclude the structure's continued designation as a historic structure; and
3. The variance is the minimum necessary to preserve the historic character and design of the structure.

G107.2.2 Floodway restrictions. The Board of Standards and Appeals shall not issue a variance for any proposed development in a floodway if any increase in flood levels would result during the base flood discharge.

G107.2.3 General conditions for variance. Except for historic structures as provided for in Section G107.2.1, the Board of Standards and Appeals is authorized to issue a variance only upon:

1. A determination that the new construction, substantial improvement, or other proposed development is located on a tax lot that, on November [18] 16, 1983, was no more than ½ acre (0.2 hectare) in size. However, where the tax lot has been determined to be larger than ½ acre (0.2 hectare), the technical justification required for issuing the variance increases with the lot size;
2. Showing of good and sufficient cause;
3. Determination that failure to grant the variance would result in exceptional hardship to the applicant;
4. Determination that the granting of a variance will not result in:
 - a. Increased flood heights;
 - b. Additional threats to public safety[, provided, however, that the variance is permitted to increase risks to life and property for the subject structure];
 - c. Extraordinary public expense;
 - d. Nuisances;
 - e. Fraud on or victimization of the public; or
 - f. Conflict with existing local laws or ordinances; and
5. Determination that the variance is the minimum necessary, considering the flood hazard, to afford relief.

G107.2.4 Functionally dependent facilities. The Board of Standards and Appeals is authorized to issue a variance for the construction or substantial improvement of a functionally dependent facility provided that:

1. The criteria for Sections G107.2.1 through G107.2.3 are met; and
2. All methods and materials utilized minimize flood damage during the base flood and create no additional threats to public safety.

G107.3 Standards for variance. In reviewing applications for variances, the Board of Standards and Appeals shall consider all technical evaluations, all relevant factors, all other portions of this appendix and the following:

1. The danger that materials and debris may be swept onto other lands resulting in injury or damage;
2. The danger to life and property due to flooding or erosion damage;

3. The susceptibility of the proposed development, including contents, to flood damage and the effect of such damage on current and future owners;
4. The importance of the services provided by the proposed development to the community;
5. The availability of alternate locations for the proposed development that are not subject to flooding or erosion;
6. The relationship of the proposed development to the comprehensive plan and flood plain management program for that area;
7. The safety of access to the property in times of flood for ordinary and emergency vehicles;
8. The expected heights, velocity, duration, rate of rise and debris and sediment transport of the floodwaters and the effects of wave action, if applicable, expected at the site; and
9. The costs of providing governmental services during and after flood conditions including maintenance and repair of public utilities and facilities such as sewer, gas, electrical and water systems, streets and bridges.

G107.4 Notification of risks. Upon issuance of a variance, the Executive Director of the Boards of Standards and Appeals shall provide written notice to the owner and the applicant that:

1. The issuance of a variance to construct a structure below the base flood level will result in increased premium rates for flood insurance up to amounts as high as twenty-five dollars for each one hundred dollars of insurance coverage; and
2. That such construction below the base flood level increases risks to life and property.

G107.5 Records. The Board of Standards and Appeals shall:

1. Maintain a record of all variance actions, including justification for their issuance; and
2. Report such variances issued in its biennial report submitted to the Federal Emergency Management Agency (FEMA).

§6. Chapter G2 of appendix G of the New York city building code, as added by local law number 33 for the year 2007, and section G201.2 as amended by local law number 8 for the year 2008, local law number 95 for the year 2013, local law number 96 for the year 2013, and local law number 99 for the year 2013, is amended to read as follows:

CHAPTER G2 DEFINITIONS

SECTION BC G201 DEFINITIONS

G201.1 General. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein.

G201.2 Definitions.

500-YEAR FLOOD ELEVATION. The elevation of the flood having a 0.2-percent chance of being equaled or exceeded in any given year, as specified on FEMA FIRM 360497 or FEMA FIS 360497.

A-ZONE. An area of special flood hazard without high velocity wave action. When not shown on the FIRMs, the water surface elevation may be determined from available data by the registered design professional of record in accordance with Section G103.3. See also “Area of special flood hazard.”

AREA OF SPECIAL FLOOD HAZARD. The land in the flood plain delineated as subject to a 1-percent or greater chance of flooding in any given year. Such areas are designated on the Flood Insurance Rate Map (FIRM) as A-Zones, Limit of Moderate Wave Action (Coastal A-Zones), or V-Zones. Such areas are also known as the base flood plain or 100 year floodplain. Areas designated as X-Zones shall not be deemed areas of special flood hazard for the purposes of this Appendix.

BASE FLOOD. The flood having a 1-percent chance of being equaled or exceeded in any given year.

BASE FLOOD ELEVATION. The elevation of the base flood, including wave height, as specified on FEMA FIRMs 360497 or as determined in accordance with Section G103.3. In areas designated as Zone AO, the base flood elevation shall be the elevation of the highest existing grade of the building’s perimeter plus the depth number (in feet) specified on the flood hazard map.

BASEMENT (FOR FLOOD ZONE PURPOSES). The portion of a building having its floor subgrade (below ground level) on all sides.

BREAKAWAY WALL. An open lattice wall that is not part of the structural support of the building to which it is attached and that is intended through its design and construction to collapse under specific later loading forces without causing damage to the elevated portion of the building or the supporting foundation system.

COASTAL A-ZONE: An area within a special flood hazard area, shown on FEMA FIRMs 360497 as an area bounded by a “Limit of Moderate Wave Action,” landward of a V-Zone or landward of an open coast without mapped V-Zones. In a Coastal A-Zone, the principal source of flooding must be astronomical tides, storm surges, seiches, or tsunamis, and not riverine flooding. During the base flood conditions, the potential for breaking wave heights must be

greater than or equal to 1 foot, 6 inches (457 mm). In no case shall an area of special flood hazard be deemed a coastal A-Zone unless and until it has been identified as such on the adopted FEMA FIRMs 360497.

DESIGN FLOOD ELEVATION. The applicable elevation specified in ASCE 24, Tables 2-1,4-1,5-1, 6-1, or 7-1, depending on the structural occupancy category designated in ASCE 24, Table 1-1.

DEVELOPMENT. Any man-made change to improved or unimproved real estate, including but not limited to, buildings or other structures, temporary structures, temporary or permanent storage of materials, mining, dredging, filling, grading, paving, excavations, operations and other land disturbing activities.

EXISTING CONSTRUCTION. See “PRE-FIRM DEVELOPMENT.”

EXISTING STRUCTURE. See “PRE-FIRM DEVELOPMENT.”

FLOOD or FLOODING. A general and temporary condition of partial or complete inundation of normally dry land from:

1. The overflow of inland or tidal waters.
2. The unusual and rapid accumulation or runoff of surface waters from any source.

FLOOD-DAMAGE-RESISTANT MATERIALS. Any construction material, including finishes, capable of withstanding direct and prolonged contact with floodwaters without sustaining any damage that requires more than cosmetic repair.

FLOOD INSURANCE RATE MAP (FIRM). The official flood map on which the Federal Emergency Management Agency (FEMA) has delineated areas of special flood hazard, base flood elevations, and the flood boundary and floodways.

FLOOD INSURANCE STUDY (FIS). The official report provided by the Federal Emergency Management Agency (FEMA) containing the Flood Insurance Rate Map (FIRM), the water surface elevation of the base flood and supporting technical data.

FLOODPROOFING, DRY. For buildings and structures that are nonresidential (for flood zone purposes), a combination of design modifications that results in the building’s or structure’s being water tight to the design flood elevation, including the attendant utility and sanitary facilities, with walls substantially impermeable to the passage of water and with structural components having the capacity to resist loads as identified in ASCE 7.

FLOODPROOFING, WET. A floodproofing method designed to permit parts of the structure below the design flood elevation that are used for parking, storage, building access, or crawl space to intentionally flood, by equalizing hydrostatic pressures and by relying on the use of flood damage-resistant materials and construction techniques.

FLOODWAY. The channel of the river, creek or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height. Floodways are mapped only in the Boroughs of the Bronx and Staten Island.

FUNCTIONALLY DEPENDENT FACILITY. A facility that cannot be used for its intended purpose unless it is located or carried out in close proximity to water, such as a docking or port facility necessary for the loading or unloading of cargo or passengers, shipbuilding or ship repair. The term does not include long-term storage, manufacture, sales or service facilities.

HISTORIC STRUCTURE. A pre-FIRM building or structure:

1. Designated as a landmark or located within an historic district designated by the New York City Landmarks Preservation Commission;
2. Listed or preliminarily determined to be eligible for listing in the National or State Register of Historic Places; or
3. Determined by the Secretary of the U.S. Department of the Interior or the New York State Department of Parks and Recreation as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district.

LETTER OF MAP AMENDMENT (LOMA). An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing structures or tax lots or portions of tax lots from areas of special flood hazard, resulting from a demonstration that the pre-FIRM ground elevations are at or above the base flood elevation.

LETTER OF MAP REVISION BASED ON FILL (LOMR-F). An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing structures or tax lots or portions of tax lots from areas of special flood hazard, resulting from the post-FIRM placement of compacted fill, such that the new ground elevation is at or above the base flood elevation.

LETTER OF MAP REVISION (LOMR). An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing or adding structures or tax lots or portions of tax lots from areas of special flood hazard, which generally results from physical measures implemented that affect the hydrologic or hydraulic characteristics of a flooding source and thus result in the modification of the existing regulatory floodway, the effective base flood elevations, or the special flood hazard area.

LOWEST FLOOR. The lowest floor of the lowest enclosed area, including crawl spaces and basements (for flood zone purposes).

Exception: The lowest floor shall not include any wet floodproofed spaces usable solely for vehicle parking, building access, storage or crawl space, provided that such enclosure is not built so as to render the structure in violation of this appendix, including that:

1. Such enclosure shall allow for the automatic entry and exit of floodwaters;
2. Such enclosure shall be constructed solely of flood-resistant materials and finishes;
3. Such enclosure shall have a floor elevation equal to or higher than the outside adjacent grade on at least one side; and
4. Such outside adjacent grade shall slope down, towards the source of flooding, providing positive drainage by gravity, thus preventing accumulations of water under or in the structure after the floodwaters recede without the use of pumps, pipes or drains.

MANUFACTURED HOME. A structure that is transportable in one or more sections, built on a permanent chassis, designed for use with or without a permanent foundation when attached to the required utilities, and constructed to the Federal Mobile Home Construction and Safety Standards and rules and regulations promulgated by the U.S. Department of Housing and Urban Development. The term also includes mobile homes, park trailers, travel trailers and similar transportable structures that are placed on a site for 180 consecutive days or longer.

MANUFACTURED HOME PARK OR SUBDIVISION. A parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.

MARKET VALUE OF STRUCTURE. The price that a buyer is willing, but is not under any duty, to pay for a particular structure to an owner who is willing, but not obligated, to sell, exclusive of the value of the land, or of other buildings or structures on the same tax lot. The market value of a structure shall be determined in accordance with rules promulgated by the commissioner.

NATIONAL GEODETIC VERTICAL DATUM (NGVD). The national vertical datum standard established in 1929; used as a reference for establishing elevations within a flood plain.

NEW CONSTRUCTION. See “POST-FIRM DEVELOPMENT.”

NONRESIDENTIAL (FOR FLOOD ZONE PURPOSES). A building or structure that either:

1. Contains no space classified in Group I-1, R- 1, R-2, or R-3, and contains no space that is accessory, as such term is defined in the New York City Zoning Resolution, to any Group I-1, R-1, R-2, or R-3 occupancy; or
2. Contains such space(s), but also contains space on the lowest floor that is not

accessory, as such term is defined in the New York City Zoning Resolution, to a Group I-1, R-1, R-2, or R-3 occupancy.

NORTH AMERICAN VERTICAL DATUM (NAVD). The national vertical datum standard established in 1988, used as a reference for establishing elevations within a flood plain.

PATIENT CARE AREA (FOR FLOOD ZONE PURPOSES). Any space meeting the following conditions:

1. The space is located within a building or structure, or portion thereof, that is classified in Group I-2; and
2. The space is primarily used for the provision of medical services to persons, including, but not limited to, consultation, evaluation, monitoring and treatment services.

Exceptions: The following spaces shall not be considered patient care areas (for flood zone purposes):

1. "Emergency rooms or departments" as defined in 10 NYCRR 700.2(a)(2) and
2. Spaces primarily used for the provision of medical services identified in 10 NYCRR 703.6(c)(2)(i).

PRE-FIRM DEVELOPMENT. Any development:

1. Completed prior to November [13] 16, 1983;
2. Under construction on November [13] 16, 1983 provided that the start of construction was prior to said date; or
3. Completed on or after November [13] 16, 1983 but that:
 - 3.1. Was not located within an area of special flood hazard at the start of construction; and
 - 3.2. Is now located within an area of special flood hazard as a result of a subsequent change to the FIRM.

PRE-FIRM STRUCTURE. See "PRE-FIRM DEVELOPMENT."

POST-FIRM DEVELOPMENT. Any development that is not pre-FIRM development.

POST-FIRM STRUCTURE. See "POST-FIRM DEVELOPMENT."

RECREATIONAL VEHICLE. A vehicle that is built on a single chassis, 400 square feet (37.16 m²) or less when measured at the largest horizontal projection, designed to be

self-propelled or permanently towable by a light-duty truck, and designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational, camping, travel or seasonal use. A recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect-type utilities and security devices and has no permanently attached additions.

RESIDENTIAL (FOR FLOOD ZONE PURPOSES). A building or structure containing any space that is either:

1. Classified in Group I-1, R-1, R-2, or R-3; or
2. Accessory, as such term is defined in the New York City Zoning Resolution, to any Group I-1, R-1, R-2, or R-3 occupancy.

Exception: Such a building or structure shall be considered nonresidential (for flood zone purposes) when also containing space on the lowest floor that is not accessory, as such term is defined in the New York City Zoning Resolution, to a Group I-1, R-1, R-2, or R-3 occupancy.

SAND DUNES. Naturally occurring accumulations of sand in ridges or mounds landward of a beach.

SHADED X-ZONE. The land in the floodplain delineated as subject to a 0.2-percent or greater chance of flooding, but less than one percent of flooding, in any given year. Such areas are designated on the Flood Insurance Rate Map (FIRM) as shaded X-Zones.

SPECIAL FLOOD HAZARD AREA. See “AREA OF SPECIAL FLOOD HAZARD.”

START OF CONSTRUCTION. The date of permit issuance for: (i) post-FIRM developments; (ii) substantial improvements to pre-FIRM structures; and (iii) those pre-FIRM developments that, at the time of permit issuance, were not within an area of special flood hazard but that, prior to completion, were within an area of special flood hazard as a result of map change; provided the actual commencement of construction, repair, reconstruction, rehabilitation, addition, placement or other improvement is within 180 days after the date of permit issuance and such construction activity is not thereafter suspended or abandoned for 180 days or more. For the purposes of this definition:

1. The actual commencement of construction means the first placement of permanent construction of a building (including a manufactured home or prefabricated building) on a site, such as the pouring of a slab or footings, installation of pilings or construction of columns.
2. Permanent construction does not include land preparation (such as clearing, excavation, grading or filling), the installation of streets or walkways, excavation for abasement (for flood zone purposes), footings, piers or foundations, the erection of temporary forms or the installation of accessory buildings such as garages or

sheds not occupied as dwelling units or not part of the main building.

3. For a substantial improvement, the actual commencement of construction means the first alteration of any wall, ceiling, floor or other structural part of a building, regardless of whether that alteration affects the external dimensions of the building.

SUBSTANTIAL DAMAGE. Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before-damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.

SUBSTANTIAL IMPROVEMENT. Any repair, reconstruction, rehabilitation, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the improvement or repair is started. If the structure has sustained substantial damage, any repairs are considered substantial improvement regardless of the actual repair work performed. The term does not, however, include either:

1. Any project for improvement of a building required to correct pre-FIRM health, sanitary or safety code violations identified by the commissioner, the Fire Commissioner, the Commissioner of Housing Preservation and Development, or the Commissioner of Health and Mental Hygiene, and that are the minimum necessary to assure safe living conditions; or
2. Any alteration of a historic structure provided that the alteration will not preclude the structure's continued designation as a historic structure.

VARIANCE. A grant of relief from the requirements of this appendix, which permits construction in a manner otherwise prohibited by this appendix.

V-ZONE. An area of special flood hazard subject to high-velocity wave action.

§7. Section BC G301 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC G301 GENERAL

G301.1 All developments. To the extent required by Section G102.1, all developments, including but not limited to utility installation, site improvements, placement of prefabricated buildings and manufactured homes, new building construction, alterations and repairs, shall be designed and constructed to resist the effects of flood hazards and flood loads in accordance with this appendix and ASCE 24.

G301.1.1 Multiple flood zones. For a structure that is located in more than one zone (for instance both an A-Zone and an X-Zone, or both an A-Zone and a V-Zone), the provisions associated with the most restrictive area of special flood hazard shall apply to the entire structure.

G301.2 [Reserved] Design requirements and load combinations. Any construction within the scope of Section G102.1, located in a special flood hazard area, shall be designed and constructed to resist the loads and load combinations specified in Chapter 16.

§8. Section BC G303 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC G303 SITE IMPROVEMENT

G303.1 Development in floodways. Development or land disturbing activity is prohibited in floodways unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practice that the proposed encroachment will not result in any increase in the level of the base flood, in accordance with Section G103.5.

G303.2 Sewer facilities. All new and replaced sanitary sewer facilities, private sewage treatment plants (including all pumping stations and collector systems) and on-site waste disposal systems shall be designed in accordance with Chapter [8] 7, ASCE 24, to minimize or eliminate infiltration of floodwaters into the facilities and discharge from the facilities into floodwaters, or impairment of the facilities and systems.

G303.3 Water facilities. All new and replacement water facilities shall be designed in accordance with the provisions of Chapter [8] 7, ASCE 24 to minimize or eliminate infiltration of floodwaters into the systems.

G303.4 Storm drainage. Storm drainage shall be designed to convey the flow of surface waters to minimize or eliminate damage to persons or property and shall meet the requirements of ASCE 24.

G303.5 Streets and sidewalks. Streets and sidewalks shall be designed to minimize potential for increasing or aggravating flood levels and shall meet the requirements of Section G303.7.

G303.6 Retaining walls and driveways. Retaining walls and driveways shall meet the requirements of Section G303.7.

G303.7 Grading and fill. In areas of special flood hazard grading and/or fill shall not be approved:

1. Unless such fill is placed, compacted and sloped to minimize shifting, slumping and erosion during the rise and fall of flood water and, as applicable, wave action, in accordance with ASCE 24.
2. In floodways, unless it has been demonstrated through hydrologic and hydraulic analyses performed by an engineer in accordance with standard engineering practice that the proposed grading or fill, or both will not result in any increase in the flood levels

during the occurrence of the design flood, in accordance with Section G103.5.

3. In Coastal A-Zones and V-Zones, unless such fill is conducted and or placed to avoid diversion of water and waves towards any building or structure.

§9. Section BC G304 of the New York city building code, as added by local law number 33 for the year 2007, item 5.1 of section G304.1.1 of the New York city building code, as added by local law number 100 for the year 2013, and section G304.1.2 as amended by local law number 95 for the year 2013, is amended to read as follows:

**SECTION BC G304
POST-FIRM CONSTRUCTION AND SUBSTANTIAL
IMPROVEMENTS**

G304.1 A-Zone construction standards. In addition to the requirements of ASCE 24, [The] the following standards shall apply to post-FIRM construction and substantial improvements located within A-Zones, other than Coastal A-Zones.

G304.1.1 Residential. For buildings or structures that are residential (for flood zone purposes), all post-FIRM new buildings and substantial improvements shall comply with the applicable requirements in Chapter G3 of this code and ASCE 24, and shall be elevated as follows:

1. **Lowest floor.** The lowest floor, including the basement (for flood zone purposes), shall be elevated to at or above the design flood elevation specified in ASCE 24, Table 2-1;
2. **Enclosures below the design flood elevation.** Enclosed spaces below the design flood elevation specified in ASCE 24, Table 2-1, shall be useable solely for parking of vehicles, building access, storage, or crawlspace, and shall be wet floodproofed in accordance with ASCE 24. Breakaway walls are not required in A-Zones;
3. **Under-floor spaces.** The finished ground level of an under-floor space, such as a crawl space, shall be equal to or higher than the outside finished ground level on at least one side.
4. **Materials.** Only flood-damage-resistant materials and finishes shall be utilized below the design flood elevation specified in ASCE 24, Table 5-1;

[4.] 5. Utilities and equipment. Utilities and attendant equipment shall be located at or above the design flood elevation specified in ASCE 24, Table 7-1, or shall be constructed so as to prevent water from entering or accumulating within the components during conditions of flooding in accordance with ASCE 24;

5.1 Fire protection systems and equipment. The following fire protection systems and equipment shall be located at or above the design flood elevation

specified in ASCE 24, Table 7-1, except that where the system or equipment or portion thereof serves only spaces located below such design flood elevation, the system or equipment or portion thereof may be located [at or above] below such design flood elevation:

- 5.1.1. Sprinkler control valves that are not outside stem and yoke valves;
- 5.1.2. Fire standpipe control valves that are not outside stem and yoke valves;
- 5.1.3. Sprinkler booster pumps and fire pumps;
- 5.1.4. Dry pipe valve-related electrically operated alarm appurtenances;
- 5.1.5. Alarm control panels for water and non-water fire extinguishing systems;
- 5.1.6. Alarm control panels for sprinkler systems, pre-action sprinkler systems, deluge sprinkler systems, and combined dry pipe and pre-action sprinkler systems;
- 5.1.7. Electrically operated waterflow detection devices serving sprinkler systems and
- 5.1.8. Air compressors serving sprinkler systems and pre-action sprinkler systems

[5.] 6. Certifications. Applications shall contain applicable certifications in accordance with Section G104.5; and

[6.] 7. Special inspections. Special inspections shall be as required by Section G105.

G304.1.2 Nonresidential. For buildings or structures that are nonresidential (for flood zone purposes), all post-FIRM new buildings and substantial improvements shall comply with the applicable requirements in Chapter G3 of this code and ASCE 24, and shall comply with either of the following:

- 1. Elevation option.** The structure shall comply with Items 1 through [6] 7 of Section G304.1.1; or
- 2. Dry floodproofing option.** The structure shall comply with the following:
 - 2.1. Elevation of dry floodproofing. The structure shall be dry floodproofed to at or above the design flood elevation specified in ASCE 24, Table 6-1;
 - 2.2. Dwelling units, patient care areas (for flood purposes) and sleeping spaces. Where dwelling units, patient care areas (for flood purposes) or spaces intended to be used by persons for sleeping purposes are located in a building utilizing the dry floodproofing option, the following additional requirements shall be met:
 - 2.2.1. All rooms and spaces within dwelling units, patient care areas (for flood purposes) or spaces intended to be used by persons for sleeping purposes shall be located at or above the design flood elevation;

2.2.2. [For buildings containing dwelling units, no more than one toilet and one sink shall be located below the design flood elevation. Any such toilet room shall not be located within a dwelling unit and shall be no larger than required by Chapter 11; and no roughing therein shall be permitted to accommodate additional fixtures;

2.2.3. For buildings containing dwelling units, no more than one two-compartment laundry tray shall be permitted below the design flood elevation;

2.2.4. For buildings containing dwelling units, no kitchens or kitchenettes shall be permitted below the design flood elevation;

2.2.5.]A restrictive declaration noting the above [restrictions] restriction shall be filed with the City Register or County Clerk, and the page number and liber number shall be identified in the permit application and on the certificate of occupancy.

2.3. Utilities and equipment. Utilities and attendant equipment shall be located within the dry floodproofed enclosure, or may be located outside the dry floodproofed enclosure provided that they are located at or above the design flood elevation specified in ASCE 24, Table 7-1, or are constructed so as to prevent water from entering or accumulating within the components during conditions of flooding in accordance with ASCE 24.

2.4. Certifications. Applications shall contain applicable certifications in accordance with Section G104.5; and

2.5. Special inspections. Special inspections shall be as required by Section G105.

G304.2 V-Zone construction standards. In addition to the requirements of ASCE 24, the following standards shall apply to post-FIRM construction and substantial improvements located within V-Zones.

- 1. Foundation.** The lowest floor shall be elevated on adequately anchored pilings or columns and securely anchored to such piles or columns to prevent floatation, collapse and lateral movement resulting from wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16 and this appendix.
- 2. Lowest horizontal member.** The lowest portion of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) shall be at or above the design flood elevation specified in ASCE 24, Table 4-1.
- 3. Below the lowest horizontal member.** Spaces below the lowest horizontal member shall be either:

- 3.1. Free of obstructions; or
- 3.2. Enclosed with breakaway walls providing unconditioned space useable solely for parking of vehicles, building access, storage or crawl space. Such breakaway walls shall:
 - 3.2.1. Be of an open lattice type construction only;
 - 3.2.2. Meet the load requirements of Section [5.3.2.3] 5.3.3 of ASCE 7; and
 - 3.2.3. Meet the additional requirements of ASCE 24.
4. **Materials.** Only flood-damage-resistant materials and finishes shall be utilized below the design flood elevation specified in ASCE 24, Table 5-1;
5. **Utilities and equipment.** Utilities and attendant equipment shall be located at or above the design flood elevation specified in ASCE 24, Table 7-1, or shall be constructed so as to both resist the wave action and prevent water from entering or accumulating within the components during conditions of flooding in accordance with ASCE 24;
6. **Prohibitions.** The following shall be prohibited in V-Zones:
 - 6.1. Development, including land-disturbing activities, seaward of the reach of mean high tide;
 - 6.2. Use of fill for structural support of buildings; and
 - 6.3. Man-made alterations of sand dunes that would increase potential damage to buildings.
7. **Certifications.** Applications shall contain applicable certifications in accordance with Section G104.5; and
8. **Special inspections.** Special inspections shall be as required by Section G105.

G304.3 Coastal A-Zone construction standards. In addition to the requirements of ASCE 24, all post-FIRM new buildings and substantial improvements in a Coastal A-Zone shall comply with the V-Zone construction standards of Section G304.2.

Exceptions: The following structural systems shall be permitted in a Coastal A-Zone:

1. **Wave-resisting stem wall foundation.** Stem walls supporting a floor system above, and backfilled with soil or gravel to the underside of the floor system, shall be permitted in Coastal A-Zones. The design and construction of the shallow foundation system shall comply with the following:

- 1.1. The underside of such floor system shall be located at or above the design flood elevation specified in ASCE 24, Table 4-1.
 - 1.2. Stem walls enclosing areas below the design flood elevation shall not be permitted. Stem walls shall be designed to transfer all vertical and lateral forces to the slab above and to the foundation elements below;
 - 1.3. The design shall consider all forces resulting from flooding, including wave action, debris impact, erosion, and local scour;
 - 1.4. The design shall consider all forces resulting from soil pressure behind the walls, including the effect of hydrostatic loads, and all live and dead surcharge loads from the slab above;
 - 1.5. Flood openings shall not be required in stem walls constructed in accordance with this section;
 - 1.6. Where soils are susceptible to erosion and local scour, stem walls shall be supported by deep footings;
 - 1.7. Shallow foundations including spread footing, mat and raft foundations shall be designed to prevent sliding, uplift, or overturning when exposed to the combination of loads in ASCE Section 1.6.2.
2. **Wave-resisting dry floodproofing wall and foundation system.** Buildings that are non-residential (for flood zone purposes) and that are located in Coastal A-Zones shall be permitted to be dry floodproofed in accordance with Section G304.1.2 provided the structure is dry floodproofed to at or above the design flood elevation specified in ASCE 24, Table 6-1. For buildings or structures utilizing this exception, construction documents shall include calculations demonstrating that the foundation and building, including flood shields if provided, will resist the wave action, including the combination of loads in ASCE Section 1.6, to at or above the design flood elevation specified in ASCE 24, Table 4-1.

§10. Section BC G308 of the New York city building code, as added by local law number 33 for the year 2007, and sections G308.6 through G308.7.2 as added by a local law number 109 for the year 2013, is amended to read as follows:

SECTION BC G308
OTHER [DEVELOPMENT] BUILDING WORK

G308.1 [Accessory] Detached accessory structures. [Accessory] Detached accessory structures shall be anchored to prevent flotation, collapse and lateral movement resulting from hydrostatic loads, including the effects of buoyancy, during conditions of flooding to the design flood elevation. Enclosed accessory structures usable solely for parking or storage shall be wet

floodproofed and shall have flood openings to allow for the automatic entry and exit of flood waters designed in accordance with ASCE 24.

G308.2 Fences [in floodways]. Fences in floodways that may block the passage of floodwaters, such as stockade fences and wire mesh fences, shall meet the requirement of Section G103.5.

G308.3 Oil derricks. Oil derricks located in areas of special flood hazard shall be designed in conformance with ASCE 24.

G308.4 Retaining walls, sidewalks and driveways. Retaining walls, sidewalks and driveways shall meet the requirements of Section G303.7.

G308.5 Prefabricated swimming pools in floodways. Prefabricated swimming pools in floodways shall meet the requirements of Section G103.5.

G308.6 Temporary flood shields. Temporary flood shields shall be permitted in accordance with Section 6.2.3 of ASCE 24.

G308.7 Temporary stairs and ramps. Temporary stairs and ramps shall comply with the requirements of Sections G308.7.1 and G308.7.2.

G308.7.1 Evacuated buildings. Temporary stairs and ramps shall be permitted to provide elevated ingress and egress in compliance with Item 3 of Section 6.2.2 of ASCE 24 for buildings or portions of buildings that are planned to be evacuated during design flood conditions, except for maintenance and emergency personnel, provided that such temporary stairs and ramps shall not be permitted to serve as a required means of egress for a dwelling unit or for any area described in Item 2.2.1 of Section G304.1.2 required to be located at or above the design flood elevation.

G308.7.2 Existing buildings. Temporary stairs and ramps for an existing building or portions thereof shall be permitted to provide elevated ingress and egress in compliance with Item 3 of Section 6.2.2 of ASCE 24, including as a required means of egress for dwelling units or for areas described in Item 2.2.1 of Section G304.1.2 required to be located at or above the design flood elevation, where such temporary stairs and ramps comply with Sections 1009 and 1010.

§11. Chapter G3 of appendix G of the New York city building code is amended by adding a new Section BC G309 to read as follows:

SECTION BC G309
TEMPORARY STRUCTURES AND TEMPORARY
STORAGE

G309.1 Temporary structures. Temporary structures shall be erected for a period of less than 180 days. Temporary structures shall be anchored to prevent flotation, collapse or lateral move-

ment resulting from hydrostatic loads, including the effects of buoyancy, during conditions of the base flood. Fully enclosed temporary structures shall have flood openings to allow for the automatic entry and exit of floodwaters.

G309.2 Temporary storage. Temporary storage includes storage of goods and materials for a period of fewer than 180 days. Stored materials shall not include hazardous materials.

G309.3 Floodway encroachment. Temporary structures and temporary storage in floodways shall meet the requirements of Section G103.5.

§12. Chapter G3 of appendix G of the New York city building code is amended by adding a new Section BC G310 to read as follows:

SECTION BC G310

UTILITY AND MISCELLANEOUS GROUP U BUILDINGS AND OTHER SIMILAR STRUCTURES

G310.1 Utility and miscellaneous Group U buildings and other similar structures. Section G310 shall govern utility and miscellaneous Group U buildings that are identified in Section 312 and other similar structures, including, but not limited to, agricultural buildings, aircraft hangars (accessory to a one- or two-family residence), barns, grain silos (accessory to a residential occupancy), greenhouses, livestock shelters, sheds, stables, and towers.

G310.2 Flood loads. Utility and miscellaneous Group U buildings and similar structures, including substantial improvement of such buildings and structures, shall be anchored to prevent flotation, collapse or lateral movement resulting from flood loads, including the effects of buoyancy, during conditions of the design flood.

G310.3 Elevation. Utility and miscellaneous Group U buildings and similar structures, including substantial improvement of such buildings and structures, shall be elevated such that the lowest floor, including basement, is at or above the design flood elevation specified in ASCE 24.

G310.4 Enclosures below design flood elevation. Fully enclosed areas below the design flood elevation shall comply with Section G304.

G310.5 Flood-damage-resistant materials. Flood-damage-resistant materials shall be used below the design flood elevation.

G310.6 Protection of mechanical, plumbing and electrical systems. Mechanical, plumbing and electrical systems, including plumbing fixtures, shall be elevated to or above the design flood elevation.

Exception: The following shall be permitted to be located below the design flood elevation provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads

and stresses, including the effects of buoyancy, during the occurrence of flooding to the design flood elevation in compliance with the flood-resistant construction requirements of this code:

1. Electrical systems, equipment and components;
2. Heating, ventilating, air conditioning, and plumbing appliances;
3. Plumbing fixtures;
4. Duct systems; and
5. Other service equipment.

Electrical wiring systems shall be permitted to be located below the design flood elevation provided they conform to the provisions of the *New York City Electrical Code*.

§13. Section BC G402 of the New York city building code, as amended by local law number 8 for the year 2008 and local law number 96 for the year 2013, is amended to read as follows:

*As modified in Chapter G5.

§14. Chapter G5 of appendix G of the New York city building code, as amended by local law number 8 for the year 2008, local law number 83 for the year 2013 and a local law number 109 for the year 2013, is amended to read as follows:

CHAPTER G5 MODIFICATIONS TO REFERENCED STANDARDS

SECTION BC G501 MODIFICATIONS

The following amendments are hereby made to the referenced standards listed in Section G401.

G501.1 Amendments to ASCE 24-05. The following amendments are hereby made to the applicable sections of ASCE 24-05. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*.

Section 1.1. Section 1.1 (Scope) is amended by deleting Items 1 through 4, and by adding the following paragraph to read as follows:

The scope of this standard is as provided for in Section G102.1 of the *New York City Building Code*, Appendix G.

[Section 1.1.1. A new Section 1.1.1 is added to read as follows:

1.1.1 A-Zones. Notwithstanding any other provision in this standard, no special flood hazard area in New York City shall be classified as a Coastal A-Zone. All areas of special flood hazard that are identified on the FIRM as an A-Zone shall be classified as flood hazard areas that are “other than coastal high hazard area or coastal A-Zones,” and shall comply with the applicable items in Section 1.1 as such.]

Section 1.1.2. A new Section 1.1.2 is added to read as follows:

1.1.2 High-risk flood hazard areas. Notwithstanding any other provision in this standard, no special flood hazard in New York City shall be classified as alluvial fan area, flash flood area, mudslide area, ice jam and debris area, erosion-prone area, high-velocity flow area. [The only applicable high-risk flood hazard areas in New York City are the Coastal High Hazard Areas (V-Zones).]

Section 1.2. Section 1.2 (Definitions) is amended by modifying only the following definitions:

[Coastal A Zone—Reserved.]

Design flood elevation—The applicable elevation specified in Table 2-1, 4-1, 5-1, 6-1, or 7-1, depending on the structural occupancy category designated in Table 1-1.

High-risk flood hazard area—An area designated as a coastal high hazard area, being those areas identified on the FIRM as a V-Zone or Coastal A-Zone.

Nonresidential—As defined in Section G201 of the *New York City Building Code*, Appendix G.

Residential—As defined in Section G201 of the *New York City Building Code*, Appendix G.

Section 1.4.3. Table 1-1 of Section 1.4.3 (Classification of Structures) is amended to read as follows:

TABLE 1-1
CLASSIFICATION OF STRUCTURES FOR FLOOD-RESISTANT DESIGN AND
CONSTRUCTION
(CLASSIFICATION SAME AS NEW YORK CITY BUILDING CODE TABLE 1604.5)

NATURE OF OCCUPANCY	STRUCTURAL OCCUPANCY CATEGORY
Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Agricultural facilities • Certain temporary facilities • Minor storage facilities 	I
Buildings and other structures except those listed in Structural Occupancy Categories I, III and IV	II
Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Buildings and other structures where more than 300 people congregate in one area • Buildings and other structures with elementary school, secondary school or day-care facilities with an occupant load greater than 250 • Buildings and other structures with an occupant load greater than 500 for colleges or adult education facilities • Health care facilities with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities • Jails and detention facilities • Power-generating stations, water treatment for potable water, waste water treatment facilities and other public utility facilities not included in Structural Occupancy Category IV • Buildings and other structures not included in Structural Occupancy Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released 	III
Buildings and other structures designed as essential facilities including, but not limited to: <ul style="list-style-type: none"> • Hospitals and other health care facilities having surgery or emergency treatment facilities • Fire, rescue and police stations and emergency vehicle garages • Designated earthquake, hurricane or other emergency shelters • Designated emergency preparedness, communication, and operation centers and other facilities required for emergency response • Power-generating stations and other public utility facilities required as emergency backup facilities for Structural Occupancy Category IV structures • Structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.7(2) of the <i>New York City Building Code</i> • Aviation control towers, air traffic control centers and emergency aircraft hangars • Buildings and other structures having critical national defense functions • Water treatment facilities required to maintain water pressure for fire suppression 	IV

STRUCTURAL OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Occupancy Categories I, III and IV
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. • Buildings and other structures containing elementary school, secondary school or day care facilities with an occupant load greater than 250. • Buildings and other structures containing adult education facilities, such as colleges and universities, with an occupant load greater than 500. • Group I-2 occupancies with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities. • Group I-3 occupancies. • Any other occupancy with an occupant load greater than 5,000^a. • Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Occupancy Category IV. • Buildings and other structures not included in Occupancy Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released.
IV	Buildings and other structures designated as essential facilities, including but not limited to: <ul style="list-style-type: none"> • Group I-2 occupancies having surgery or emergency treatment facilities. • Fire, rescue, ambulance and police stations and emergency vehicle garages. • Designated earthquake, hurricane or other emergency shelters. • Designated emergency preparedness, communications and operations centers and other facilities required for emergency response. • Power-generating stations and other public utility facilities required as emergency backup facilities for Occupancy Category IV structures. • Structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.1(2). • Aviation control towers, air traffic control centers and emergency aircraft hangars. • Buildings and other structures having critical national defense functions. • Water storage facilities and pump structures required to maintain water pressure for fire suppression.

a. For purposes of occupant load calculation, occupancies required by Table 1004.1.1 to use gross floor area calculations shall be permitted to use net floor areas to determine the total occupant load.

Section 2.3. Table 2-1 of Section 2.3 (Elevation Requirements) is amended to read as follows:

**TABLE 2-1
MINIMUM ELEVATION OF THE TOP OF LOWEST FLOOR
RELATIVE TO DESIGN FLOOD ELEVATION (DFE)—A-ZONES^a**

STRUCTURAL OCCUPANCY CATEGORY ^b	MINIMUM ELEVATION OF LOWEST FLOOR
I	DFE=BFE
[11] II (1-and 2- family dwellings)	DFE=BFE+ 2 ft
II ^c (all others)	DFE=BFE+ 1 ft
III ^c	DFE=BFE+ 1 ft
IV ^c	DFE=BFE+ 2 ft

- a. Minimum elevations shown in Table 2-1 do not apply to V Zones (see Table 4-1). Minimum elevations shown in Table 2-1 apply to A-Zones unless specific elevation requirements are given in Section 3 of this standard.
- b. See Table 1-1 or Table 1604.5 of the *New York City Building Code*, for structural occupancy category descriptions.
- c. For nonresidential buildings and nonresidential portions of mixed-use buildings, the lowest floor shall be allowed below the minimum elevation if the structure meets the floodproofing requirements of Section 6.

[Section 4.1.1. Section 4.1.1 (Identification of Coastal High Hazard Areas and Coastal A Zones) is amended to read as follows:

4.1.1 Identification of Coastal High Hazard Areas and Coastal A Zones. For the purposes of this standard, “Coastal High Hazard Areas” shall mean those locations where an area has been designated as subject to high velocity wave action on a community’s flood hazard map (V-Zones). No special flood hazard area in New York City shall be classified as a Coastal A-Zone.]

Section 4.4. Table 4-1 of Section 4.4 (Elevation Requirements) is amended to read as follows:

**TABLE 4-1
MINIMUM ELEVATION OF BOTTOM OF LOWEST SUPPORTING
HORIZONTAL STRUCTURAL MEMBER OF LOWEST FLOOR
RELATIVE TO DESIGN FLOOD ELEVATION (DFE)—V-ZONES AND COASTAL A-ZONES**

STRUCTURAL OCCUPANCY CATEGORY ^a	MEMBER ORIENTATION RELATIVE TO THE DIRECTION OF WAVE APPROACH	
	Parallel ^b	Perpendicular ^b
I	DFE=BFE	DFE=BFE
[11] II (1-and 2- family dwellings)	DFE=BFE + 2 ft	DFE=BFE + 2 ft
II (all others)	DFE=BFE	DFE=BFE+ 1 ft

III	DFE=BFE+ 1 ft	DFE=BFE+ 2 ft
IV	DFE=BFE+ 1 ft	DFE=BFE+ 2 ft

- a. See Table 1-1, or Table 1604.5 of the *New York City Building Code*, for structural occupancy category descriptions.
- b. Orientation of lowest horizontal structural member relative to the general direction of wave approach; parallel shall mean less than or equal to +20 degrees from the direction of approach; perpendicular shall mean greater than +20 degrees from the direction of approach.

Section 4.6.1. Section 4.6.1 (Breakaway Walls) is amended by adding the following sentence:

All breakaway walls enclosing spaces below the DFE in V-Zones shall be open lattice, and not solid, with such enclosed spaces constructed as unconditioned per the *New York State Energy Conservation Construction Code*.

Section 5.1. Table 5-1 of Section 5.1 (Materials, General) is amended to read as follows:

**TABLE 5-1
MINIMUM ELEVATION, RELATIVE TO DESIGN FLOOD
ELEVATION (DFE), BELOW WHICH FLOOD-DAMAGE-RESISTANT
MATERIALS SHALL BE USED**

STRUCTURAL OCCUPANCY CATEGORY ^a	A-ZONE	[V-ZONES] Coastal High Hazard Areas and Coastal A-Zones	
		Orientation Parallel ^b	Orientation Perpendicular ^b
I	DFE=BFE	DFE=BFE	DFE=BFE
[11] II (1-and 2-family dwellings)	DFE=BFE+ 2 ft	DFE=BFE+ 2 ft	DFE=BFE+ 2 ft
II (all others)	DFE=BFE+ 1 ft	DFE=BFE+1 ft	DFE=BFE+ 2 ft
III	DFE=BFE+ 1 ft	DFE=BFE+ 2 ft	DFE=BFE+ 3 ft
IV	DFE=BFE+ 2 ft	DFE=BFE+ 2 ft	DFE=BFE+ 3 ft

- a. See Table 1-1, or Table 1604.5 of the *New York City Building Code*, for structural occupancy category descriptions.
- b. Orientation of lowest horizontal structural member relative to the general direction of wave approach; parallel shall mean less than or equal to +20 degrees from the direction of approach; perpendicular shall mean greater than +20 degrees from the direction of approach.

Section 5.2.6. Section 5.2.6 (Finishes) shall be amended to read as follows:

5.2.6 Finishes and other materials. Interior and exterior finishes, as well as any materials not otherwise provided for in Sections 5.2.1 through 5.2.5, shall be flood damage-resistant materials in accordance with FEMA Technical Bulletin [2-93] 2/August 2008, Flood [resistant] Damage-Resistant Materials Requirement for Buildings Located in Special Flood Hazard Areas, or shall be required to be approved by the authority having jurisdiction.

Section 6.2. Table 6-1 of Section 6.2 (Dry Floodproofing) is amended to read as follows:

**TABLE 6-1
MINIMUM ELEVATION OF FLOODPROOFING, RELATIVE TO
DESIGN FLOOD ELEVATION (DFE)—A-ZONES**

STRUCTURAL OCCUPANCY CATEGORY ^a	MINIMUM ELEVATION OF FLOODPROOFING ^b
I	DFE=BFE+1 ft
II ^c	DFE=BFE+1 ft
III	DFE=BFE+ 1 ft
IV	IDFE=BFE+ 2 ft

- a. See Table 1-1, or Table 1604.5 of the *New York City Building Code*, for structural occupancy category descriptions.
- b. Wet or dry floodproofing shall extend to the same level.
- c. Dry floodproofing of residential buildings and residential portions of mixed use buildings shall not be permitted.

Section 6.2.2. Item 3 of Section 6.2.2 (Dry Floodproofing Requirements) is amended to read as follows:

3. Have either:

- [1.1] 3.1. All required means of egress elevated to or above the applicable DFE specified in Table 6-1, capable of providing human ingress and egress during the design flood; or
- [1.2] 3.2. At least one elevated door located in close proximity to each required means of egress to the exterior that is to be blocked by flood shields or flood control devices, such that the face of the elevated door itself, and not merely its directional signage, is clearly visible to a person approaching the blocked egress door(s). Such door(s) shall be elevated to at or above the applicable DFE specified in Table 6-1, capable of providing human ingress and egress during the design flood. Such door(s) shall meet all *New York City Building Code* requirements for a required means of egress to the exterior of the structure including hardware and signage, but shall not be required to comply with the occupant load calculations, unless the structure is intended for occupancy during the design flood. Such door may be accessed by open steps and shall not be required to comply with Chapter 11 of the *New York City Building Code* if its only purpose is to provide supplemental egress and ingress during conditions of flooding and to provide emergency egress at other times.

Section 6.2.3. Section 6.2.3 (Limits on Human Intervention) is amended to read as follows:

Section 6.2.3 Limits on Human Intervention. Dry floodproofing measures that require human intervention to activate or implement prior to or during a flood, including temporary stairs or ramps, shall be permitted only when all of the following conditions are satisfied:

1. The flood warning time (alerting potential flood victims of pending flood situation) shall be a minimum of 12 hours, unless the community operates a flood warning system and implements an emergency plan to ensure safe evacuation of flood hazard areas, in which case human intervention is allowed only if the community can provide a minimum flood warning time equal to or longer than the cumulative:

- (a) time to notify person(s) responsible for installation of floodproofing measures, plus
- (b) time for responsible persons to travel to structure to be floodproofed, plus
- (c) time to install, activate, or implement floodproofing measures, plus
- (d) time to evacuate all occupants from the flood hazard area;

2. All removable shields or covers for openings such as windows, doors, and other openings in walls and temporary stairs or ramps shall be designed to resist flood loads specified in Section 1.6; and

3. Where removable shields or temporary stairs or ramps are to be used, a flood emergency plan shall be approved by the authority having jurisdiction and shall specify, at a minimum, the following information: storage location(s) of the shields and temporary stairs and ramps; the method of installation and removal; conditions activating installation and removal; maintenance of shields and attachment devices and temporary stairs and ramps; periodic practice of installing and removing shields and temporary stairs and ramps; testing sump pumps and other drainage measures; and inspecting necessary material and equipment to activate or implement floodproofing. The flood emergency plan shall be permanently posted in at least two conspicuous locations within the structure.

Section 7.1. Table 7-1 of Section 7.1 (General) is amended to read as follows (see Table 7-1 below):

**TABLE 7-1
MINIMUM ELEVATION OF UTILITIES AND ATTENDANT EQUIPMENT
RELATIVE TO DESIGN FLOOD ELEVATION (DFE)**

STRUCTURAL OCCUPANCY CATEGORY ^a	LOCATE UTILITIES AND ATTENDANT EQUIPMENT ABOVE ^b		
	A-Zones	[V-Zones] Coastal High Hazard Area and Coastal A-Zones	
		Orientation Parallel ^c	Orientation Perpendicular ^c
I	DFE=BFE	DFE=BFE	DFE=BFE
[11]II (1-and 2- family dwellings)	DFE=BFE+2 ft	DFE=BFE+2 ft	DFE=BFE+2 ft

II ^c (all others)	DFE=BFE+1 ft	DFE=BFE+ 1 ft	DFE=BFE+2 ft
III	DFE=BFE+ 1 ft	DFE=BFE+ 2 ft	DFE=BFE+ 3 ft
IV	DFE=BFE+ 2 ft	DFE=BFE+ 2 ft	DFE=BFE+ 3 ft

- a. See Table 1-1, or Table 1604.5 of the *New York City Building Code*, for structural occupancy category descriptions.
- b. Locate utilities and attendant equipment above elevations shown unless otherwise provided in the text.
- c. Orientation of lowest horizontal structural member relative to the general direction of wave approach; parallel shall mean less than or equal to +20 degrees from the direction of approach; perpendicular shall mean greater than +20 degrees from the direction of approach

Section 7.3.3. Section 7.3.3 is amended to read as follows:

7.3.3 Plumbing Systems Installed Below Minimum Elevations. Plumbing systems and components, including plumbing fixtures, shall be elevated above the elevation specified in Table 7-1. Where plumbing systems and components have openings below the elevation specified in Table 7-1, the openings shall be protected with automatic backwater valves or other automatic backflow devices. Devices shall be installed in each line that extends below the DFE to prevent release of sewage into floodwaters and to prevent infiltration by floodwaters into the plumbing. Redundant devices requiring human intervention shall be permitted. Plumbing systems shall be provided with backwater valves in the building drain at its point of exit from the building and downstream of the building trap.

Section 7.3.4. Section 7.3.4 is amended to read as follows:

7.3.4 Sanitary Systems. Sanitary systems shall be designed to minimize infiltration of flood waters into the systems and discharges from the systems into floodwaters. Vents and openings shall be above the elevation specified in Table 7-1. Sanitary system storage tanks shall be designed, constructed, installed, and anchored to resist at least 1.5 times the potential buoyant and other flood forces acting on an empty tank during design flood conditions. Tanks and piping shall be installed to resist local scour and erosion. Sanitary systems shall be provided with backwater valves at the point of exit from the building and downstream of the building trap. Sanitary systems that must remain operational during or immediately after the design flood or lesser floods shall be equipped with a sealed storage tank that is sized to store at least 150% of the anticipated sewage flow associated with occupancy during flood conditions and during subsequent periods of saturated soil when sewage will not percolate.

Section 7.5.1. A new section 7.5.1 is added to read as follows:

[7.5.1 Elevator signage. Where there is potential for an elevator cab to descend below the elevation specified in Table 7-1 into a wet floodproofed space, the elevator shall be equipped with controls that will prevent the cab from descending into floodwaters. Permanent, durable, and washable signage shall be placed in the elevator cab and in the elevator lobby on any story subject to flooding, stating that “In the event of flooding, water

sensors in the elevator shaft will prevent the elevator from descending to [description of story, e.g., ground floor, first floor, parking level, etc.] and will automatically cause the elevator to rise to [description of story, e.g., second floor, mezzanine, etc.].”] **7.5.1 Elevator signage.** Where there is potential for an elevator cab to descend below the elevation specified in Table 7-1 into a wet floodproofed space, the elevator shall be equipped with controls that will prevent the cab from descending into floodwaters. Permanent, durable, and washable signage shall be placed in the elevator cab and in the elevator lobby on any story subject to flooding, stating that “In the event of flooding, water sensors in the elevator shaft will prevent the elevator from descending to [description of story, e.g., ground floor, first floor, parking level, etc.] and will automatically cause the elevator to rise to [description of story, e.g., second floor, mezzanine, etc.].”

Section 9.3.1. The second sentence of the first paragraph of Section 9.3.1 (Attached Garages and Carports) is amended to read as follows:

Wet floodproofed garages and carports are permitted below elevations specified in Table 2-1 provided the lowest level of the garage or carport is at or above grade on at least one side, the garage or carport walls meet the opening requirements of Section 2.6, and the lowest level of the garage or carport is not classified as a “lowest floor” pursuant to Appendix G of the *New York City Building Code*.

Section 9.5. Section 9.5 (Pools) is amended by adding a new paragraph to read as follows:

Mechanical equipment for pools such as pumps and water heaters, and associated electrical wiring, shall comply with Section 7.2 and 7.4.

G501.2 Reserved.

G501.3 Reserved.

Subpart 40 (Appendix H of the New York City Building Code)

§1. Section H101 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC H101 GENERAL

H101.1 General. An outdoor sign shall not be erected in a manner that would confuse or obstruct the view of or interfere with exit signs required by Chapter 10 of this code or with official traffic signs, signals or devices. Signs and sign support structures, together with their supports, braces, guys and anchors, shall be kept in repair and in proper state of preservation. The display surfaces of signs shall be kept neatly painted or posted at all times. No sign shall project beyond the street line except as permitted by Chapter 32 of this code.

H101.2 Signs exempt from permits. The signs specified in Section 28-105.4.5 of the Administrative Code are exempt from the requirements to obtain a permit before erection. The changing of moveable parts of an approved sign that is designed for such changes, or the repainting or repositioning of display matter shall not be deemed an alteration requiring a separate permit.

§2. Section H102 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC H102 DEFINITIONS

H102.1 General. Unless otherwise expressly stated, the following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 of this code for general definitions.

COMBINATION SIGN. A sign incorporating any combination of the features of pole, projecting and roof signs.

DISPLAY SIGN. The area made available by the sign structure for the purpose of displaying the sign.

FILM SIGN: A flat section of a material that is extremely thin in comparison to its length and breadth and has a nominal maximum thickness of 0.01 inch (0.25mm).

GROUND SIGN. A billboard or similar type of sign which is supported by one or more uprights, poles or braces in or upon the ground other than a combination sign or pole sign, as defined by this code.

POLE SIGN. A sign wholly supported by a sign structure in the ground.

PROJECTING SIGN. A sign other than a wall sign, which projects from and is supported by a wall of a building or structure.

ROOF SIGN. A sign erected upon or above a roof or parapet of a building or structure.

SIGN. Any letter, figure, character, mark, plane, point, marquee sign, design, poster, pictorial, picture, stroke, stripe, line, trademark, reading matter or illuminated service, which shall be constructed, placed, attached, painted, erected, fastened or manufactured in any manner whatsoever, so that the same shall be used for the attraction of the public to any place, subject, person, firm, corporation, public performance, article, machine or merchandise, whatsoever, which is displayed in any manner outdoors. Every sign shall be classified and conform to the requirements of that classification as set forth in this chapter.

SIGN STRUCTURE. Any structure which supports or is capable of supporting a sign as defined in this code. A sign structure is permitted to be a single pole and is not required to be an integral part of the building.

TEMPORARY SIGN. A sign, with display area 500 square feet (46.5 m²) or less, erected for a period of 30 days or less.

WALL SIGN. Any sign attached to or erected against the wall of a building or structure, projecting no more than 15 inches (381 mm) from the face of the wall, with the exposed face of the sign in a plane parallel to the plane of said wall.

§3. Section H104 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC H104 IDENTIFICATION

H104.1 Identification. Every outdoor advertising display sign hereafter erected, constructed or maintained, for which a permit is required, shall be marked and identified in accordance with Section [28-502.4] 28-502.5 of the Administrative Code and as required elsewhere in this appendix.

§4. Section H105 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC H105 DESIGN AND CONSTRUCTION

H105.1 General requirements. Signs shall be designed and constructed to comply with the provisions of this code for use of materials, loads and stresses.

H105.2 Permits, drawings and specifications. Where a permit is required, as provided in Chapter 1, construction documents shall be required. These documents shall show the dimensions, material and required details of construction, including loads, stresses and anchors. [Every] It is the responsibility of the property owner to have every sign for which a permit is required [shall be] inspected at least once every calendar year.

H105.3 Wind load. Signs shall be designed and constructed to withstand wind pressure as provided for in Chapter 16 of this code.

H105.4 Seismic load. Signs shall be designed to [withstand wind pressures shall be considered capable of withstanding earthquake loads, except as provided for in] meet seismic requirements of Chapter 16 of this code.

H105.5 Working stresses. In outdoor advertising display signs, the allowable working stresses shall conform to the requirements of Chapter 16 of this code. The working stresses of

wire rope and its fastenings shall not exceed 25 percent of the ultimate strength of the rope or fasteners.

Exceptions:

1. The allowable working stresses for steel and wood shall be in accordance with the provisions of Chapters 22 and 23 of this code.
2. The working strength of chains, cables, guys or steel rods shall not exceed one-fifth of the ultimate strength of such chains, cables, guys or steel.

H105.6 Attachment. Signs attached to masonry, concrete or steel shall be safely and securely fastened by means of metal anchors, bolts or approved expansion screws of sufficient size and anchorage to safely support the loads applied.

§5. Section H107 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION BC H107
MATERIAL LIMITATIONS**

H107.1 Use of combustibles. In all signs required to be constructed of noncombustible materials pursuant to the provisions of Sections H109 through H116, the following materials may be used for moldings, cappings, nailing blocks, letters and latticing, or other purely ornamental features of signs, unless otherwise directed by the commissioner: wood, approved plastic or plastic veneer panels as provided for in Chapter 26 of this code, or other materials of combustible characteristics similar to wood. In all signs permitted to be constructed of combustible materials pursuant to the provisions of Sections H107 through H116, wood and other materials of combustible characteristics similar to wood shall be permitted, pursuant to the provisions of Sections H109 through H116, on the display surface without limit, except that approved plastic shall be limited in area by the provisions of Section H107.1.3.

H107.1.1 Approved plastic materials. Plastic materials which burn at a rate no faster than 2.5 inches per minute (64 mm/s) when tested in accordance with ASTM D 635 shall be deemed approved plastics and can be used as the display surface material and for the letters, decorations and facings on signs, subject to the area limitations of Sections H107.1.2 through H107.1.3.

Exception: Flexible vinyl signs shall comply with the requirements of Section H114.

H107.1.2 Plastic area limitations for internally illuminated signs. Except as provided for in Sections 402.14 and 2611 of this code, approved plastic used on the display surface of internally illuminated signs shall be permitted up to 200 square feet (18.6 m²) in area on signs required to be of noncombustible construction and on signs permitted to be of combustible construction.

H107.1.3 Plastic area limitations for all other signs. Approved plastic used on the display surface of ground signs, walls signs, roof signs, projecting signs, and marquee signs shall be limited in area as provided by Sections H107.1.3.1 through H107.1.3.4.

H107.1.3.1 Plastic area limitations on noncombustible ground signs and wall signs. On ground signs and wall signs required to be constructed of noncombustible materials, if the display surface does not exceed 150 square feet (13.9 m²), the entire display surface shall be permitted to be covered by approved plastic. If the area of a display surface exceeds 150 square feet (13.9 m²), the area occupied or covered by approved plastics shall be limited to 150 square feet (13.9 m²) plus 50 percent of the difference between 150 square feet (13.9 m²) and the total area of display surface. The area of plastic on a display surface shall not in any case exceed 1,050 square feet (97.5 m²), unless approved by the commissioner.

H107.1.3.2 Plastic area limitations on combustible ground signs and wall signs. On ground signs and wall signs permitted to be constructed of combustible materials, if the display surface does not exceed 300 square feet (27.9 m²), 50 percent of the display surface shall be permitted to be covered by approved plastic. If the area of a display surface exceeds 300 square feet (27.9 m²), the area occupied or covered by approved plastics shall be limited to 150 square feet (13.9 m²) plus 25 percent of the difference between 150 square feet (13.9 m²) and the total area of display surface. The area of plastic on a display surface shall not in any case exceed 575 square feet (53.4 m²), unless approved by the commissioner.

H107.1.3.3 Plastic area limitations on noncombustible roof signs, projecting signs, and marquee signs. On roof signs, projecting signs, and marquee signs required to be constructed of noncombustible materials, if the display surface does not exceed 150 square feet (13.9 m²), the entire display surface shall be permitted to be covered by approved plastic. If the area of a display surface exceeds 150 square feet (13.9 m²), the area occupied or covered by approved plastics shall be limited to 150 square feet (13.9 m²) plus 25 percent of the difference between 150 square feet (13.9 m²) and the total area of display surface. The area of plastic on a display surface shall not in any case exceed 575 square feet (53.4 m²), unless approved by the commissioner.

H107.1.3.4 Plastic area limitations on combustible roof signs. On roof signs permitted to be constructed of combustible materials, if the display surface does not exceed 1,000 square feet (92.9 m²), 25 percent of the display surface shall be permitted to be covered by approved plastic. If the area of a display surface exceeds 1,000 square feet (92.9 m²), the area occupied or covered by approved plastics shall be limited to 250 square feet (23.2 m²) plus 10 percent of the difference between 250 square feet (23.2 m²) and the total area of display surface. The area of plastic on a display surface shall not in any case exceed 350 square feet (32.5 m²), unless approved by the commissioner.

H107.2 Glass panels. Glass panels used in display areas of signs shall be [limited in size, thickness and type of glass as provided by Table H 107.2] designed in accordance with Chapter 24 of this code.

**[TABLE H107.2
SIZE, THICKNESS AND TYPE OF GLASS PANELS IN SIGNS**

MAXIMUM SIZE OF EXPOSED PANEL		MINIMUM THICKNESS OF GLASS (inches)	TYPE OF GLASS
Any dimension (inches)	Area (square inches)		
30	500	1/8	Plain, plate or wired
45	700	3/16	Plain, plate or wired
144	3,600	1/4	Plain, plate or wired
> 144	> 3,600	1/4	Wired glass

For SI: 1 inch = 25.4 mm, 1 square inch = 645 mm².]

§6. Section H112 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION BC H112
PROJECTING SIGNS**

H112.1 Materials. Projecting signs shall be constructed entirely of noncombustible materials, and the facings of such signs shall be of noncombustible materials, except as permitted by Section H107.

H112.2 Attachment. Projecting signs shall be securely attached to a building or structure by metal supports such as bolts, anchors, chains, guys or steel rods. Supports shall be secured to a bolt or expansion screw that will develop the strength of the supporting chains, guys or steel rods, with a minimum 5/8-inch (15.9mm) bolt or lag screw, by an expansion shield. Turn buckles shall be placed in chains, guys or steel rods supporting projecting signs. Staples or nails shall not be used to secure any projecting sign to any building or structure. The dead load of projecting signs not parallel to the building or structure and the load due to wind pressure shall be supported with chains, guys or steel rods having net cross-sectional dimension of not less

than 3/8-inch (9.5 mm) diameter. Such supports shall be erected or maintained at an angle of at least 45 [percent] degrees (0.78 rad) [with] from the horizontal to resist the dead load and at angle of 45 [percent] degrees (0.78 rad) or more with the face of the sign to resist the specified wind pressure. If such projecting sign exceeds 30 square feet (2.8 m²) in one facial area, there shall be provided at least two such supports on each side not more than 8 feet (2438 mm) apart to resist the wind pressure.

H112.3 Wall mounting details. Chains, cables, guys or steel rods used to support the live or dead load of projecting signs are permitted to be fastened to solid masonry walls with expansion bolts or by machine screws in iron supports, but such supports shall not be attached to an unbraced parapet wall. Where the supports must be fastened to walls made of wood, the supporting anchor bolts must go through the wall and be plated or fastened on the inside in a secure manner.

H112.4 Height limitation. A projecting sign shall not be erected on the wall of any building so as to project above the roof or cornice wall or above the roof level where there is no cornice wall; except that a sign erected at a right angle to the building, the horizontal width of which sign is perpendicular to such a wall and does not exceed 24 inches (610 mm), is permitted to be erected to a height not exceeding 5 feet (1524 mm) above the roof or cornice wall or above the roof level where there is no cornice wall. A sign attached to a corner of a building and parallel to the vertical line of such corner shall be deemed to be erected at a right angle to the building wall.

Exception: On buildings 35 feet (10 668 mm) high or less, projecting signs, not exceeding 24 inches (610 mm) in width, may be erected to a maximum height of 40 feet (12 192 mm) above grade but in no case to a height of more than 15 feet (4572 mm) above the main roof level.

H112.5 Additional loads. Projecting sign structures which will be used to support an individual on a ladder or other servicing device, whether or not specifically designed for the servicing device, shall be capable of supporting the anticipated additional load, but not less than a 100-pound (445 N) concentrated horizontal load and a 300-pound (1334 N) concentrated vertical load applied at the point of assumed or most eccentric loading. The building component to which the projecting sign is attached shall also be designed to support the additional loads.

H112.6 Thickness. Projecting signs shall be limited in thickness as provided for in Table H112.6.

**TABLE H112.6
THICKNESS OF PROJECTING SIGNS**

PROJECTION (feet)	MAXIMUM THICKNESS (feet)
5	2

4	2.5
3	3
2	3.5
1	4

For SI: 1 foot = 304.8 mm.

H112.7 Location restrictions. Projecting signs shall not be erected on buildings located on those streets and avenues listed in Section 3202.2.1.8.

§7. Section H114 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION BC H114
FLEXIBLE FABRIC SIGNS**

H114.1 General. The provisions of this section shall apply to flexible fabric signs and flexible fabric sign structures, including the fabric display area, the restraining framework, and all stiffening and fastening devices.

H114.2 Materials. Fabric used in flexible fabric signs shall be flame resistant in accordance with NFPA 701 or listed under UL 214.

H114.2.1 Longevity. The same fabric shall not be used for longer than a 12-month period. The same fabric may be relocated and re-erected within that 12-month period, but in no case shall re-inking of fabrics be permitted.

H114.2.2 Affidavit. [The sign graphics producer shall furnish] Prior to installation of a flexible fabric sign, an affidavit [attesting] shall be submitted to the Department in which the sign graphic producer shall attest that the sign was made from noncombustible fabric, flame-resistant fabric tested in accordance with NFPA 701 by a nationally recognized testing entity, or fabric bearing a UL Classification Mark obtained from the manufacturer of the fabric.

H114.2.3 Identification. The additional requirements set forth in sections H114.2.3.1 through H114.2.3.2 shall apply:

H114.2.3.1 UL classification decal. [The licensed sign hanger shall affix] All signs shall bear a decal bearing the UL Classification Mark or name of the testing entity and its listing number on a corner of the face of the fabric. This decal shall be of color(s)

contrasting with those of the background of the display, and shall be readable from street or roadway level with the aid of binoculars.

H114.2.3.2 Date of sign erection. All signs shall bear a decal identifying [, and] the date of erection of the flexible sign structure[, to] on a corner of the face of the sign fabric. This decal shall be of color(s) contrasting with those of the background of the display, and shall be readable from street or roadway level with the aid of binoculars. If the same fabric is relocated, the existing decal shall remain, and a new decal stating the re-erection date shall be affixed.

H114.2.4 Limitations. When erected on walls, flexible fabric signs exceeding 500 square feet (46.5 m²) in area shall be of the open weave type, unless backed by means of a wall sign or projecting sign structure supported as provided by Sections H111 and H112.

H114.3 Attachment to exterior walls. A flexible fabric sign attached to an exterior wall shall be attached in accordance with this section. The sign fabric shall not be placed in front of doors, windows, glass blocks, louvers, grilles, fire escapes, exterior stairs, balconies, marquees, wall recesses or projections unless backed by a wall sign or a projecting sign structure as provided by Sections H111 and H112.

H114.3.1 Load spreader bars. Load spreader bars comprised of noncombustible materials must be inserted around the entire perimeter of the fabric display area into pockets that are either woven, or heat-welded and stitched seamed. The load spreader bars shall be provided with rounded edges to prevent tearing of the fabric.

H114.3.2 Spring snaps. As an alternate to load spreader bars, the side hems of the fabric may be equipped with grommets to receive spring snaps. The applicant shall determine the appropriate spacing of grommets. The sides of fabric display areas equipped with grommets may be secured with spring snaps to vertical steel wire rope in lieu of restraining angles. The vertical steel wire rope shall be anchored to the wall or other mounting surface by means of eyebolts spaced at intervals to be determined by the applicant. The ends of the vertical steel wire rope shall be restrained by means of turnbuckles or “J” hooks secured to metal angles.

H114.3.3 Fasteners. Fasteners shall consist of “J” hooks secured with lock nuts or double nuts to continuous metal restraining angles around the perimeter of the display area. The “J” hooks shall extend through holes in the load spreader bars. The ends of the “J” hooks shall be secured with either safety clips or nuts in order to prevent accidental dislodging of the load spreader bars. In lieu of “J” hooks and restraining angles, the load spreader bars in the pockets along the top edge of the fabric display area may be bolted to steel flat bars.

H114.3.3.1 Metal restraining angles and bars. For all flexible sign structures, the metal angles and/or steel flat bars shall be secured to the wall or other mounting surface. Angles and/or bars shall not be secured to any parapet or wall unless the applicant has determined that the parapet or wall is capable of resisting the loads imposed on it by the flexible sign structure. Unsatisfactory parapets or walls shall be braced or otherwise

reinforced as determined by the applicant, prior to the erection of the flexible sign structure. A wall sign, projecting sign, roof sign or ground sign structure must be capable of resisting the loads imposed on it by the flexible sign structure.

H114.3.4 Tensioning. Initial tension may be applied mechanically to the fabric display area, but it shall be held in final position by adjusting or tightening the turnbuckles, or the nuts holding the “J” hooks to the restraining angles. Mechanical tensioning devices may not remain attached to the flexible sign, except as permitted by Section [H115.4] H114.4.

H114.4 Attachment to sign structures. Fabric stretched around any edge of a sign structure shall be protected from any sharp edge that may cut or tear the fabric. The perimeter of the fabric located on the front or rear of a sign structure shall be secured as required by Section [H115.3] H114.3, except that the “J” hooks may be secured directly to the sign structure.

H114.4.1 Tensioning devices. Opposing ends of a fabric sign stretched around the edges of a sign structure may be secured to each other by means of mechanical tensioning devices behind the sign structure, provided that the open ends for the “S” hooks shall be closed with safety clips. Spring snaps may be used in lieu of “S” hooks. The mechanical tensioning devices shall be fastened to safety wires, placed through the holes in the load spreader bars or grommets, to prevent the devices from falling in the event of loss of tension.

H114.4.2 Limitations. The length of the fabric or safety wire perpendicular to any edge of the sign structure shall be dimensioned such that in the event of failure of any part of the flexible sign structure, no load spreader bars, mechanical tensioning devices, clamps, or wires will strike any nearby doors, windows, vents, chimneys, grilles, skylights, light fixtures, decorations or other wall appurtenances, or mechanical equipment, nor shall any load spreader bar fall within 10 feet (3048 mm) of grade.

§8. Section H117 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC H117 REFERENCED STANDARDS

H117.1 General. This section lists the standards that are referenced in various sections of this appendix. The standards are listed herein by the promulgating agency of the standard, the standard identification, the effective date and title and the section or sections of this document that reference the standard.

[E117.2] H117.2 Subsequent additions, modifications or deletions. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the *Administrative Code*.

[E117.3] H117.3 Applicability. The application of the referenced standards shall be as specified in Section 102.4.

[E117.4] H117.4 Standards.

ASTM D [635-03] <u>635-10</u>	Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position	H107.1.1
NFPA 701-04	Methods of Fire Test for Flame Propagation of Textiles and Films	H114.2
UL 214-01	Standard for Tests for Flame Propagation of Fabrics and Films	H114.2

Subpart 41 (Appendix K of the New York City Building Code)

§1. Appendix K of the New York city building code is REPEALED and a new Appendix K is added to read as follows:

APPENDIX K

**MODIFIED INDUSTRY STANDARDS FOR ELEVATORS AND CONVEYING
SYSTEMS**

CHAPTER K1

**MODIFICATIONS TO ASME A17.1 - 2000, SAFETY
CODE FOR ELEVATORS AND ESCALATORS, WITH SUPPLEMENTS A17.1a – 2002
AND A17.1b - 2003**

K101.1 General. As referenced by Chapter 30 of the *New York City Building Code*, the provisions of ASME A17.1-00 with supplements A17.1a-02 and A17.1b-03 shall be modified in accordance with this chapter. The section numbers correlate to those in the referenced ASME standard. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*. This appendix incorporates and supersedes modifications to such standard made by 1 RCNY 3610-01 and 1 RCNY 3610-02.

**PART 1
GENERAL**

**SECTION 1.3
DEFINITIONS**

1.3 Add or delete and revise the following definitions to Section 1.3 as follows:

Delete and revise the definition “Designated level” to read as follows:

DESIGNATED LEVEL. For the purpose of applying Section 2.27.3, designated level shall mean the street floor or other level that best serves the needs of emergency personnel for fire fighting or rescue purposes.

Add new definition “Elevator classification” to read as follows:

ELEVATOR CLASSIFICATION. Elevator is classified as freight or passenger.

Delete and revise the definition “Hospital emergency service” to read as follows:

HOSPITAL EMERGENCY SERVICE. A special operating control function that may be provided for elevators in Occupancy Group I-2 (Hospital) or other applicable medical facility used to transport a patient in a life or death situation.

Add new definition “Patient elevator” to read as follows:

PATIENT ELEVATOR. An elevator located in a building classified in Occupancy Group I-2 (Hospital) reserved for the “sole” use of vertical transportation of nonambulatory patients who are incapable of self-preservation because of age, physical or mental disability. Hospital staff or other passengers transporting a patient are permitted to ride with the patient. Such elevators must be operated by a designated attendant and shall meet the requirements of Sections 2.27.4 and 2.27.5.3.

Add new definition “Sky lobby” to read as follows:

SKY LOBBY. The lowest landing of an elevator or a group of elevators located above the street level.

Add new definition “Smoke hole” to read as follows:

SMOKE HOLE. An opening for venting at the top of the elevator hoistway(s).

Add new definition “Zero clearance vestibule” to read as follows:

ZERO CLEARANCE VESTIBULE. A limited space on the elevator lobby between the exterior of the hoistway door and the security door attached to the elevator hoistway.

PART 2
ELECTRIC ELEVATORS

SECTION 2.1

CONSTRUCTION OF HOISTWAYS AND HOISTWAY ENCLOSURES

2.1.4 Control of smoke and hot gases.

Delete Section 2.1.4.

2.1.6 Projections, recesses and setbacks in hoistway enclosures.

Delete and revise Section 2.1.6.2 to read as follows:

2.1.6.2 On sides not used for loading and unloading:

- (a) Recesses, except those necessary for installation of elevator equipment, shall not be permitted;
- (b) Beams, floor slabs, or other building construction making an angle less than 75 degrees with the horizontal shall not project more than 50 mm (2 in.) inside the hoistway enclosure unless the top surface of the projection is beveled at an angle not less than 75 degrees with the horizontal;
- (c) Separator beams between adjacent elevators are not required to have bevels;
- (d) Where setbacks exceeding 50 mm (2 in.) occur in the enclosure wall, the top of the setback shall be beveled at an angle of not less than 75 degrees with the horizontal;
- (e) Bevels are not required if the projections and setbacks are covered with material conforming to the following:
 - (1) It shall be equal to or stronger than 1.110 mm (0.0437 in.) wire;
 - (2) It shall have openings not exceeding 25 mm (1 in.); and
 - (3) It shall be supported and braced such that it will not deflect more than 25 mm (1 in.) when subjected to a force of 4.79 kPa (100 lbs. per sq ft) applied horizontally at any point.

SECTION 2.2 PITS

2.2.2 Design and construction of pits.

Delete and revise Section 2.2.2.5 to read as follows:

2.2.2.5 Elevators with sprinklers in the shaftway shall be provided with a drain or sump pump.

2.2.4 Access to pits.

Delete and revise Section 2.2.4.1 to read as follows:

2.2.4.1 Access shall be by means of the lowest hoistway door or by means of a separate pit access door located at the level of the pit floor.

Add new Subsection (f) to Section 2.2.4.4 to read as follows:

2.2.4.4 Separate pit door, when provided, shall be subject to the following requirements:

(f) Pit doors shall be labeled “DANGER, ELEVATOR PIT” with letters not less than 51 mm (2 in.) high.

SECTION 2.7 **MACHINE ROOMS AND MACHINE SPACES**

2.7.3.4 Access doors and openings.

Add new Subsection (e) to Section 2.7.3.4.1 to read as follows:

2.7.3.4.1 Access doors to machine rooms and overhead machinery spaces shall:

(e) Be labeled “ELEVATOR MACHINE ROOM,” with letters not less than 51 mm (2 in.) high.

2.7.5 Lighting, temperature, and humidity in machine rooms and machinery spaces.

Add new Section 2.7.5.3 to read as follows:

2.7.5.3 A duplex receptacle rated at not less than 20A, 120V with ground fault circuit interrupter shall be provided in each machine room and machinery space. The receptacle shall not be used for permanently installed equipment.

2.7.8 Remote machine and control rooms.

Delete and revise Section 2.7.8.4 to read as follows:

2.7.8.4 Permanent two-way voice communication shall be provided between the elevator car, elevator machine room, and/or control room, and the lobby fire command station (where required or provided).

SECTION 2.8
EQUIPMENT IN HOISTWAYS AND
MACHINE ROOMS

2.8.1 Electrical equipment and wiring.

Delete and revise Section 2.8.1.2 to read as follows:

2.8.1.2 Only such electrical wiring, raceways, and cables used directly in connection with the elevator, including wiring for signals, for communication with the car, fire department communications equipment, for lighting, heating, air conditioning, and ventilating the car, for fire detecting systems, for pit sump pumps, and for heating and lighting the hoistway and/or machine room and equipment allowed in Section 2.14.1.9.1(d) shall be permitted to be installed inside the hoistway.

2.8.2 Pipes, ducts, tanks, and sprinklers.

Delete and revise Section 2.8.2.3 to read as follows:

2.8.2.3 Sprinkler systems are not permitted in control/machine rooms.

SECTION 2.11
PROTECTION OF HOISTWAY OPENINGS

2.11.1 Entrances and emergency doors required.

Delete and revise Section 2.11.1.1 to read as follows:

2.11.1.1 Hoistway landing entrances. All elevator hoistway-landing openings shall be provided with entrances that shall guard the full height and width of the openings. Entrances shall be at least 2030 mm (80 in.) in height and 915 mm (36 in.) in width.

Delete and revise Subsection (a) of 2.11.1.2 to read as follows:

2.11.1.2 Emergency doors in blind hoistways. Where an elevator is installed in a single blind hoistway, there shall be installed in the blind portion of the hoistway, in line with the car door, an emergency door at every third floor, but not more than 11 m (36 ft) from sill to sill, conforming to the following:

(a) The clear opening shall be at least 915mm (36 in.) wide and 2030 mm (80 in.) high.

2.11.2 Types of entrances.

Delete and revise Section 2.11.2.1 to read as follows:

2.11.2.1 Passenger elevators. For passenger elevators, entrances shall be one of the following types:

- (a) Horizontally sliding;
- (b) Horizontally swinging, single-section;
- (c) Hand- or power-operated vertically sliding that slide up to open.

Delete and revise Section 2.11.2.2 to read as follows:

2.11.2.2 Freight elevators. For freight elevators, entrances shall be one of the following types:

- (a) Horizontally sliding;
- (b) Swinging, single-section;
- (c) Center-opening, two- horizontally swinging, subject to the restrictions of Section 2.11.2.3;
- (d) Vertically sliding biparting counterbalanced (see Section 2.16.4); or
- (e) Vertically sliding counterweighted, single or multisection.

2.11.6 Opening of hoistway doors.

Delete and revise Section 2.11.6.2 to read as follows:

2.11.6.2 Means shall not be provided for locking out of service the doors at:

- (a) The top terminal landing;
- (b) The bottom terminal landing;
- (c) The designated sky lobby and sky lobby alternate landings for elevators equipped with Phase I Emergency Recall Operation, when Phase I is effective;
- (d) Any landing for elevators equipped with Phase II Emergency In-Car Operation when Phase II is effective;
- (e) Consecutive vacant floors;
- (f) Main lobby street floor.

Add new Section 2.11.6.5 to read as follows:

2.11.6.5 Mechanical locking of vestibule doors.

- (a) Zero clearance vestibule. Elevator landings provided with a zero clearance vestibule, not to exceed 150 mm (6 in.) from the elevator hoistway door, are permissible only when locking devices accessible from the car are installed exclusively on the door that separates the zero clearance vestibule from the occupied floor space.
- (b) Elevator landing on floors other than designated level provided with a vestibule. Locking devices at the vestibule will be permitted under any one of the following:
- (1) A red telephone is installed in the vestibule near the elevator doors in the elevator lobby to communicate with the main lobby fire command station or building manager's office or to central service station when the building is not attended. A sign shall be posted near the telephone. The sign shall read "**In Case of Fire or Other Emergency, Use This Phone to Contact Lobby or Building Manager or Central Service Station**".
 - (2) The locking devices on the vestibule door leading to an exit are released upon the activation of any detection or signaling devices or power failure and are approved as failsafe meeting the requirements of Chapter 9 of the *New York City Building Code*.
 - (3) At least one exit stair is located within the vestibule.

2.11.7 Glass in hoistway doors.

Delete and revise Sections 2.11.7.1, 2.11.7.1.1 and 2.11.7.1.2 and add a new Section 2.11.7.1.2.1 to Section 2.11.7.1.2 to read as follows:

2.11.7.1 Vision panels. Manually operated or self-closing hoistway doors of the vertically or horizontally sliding type, for elevators with automatic or continuous-pressure operation, shall be provided with a vision panel. In multi doors, the vision panel is required in one only, but is permitted to be placed in all sections. All horizontally swinging elevator doors shall be provided with vision panels. Vision panels are permitted for any type of hoistway door. Vision panels shall not be required at the landing of automatic operation elevators equipped with horizontally side sliding car and hoistway doors.

Where required or used, vision panels shall conform to Sections 2.11.7.1.1 through 2.11.7.1.7.

2.11.7.1.1 The area of any single vision panel shall not be less than 0.008 m² (12 in²), and the total area of one or more panels in any hoistway door shall not be more than 0.026 m² (40 in²).

2.11.7.1.2 Each clear panel opening shall reject a ball 102 mm (4 in.) in diameter.

2.11.7.1.2.1 Hoistway door vision panels must be protected by protective grills made of number sixteen (16) gauge stainless or galvanized steel in accordance with the following specifications:

- (a) Grills shall be sized to fit within or over the vision panel frame and completely cover the vision panel opening in the elevator, car doors and hoistway doors.
- (b) Grills and vision panel frames shall be secured by means of non-reversible screws or other tamper proof fasteners.
- (c) Grills shall contain openings that shall not be larger than 19 mm (0.75 in.) in diameter.
- (d) All cut edges shall be deburred.
- (e) Requirements for such grills may be waived if certification is submitted that such elevator is operated manually or twenty four (24) hour doorman service is provided. A security guard shall not be considered doorman service.
- (f) For the purpose of this section, 6 mm (0.25 in.) thick, listed wire glass on shaftwall side of assembly, 6 mm (0.25 in.) listed wire glass in middle, and 6 mm (0.25 in.) thick polycarbonate on hallway side only, may be used in lieu of the metal protective.

2.11.11 Entrances, horizontal slide type.

Delete and revise Subsection (a) of Section 2.11.11.6 to read as follows:

2.11.11.6 Bottom guides. Bottom guides shall conform to the following:

- (a) The bottom of each panel shall be guided by two or more members.

Delete and revise the heading of Section 2.12 to read as follows:

SECTION 2.12 **HOISTWAY-DOOR LOCKING DEVICES AND** **HOISTWAY ACCESS SWITCHES AND** **ELEVATOR PARKING DEVICES**

2.12.3 Hoistway-door combination mechanical locks and electric contacts.

Delete Section 2.12.3 in its entirety.

2.12.4 Listing/certification door locking devices and door or gate electric contacts.

Delete and revise Section 2.12.4.1 to read as follows:

2.12.4.1 Type tests. Each type and make of hoistway-door interlock, and car door or gate electric contact shall be of an approved type.

Add new Section 2.12.6.2.6 to read as follows:

2.12.6.2.6 Elevator parking device.

(a) Parking devices required. Elevators that are operated from within the car only and have manual operated doors that can be opened with a common tool shall have elevator-parking devices installed at that landing. This device shall be located at a height not greater than 2.11 m (6 ft 11 in.) above the floor. Parking devices are not required for elevators having hoistway doors that are automatically unlocked when the car is within the landing zone.

(b) General design requirements. Parking devices shall conform to the following requirements:

(1) They shall be mechanically or electrically operated.

(2) They shall be designed and installed so that friction or sticking or the breaking of any springs used in the device will not permit opening or unlocking a door when the car is outside the landing zone of that floor.

(3) Springs, where used, shall be of the restrained compression type, to prevent separation of the parts in case the spring breaks.

(c) Car interior lighting. The car interior lighting shall not be extinguished and must meet the requirements of 3.4.5 of ASME A17.3 as modified by Chapter K3 of this appendix.

Delete and revise Section 2.12.7.3.2 to read as follows:

2.12.7.3.2 The car cannot be operated at a speed greater than 0.35 m/s (75 ft/min).

Delete and revise Section 2.13.2.1.2 to read as follows:

2.13.2.1.2 Collapsible car gates shall not be power opened.

SECTION 2.14
CAR ENCLOSURES, CAR DOORS AND GATES AND
CAR ILLUMINATION

2.14.2 Passenger-car enclosures.

Delete and revise Section 2.14.2.1.1 to read as follows:

2.14.2.1.1 Materials in their end use configuration, other than those covered by Sections 2.14.2.1.2 through 2.14.2.1.6, shall conform to the following requirements, based on the tests conducted in accordance with the requirements of ASTM E 84, UL 723, or NFPA 255:

- (a) Flame spread rating of 0 to 50.
- (b) Smoke development of 0 to 100.

Delete and revise Subsections (a) and (b) of Section 2.14.2.5 to read as follows:

2.14.2.5 Vision panels. Vision panels are not required, but where used, shall:

- (a) Be of a total area of not more than 0.047 m² (72 in²), and contain no single glass panel having a width exceeding 101 mm (4 in.);
- (b) Hoistway door vision panels must be protected by protective grills made of number sixteen (16) gauge stainless or galvanized steel in accordance with the following specifications:
 - (1) Grills shall be sized to fit within or over the vision panel frame and completely cover the vision panel opening in the elevator, car doors and hoistway doors.
 - (2) Grills and vision panel frames shall be secured by means of non-reversible screws or other tamper proof fasteners.
 - (3) Grills shall contain openings that shall not be larger than 19 mm (0.75 in.) in diameter.
 - (4) All cut edges shall be deburred.
 - (5) Requirements for such grills may be waived if certification is submitted that such elevator is operated manually or twenty-four (24) hour doorman service is provided. A security guard shall not be considered doorman service.
 - (6) For the purpose of this subsection (b), a vandal resistant 6 mm (0.25 in.) polycarbonate sheet, such as Lexan, in two (2) layers, one (1) on each side of the required wire glass, may be used in lieu of the metal protective.

2.14.4 Passenger and freight car doors and gates, general requirements.

Delete and revise Section 2.14.4.11 to read as follows:

2.14.4.11 Closed position of car doors or gates. Car doors or gates shall be considered to be in the closed position under the following conditions:

- (a) For horizontally sliding doors or gates, when the clear open space between the leading edge of the door or gate and the nearest face of the jamb does not exceed 25 mm (1 in.) except where car doors are provided with a car-door interlock(s), 10 mm (0.375 in.);
- (b) For vertically sliding counterweighted doors or gates, when the clear open space between the leading edge of the door or gate and the car platform sill does not exceed 25 mm (1 in.); and
- (c) For horizontally sliding center-opening doors, or vertically sliding biparting counterbalanced doors, when the door panels are within 25 mm (1 in.) of contact with each other, except where horizontally sliding center opening car doors are provided with a car door interlock(s), 10 mm (0.375 in.).

2.14.7 Illumination of car and lighting fixtures.

Delete and revise Section 2.14.7.1.4 to read as follows:

2.14.7.1.4 Each elevator shall be provided with a guarded electric light and convenience outlet fixture on the car top and under the car platform.

SECTION 2.15 **CAR FRAMES AND PLATFORMS**

2.15.8 Protection of platforms against fire.

Delete and revise Section 2.15.8 to read as follows:

2.15.8 Protection of platforms against fire. All platform materials exposed to the hoistway shall be either:

- (a) Metal; or
- (b) Other materials that, in their end use configuration, conform to the following requirements, based on the tests conducted in accordance with the requirements of ASTM E 84, UL 723 or NFPA 255:

 - (1) Flame spread rating of 0 to 50; and
 - (2) Smoke development of 0 to 100.

SECTION 2.16
CAPACITY AND LOADING

2.16.1 Minimum rated load for passenger elevators.

Add new Section 2.16.1.3.3 to read as follows:

2.16.1.3.3 Nonpermanent freight-handling equipment (Section 2.14.1.9.1) shall be removed when the elevator is used for passenger service.

SECTION 2.20
SUSPENSION ROPES AND THEIR CONNECTIONS

2.20.9 Suspension rope fastening.

Add new text to Section 2.20.9.5 to read as follows:

2.20.9.5 Wedge rope sockets. Wedge socket assemblies shall be of a design as shown in Fig. 2.20.9.5, and shall conform to Sections 2.20.9.2 and 2.20.9.3, and Sections 2.20.9.5.1 through 2.20.9.5.6. Wedge rope sockets are not permitted on counterweighted winding drum machines.

SECTION 2.21
COUNTERWEIGHTS

2.21.1 General requirements.

Delete and revise Section 2.21.1.2 to read as follows:

2.21.1.2 Retention of weight sections. Means shall be provided to retain weights in place in the event of buffer engagement or safety application or if they become broken. Where tie rods are used, a minimum of two (2) shall be provided and they shall pass through all weight sections. Tie rods shall be provided with a lock nut and a cotter pin at each end. Counterweight material shall be steel, iron or lead only and shall have a minimum melting temperature of 620°F (327°C).

2.21.4 Compensation means.

Delete and revise Section 2.21.4 to read as follows:

2.21.4 Compensation means. Except for safety hooks, where used, compensation means, such as compensating ropes or chains or other mechanical means and their attachments used to tie the counterweight and car together, shall be capable of withstanding, with a factor of safety of five (5), any forces to which the means is subjected with the elevator at rest. The maximum suspended weight of compensation means with car or counterweight at the top of its travel and one half-total weight of tension sheave assembly, where used, shall be included.

The factor of safety for compensation means shall be based on the proof load, breaking strength, or test reports.

SECTION 2.22 **BUFFERS AND BUMPERS**

2.22.4 Oil buffers.

Add new Subsections (a) and (b) to Section 2.22.4.6 to read as follows:

2.22.4.6 Means for determining oil level. Oil buffers shall be provided with means for determining that the oil level is within the maximum and minimum allowable limits. Glass sight gauges shall not be used.

(a) A fixed inclined ladder shall be provided where the top of the buffer cylinder is over 1524 mm (5 ft) in height above the pit floor.

(b) A fixed vertical or inclined ladder fitted with an inspection and maintenance platform with guard rails shall be provided where the top of the car buffer cylinder is over 2134 mm (7 ft) from the pit floor.

SECTION 2.24 **DRIVING MACHINES AND SHEAVES**

2.24.10 Means for inspection of gears.

Delete and revise Section 2.24.10 to read as follows:

2.24.10 Means for inspection of gears. Each gear case of geared machines shall have access to permit inspection of the contact surfaces of the gears.

SECTION 2.25 **TERMINAL STOPPING DEVICES**

2.25.3 Final terminal-stopping devices.

Add new Subsection (d) to Section 2.25.3.1 to read as follows:

2.25.3.1 General requirements. Final terminal-stopping devices shall conform to Section 2.25.1 and the following:

(d) Final limit switches and bracket shall be permanently secured and pinned.

SECTION 2.26 **OPERATING DEVICES AND CONTROL EQUIPMENT**

2.26.1.4 Inspection operation.

Add new Items 3 and 4 to Section 2.26.1.4.1, Subsection (c) to read as follows:

2.26.1.4.1 General requirements.

- (c) Inspection operating devices shall:
- (1) Be of the continuous-pressure type;
 - (2) Be labeled “UP” and ”DOWN,” respectively;
 - (3) A separate device of the continuous-pressure type labeled “ENABLE” shall be provided adjacent to the inspection operating devices; and
 - (4) The inspection operating devices shall become effective only when the “ENABLE” device is activated.

Delete and revise Section 2.26.1.4.2 to read as follows:

2.26.1.4.2 Top-of-car inspection operation. Top-of-car inspection operation shall conform to Section 2.26.1.4.1 and the following:

- (a) A stop switch (see Section 2.26.2.8) shall be permanently located on the car top and readily accessible to a person standing at the hoistway entrance normally used for access to the car top.
- (b) The transfer switch (see Section 2.26.1.4.1(b)) shall be located on the car top and shall be so designed as to prevent accidental transfer from the “INSPECTION” to “NORMAL” position.
- (c) The inspection operating devices (see Section 2.26.1.4.1(c)) shall be permitted to be of the portable type provided that:
 - (1) the “ENABLE” device (see Section 2.26.1.4.2(c)), and a stop switch, in addition to the stop switch required in Section 2.26.1.4.2(a) are included in the portable unit; and
 - (2) the flexible cord is permanently attached so that the portable unit cannot be detached from the car top.
- (d) Separate additional devices of the continuous-pressure type shall be permitted to be provided on the car top to make power door opening and closing and automatic car-leveling operative from the top of the car for testing purposes.

2.26.2 Electrical protective devices:

Delete and revise Section 2.26.2.5 to read as follows:

2.26.2.5 Emergency stop switch. On all elevators, an emergency stop switch shall be provided in the car, and located in or adjacent to each car operating panel. When open (“STOP” position), this switch shall cause the electric power to be removed from the elevator driving-machine motor and brake. Emergency stop switches shall:

- (a) Be of the manually opened and closed type;
- (b) Have red operating handles or buttons;
- (c) Be conspicuously and permanently marked “STOP,” and shall indicate the “STOP” and “RUN” positions; and
- (d) While opened, cause the audible device to sound (see Section 2.27.1.1.1).

Delete Section 2.26.2.21 in its entirety.

2.26.5 System to monitor and prevent automatic operation of the elevator with faulty door contact circuits.

Add the following exception to Section 2.26.5(b)(2):

Exception: When operating on Firefighters’ Service Phase II, item (b)(2) shall not be permitted.

SECTION 2.27
EMERGENCY OPERATION AND
SIGNALING DEVICES

2.27.1 Car Emergency signaling devices.

Add new text to Section 2.27.1.1.1 as follows:

2.27.1.1.1 A two-way communications means between the car and a location in the building that is readily accessible to authorized and emergency personnel shall be provided. Means shall be provided to enable two-way voice communication between the machine room and the interior of the car.

Delete and revise Section 2.27.2.4.3 to read as follows:

2.27.2.4.3 Means shall be provided adjacent to the selector switch (es) to indicate that the elevator is at the designated level with the doors in the normally open position.

2.27.3 Firefighters’ emergency operation—automatic elevators.

Delete and revise Sections 2.27.3.1.1, 2.27.3.1.2 and 2.27.3.1.3 to read as follows:

2.27.3.1.1 A two-position key-operated switch shall be:

- (a) Provided at the designated level for each single elevator or for each group of elevators;
- (b) Labeled “FIRE RECALL” and its positions marked “NORMAL” and “FIREMAN SERVICE” (in that order). The “FIRE RECALL” letters shall be a minimum of 5mm (0.25 in.) high in red or a color contrasting with a red background;
- (c) Located in the lobby within sight of the elevator or all elevators in that group and shall be readily accessible.

2.27.3.1.2 An additional key-operated “FIRE RECALL” switch, with two (2) positions, marked “NORMAL” and “FIREMAN SERVICE” (in that order), shall be permitted at the building fire control station.

2.27.3.1.3 The switch(s) shall be rotated clockwise to go from “NORMAL” to “FIREMAN SERVICE” positions. Keys shall be removable in the “NORMAL” and “FIREMAN SERVICE” positions.

Delete and revise Section 2.27.3.1.5 to read as follows:

2.27.3.1.5 All “FIRE RECALL” switches shall be provided with an illuminated visual signal (see Fig. 2.27.3.1.6(h), to indicate when Phase I Emergency Recall Operation is in effect.

Delete and revise Section 2.27.3.2 to read as follows:

2.27.3.2 Phase I fire alarm activation.

2.27.3.2.1 Smoke detectors. Except as set forth in subsection k of this section, smoke detectors installed in accordance with subsections a, b, c or d shall initiate Phase I emergency recall operation.

- (a) In buildings where a fire command station is not required or provided, a single smoke detector shall be installed in the ceiling of each elevator landing over the call button on each floor.
- (b) In buildings where a fire command station is required or provided, either of the following shall apply:
 - (1) An analog addressable smoke detector employing alarm verification shall be installed in the ceiling of each elevator landing over the call button on each floor, or

(2) Two (2) smoke detectors for cross zoning shall be installed in the ceiling of each elevator landing on each floor and spaced as follows:

(i) In an elevator landing containing one (1) or two (2) elevators, the distance between smoke detectors shall be the width of the hoistway(s) but not greater than 3048 mm (10 ft).

(ii) In an elevator landing containing three (3) or more elevators, the distance between smoke detectors shall be the distance between the centerlines of the end elevators but not greater than 6096 mm (20 ft).

(c) Associated Elevators:

(1) In associated elevator machine rooms of the buildings described in subsection (a) above, a smoke detector shall be installed.

(2) In associated elevator machine rooms of the buildings described in subsection (b) above, either of the following shall be installed:

(i) An analog addressable smoke detector employing alarm verification; or

(ii) At least two (2) smoke detectors for cross zoning spaced 6096 mm (20 ft) apart but not closer to the hoistway enclosure walls one-fourth (1/4) distance of the width of the machine room.

(d) A smoke detector shall be installed at the top of the hoistway(s) in Occupancy Group R-2 where a fire alarm system is installed or required. Smoke detectors may be installed in any other hoistway and shall be installed in hoistways that are sprinklered.

(e) Smoke detectors are not required in elevator landings at an unenclosed landing which is open to the outside air.

(f) Smoke detector:

(1) In buildings described in subsection (a) above, where a single smoke detector is installed in the elevator landing, the activation of a smoke detector in any elevator landing, other than the sky lobby, shall cause all automatic elevators servicing the floor on which the sensing device is activated to return nonstop to the designated or sky lobby level, except as modified by the commissioner.

(2) In buildings described in subsection (b) above, where either an analog addressable smoke detector or two (2) smoke detectors for cross zoning are installed, the activation of either an analog addressable smoke detector or any one of the two smoke detectors for cross zoning in any elevator lobby shall annunciate at the fire command station only with floor identification. After

verification of an alarm condition either from the analog addressable smoke detector or from the first detector of cross zoning detectors, the completion of the delayed time period of an analog addressable smoke detector or the activation of both smoke detectors for cross zoning in any elevator lobby, other than the sky lobby, shall cause all automatic elevators servicing the floor on which the sensing device is activated to return nonstop to the designated or sky lobby level, except as modified by the commissioner.

(3) In associated machine rooms described in Item 1 of subsection (c) above, the activation of the smoke detector in the elevator machine room shall cause all automatic elevators having any equipment located in that machine room, and any associated elevators of a group automatic operation, to return nonstop to the designated or sky lobby level, except as modified by the commissioner.

(4) In associated machine rooms described in Item 2 of subsection (c) above, where either an analog addressable smoke detector or two (2) smoke detectors for cross zoning are installed, the activation of either an analog addressable smoke detector or any one of the two smoke detectors for cross zoning in any elevator machine room shall annunciate at the fire command station only with floor identification. After verification of an alarm condition either from the analog addressable smoke detector or from the first detector of cross zoning detectors, the completion of the delayed time period of an analog addressable smoke detector or the activation of both smoke detectors for cross zoning in any elevator machine room shall cause all automatic elevators having any equipment located in that machine room, and any associated elevators of a group automatic operation, to return nonstop to the designated or sky lobby level, except as modified by the commissioner.

(5) In addition to the activation of mechanical ventilation if provided (Section 2.1.4), the activation of a smoke detector in any elevator hoistway shall cause all automatic elevators having any equipment located in the hoistway and any associated elevators of a group automatic operation, to return nonstop to the designated or sky lobby level. The operation of this subsection shall conform to the requirements of Section 2.27.3.1.

(g) When the lowest landing of elevators is above the designated level, such as the sky lobby level, the activation of smoke detectors in the sky lobby level or the activation of the waterflow alarm (Section 2.27.3.2.2) on the sky lobby floor shall cause such elevators to return nonstop to a floor two (2) stories above the sky lobby level or, in the absence of a stop at that floor, to the nearest landing above the sky lobby level.

(h) Elevators shall react only to the first smoke detector zone that is activated for that group.

(i) Smoke detectors and/or smoke detector systems shall not be self-resetting.

- (j) Activation of smoke detectors to initiate elevator recall shall override any automatic programming for car stops but shall not affect the other elevator safety circuits.
- (k) The following buildings shall be exempt from the requirements of this section:
- (1) Buildings where the main use or dominant occupancy is classified in Occupancy Group R-2, except that they shall comply with the requirements of Section 2.27.3.2.1(d).
 - (2) Buildings where the main use or dominant occupancy is classified in Occupancy Group R-3.
 - (3) Existing buildings with occupied floors at or below 22 860 mm (75 ft) above the lowest Fire Department vehicle access level classified in Occupancy Group E that have at least one elevator available at all times for immediate use by the Fire Department and that are in compliance with the Fire Department's regulations governing "life safety requirements for schools with students having physical disabilities."
 - (4) Existing office buildings, one hundred (100) feet or more in height and existing high-rise buildings as defined by the *New York City Building Code* equipped throughout with an automatic sprinkler system including a waterflow alarm.

2.27.3.2.2 Sprinkler waterflow alarm. In a building equipped throughout with an automatic sprinkler system, the activation of the waterflow alarm shall cause Phase I emergency recall operation to be initiated (Section 2.27.3. 1).

Delete and revise Section 2.27.3.3 to read as follows:

2.27.3.3 Phase II emergency in-car operation. A three-position ("NORMAL," "HOLD," and "FIREMAN SERVICE" in that order) key-operated switch shall be provided in an operating panel in each car. The switch shall be rotated clockwise to go from the "NORMAL" to "HOLD" to "FIREMAN SERVICE" position. It shall become effective only when the designated or sky lobby level Phase I switch (Section 2.27.3.1) is in the "FIREMAN SERVICE" position or a smoke detector or water-flow alarm has been activated, and the car has returned to the designated, sky lobby or the level designated by Section 2.27.3.2.1(g) by Phase I operation. The key shall be removable in "NORMAL" or "HOLD" position. The "NORMAL," "HOLD," and "FIREMAN SERVICE" positions shall not change the operation until the car is at a landing with the doors in the normal open position.

2.27.3.3.1 When the Phase II switch is in the "FIREMAN SERVICE" position, the elevator shall be on Phase II operation, and the elevator shall operate as follows:

- (a) The elevator shall be operable only by a designated person in the car.
- (b) All corridor call buttons and directional lanterns shall remain inoperative. Car position indicators, where provided, shall remain in service. Hall position indicators, where provided, shall remain inoperative except at the designated level, sky lobby level and the fire control station, where they shall remain in service for Fire Department operations.
- (c) Only a continuous pressure door open button shall control the opening of power-operated doors. If the button is released prior to the door reaching the normal open position, the doors shall automatically close. Section 2.13.3.3, Section 2.13.4.2.1(b)(2), and Section 2.13.4.2.1(c) do not apply. On cars with two entrances, separate door-open buttons shall be provided for each entrance if both entrances can be opened at the same landing.
- (d) Open power-operated doors shall be closed only by momentary pressure on the door close button. On cars with two entrances, a separate door-close button shall be provided for each entrance if both entrances can be opened at the same landing.
- (e) Opening and closing of power operated car doors or gates that are opposite manual swing or manual slide hoistway doors shall conform to the requirements of Section 2.27.3.3.1(c) and (d). Door opening and closing buttons shall be provided in the car-operating panel.
- (f) Door reopening devices rendered inoperative, per Section 2.27.3.1.6(e) shall remain inoperative. Full speed closing is permitted. Corridor door opening and closing buttons, if provided, shall be rendered inoperative.
- (g) Every car shall be provided with a button marked “CALL CANCEL” located in the same car operating panel as the Phase II switch, which shall be effective during Phase II operation. When activated, all registered calls shall be canceled and a traveling car shall stop at or before the next available landing.
- (h) Floor selection buttons shall be provided in the car to permit travel to all landings served by the car and they shall be operative at all times. Means that prevent the operation of the floor selection buttons or door operating buttons shall be rendered inoperative.
- (i) A traveling car shall stop at the next available landing for which a car call was registered. When a car stops at a landing, all registered car calls shall be cancelled.
- (j) The emergency stop switch shall remain operative.

2.27.3.3.2 When the Phase II switch is in the “HOLD” position, the elevator shall be on Phase II operation. The car shall remain at the landing with its doors open. The door close buttons shall be inoperative.

2.27.3.3.3 When the Phase II switch is in the “NORMAL” position, the elevator is not at the designated or sky lobby level and Phase I is in effect, the elevator shall operate as follows.

- (a) Automatic power-operated horizontally-sliding doors shall close automatically and the car shall revert to Phase I operation (Section 2.27.3.1) upon completion of door closing. All door reopening devices shall remain inoperative. Door open buttons shall remain operative. Full speed closing is permitted. If the Phase II switch is turned to the “FIREMAN SERVICE” or “HOLD” position prior to the completion of door closing, the doors shall reopen.
- (b) Elevators having power operated vertically sliding doors shall have corridor door open and close buttons rendered operative. All door reopening devices shall remain inoperative. Door closing shall be in accordance with the requirements of Section 2.27.3.3.1(d) Full speed closing is permitted. If the Phase II switch is turned to the “FIREMAN SERVICE” or “HOLD” position prior to the completion of door closing, the doors shall reopen. The car shall revert to Phase I operation (Section 2.27.3.1) upon completion of door closing.
- (c) Elevators having manual doors shall revert to Phase I operation (Section 2.27.3.1) upon completion of door closing.

2.27.3.3.4 When the Phase II switch is in the “NORMAL position and the car is not at the designated or the sky lobby level, and Phase I is not in effect, the car shall remain at the landing with the doors open and door-close buttons inoperative and shall remain in Phase II.

2.27.3.3.5 Elevators shall be removed from Phase II operation only when:

- (a) The Phase II switch is in the “NORMAL” position and the car is at the designated or sky lobby level with the doors in the normal open position; or
- (b) The Phase II switch is in the “NORMAL” position when Phase I is in effect at the designated or sky lobby level with the doors in the normal open position.

2.27.3.3.6

- (a) For all elevators, applications filed after March 12, 1991 (the effective date of adoption of Cal #1 1-91-BCR), that propose the installation, alteration or change of controller, elevator machinery and any other work, excluding minor alteration and ordinary repairs, and applications filed for new elevators, the cost of which exceeds \$10,000 per car over twelve-month period, shall comply with the requirements of this subsection.
- (b) In elevators complying with the requirements of subsection (a) above, a three-position switch labeled “NORMAL,” “HOLD,” and “FIREMAN SERVICE” shall be required to replace the existing two-position switch (“NORMAL” and “FIREMAN

SERVICE”). The new “HOLD” position shall be marked by engraving or by affixing a permanent label to the operating panel of the elevator.

2.27.4 Firefighters’ emergency operation nonautomatic elevators.

Delete and revise Section 2.27.4.1 to read as follows:

2.27.4.1 Phase I emergency recall operation. A two-position key-operated switch shall be provided at the designated or the sky lobby level only for each single elevator or for each group of elevators. The two-position switch shall be “NORMAL” and “FIREMAN SERVICE” (in that order). The commissioner with the concurrence of the fire commissioner may allow an additional two-position key-operated switch marked “NORMAL” and FIREMAN SERVICE” (in that order) at another location. However, it shall not affect Phase I operation if the designated-level or sky lobby level smoke detector or waterflow alarm has been activated. The switch(es) shall be rotated clockwise to go from the “NORMAL” to “FIREMAN SERVICE” position. All keys shall be removable from any position.

No device, other than Phase I switch(es), smoke detectors in the elevator lobbies, machine room, or hoistway, or a waterflow alarm in lieu of smoke detectors in the elevator lobbies, shall initiate Phase I operation.

When all switches are in the “NORMAL” position, normal elevator service shall be retained and operation from the smoke detectors or waterflow alarm required shall be functional.

When a Phase I switch is in the “FIREMAN SERVICE” position, a visual and audible signal shall be provided to alert the attendant to return nonstop to the designated or sky lobby level. The visual signal shall read “FIRE RECALL – RETURN TO” {insert level to which the car should be returned (the designated level or sky lobby level)}. The smoke detectors or waterflow alarm shall be activated when Phase I is in effect.

Delete and revise Section 2.27.4.2 to read as follows:

2.27.4.2 Phase I smoke detectors or waterflow alarm devices activation. Smoke detectors shall be installed in accordance with the requirements of Section 2.27.3.2 Phase I operation and shall be initiated when either any smoke or waterflow alarms are activated.

- (a) When the lowest landing of elevators is above the designated level, such as the sky lobby level, the activation of smoke detectors or a waterflow alarm in the sky lobby or sky lobby floor shall cause such elevators to return nonstop to a floor two stories above the sky lobby level or in the absence of a stop at that floor, to the nearest landing above the sky lobby level.
- (b) Elevators shall react only to the first smoke detector zone that is activated for that group.

- (c) Smoke detectors and/or smoke detector systems shall not be self-resetting.
- (d) Activation of smoke detectors to initiate elevator recall shall override any automatic programming for car stops but shall not affect the other elevator safety circuits.
- (e) The buildings described in Section 2.27.3.2(1)(k) and meeting its requirements and buildings equipped throughout with an automatic sprinkler system are exempt from the requirements of this section.

2.27.5 Firefighters' emergency operation automatic elevators with designated attendant operation.

Delete and revise Section 2.27.5.2 to read as follows:

2.27.5.2 When operated by a designated attendant in the car (except hospital emergency service):

- (a) Elevators parked at a floor shall conform to the requirements of Section 2.27.3.1. At the completion of a time delay of not less than fifteen (15) seconds nor more than sixty (60) seconds, elevators shall conform to the requirements of Section 2.27.3. There shall be no delay when the car is at the designated level.
- (b) A moving car shall conform to the requirements of Section 2.27.3.

Add three new Subsections 2.27.5.3.1, 2.27.5.3.2 and 2.27.5.3.3 to read as follows:

2.27.5.3.1 Hospital emergency service recall operation. When hospital emergency service is provided, a two-position key-operated corridor call (Hospital Emergency Service) switch shall be provided at one or more landings to activate the special control function by authorized or designated personnel. The two-position switch shall be marked "NORMAL" and "HOSPITAL EMERGENCY SERVICE." Keys shall be removable only in the "NORMAL" position.

When the switch is in the "HOSPITAL EMERGENCY SERVICE" position:

- (a) All patient elevator cars equipped with the special control function shall override normal automatic operating modes for immediate recall of the patient elevator(s) to the landing at which the call is registered.
- (b) On patient elevator cars with two entrances, if both entrances can be opened at the designated level, the doors serving the corridor where the two-position hospital emergency service switch is located shall open and remain open.
- (c) A patient elevator car traveling away from the designated level shall reverse at or before the next available landing without opening its doors.

- (d) A patient elevator car stopped at a landing other than the designated level, with the doors open and in-car emergency stop switch in the run position, shall close the doors without delay and proceed to the designated level.
- (e) A visual and audible signal shall be activated within the patient elevator car to alert the passengers and/or attendant operator that the “hospital emergency service” function has been activated.
- (f) Upon arrival at the registered call landing, power operated doors shall open automatically and remain in the open position for a predetermined adjustable time period to allow the authorized personnel sufficient time to activate the “in- car” special operation function.
- (g) If the Phase I (Section 2.27.3.1) recall mode is initiated while the elevator is under “hospital emergency service” recall mode and “in-car” hospital emergency service is not activated, the elevator shall revert to Phase I (Section 2.27.3.1) operation.
- (h) Hospital emergency service corridor recall shall not override fire emergency Phase I (Section 2.27.3.1) or Phase II (Section 2.27.3.3) operation in effect.

2.27.5.3.2 Hospital emergency service in-car operation. A two-position “NORMAL” and “HOSPITAL EMERGENCY SERVICE” key-operated switch shall be provided in an operating panel inside the patient elevator(s) to activate the “hospital emergency service,” a special independent operating mode. The switch shall be rotated clockwise to go from the “NORMAL” to “HOSPITAL EMERGENCY SERVICE” position. It shall become effective only when the designated level corridor call “hospital emergency service” switch is in the “HOSPITAL EMERGENCY SERVICE” position and the car has returned to the designated level by “hospital emergency service” recall operation.

When the “in-car” switch is in the “HOSPITAL EMERGENCY SERVICE” position, the patient elevator shall be on hospital emergency service operation, and the patient elevator shall operate as follows:

- (a) The patient elevator shall be operable only by a designated person in the car.
- (b) Activation of the “in-car” operating mode shall remove the patient elevator from normal automatic and/or attendant service.
- (c) The patient elevator(s) shall not be recalled under Phase I (Section 2.27.3.1) operation after the activation of “in-car” operation mode.
- (d) Doors shall remain open until the authorized person registers the car call and initiates the door closing function.
- (e) The patient elevator shall travel directly to the selected landing, overriding normal corridor call demand or Phase I (Section 2.27.3.1) recall and shall automatically open

the doors upon the arrival at the selected landing, except when the smoke detector(s) are activated on the selected landing or the waterflow alarm is activated on that floor. In such case, before the patient elevator has reached the selected landing, the patient elevator shall stop at a floor two stories below the selected landing or in the absence of a stop at that floor, at the nearest landing below the selected landing.

(f) When the patient elevator reaches the selected floor and the smoke detector(s) are activated on that landing or the waterflow alarm is activated on that floor before the doors are open, the patient elevator, without opening the doors, shall travel to a floor two stories below the selected landing or in the absence of a stop at that floor, to the nearest landing below the selected landing.

(g) Doors shall remain open with the audible and visual signal functioning until the “in-car” switch is turned to the “NORMAL” position or for a predetermined adjustable time period to allow the removal of patients from the car and the patient elevator is placed into automatic, attendant or Phase I (Section 2.27.3. 1) if in effect, operating mode.

(h) Upon transfer from “HOSPITAL EMERGENCY SERVICE” back to normal operation during a fire emergency and Phase I (Section 2.27.3.1) is in effect, the patient elevator shall be automatically recalled to the designated level.

2.27.5.3.3 Hospital emergency service switches color. The color of the Hospital Emergency Service switches located in the corridor at the designated level and inside the patient elevator(s) operating panel shall be blue.

Delete Section 2.27.7 in its entirety.

Delete and revise Section 2.27.8 to read as follows:

2.27.8 Switch keys. The switches required by Section 2.27.2 through Section 2.27.5 for all elevators in a building shall be operable only by a citywide standard key 2642 and the New York City Fire Department standard key. The citywide standard key shall be designed in accordance with the requirements of the Fire Department and shall be obtained only through Fire Department authorization. Citywide standard keys shall be kept on the premises by a person responsible for the maintenance and operation of the elevators in a location readily accessible to authorized persons in an emergency, but not where they are available to the public.

SECTION 2.29 **IDENTIFICATION**

Delete and revise Section 2.29.1 to read as follows:

2.29.1 Identification of equipment. Each elevator shall be assigned a unique numerical identification, a minimum of 6 mm (0.25 in.) in height. The identification number shall be applied to the following locations:

- (a) The driving machine;
- (b) MG and/or transformers set;
- (c) Controller;
- (d) Selector;
- (e) Governor;
- (f) Main line disconnect switch;
- (g) The crosshead, or where there is no crosshead, the car frame, such that it is visible from the top of the car;
- (h) The car operating panel, minimum of 13 mm (0.5 in.) in height;
- (i) Adjacent to or on every elevator entrance at the designated level, minimum of 75 mm (3 in.) height; and
- (j) Each bank of elevators shall be identified by an alphabetic letter.

Add new Section 2.29.1.1 to read as follows:

2.29.1.1 New York City identification number. Each elevator shall be assigned a unique numerical identification, engraved into a metal tag, in block type, with a minimum of 6 mm (0.25 in.) in height, and securely attached in a permanent manner. The city identification number shall be applied to the following locations:

- (a) The driving machine;
- (b) MG and/or Transformers set;
- (c) Controller;
- (d) Main line disconnect switch;
- (e) The crosshead, or where there is no crosshead, the car frame, such that it is visible from the top of the car;
- (f) The car operating panel (main panel only).

PART 3
HYDRAULIC ELEVATORS

SECTION 3.7
MACHINE ROOMS AND MACHINERY SPACES

Delete and revise first paragraph of Section 3.7 to read as follows:

Machine rooms and machinery spaces shall conform to Section 2.7.1 through Section 2.7.5 and Section 2.7.7 and shall be vented to the outside air naturally or mechanically.

SECTION 3.26
OPERATING DEVICES AND CONTROL EQUIPMENT

3.26.3 Anticreep and leveling operation.

Delete and revise Section 3.26.3.1.2 to read as follows:

3.26.3.1.2 The anticreep device shall maintain the car within 13 mm (0.5 in) of the landing irrespective of the position of the hoistway door.

PART 4
ELEVATORS WITH OTHER TYPES OF
DRIVING MACHINES

SECTION 4.3
HAND ELEVATORS

Delete Section 4.3 in its entirety.

PART 5
SPECIAL APPLICATION ELEVATORS

SECTION 5.2
LIMITED-USE/LIMITED-APPLICATION ELEVATORS

5.2.1 Electric limited-use/limited-application elevators.

Delete and revise Section 5.2.1.13 to read as follows:

5.2.1.13 Power operation of hoistway doors and car doors. When provided, power operation, power opening, and power closing of hoistway doors and car doors shall conform to Section 2.13, except as modified by Section 5.2.1.13.

(a) Requirement of Section 2.13.1(b) is modified as follows: Power-operated swing hoistway doors shall not be permitted.

(b) Requirement of Section 2.13.2.2.3 does not apply.

(c) Requirement of Section 2.13.3.4 does not apply.

(d) Requirement of Section 2.13.6 does not apply.

Delete and revise Subsection (b) of Section 5.2.1.16.1 to read as follows:

5.2.1.16.1 Rate load and platform area.

(b) The inside net platform area shall not exceed 1.67 m² (18 ft²) and in no event shall be less than 1219 mm by 1219 mm (4 ft by 4 ft) with a minimum 812 mm (32 in.) clear door opening. The car operating panel shall be on the strike wall.

PART 6
ESCALATORS AND MOVING WALKS

SECTION 6.1
ESCALATORS

6.1.1 Protection of floor openings.

Delete and revise Section 6.1.3.3.5 to read as follows:

6.1.3.3.5 Clearance between skirt and step. The clearance on either side of the steps between the step and the adjacent skirt panel shall not be more than 4 mm (0.16 in.), and the sum of the clearances on both sides shall be not more than 7 mm (0.28 in.).

Add new text to Subsection (c) of 6.1.3.3.6 to read as follows:

6.1.3.3.6 Skirt panels.

(c) The exposed surfaces of the skirt panels adjacent to the steps shall be smooth and made from a low friction material, or permanently treated with a friction-reducing material. Untreated surfaces, such as porcelain, enameled steel bronze, or stainless steel, are not acceptable.

Delete Section 6.1.3.3.7 in its entirety.

Delete and revise Section 6.1.3.3.8 to read as follows:

6.1.3.3.8 Skirt deflector devices. Deflector devices shall be required and extend from skirt panels parallel to the escalator path of travel. Means to secure such deflector devices are required to be on the exposed surface of the skirt. Any exposed fastener heads shall be of the tamper-resistant type and flush to within 1 mm (0.04 in.).

Delete and revise Section 6.1.3.5.4 to read as follows:

6.1.3.5.4 Clearance between step threads. The maximum clearance between step treads on the horizontal run shall be 6 mm (0.25 in.). (See Appendix I of ASME A17.1a, Fig. I7)

Delete and revise Section 6.1.6.3.6 to read as follows:

6.1.6.3.6 Skirt obstruction device. Means shall be provided to cause the electric power to be removed from the escalator driving machine motor and brake, if an object becomes caught between the step and the skirt as the step approaches the upper combplate, intermediate device or lower comb plate. On units having a run of 6096 mm (20 ft) or more, intermediate devices shall be provided on both sides of the escalator with devices located at intervals of 3048 mm (10 ft) or less. The activation of an intermediate device shall stop the escalator at a rate not greater than 914 mm (3 ft) per second squared in the direction of travel. The upper and lower skirt devices shall be located so that the escalator will stop before that object reaches the comb plate. The activation of any skirt device shall stop the escalator when a load equal to the brake rated load is applied while the escalator is running.

Delete and revise Section 6.1.6.3.13 to read as follows:

6.1.6.3.13 Comb-step impact devices. Devices of the manual reset type shall be provided that will cause the opening of the power circuit to the escalator driving machine motor and brake if either:

- (a) A horizontal force greater than 1780 N (400 lbf) in the direction of travel is applied at either side, or greater than 3560 N (800 lbf) is applied at the center of the front edge of the comb plate ; or
- (b) A resultant vertical force greater than 268 N (60 lbf) in the upward direction is applied at the center of the front of the comb plate.

Add new Section 6.1.6.3.16 to read as follows:

6.1.6.3.16 Service ports. Service ports used for diagnostic purposes or for resetting faults, shall be placed in a location accessible only to elevator personnel.

Add new Section 6.1.6.3.17 to read as follows:

6.1.6.3.17 Phase protection of motors. Escalators having a polyphase alternating current power supply shall be provided with means to remove power from the drive motor and brake if a reversal of phase rotation, or phase failure of the incoming polyphase alternating-current power occurs.

Delete and revise Section 6.1.6.9.2 to read as follows:

6.1.6.9.2 Additional signs and monitors. Signs and monitors in addition to those required by Section 6.1.6.9.1 relating to cautions or warnings applying to escalator passengers, when provided, shall be in a readily visible location, and limited to conveying any additional cautions and/or warnings. The additional signs and monitors shall be prohibited in the area starting from 3000 mm (118 in.) horizontally outward from the end of the newel and to the point where the steps start to move vertically. Its location shall not impede or otherwise cause persons about to board the escalator to suddenly pause or stop. The sign shall comply with ANSI Z535.2.

Add new Section 6.1.6.9.3 to read as follows:

6.1.6.9.3 Additional signs or graphics. Signs or graphics other than those specified in Section 6.1.6.9.1 and Section 6.1.6.9.2 shall not be permitted adjacent to the escalator in such a manner that obstructs boarding passenger view of the signs required in Section 6.1.6.9.1, obstructs or reduces passenger access to the handrails, within the safety zone (see Section 6.1.3.6.4), nor on the escalator except for signs, graphics, manufacturer's identification, owner's identification or markings. They shall not be distracting, create passenger flow hazards, or impair function of safety devices. Step riser signs or graphics, and handrail signs or graphics are not permitted.

Add new Section 6.1.9 to read as follows:

6.1.9 New York City identification number. Each escalator shall be assigned a unique numerical identification a minimum of 6 mm (0.25 in) in height. The city identification number shall be applied on the right hand side, facing the newel, at the top and bottom of the escalator as well as the following locations:

- (a)* The driving machine;
- (b)* Controller;
- (c)* Main line disconnect switch.

Add new Section 6.1.9.1 to read as follows:

6.1.9.1 Building identification number. Each escalator shall be assigned a unique alphabetical or numerical identification, a minimum of 6 mm (0.25 in) in height. The building identification number shall be applied on the exterior, clearly visible, at the top or bottom of the escalator.

Delete and revise Section 6.2.6.3.11 to read as follows:

6.2.6.3.11 Comb-pallet impact devices. Devices of the manual reset type shall be provided that will cause the opening of the power circuit to the moving walk driving-machine motor and brake if either:

(a) A horizontal force greater than 1780 N (400 lbf) in the direction of travel is applied at either side, or greater than 3560 N (800 lbf) is applied at the center of the front edge of the combplate; or

(b) A resultant vertical force greater than 268 N (60 lbf) in the upward direction is applied at the center of the front of the combplate.

Add new Section 6.2.6.3.13 to read as follows:

6.2.6.3.13 Phase protection of motors. Moving walks having a polyphase alternating current power supply shall be provided with means to remove power from the drive motor and brake if a reversal of phase rotation, or phase failure of the incoming polyphase alternating-current power occurs.

Add new Section 6.2.6.3.14 to read as follows:

6.2.6.3.14 Service ports. Service ports used for diagnostic purposes or for resetting faults, shall be placed in a location accessible only to elevator personnel.

Add new Section 6.2.6.8.3 to read as follows:

6.2.6.8.3 Additional signs or graphics. Signs or graphics other than those specified in Sections 6.2.6.8.1 and 6.2.6.8.2 shall not be permitted adjacent to the walk in such a manner that obstructs boarding passenger view of the signs required in Section 6.2.6.9.1, obstructs or reduces passenger access to the handrails, within the safety zone, nor on the moving walk except for signs, graphics, manufacturer's identification, owner's identification, or markings required by the *New York City Building Code*. They shall not be distracting, create passenger flow hazards, or impair function of safety devices. Handrail signs or graphics are not permitted on the moving walk.

Add new Section 6.2.9 to read as follows:

6.2.9 New York City identification number. Each moving walk shall be assigned a unique numerical identification a minimum of 6 mm (0.25 in) in height. The city identification number shall be applied on the right hand side, facing the newel, at both ends of the moving walk as well as the following locations:

(a) The driving machine;

(b) Controller;

(c) Main line disconnect switch.

Add new Section 6.2.9.1 to read as follows:

6.2.9.1 Building identification number. Each moving walk shall be assigned a unique alphabetical or numerical identification, a minimum of 6 mm (0.25 in) in height. The building identification number shall be applied on the exterior, clearly visible, at either end of the moving walk.

PART 7
DUMBWAITERS AND MATERIAL LIFTS

SECTION 7.4
MATERIAL LIFTS WITHOUT AUTOMATIC
TRANSFER DEVICES

7.4.2 Classification

Delete and revise Section 7.4.2 to read as follows:

7.4.2 Classification of material lifts.

(a) Type A Material Lifts shall conform to ASME B20. 1.

(b) Type B Material Lifts are not permitted.

SECTION 7.5
ELECTRIC MATERIAL LIFTS WITHOUT
AUTOMATIC TRANSFER DEVICES

7.5.1.2 Car doors and gates.

Delete and revise Section 7.5.1.2.1 to read as follows:

7.5.1.2.1 Requirement Section 2.14.4.1 applies to Type A Material Lifts.

7.5.3 Capacity and loading.

Add new Section 7.5.3.5 to read as follows:

7.5.3.5 The maximum capacity shall be 1134 kg. (2500 lbs.) at 23 kg/m² (50 lbs. per square ft).

7.5.5 Speed governors.

Delete and revise Section 7.5.5.1 to read as follows:

7.5.5.1 The requirements of Section 2.18.1 apply, except the rated speed shall be modified to read 0.125m/s (25 ft/min).

7.5.12 Operating devices and control equipment.

Delete and revise Section 7.5.12.1.5 to read as follows:

7.5.12.1.5 The requirements of Section 2.26.2.5 do not apply. An emergency stop switch (switches) conforming to Section 2.26.2.5 (a), (b), and (c) shall be provided to stop operation of the material lift, and the door and gate operation (if power operated). The emergency stop switch shall be located in each hall station.

Delete and revise Section 7.5.12.1.10 to read as follows:

7.5.12.1.10 The requirement of Section 2.26.2.15 applies.

PART 8
GENERAL REQUIREMENTS

SECTION 8.1
SECURITY

8.1.2 Group 1: Restricted.

Add new Note (p) to Section 8.1.2 to read as follows:

(p) The requirements of Section 2.14.1.10 and Section 5.1.11.1.2(d), side emergency exit doors apply.

8.1.4 Group 3: Emergency operation.

Delete and revise Section 8.1.4 to read as follows:

8.1.4 Group 3: Emergency operation. Group 3 covers access or operation of equipment by fire fighters and emergency personnel. This key shall be a citywide standard key 2642 as defined by the New York City Fire Department.

SECTION 8.4
ELEVATOR SAFETY REQUIREMENTS FOR
SEISMIC RISK ZONE 2 OR GREATER

8.4.4 Car enclosures, car doors and gates and car illumination.

Delete Section 8.4.4 in its entirety.

SECTION 8.6
MAINTENANCE, REPAIR, AND REPLACEMENT

Delete and revise section 8.6.4.6 to read as follows:

8.6.4.6 Brakes

8.6.4.6.1 The driving-machine brake shall be maintained annually to ensure proper operations, including, but not limited to the following:

(a) residual pads (anti-magnetic pads);

(b) lining and running clearances;

(c) pins and levers;

(d) springs;

(e) sleeves and guide bushings;

(f) discs and drums; and

(g) brake coil and plunger.

8.6.4.6.1.1 Brake maintenance shall be entered in the maintenance records.

8.6.4.6.1.2 A metal tag indicating the elevator maintenance company and date of service shall be attached to the elevator controller.

8.6.4.6.2 If any part of the driving machine brake is changed or adjusted that can affect the holding capacity or decelerating capacity of the brake when required (see Section 2.24.8.3), it shall be adjusted and checked by means that will verify its proper function and holding capacity.

8.6.4.10 Refastening or resocketing of car hoisting ropes on winding-drum machines.

Delete and revise Section 8.6.4.10.1 to read as follows:

8.6.4.10.1 General.

(1) The hoisting ropes of elevators having winding-drum driving-machines with 1:1 roping, if of the babbitted rope socket type, shall be resocketed at intervals no longer than:

(a) One (1) year, for machines located over the hoistway;

(b) Two (2) years, for machines located below or at the side of the hoistway;

(c) Four (4) years, for all counterweight cable ends of drum machines;

- (2) In addition to the foregoing requirements, rope fastenings shall be resocketed when an inspection reveals any evidence of failure at the shackle regardless of the period of time since last re-shackling.
- (3) Where auxiliary rope-fastening devices conforming to the requirements of Section 2.20.10 or where car hoist ropes with an additional approved type emergency clamping devices are installed, refastening at the period specified is not required provided that, where such devices are installed, all hoisting ropes shall be refastened on the failure or indication of failure of any rope fastening. Wedge clamp shackles shall not be used on drum machines.
- (4) Where the elevator is equipped with a drum counterweight, the fastenings shall be examined for fatigue or damage at the socket. Where fatigue or damage is detected, the ropes shall be refastened in conformance with Section 8.6.4.10.2.

Delete and revise Section 8.6.4.10.3 to read as follows:

8.6.4.10.3 Tags. A legible metal tag shall be securely attached through one of the tapered rope sockets during each resocketing, (as shown in the diagram below) and shall bear the following information:

- (a) The name of the person or firm who performed the resocketing and;
- (b) The date on which the rope was resocketed. The material and marking of the tags shall conform to Section 2.16.3.3, except that the height of the letters and figures shall be not less than 1.5 mm (0.0625 in.).

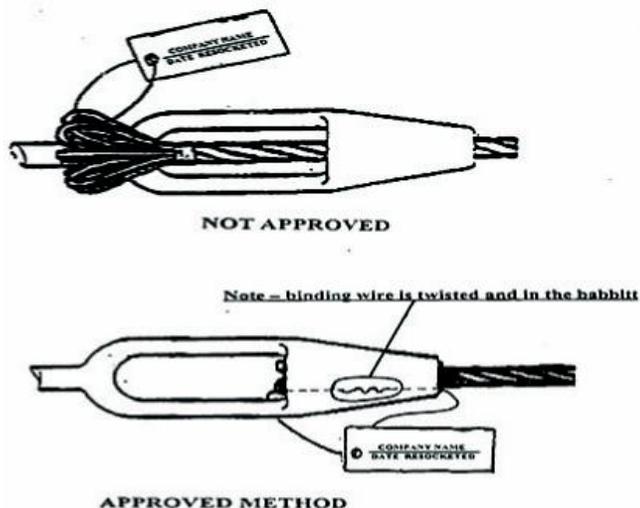

Diagram 8.6.4.10.3

8.6.8.3 Step/skirt performance index.

Delete Section 8.6.8.3 in its entirety.

SECTION 8.7
ALTERATIONS

8.7.2 Alterations to electric elevators.

Delete and revise subsection 8.7.2.10.1(c) to read as follows:

(c) Where an alteration is made to any hoistway entrance, it shall conform to Sections 2.11.3, 2.11.5, 2.11.6.5, 2.11.7, 2.11.8, and 8.7.2.10.5. The entire installation shall also conform to Sections 2.12 and 2.13.

Add new subsection 8.7.2.10.6

8.7.2.10.6 Intermediate hoistway entrances placed out of service. Where permitted by the *New York City Building Code*, an intermediate hoistway entrance placed out of service shall comply with the following:

- (a) Interlocks shall remain in the safety circuit with door panel(s) separately secured in closed position on the hoistway side.
- (b) Eliminate the capability of automatic elevators from opening the car doors at the floor placed out of service.
- (c) Egress and firefighters' service shall not be compromised.
- (d) Associated labeling and signaling shall be removed.

Delete and revise Section 8.7.2.13, Subsection (c) to read as follows:

8.7.2.13 Door reopening device.

(c) When firefighters' emergency operation is provided, door reopening devices and door closing during Phase I and Phase II shall comply with the requirements applicable at the time of installation or alteration.

8.7.2.14 Car enclosures, car doors, and gates and car illumination.

Delete and revise Section 8.7.2.14.1 to read as follows:

8.7.2.14.1 Where an alteration consists of the installation of a new car, the installation shall conform to Sections 2.12.6, 2.14, 2.15, and 2.17 (see also Section 8.7.2.15.1).

Delete and revise Subsection (e) of Section 8.7.2.14.2 to read as follows:

8.7.2.14.2

(e) Side emergency exits may be permanently fixed in the closed position provided that the corresponding side emergency exit on an adjacent car shall also be fixed in the closed position. The installation shall conform to Section 2.12.6.

Delete and revise Section 8.7.2.14.3, Subsection (b), Item (2) to read as follows:

8.7.2.14.3

(2) Smoke development of 0 to 100.

8.7.2.17 Change in travel or rated speed.

Add new Items (4) and (5) to 8.7.2.17.1, Subsection (c) to read as follows:

8.7.2.17.1 Increase or decrease in travel.

(4) Where the only hoistway alteration is the decrease in travel at the upper end of the travel, the installation shall be modified as follows:

(i) Terminal stopping devices shall be provided based on the new top terminal landing location and the final limit switch shall be of the manual reset type.

(ii) A key controlled switch shall be provided in accordance with Section 8.1.5 (i.e., Group 1) requirements to by-pass the new top terminal stopping devices, when the elevator transfer switch is placed in the top-of-car inspection operation position, for access to the hoistway above the terminal landing.

The switch shall be manually operated, be labeled "Terminal By-Pass," and shall have two (2) positions; by-pass and normal.

The switch shall be located in the hoistway, in the vicinity of the terminal limits and shall be accessible to a person standing on the car top. The car transfer switch shall not be removed from the top-of-car inspection operation position until the terminal limit by-pass switch is placed in the Normal position.

(iii) Existing terminal stopping devices shall remain functional. The hoistway door electro-mechanical safety interlocks shall remain in the safety circuit and locked with door panel(s) separately secured in closed position on the hoistway side.

(iv) Associated floor labeling and signaling shall be removed.

(5) For manually operated elevators, as an exception to Item 4, the hoist ropes shall be extended and the upper limit switches shall be lowered to the new top terminal landing. Access for maintenance and inspection of the equipment at the top of the hoistway shall be provided.

8.7.2.25 Driving machines and sheaves.

Delete and revise Subsection (a) of Section 8.7.2.25.1 to read as follows:

8.7.2.25.1 Alterations to driving machines and sheaves.

(a) Where a driving machine is installed as part of an alteration, the installation shall conform to Sections 2.7.2.2, 2.9, 2.10.1, 2.19, 2.20, 2.24, and 2.26.8. The requirements of Sections 2.7.2.2 and 2.19 shall apply only to the extent that the existing installation permits.

8.7.2.27 Operating devices and control equipment.

Delete and revise Subsection (a) of Section 8.7.2.27.4 to read as follows:

8.7.2.27.4 Controllers.

(a) Where a controller is installed as part of an alteration, it shall conform to Sections 2.22, 2.25, 2.26.1.4, 2.26.1.5, 2.26.4 through 2.26.9, and 2.27.2 through 2.27.8.

Delete and revise Subsection 8.7.2.27.5(e) to read as follows:

8.7.2.27.5 Change in type of motion control.

(e) Ascending car overspeed protection and unintended car movement protection shall conform to Section 2.19 to the extent that the existing installation permits. Where hoisting machinery is retained or altered in such a way that makes the installation of an emergency braking system per Section 2.19.3 impossible, conformance with Section 2.19 is not required.

SECTION 8.8 **WELDING**

8.8.1 Qualification of welders.

Delete and revise Section 8.8.1 read as follows:

8.8.1 Qualification of welders. Where required elsewhere in the *New York City Building Code*, welding of parts, except for tack welds later incorporated into finished welds, shall be undertaken:

(a) by welders qualified in accordance with the requirements of Section 5 of AWS D1.1, whereby the welders shall be qualified by the manufacturer or contractor; a professional consulting engineer; or a recognized testing laboratory; and

(b) as per department rules.

SECTION 8.10 **ACCEPTANCE INSPECTIONS AND TESTS**

8.10.1 General requirements for acceptance inspections and tests.

Delete and revise Section 8.10.1.1.3 to read as follows:

8.10.1.1 Persons authorized to make inspections and tests.

8.10.1.1.3 The inspector shall be a special inspector who meets the qualifications prescribed by rule of the department.

8.10.2. Inspection and test requirements for new installations.

Delete and revise Subsection (o) of Section 8.10.2.2.2 to read as follows:

8.10.2.2.2 Machine room.

(o) Braking System. For passenger elevators and all freight elevators, the brake shall be tested for compliance with applicable requirements. A test of the brake shall be made with 125 percent of load. When the car returns to one of the lower landings, the main line switch shall be pulled while the car is running at inspection speed to ensure the brake has set and holds the load. The driving machine shall safely lower, stop, and hold the car with this load. Freight elevators of class C-2 loading shall sustain and level the elevator car. (Section 2.16.6) (Item 2.15 of ASME A17.2).

(1) Braking system (Section 2.24.8.2.2).

(2) Electromechanical brake (Section 2.24.8.3).

8.10.4 Acceptance inspection and tests of escalators and moving walks.

Delete and revise Subsection (p) of Section 8.10.4.1.1 to read as follows:

8.10.4.1.1 External inspection and tests.

(p) Skirt Panels (Items 1.17 and 3.17 of ASME A17.2)

(1) Clearance between skirt and steps (Section 6.1.3.3.5 or Section 6.2.3.3.5(a), and Section 6.2.3.3.6(a)).

(2) Height above step (Section 6.1.3.3.6(a) or Section 6.2.3.3.5(b), and Section 6.2.3.3.6(b)).

(3) Deflection (Section 6.1.3.3.6(b) or Section 6.2.3.3.6(c)).

(4) Smoothness (Section 6.1.3.3.6(c) or Section 6.2.3.3.6(d)).

8.10.5 Acceptance inspection and tests of other equipment.

Delete Section 8.10.5.3 in its entirety.

SECTION 8.11 **PERIODIC INSPECTIONS AND TESTS**

8.11.1 General requirements for periodic inspections and tests.

Delete and revise Section 8.11.1.1 to read as follows:

8.11.1.1 Persons authorized to make inspections and tests. The inspector shall be a special inspector who meets the qualifications prescribed by rule of the department.

Delete and revise Section 8.11.1.3 to read as follows:

8.11.1.3 Periodic inspection and test frequency. See Chapter 3 of Title 28 of the *Administrative Code*.

(NOTE: Required intervals for periodic inspections and tests can be found in Table N1 as modified by this appendix.)

Delete and revise Section 8.11.1.4 to read as follows:

8.11.1.4 Installation placed out of service. An installation placed out of service permanently or temporarily so that it cannot be operated for a definite period shall comply with the following requirements:

8.11.1.4.1 Elevators not in use but available for service. Elevators not in use but available for service are those elevators whose power feed line has been disconnected by opening the main line switch. All required tests shall be regularly performed and a periodic inspection shall be made, and fees shall be paid pursuant to the *New York City Building Code*. An elevator inspector shall verify that these tests and inspections are being performed, and that the power was interrupted.

8.11.1.4.1.1 Elevators placed out of service (dismantled). Elevators that are dismantled shall have power feed lines disconnected from the main line disconnect switch and shall meet the requirements of subsections (a) or (b), below:

- (a) An electric elevator, dumbwaiter, sidewalk elevator or material lift whose suspension ropes have been removed, whose car and counterweight rest at the bottom of the hoistway, and whose hoistway doors have been permanently barricaded or sealed in the closed position on the hoistway side; or
- (b) A hydraulic elevator, dumbwaiter, sidewalk elevator or material lift whose car rests at the bottom of the hoistway; whose pressure piping has been disassembled and a removed from the premises; whose hoistway doors have been permanently barricaded or sealed in the closed position.

In addition, an application to dismantle the elevator shall be filed with the department and an inspection fee charged. Thereafter, one (1) additional inspection per year shall be made to verify that the status is unchanged and fees shall be paid for such inspection. Before the installation is put back in service, an application to restore service shall be filed with the department. For access to the bottom of the hoistway, the requirements of Section 8.11.1.4.1.2(b)(4) shall apply.

8.11.1.4.1.2 Elevators removed and permanently discontinued – one elevator shaftway. When a single elevator with one elevator shaftway is removed and permanently discontinued, an application shall be filed with the department and inspection fees charged. Such process shall meet the following requirements:

- (a) If it is proposed to extend the floor at every story of the building, the new construction shall be the same or of similar construction as the existing adjacent floor and of equivalent or better fire resistive rating. All hoistway equipment shall be completely removed; rails may remain.
- (b) If the hoistway shaft is to remain open:
 - (1) All hoistway equipment shall be completely removed; rails may remain. Except as provided in Item 4, all door and window assemblies opening onto masonry shaftway and masonry enclosed associated machine rooms shall be completely removed and the open space so created shall be filled with the same or similar material of equal thickness and of equivalent or better fire-resistive rating as the adjacent masonry.
 - (2) Except as provided in Item 3, all door and window assemblies opening onto the hoistway shaft that were originally enclosed with an open wire screen and subsequently enclosed with other than masonry units (i.e., metal lath and plaster or transit boards) shall remain. Such door and window assemblies shall be fastened in a closed position and shall be adequately welded or bolted shut. The assembly shall be enclosed in material of equal or similar thickness of equivalent or better fire- resistive rating as the adjacent enclosure.

(3) The sidewalk elevator door at the street level shall be fastened in a closed position and shall be adequately welded shut. The underside of such door shall be properly reinforced and supported by steel beams and columns to support the same loading as the sidewalk.

(4) Firefighter access to the bottom of the hoistway (elevator pit) shall be provided through the door assembly of the pit door and shall meet the following requirements:

(i) If the machine room is located at or near the level of the bottom of the shaftway and is so located that access to the bottom of the shaftway is readily available through the machine room, the door to the machine room shall be kept closed with a heavy-duty dead bolt locking device.

(ii) If the machine room is located other than at or near the level of the bottom of the shaftway or the bottom of the shaftway is not otherwise readily accessible through the machine room, the lowermost door opening onto the shaftway shall be kept closed with a heavy-duty dead bolt locking device. A conspicuous sign of 26 mm (1 in.) block letters with contrasting background permanently affixed to the door and shall read "HOISTWAY."

(iii) The key to the locking device required in Items (i) and (ii) above shall be kept by the building superintendent and shall be readily available to the commissioner or the commissioner's representative and to firefighters.

(c) The ventilation opening (smoke hole) in the flooring provided at the top of the hoistway immediately below the sheaves or at the level of the top of the machine room floor beams and the ventilation opening at the exterior portion of the machine room shall be maintained.

(d) All electric service to the elevator hoistway and machine room shall be disconnected outside the confines of the elevator hoistway and machine room.

8.11.1.4.1.3 Elevators removed and permanently discontinued – multielevator shaftway. When a single elevator in multielevator shaftway is removed and permanently discontinued, an application shall be filed with the department and inspection fees charged. Such process shall meet the following requirements:

(a) If it is proposed to extend the floor at every story of the building, the new construction shall be the same or of similar construction as the existing adjacent floor and of equivalent or better fire resistive rating. All hoistway equipment for the discontinued elevator shall be completely removed; rails

may remain. The shaft enclosure shall be rearranged so that the remaining operating elevators are properly enclosed to maintain the integrity of the shaftway.

(b) If the hoistway shaft is to remain open:

(1) All hoistway equipment for the discontinued elevator shall be completely removed; rails may remain. All door assemblies serving the discontinued elevator, openings onto masonry shaftway shall be completely removed and the open space so created shall be filled with the same or similar material of equal thickness of equivalent or better fire-resistive rating as the adjacent masonry.

(2) All door assemblies serving the discontinued elevator, opening onto the hoistway shaft that were originally enclosed with an open wire screen and subsequently enclosed with other than masonry units (i.e. metal lath and plaster or transite boards), shall remain. Such door assemblies shall be fastened in a closed position and shall be adequately welded shut. The assembly shall be enclosed in material of equivalent or better fire resistive rating as the adjacent enclosure.

8.11.1.4.2 Escalator installation placed out of service.

8.11.1.4.2.1 Escalators not in use but available for service. Escalators not in use but available for service are those escalators whose power feed lines have been disconnected from the main line disconnect switch and whose entrances have been barricaded. All required tests shall be regularly performed and a periodic inspection shall be made, and fees shall be paid pursuant to the *New York City Building Code*. An elevator inspector shall verify that these tests and inspections are being performed, and that the power was interrupted.

8.11.1.4.2.2 Escalators discontinued or placed out of service. Escalators discontinued or placed out of service shall comply with Section 8.11.1.4.2.1. An application shall be filed with the department and an inspection fee charged. Thereafter, one (1) additional inspection per year shall be made to verify that the status is unchanged and fees shall be paid for such inspection. Before the installation is put back in service, it shall be subject to all of the routine and periodic inspections and tests required by the *New York City Building Code*.

8.11.1.4.2.3 Escalators removed and permanently discontinued. An application shall be filed with the department and inspection fees charged. The escalator steps, newels, rails, all wire cables, and other equipment and machinery shall be completely removed. An opening created by the removal of the escalator shall be filled with new construction of the same or similar construction as the existing adjacent floor and of equivalent or better fire restive rating.

8.11.1.4.3 Moving walk installation placed out of service.

8.11.1.4.3.1 Moving walks not in use but available for service. Moving walks not in use but available for service are those moving walks whose power feed lines have been disconnected from the main line disconnect switch and whose entrances have been barricaded. All required tests shall be regularly performed and a periodic inspection shall be made and fees charged. An elevator inspector shall verify that these tests and inspections are being performed, and that the power was interrupted.

8.11.1.4.3.2 Moving walk discontinued or placed out of service. Moving walks discontinued or placed out of service shall meet the requirements of Section 8.11.1.4.3.1 except for periodic inspection. An application shall be filed with the department and inspection fees charged. Thereafter, one additional inspection per year shall be made to verify that the status is unchanged and fees shall be paid for such inspection. Before the installation is placed back in service, it shall be subject to all of the routine and periodic inspections and tests required by the *New York City Building Code*.

8.11.1.4.3.3 Moving walk removed and permanently discontinued. An application shall be filed with the department and inspection fees charged. The moving walk treadways, newels, rails, all wire cables, and other equipment and machinery shall be completely removed. The truss may remain. An opening created by the removal of the moving walk shall be covered by new construction of the same or similar construction as the existing adjacent floor and of equivalent or better fire resisting rating.

Delete and revise Section 8.11.4.1 (v) as follows:

(v) Code Data Plate (Section 2.23.2) (Item 2.14). (Category 1 test only.)

Delete and revise Table N1 as follows:

TABLE N1
REQUIRED INSPECTION AND TEST INTERVALS IN "MONTHS"

		Periodic Inspection By Department		Periodic Test on Behalf of Owner (4)

Notes:

- (1) Where filing with the Department is not required, Owner shall perform inspection and maintain log of each inspection/test performed as required by the *New York City Building Code* and available to the Department upon request.
- (2) For Category 1 Inspection/Test, a minimum six (6) month time interval from the date of previous calendar year Category 1 Inspection/Test.
- (3) See Article 304
- (4) Dismantled devices do not require Category 1, 3 or 5 Tests.
- (5) Category 5 Tests are due by the last day of the month on the 5th anniversary. For example, if the Category 5 Test was last performed on 7/1/09, then the Category 5 Test must be performed by 7/31/14.

Delete and revise Section 8.11.1.6 to read as follows:

8.11.1.6 Test tags. A metal test tag with the test date, the category number requiring the test, and the name of the person or firm performing the test shall be installed in the machine room and at the vicinity of the lower starting station of escalators and moving walks for all Category 1, 3 and 5 tests.

Delete and revise Section 8.11.2.3.4 to read as follows:

8.11.2.3.4 Braking system. For passenger elevators and all freight elevators, the brake shall be tested for compliance with applicable requirements. The load shall be placed in the car as shown in Table 8.11.2.3.4 and the car run to the lowest landing by normal operating means. The driving machine shall safely lower, stop and hold the car with this load. Freight elevators of Class C-2 loading shall sustain and level the elevator car.

A test of the brake shall be made in accordance with Section 8.10.2.2.2 (o).

Delete Section 8.11.4.2.19 in its entirety.

Delete and revise Section 8.11.4.2.20 to read as follows:

8.11.4.2.20 Clearance between step and skirt. Escalators shall be tested as follows:

The clearance between step and skirt shall be taken at each step. These measurements shall be made independently on each side of the escalator.

CHAPTER K2
MODIFICATIONS TO ASME B20.1-2006,
SAFETY STANDARD FOR CONVEYORS AND
RELATED EQUIPMENT

K201.1 General. As referenced in Section 3001.2 of the *New York City Building Code*, the provisions of ASME B20.1—06 shall be modified in accordance with this chapter. The section numbers correlate to those in the referenced ASME standard. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*.

1 SCOPE

Delete and revise the text of Section 1 to read as follows:

This standard applies to the design, construction, installation, maintenance, inspection, and operation of conveyors and conveying systems in relation to hazards. The conveyors may be of the bulk material, package, or unit handling types where the installation is designed for permanent, temporary, or portable operation.

This standard shall apply, with the exceptions noted below, to all conveyor installations.

This standard specifically excludes any conveyor designed for, installed for, or used for the movement of human beings. This standard does, however, apply to certain conveying devices that incorporate within their supporting structure, work stations or operator's stations specifically designed for authorized personnel.

This standard does not apply to conveyors such as underground mine conveyors for which specific standards are already in effect, or to equipment such as industrial trucks, tractors, trailers, automatic guided vehicles, tiering machines (except pallet load tierers), cranes, hoists, power shovels, power scoops, bucket drag lines, trenchers, platform elevators designed to carry passengers or operator, manlifts, moving walks, moving stairways (escalators), highway or railroad vehicles, cableways, tramways, dumbwaiters, pneumatic conveyors, robots or integral machine transfer devices. Some of the foregoing have specific standards.

4 DEFINITIONS

Delete and revise the definition "Conveyor, vertical reciprocating" in Section 4 to read as follows:

CONVEYOR, VERTICAL RECIPROCATING. A permanent reciprocating power or gravity actuated unit (not designed to carry passengers or an operator) that receives objects on a carrier and transmits these objects vertically between two or more levels.

6 SPECIFIC SAFETY STANDARDS

Add a new section 6.6.3 to read as follows:

6.6.3. Incline reciprocating conveyor testing. Incline reciprocating conveyors shall be inspected and tested as per section 6.12.3.

6.21 Vertical reciprocating conveyors.

6.21.1 Add new Subsections d, e, f, g, h, i, j and k to Section 6.21.1 to read as follows:

6.21.1 Safety considerations.

- (d) Travel distance shall be limited to less than 22 860 mm (75 ft) with a maximum of four landings served.
- (e) Conveyor(s) shall be enclosed in a 2-hour fire rated hoistway, equipped with a minimum 1½ hour fire- rated entrance at each landing served.
- (f) Access at landings shall be a restricted area for authorized personnel with no public

access.

- (g) Where there is an occupied space or an unoccupied space not secured against unauthorized access under the hoistway, the conveyor shall be equipped with a safety designed to stop and hold the conveyor with the rated full load capacity independent of the hoisting or driving mechanism.
- (h) The operating device shall not be located inside the conveyor enclosure and must be external to the hoistway at each landing served.
- (i) The system shall incorporate a position indicator at each floor landing to register the location of the conveyor.
- (j) The rated load capacity shall not be less than 239 kg/m² (49 lbs. per sq ft) with a maximum capacity of 9072 kg (20,000 lbs).
- (k) The rated speed shall not exceed 406 mm/sec (80 FPM).
- (l) VRCs are permitted only in commercial and industrial occupancies.

6.21.2 Delete and revise Subsections (b), (c) and (d) of Section 6.21.2 to read as follows:

6.21.2 Guarding.

- (b) The conveyor housing shall be equipped with doors or equivalent means at each manual landing and unloading station, arranged so that they can be opened only when the carrier is present at the level and such that the carrier cannot be actuated until they are closed. This requirement shall be satisfied by the use of an interlock as required by ASME A17.1, Section 2.12.2.
- (c) Vertical reciprocating conveyors designed to automatically receive and discharge material shall have interlocked doors as in subsection (b) above .
- (d) Where the application requires that personnel walk onto the carrier to load or unload material, the carriers shall be provided with a conveyor enclosure securely fastened to the conveyor platform. The enclosure walls shall be of solid, grille or perforated construction; and shall be of such strength and support that when subjected to a leaning or falling rated load on the conveyor, the enclosure walls will not deflect or deform in a way that reduces running clearances to less than 13 mm (0.5 in.). Enclosure entrance(s) shall be provided with solid doors or gates; and shall guard the full width opening with a minimum height of 2030 mm (80 in.). Grille or perforated portions of conveyor enclosures and entrance gates shall reject a ball 38 mm (1.5 in.) in diameter.

Add the following new section 6.21.3 to read as follows:

6.21.3 Periodic testing.

- (a) All conveyors shall be inspected and tested as per Table N 1 of ASME A17.1 as modified by Chapter K1 of this appendix.
- (b) All safety devices shall be tested during the applicable Cat 1 and Cat 5 tests, including any items required to be inspected by the manufacturer. A static full load test shall be performed every five years (Cat 5) to ensure that the conveyor holds the load.

CHAPTER K3 **MODIFICATIONS TO ASME A17.3-2002,** **SAFETY CODE FOR EXISTING ELEVATORS AND ESCALATORS**

K301.1 Retroactive requirements for existing elevators and escalators. All existing elevators and escalators shall comply with the provisions of American Society of Mechanical Engineers (“ASME”) A17.3-2002 as modified in accordance with this chapter. The section numbers correlate to those in the referenced ASME standard. This chapter codifies the retroactive requirements for existing elevators and escalators which were originally established by 1 RCNY 3610-01. The date for completion of all work necessary to comply with such requirements is December 14, 2009, except as otherwise specified in this chapter.

PART I **INTRODUCTION**

SECTION 1.5 **ALTERATIONS, MAINTENANCE, AND INSPECTIONS AND TESTS**

1.5 Delete and revise Section 1.5 to read as follows:

Existing installations shall conform to the following requirements of ASME A17.1-00:

- (a) Section 8.10.8.11, Periodic and Acceptance Inspections and Tests;
- (b) Section 8.6.8.7, Alterations, Repairs, Replacements, and Maintenance.

In addition, existing installations shall conform to ASME Addenda A17.1a-02 and A17.1b-03, and Sections 1007.4, 1607.8.1, 3001.2, 3001.4, 3002.5, and 3003.2 of the *New York City Building Code*.

PART II **HOISTWAYS AND RELATED CONSTRUCTION FOR** **ELECTRIC ELEVATORS**

SECTION 2.1

HOISTWAYS

2.1.1 Hoistway construction.

Delete Section 2.1.1 in its entirety.

2.1.2 Windows in hoistway enclosures.

Delete and revise Section 2.1.2 to read as follows:

2.1.2 Windows in hoistway enclosures. Every hoistway-window opening ten (10) stories or fewer above a thoroughfare, and every such window opening three (3) stories or fewer above the roof of an adjacent building, shall be guarded by one of the following:

- (a) Vertical bars at least $\frac{5}{8}$ in. (16 mm) in diameter or equivalent, spaced not more than 10 inches (254 mm) apart, permanently and securely fastened in place; or
- (b) Metal-sash windows having solid-section steel muntins of not less than $\frac{1}{8}$ in. (3.2 mm) thickness, spaced not more than 8 in. (203 mm) apart.

Exterior hoistway-windows shall be marked with the word "SHAFTWAY" in red letters at least 6 in. (152 mm) high on a white background.

2.1.4 Pipes conveying gases, vapors, or liquids.

Delete Section 2.1.4 in its entirety.

2.1.5 Counterweight guards.

Delete Section 2.1.5 in its entirety.

SECTION 2.2 MACHINE ROOMS AND MACHINERY SPACES

2.2.5 Pipes conveying gases, vapors, or liquids.

Delete Section 2.2.5 in its entirety.

SECTION 2.4 CLEARANCES AND RUNBYS

Delete Section 2.4 in its entirety.

SECTION 2.5 PROTECTION OF SPACES BELOW HOISTWAYS

Delete and revise Section 2.5 to read as follows:

Where the space below the hoistway is not permanently secured against access, cars shall be in compliance with the following requirements by December 14, 2010:

- (a) The cars and counterweights shall be provided with spring or oil buffers.
- (b) Car and counterweight buffer supports shall be of sufficient strength to withstand without permanent deformation the impact resulting from buffer engagement of the car plus the rated load or the counterweight with an empty car at the following speeds:
 - (1) Governor tripping speed where the safety is governor operated;
 - (2) One hundred twenty-five (125) percent of the rated speed, where the safety is not governor operated.

SECTION 2.6
HOISTWAY ENTRANCES

2.6.3 Hoistway door vision panels.

Delete and revise Section 2.6.3 to read as follows:

2.6.3 Hoistway door vision panels. Hoistway door vision panels must be protected by protective grills made of number sixteen (16) gauge stainless or galvanized steel in accordance with the following specifications:

- (a) Grills shall be sized to fit within or over the vision panel frame and completely cover the vision panel opening in the elevator, car doors and hoistway doors.
- (b) Grills and vision panel frames shall be secured by means of non-reversible screws or other tamper proof fasteners.
- (c) Grills shall contain openings that shall not be larger than 0.75 in. (19 mm) in diameter.
- (d) All cut edges shall be deburred.
- (e) The provisions of this section shall apply to both new and existing passenger cars. Requirements for such grills may be waived if certification is submitted that such elevator is operated manually or twenty-four (24) hour doorman service is provided. A security guard shall not be considered doorman service.
- (f) For the purposes of this Section 2.6.3, a vandal resistant 0.25 in. (6 mm) polycarbonate sheet, such as Lexan, in two (2) layers, one (1) on each side of the required wire glass, may be used in lieu of the metal protective.

2.6.4 Door hangers.

Delete Section 2.6.4 in its entirety.

2.6.7 Bottom guides.

Delete and revise Section 2.6.7 to read as follows:

2.6.7 Bottom guides. Existing elevators in occupancy groups R-1, R-2 and E shall comply with the following requirements:

- (a) The bottom of each horizontally sliding hoistway door panel shall be equipped with bottom guiding members and bottom safety retainers.

 - (1) The bottom of each horizontally sliding hoistway elevator door panel shall be guided by two or more members as described in ASME A17.1 Section 2.11.11.6.
 - (2) Safety Retainers – The bottom of each horizontally sliding hoistway elevator door panel shall be provided with a means of retaining the door panel in position if the primary guiding means fail, and preventing displacement of the bottom of the door panel by not more than 0.75 in. (19 mm) into the hoistway. Such Retainers shall be installed on the bottom, shaft side of each door panel, shall be fabricated of at least twelve (12) gauge stainless or galvanized steel, and shall engage the corresponding sill member by not less than 0.375 in. (9.5 mm).

Exception: New elevator doors installed under the 1996/1997 or later editions of ASME A17.1 as modified by Chapter K1 of this appendix.

- (b) The door panels shall be structurally sound and in such condition that the guide(s) and retainer(s) may be securely attached.

 - (1) At least one (1) bottom guide shall be installed near each end of every door panel.
 - (2) A safety retainer(s) totaling at least 8 in. (203 mm) in length shall be installed between the two (2) outermost guides.
 - (3) On smaller sized door panels, where due to the width of the door panel, the space between the two (2) outermost bottom guides would be less than 8 in. (203 mm), then either:

 - (i) The length of the retainer may be reduced to a minimum 4 in. (102 mm); or
 - (ii) When only one (1) bottom guide is provided near the center of the door, a 4 in. (102 mm) retainer shall be installed on each side of the bottom guide. If the space between the bottom guide and the edge of the door is less than four inches, the

length of the retainer may be reduced to the amount of the space between the bottom guide and the edge of the door.

Exception: New elevator entrance frames and doors installed under the 1996/1997 or later editions of ASME A17.1 as modified by Chapter K1 of this appendix.

SECTION 2.7 **HOISTWAY DOOR LOCKING DEVICES, PARKING DEVICES, AND ACCESS**

Delete and revise Section 2.7.2 to read as follows:

2.7.2 Elevator parking device

(a) Parking Devices Required. Elevators that are operated from within the car only and have manual operated doors that can be opened with a common tool, shall have elevator-parking devices installed at that landing. This device shall be located at a height not greater than 6 ft 11 in. (2.11 m) above the floor. Parking devices are not required for elevators having hoistway doors that are automatically unlocked when the car is within the landing zone.

(b) General Design Requirements. Parking devices shall conform to the following requirements:

(1) They shall be mechanically or electrically operated.

(2) They shall be designed and installed so that friction or sticking or the breaking of any springs used in the device will not permit opening or unlocking a door when the car is outside the landing zone of that floor.

(3) Springs, where used, shall be of the restrained compression type, which will prevent separation of the parts in case the spring breaks.

Add new Subsection (c) to Section 2.7.2 to read as follows:

(c) Car interior lighting. The car interior lighting shall not be extinguished and must meet the requirements of Section 3.4.5 of ASME A17.3 as modified by this chapter.

2.7.3 Access to hoistway.

Delete Section 2.7.3 in its entirety.

2.7.4 Restricted opening of hoistway doors and/or car doors on passenger elevators.

Delete Section 2.7.4 in its entirety.

2.7.6 Add new Section 2.7.6 to read as follows:

2.7.6 Locks on elevators and elevator hoistway doors. In high rise buildings, no switch, lock or device of any kind shall be installed on any floor on or above the street floor on any elevator car or elevator hoistway door, except elevators used exclusively for freight, that shall prevent opening of such doors by anyone not having a key, unless fire department access to cars and hoistways is provided by a city-wide standard key number 2642 and the New York City Fire Department standard key.

PART III
MACHINERY AND EQUIPMENT FOR ELECTRIC ELEVATORS

SECTION 3.1
BUFFERS AND BUMPERS

3.1 Delete Section 3.1 in its entirety.

SECTION 3.3
CAR FRAMES AND PLATFORMS

3.3.1 Car platforms.

Delete Section 3.3.1 in its entirety.

3.3.5 Protection of platforms against fire.

Delete Section 3.3.5 in its entirety.

SECTION 3.4
CAR ENCLOSURES

3.4.1 Car enclosures.

Delete Section 3.4.1 in its entirety.

3.4.2 Car doors and gates.

Delete and revise Section 3.4.2 to read as follows:

3.4.2 Car doors and gates. Passenger and loft elevators shall comply with (a) and (b) of this section by December 14, 2012:

(a) Doors, gates, and electric contacts. Cars shall have a car door or gate provided at each entrance equipped with a car door or gate electric contact. Car doors and/or gates shall conform to the following requirements:

(1) They shall be positively opened by a lever or other device attached to and operated by the door or gate.

(2) They shall be maintained in the open position by the action of gravity or by a restrained compression spring, or both, or by positive mechanical means.

(3) They shall not be readily accessible.

(b) Collapsible gates. Collapsible car gates shall conform to the following requirements:

(1) Collapsible car gates shall not be power opened to a distance exceeding one-third ($\frac{1}{3}$) of the clear gate opening, and in no case more than 10 in. (254 mm).

(2) When fully closed (extended position), gates shall reject a ball 3 in. (76 mm) in diameter for passenger elevators and 4.5 in. (114 mm) for freight elevators.

(3) Gates shall have at least every fourth vertical member guided at the top and every second vertical member guided at the bottom.

(4) Handles of manually operated collapsible gates nearest the car operating device on elevators operated from the car only shall be so located that the nearest handle is not more than 48 in. (1.22 m) from the car operating device when the gate is closed (extended position), and not more than 48 in. (1.22 m) above the car floor. Gate handles shall be provided with finger guards.

3.4.4 Emergency exits.

Delete Section 3.4.4 in its entirety.

3.4.5 Car illumination.

Delete and revise Section 3.4.5 to read as follows:

3.4.5 Car illumination. Car illumination shall comply with the provisions of this section by December 14, 2010:

(a) Interiors of cars shall be provided with an electric light or lights. Not less than two (2) lamps shall be provided.

(b) The minimum illumination at the car threshold, with the door closed, shall not be less than:

(1) For passenger elevators: 5 fc (54 lx).

(2) For freight elevators: 2 $\frac{1}{2}$ fc (27 lx).

(c) Light control switches are not required, but if provided they shall be located in or adjacent to the operating device in the car. In elevators having automatic operation, they shall be of the key-operated type or located in a fixture with a locked cover.

(d) Top of car light fixtures may be provided with a non-key-operated switch in or adjacent to the fixture.

SECTION 3.5 **SAFETIES**

3.5.1 Car safeties.

Delete Section 3.5.1 in its entirety.

3.5.2 Counterweight safeties.

Delete Section 3.5.2 in its entirety.

3.5.3 Safeties to stop ascending cars or counterweights prohibited.

Delete Section 3.5.3 in its entirety.

3.5.4 Application and release of safeties.

Delete Section 3.5.4 in its entirety.

3.5.5 Maximum permissible movement of governor rope to operate the safety mechanism.

Delete Section 3.5.5 in its entirety.

3.5.6 Rail lubricants and lubricant plate.

Delete and revise Section 3.5.6 to read as follows:

3.5.6 Rail lubricants. Rail lubricants or coatings that will reduce the holding power of the safety or prevent its functioning as required shall not be used.

SECTION 3.6 **SPEED GOVERNORS**

3.6 Delete Section 3.6 in its entirety.

SECTION 3.8 **DRIVING MACHINES AND SHEAVES**

3.8.1 General requirements.

Delete Section 3.8.1 in its entirety.

Add new Section 3.8.4.1 to read as follows:

3.8.4.1 Single plunger brakes.

(a) All existing traction elevators with single plunger brakes must comply with either of the following by January 1, 2027:

(1) Alteration of single plunger assemblies to dual-plunger type, or

(2) Compliance with Unintended Car Movement Protection as specified by Section 2.19.2 of ASME A17.1 .

(b) Notwithstanding any inconsistent provision of chapter 1 of title 28 of the *Administrative Code*, the work required to comply with this section may not be performed without a permit from the department.

SECTION 3.9
TERMINAL STOPPING DEVICES

3.9.1 Normal terminal stopping devices.

Delete Section 3.9.1 in its entirety.

3.9.2 Final terminal stopping devices.

Delete and revise Section 3.9.2 to read as follows:

3.9.2 Final terminal stopping devices. Upper and lower final terminal electromechanical stopping devices shall be provided and arranged to prevent movement of the car by the normal operating devices in either direction of travel after the car has passed a terminal landing. Final terminal stopping devices shall be located as follows:

(a) *Winding drum driving machines.* Elevators having winding drum machines shall have stopping switches on the machines and also installed in the hoistway and operated by cams attached to the car. Final limit switches and brackets shall be permanently secured and pinned.

(b) *Traction driving machines.* Elevators having traction driving machines shall have stopping switches installed in the hoistway and operated by cams attached to the car. Final limit switches and brackets shall be permanently secured and pinned.

SECTION 3.10
OPERATING DEVICES AND CONTROL EQUIPMENT

3.10.1 Types of operating devices.

Delete Section 3.10.1 in its entirety.

3.10.3 Top-of-car operating devices.

Delete Section 3.10.3 in its entirety.

3.10.4 Electrical protective devices

Delete and revise Section 3.10.4 to read as follows:

3.10.4 Electrical protective devices. Electrical protective devices shall be provided by December 14, 2010 in accordance with the following:

- (a) Slack-rope switch. Winding drum machines shall be provided with a slack-rope device equipped with a slack-rope switch of the enclosed manually reset type that shall cause the electric power to be removed from the elevator driving machine motor and brake if the suspension ropes become slack.
- (b) Compensating rope sheave switch. Compensating rope sheaves shall be provided with a compensating rope sheave switch or switches mechanically opened by the compensating rope sheave before the sheave reaches its upper or lower limit of travel to cause the electric power to be removed from the elevator driving machine motor and brake.
- (c) Broken rope, tape, or chain switches used in connection with machine room normal terminal stopping switches. Broken rope, tape, or chain switches conforming to the requirements of Section 3.6.1 shall be provided in connection with normal terminal stopping devices located in machine rooms of traction elevators. Such switches shall be opened by a failure of the rope, tape, or chain.
- (d) Car-safety mechanism switch. A switch shall be required where a car safety is provided.
- (e) Final terminal stopping devices. Final terminal stopping devices shall be provided for every elevator.
- (f) Emergency terminal speed limiting device. Where reduced stroke oil buffers are provided, emergency terminal speed limiting devices are required.
- (g) Motor generator overspeed protection. Means shall be provided to cause the electric power to be removed automatically from the elevator driving machine motor and brake should a motor generator set, driven by a direct current motor, overspeed excessively.
- (h) Motor field sensing means. Where direct current is supplied to an armature and shunt field of an elevator driving machine motor, a motor field current sensing means shall be

provided, which shall cause the electric power to be removed from the motor armature and brake unless current is flowing in the shunt field of the motor.

A motor field current sensing means is not required for static control elevators provided with a device to detect an overspeed condition prior to, and independent of, the operation of the governor overspeed switch. This device shall cause power to be removed from the elevator driving machine motor armature and machine brake.

(i) Buffer switches for oil buffers used with type C car safeties. Oil level and compression switches shall be provided for all oil buffers used with Type C safeties.

(j) Hoistway door interlocks or hoistway door electric contacts. Hoistway door interlocks or hoistway door electric contacts shall be provided for all elevators.

(k) Car door or gate electric contacts. Car door or gate electric contacts shall be provided for all elevators with car doors or gates.

(l) Normal terminal stopping devices. Normal terminal stopping devices shall be provided for every elevator.

(m) Car side emergency exit electric contact. An electric contact shall be provided on every car side emergency exit door.

(n) Electric contacts for hinged car platform sills. Hinged car platform sills, where provided, shall be equipped with electric contacts.

(o) Emergency stop switch. On all elevators, an emergency stop switch shall be provided in the car, and located in or adjacent to each car operating panel. When open (i.e. the “stop position”), this switch shall cause the electric power to be removed from the elevator driving-machine motor and brake. Emergency stop switches shall:

(1) Be of the manual open and close type;

(2) Have red operating handles or buttons;

(3) Be conspicuously and permanently marked “STOP” and indicate the “STOP” and “RUN” positions; and

(4) When open, cause an audible signaling device to sound.

(p) Stop switch in pit. A stop switch, conforming to the following requirements shall be provided in the pit of every elevator. The switch shall be located adjacent to the normal pit access. The switch shall cause the electric power to be removed from the elevator driving machine motor and brake and shall:

(1) Be of the manual open and close type;

(2) Have red operating handles or buttons;

(3) Be conspicuously and permanently marked “STOP” and indicate the “STOP” and “RUN” positions; and

(4) Be positively opened mechanically and its opening shall not be solely dependent on a spring.

(q) Buffer switches for gas spring return oil buffers. A buffer switch shall be provided for gas spring return oil buffers that will cause electric power to be removed from the elevator driving machine motor and brake if the plunger is not within 0.5 in. (13 mm) of the fully extended position.

3.10.5 Power supply line disconnecting means.

Delete Section 3.10.5 in its entirety.

3.10.11 Add new Section 3.10.11 to read as follows:

3.10.11 Signal systems on car switch elevators. Elevators with car switch operation shall be provided with a signal system by means of which signals can be given from any landing whenever the elevator is desired at the landing.

Add new Section 3.10.12 to read as follows:

3.10.12 System to monitor and prevent automatic operation of passenger and freight elevators with faulty door contact circuits.

All automatic passenger and freight elevators shall comply with this section by January 1, 2020. Means shall be provided to monitor the position of power-operated car doors that are mechanically coupled with the landing doors or power-operated car doors with manually operated swing-type hall doors, while the car is in the landing zone, in order

(a) to prevent the operation of the car if the car door is not closed (see Section 3.4.2(c) of ASME A17.3), regardless whether the portion of the circuits incorporating the car-door contact or the interlock contact of the landing door coupled with car door, or both, are closed or open, except as permitted under any of the following conditions:

(1) by a car-leveling or truck-leveling device

(2) when a hoistway access switch is operated

(3) when the top-of-car inspection operation utilizing a car door by-pass or hoistway-door bypass switch is activated

(4) when on any mode of inspection operation; and

(b) to prevent, except as permitted by inspection operation, the power closing of the doors if the car door is fully open and any of the following conditions exist:

(1) the car-door contact is closed or the portion of the circuit, incorporating this contact is bypassed;

(2) the interlock contact of the landing door that is coupled to the opened car door is closed or the portion of the circuit, incorporating this contact is bypassed, except when operating during Firefighters' Service Phase II;

Exception: For swing-type door operation, the locking (secondary) contacts shall be monitored.

(3) the car-door contact and the interlock contact of the door that is coupled to the opened car door are closed, or the portions of the circuits incorporating these contacts are bypassed;

Exception: For swing-type door operation, the locking (secondary) contacts shall be monitored.

Design and/or controller modifications shall be approved by the controller manufacturer or a registered design professional. Notwithstanding any inconsistent provision of chapter 1 of title 28 of the *Administrative Code*, the work required to comply with this section may not be performed without a permit from the department.

SECTION 3.11 **EMERGENCY OPERATION AND SIGNALING DEVICES**

3.11.1 Car emergency signaling devices.

Delete and revise Section 3.11.1 to read as follows:

3.11.1 Car emergency signaling devices. Elevators shall be provided with the following signaling devices:

(a) In all buildings, the elevator shall be provided with an audible signaling device, operable from the emergency stop switch, when provided, and from a switch marked "ALARM" that is located in or adjacent to each car operating panel. The signaling device shall be located inside the building and audible inside the car and outside the hoistway. One signaling device may be used for a group of elevators.

(b) In buildings in which a building attendant (building employee, watchperson, etc.) is not continuously available to take action when the required emergency signal is operated, the elevators shall be provided with a means within the car for communicating with or

signaling to a service which is capable of taking appropriate action when a building attendant is not available.

3.11.3 Firefighters' service.

Delete and revise Section 3.11.3 to read as follows:

3.11.3 Firefighters' service operation in existing elevators.

Firefighters' service operation shall be installed in accordance with the *New York City Building Code* in all existing elevators serving any of the following:

(a) High rise buildings or buildings classified in occupancy group M except existing R-2.

(b) All buildings or buildings classified in occupancy group A, B, E, I, or R-1 (except for "residential hotels," as such term is defined by the commissioner pursuant to rules and regulations).

SECTION 3.12
SUSPENSION MEANS AND THEIR CONNECTIONS

3.12.1 Suspension means.

PART IV
HYDRAULIC ELEVATORS

SECTION 4.2
MECHANICAL EQUIPMENT

4.2 Delete Section 4.2 in its entirety.

4.3.1 Connection to driving machine.

Delete Section 4.3.1 in its entirety.

4.3.2 Plunger stops.

Delete Section 4.3.2 in its entirety.

4.3.3 Hydraulic elevators.

Delete and revise Section 4.3.3 to read as follows:

4.3.3 Hydraulic elevators. Hydraulic elevators that have any portion of the cylinder buried in the ground and that do not have a double cylinder or a cylinder with a safety bulkhead shall comply with this section by December 14, 2014:

(a) Have the cylinder replaced with a double cylinder or a cylinder with a safety bulkhead protected from corrosion by one or more of the following methods:

(1) Monitored cathodic protection;

(2) A coating to protect the cylinder from corrosion that will withstand the installation process;

(3) By a protective plastic casing immune to galvanic or electrolytic action, salt water, and other known underground conditions; or

(b) Be provided with a device meeting the requirements of Section 3.5 or a device arranged to operate in the down direction at an overspeed not exceeding one hundred twenty-five (125) percent of rated speed. The device shall mechanically act to limit the maximum car speed to the buffer striking speed, or stop the elevator car with rated load with a deceleration not to exceed 32.2 ft/s² (9.8 m/s²), and shall not automatically reset. Actuation of the device shall cause power to be removed from the pump motor and control valves until manually reset; or

(c) Have other means acceptable to the department to protect against unintended movement of the car as a result of uncontrolled fluid loss.

SECTION 4.4 **VALVES, SUPPLY PIPING, AND FITTINGS**

4.4 Delete Section 4.4 in its entirety.

SECTION 4.5 **TANKS**

4.6 Delete Section 4.6 in its entirety.

SECTION 4.7 **OPERATING DEVICES AND CONTROL EQUIPMENT**

4.7.1 Operating devices.

Delete Section 4.7.1 in its entirety.

4.7.2 Top-of-car operating devices.

Delete Section 4.7.2 in its entirety.

4.7.3 Anticreep leveling devices.

Delete Section 4.7.3 in its entirety.

4.7.4 Electrical protective devices.

Delete and revise Section 4.7.4 to read as follows:

4.7.4 Electrical protective devices. When they apply to hydraulic elevators, the following electrical protective devices conforming to the requirements of Section 3.10.4 shall be provided:

(a) Stop switches in the pit: and

(b) Where such emergency doors are provided, in-car emergency exit door electric contacts.

Such devices shall prevent the operation of the elevator by the normal operating device and shall prevent the moment of the car in response to the anticreep leveling device.

4.7.5 Power supply line disconnecting means.

Delete Section 4.7.5 in its entirety.

ADDITIONAL REQUIREMENTS FOR COUNTERWEIGHTED
HYDRAULIC ELEVATORS

4.8 Delete Section 4.8 in its entirety.

SECTION 4.9
ADDITIONAL REQUIREMENTS FOR ROPED HYDRAULIC ELEVATORS

4.9 Delete Section 4.9 in its entirety.

PART V
ESCALATORS

SECTION 5.1
CONSTRUCTION

Delete and revise Section 5.1.4 to read as follows:

5.1.4 Antislid e device.

On high deck balustrades, antislid e devices shall be provided on decks or combination of decks when the outer edge of the deck is greater than 12 in. (305 mm) from the centerline of the handrail or on adjacent escalators when the distance between centerline of the handrails is greater than 16 in. (406 mm).

These devices shall consist of raised objects fastened to the decks, not closer than 4 in. (102 mm) to the handrail and spaced not greater than 78 in. (2000 mm) apart. The height shall be not less than ¾ in. (19 mm). There shall be no sharp corners or edges.

5.1.7 Step risers.

Delete Section 5.1.7 in its entirety.

5.1.8 Slotting of step treads.

Delete Section 5.1.8 in its entirety.

5.1.11 Step/skirt performance index

Delete Section 5.1.11 in its entirety.

SECTION 5.2
BRAKES

5.2 Delete Section 5.2 in its entirety.

SECTION 5.3
OPERATING AND SAFETY DEVICES

5.3.1 Starting switches.

Delete and revise Section 5.3.1 as follows:

5.3.1 Starting devices. In every new and existing escalator, starting devices shall be provided with the combination of a starting switch and a starting button. The escalator shall be started only after the activation of both the switch and the button.

- (a) Starting switch. Starting switches shall be of continuous pressure spring return type and shall be operated by a cylinder type lock having five-pin, five-disc or five-tumbler combination. Starting switches shall be of three-position type and shall be clearly marked as follows:

NORMAL. A central position for the key entry and spring return position.

START-UP. A right side position for starting the escalator in the upward direction.

START-DOWN. A left side position for starting the escalator in the downward direction.

(b) *Starting Button.* Starting buttons shall be of the constant pressure type and located within 6 in. (152 mm) from the starting switch. They shall be clearly marked “**Starting Button**”.

(c) *Cover Plate.* A locked, transparent cover plate that can be opened by the starting key and clearly marked “For Start Only” shall protect the starting devices.

(d) *Location of starting devices.* Starting devices shall be located at top and bottom of the escalator on the right side-facing newel.

(NOTE: The starting key shall be kept on the premises at all times and shall only be accessible to persons authorized to start escalators. It shall also be made available to the commissioner or the commissioner’s representative.)

5.3.2 Emergency stop buttons.

Delete and revise Section 5.3.2 as follows:

5.3.2 Emergency stop buttons location. A red stop button shall be visibly located at the top and bottom landings on the right side facing the escalator. Remote stop buttons are prohibited except that any escalator connected to an automatic fire alarm system shall gradually stop not exceeding the speed of 3 ft per sec² (0.91 m/s²) upon the activation of such system.

5.3.3 Speed governor.

Delete Section 5.3.3 in its entirety.

5.3.4 Broken step-chain device.

Delete Section 5.3.4 in its entirety.

5.3.5 Application of brake.

Delete Section 5.3.5 in its entirety.

5.3.6 Broken drive-chain device.

Delete Section 5.3.6 in its entirety.

5.3.7 Skirt obstruction device.

Delete and revise Section 5.3.7 as follows:

5.3.7 Skirt obstruction device. Escalators shall comply with the following no later than January 1, 2014: Means shall be provided to cause the electric power to be removed from the escalator driving machine motor and brake if an object becomes caught between the step and the skirt as the step approaches the upper combplate, intermediate device or lower combplate. On units having a run of 20 ft (6.10 m) or more, intermediate devices shall be provided on both sides of the escalator with devices located at interval of 10 ft (3.05 m) or less. The activation of an intermediate device shall stop the escalator at a rate not greater than 3 ft per sec² (0.91 m/s²) in the direction of travel. The upper and lower skirt devices shall be located so that the escalator will stop before that object reaches the combplate. The activation of any skirt device shall stop the escalator with any load up to full brake rated load with the escalator running.

Add new Section 5.3.12 to read as follows:

5.3.12 Comb-step stop device. A device shall be provided that will cause the opening of the power circuit to the escalator driving machine motor and brake where a resultant vertical force not greater than 60 lbf (268 N) in the upward direction is applied at the center of the front of the comb-plate.

SECTION 5.5
ENTRANCE AND EGRESS ENDS

5.5.2 Distinction between comb and step.

Delete Section 5.5.2 in its entirety.

5.5.3 Adjacent floor surfaces.

Delete Section 5.5.3 in its entirety.

5.5.5 Landing access plates.

Delete Section 5.5.5 in its entirety.

PART VI
DUMBWAITERS

Delete Part VI in its entirety.

PART VII
HAND ELEVATORS

Add new Section 7.0 to read as follows:

SECTION 7.0
EXISTING HAND POWERED FREIGHT ELEVATORS

Existing hand powered freight elevators shall not be subject to the provisions of this section. However, adequate protection of landing openings shall be provided by hinged or sliding doors which shall remain locked at all times except when the freight elevator is in use. Auxiliary gates not less than 36 in. (914 mm) in height, substantially constructed and secured in place, of wood or metal, or equivalent metal chains shall be installed. Such gates or chains may be arranged to lift vertically, to slide horizontally, or to swing. No part of any gate or chain shall project into the freight elevator shaft. Gates may be operated automatically or manually.

SECTION 7.1
HOISTWAY, HOISTWAY ENCLOSURES, AND RELATED CONSTRUCTION

8.2.8 Capacity and loading.

Delete Section 8.2.8 in its entirety.

8.2.9 Driving machines and sheaves.

Delete Section 8.2.9 in its entirety.

8.2.10 Terminal stopping devices.

Delete Section 8.2.10 in its entirety.

8.2.11 Locking devices for hinged swinging doors or vertically lifting covers in sidewalks or other areas exterior to the building.

Delete Section 8.2.11 in its entirety.

8.2.12 Requirements for electrical wiring and electrical equipment.

Delete Section 8.2.12 in its entirety.

8.2.13 Clearance between loading side of car platforms and hoistway enclosures.

Delete Section 8.2.13 in its entirety.

8.2.14 Operating devices and control equipment of sidewalk elevator.

Delete and revise Section 8.2.14 as follows:

8.2.14 Operating devices and control equipment of sidewalk elevator. The operation of power sidewalk elevators through openings in the sidewalk, or through openings in other exterior

areas that are accessible to the public, and that are protected by hinged doors or vertically lifting covers, shall conform to the following:

- (a) The elevator shall be operated in both the up and down directions through the opening, only from the sidewalk or other exterior area. The operation shall be by means of:
 - (1) Key-operated continuous-pressure-type up and down switches; or
 - (2) Continuous-pressure-type up-and-down operating buttons on the free end of a detachable, flexible cord 5 ft (1.52 m) or less in length.
- (b) Key-operated switches shall be of continuous pressure spring return type, and shall be operated by a cylinder-type lock having not less than a five-pin or five-disk combination with the key removable only when the switch is in the "OFF" position.
- (c) Key-operated switches and plug receptacles for flexible cords shall be mounted in weatherproof boxes with covers installed above the sidewalk or other area on the side of the building wall, located 18 in. (457 mm) or less horizontally from one side of the opening.
- (d) Operating buttons may be provided in the elevator car and at any landing below the top landing, provided that such buttons shall operate the car only when the bow-iron or stanchions are not in contact with the doors or covers in the sidewalk of other exterior area.
- (e) When the bow-iron or stanchions are in contact with the doors or covers at the sidewalk or other exterior area, it shall be possible to operate the car only by means of either the key switches or the continuous-pressure type up-and-down buttons on the free end of the flexible cord specified in Section 8.2.14(a)(1).
- (f) Flexible cords and operating keys shall not be left where they are accessible to unauthorized persons for operation of the elevator.

PART IX **MOVING WALKS**

Add new Section 9.0 to read as follows:

SECTION 9.0 **SKIRT PANELS**

- (a) The clearance on each side of the steps between step thread and the adjacent skirt panel shall be not more than 0.188 in. (4.8 mm) and the edges shall be rounded.
- (b) The exposed surface of the skirt panels adjacent to the thread shall be smooth.

SECTION 9.5
DRIVING MACHINES, MOTOR, AND BRAKE

Delete Section 9.5 in its entirety.

SECTION 9.6
OPERATING AND SAFETY DEVICES

9.6.1 General.

Delete Section 9.6.1 in its entirety.

9.6.2 Starting switch.

Delete and revise Section 9.6.2 to read as follows:

9.6.2 Starting devices. In every new and existing moving walk, starting devices shall be provided with the combination of a starting switch and a starting button. The escalator shall be started only after the activation of both the switch and the button.

(a) *Starting Switch.* Starting switches shall be of continuous pressure spring return type and shall be operated by a cylinder type lock having five-pin, five-disc or five-tumbler

combination. Starting switches shall be of three-position type and shall be clearly marked as follows:

NORMAL. A central position for the key entry and spring return position.

START-UP. A right side position for starting the escalator in the upward direction.

START-DOWN. A left side position for starting the escalator in the downward direction.

(b) *Starting Button.* Starting buttons shall be of the constant pressure type and located within 6 in. (152 mm) from the starting switch. They shall be clearly marked “**Starting Button**”.

(c) *Cover Plate.* A locked, transparent cover plate that can be opened by the starting key and clearly marked “**For Start Only**” shall protect the starting devices.

(d) *Location of starting devices.* Starting devices shall be located at top and bottom of the escalator on the right side-facing newel.

(NOTE: The starting key shall be kept on the premises at all times and may only be accessible to persons authorized to start escalators. It shall also be made available to the commissioner or the commissioner’s representative.)

9.6.3 Emergency stop buttons.

Delete and revise Section 9.6.3 to read as follows:

9.6.3 Emergency stop buttons location. A red stop button shall be visibly located at the top and bottom landings on the right side facing the moving walk. Remote stop buttons are prohibited except that any escalator connected to an automatic fire alarm system shall gradually stop not exceeding the speed of 3 ft per sec² (0.91 m/s²) upon the activation of such system.

9.6.4 Speed governor.

Delete Section 9.6.4 in its entirety.

9.6.5 Application of an electrically released brake.

CHAPTER K4
MODIFICATIONS TO ASME A17.1S-2005
SAFETY CODE FOR MACHINE-ROOM-LESS (“MRL”) ELEVATORS

K401.1 General. The provisions of American Society of Mechanical Engineers (“ASME”) A17.1S-2005 must be modified in accordance with this chapter. The section numbers correlate to those in the referenced ASME standard.

PART 1
GENERAL

SECTION 1.1
SCOPE

1.1 Delete and revise Section 1.1 to read as follows:

See ASME A17.1-2000 including A17.1a-2002 and A17.1b-2003 as amended by Chapter K1 of Appendix K of the *New York City Building Code* for additional, relevant requirements.

SECTION 1.3
DEFINITIONS

1.3 Delete and revise the definition “Control space, elevator, dumbwaiter, material lift” to read as follows:

CONTROL SPACE, ELEVATOR, DUMBWAITER, MATERIAL LIFT: a space outside the hoistway, intended for full bodily entry, which contains the motor controller. The space could also contain electrical and/or mechanical equipment used directly in connection with the elevator, dumbwaiter, or material lift, but not the electric driving machine or the hydraulic machine. (See Appendix Q of ASME A17.1S as amended by Chapter K4 of the *New York City Building Code*.)

Add the following sentence to the end of the definition “Machinery space, elevator, dumbwaiter, material lift”:

Machinery space in hoistways may not contain a motion controller, a motor controller or an operation controller.

PART 2 **ELECTRIC ELEVATORS**

SECTION 2.1 **CONSTRUCTION OF HOISTWAYS AND HOISTWAY ENCLOSURES**

2.1.4 Control of smoke and hot gases.

Delete and revise Section 2.1.4 to read as follows:

2.1.4 Control of smoke and hot gases. Hoistways must be provided with means to prevent the accumulation of smoke and hot gases when required by the *New York City Building Code*.

2.1.6 Projections, recesses and setbacks in hoistway enclosures.

Delete and revise Section 2.1.6.2 to read as follows:

2.1.6.2 On sides not used for loading and unloading:

- (a) Recesses, except those necessary for installation of elevator equipment, must not be permitted;**
- (b) Beams, floor slabs, or other building construction making an angle less than 75 degrees with the horizontal must not project more than 50 mm (2 in.) inside the hoistway enclosure unless the top surface of the projection is beveled at an angle not less than 75 degrees with the horizontal;**
- (c) Separator beams between adjacent elevators are not required to have bevels;**
- (d) Where setbacks exceeding 50 mm (2 in.) occur in the enclosure wall, the top of the setback must be beveled at an angle of not less than 85 degrees with the horizontal;**

(e) Bevels are not required if the projections and setbacks are covered with material conforming to the following:

(1) It must be equal to or stronger than 1.110 mm (0.0437 in.) wire;

(2) It must have openings not exceeding 25 mm (1 in.);

(3) It must be supported and braced such that it will not deflect more than 25 mm (1 in.) when subjected to a force of 4.79 kPa (100 lbs. per sq ft) applied horizontally at any point.

SECTION 2.2 **PITS**

2.2.2 Design and construction of pits.

Delete and revise Section 2.2.2.5 to read as follows:

2.2.2.5 Elevators with sprinklers in the shaftway must be provided with a drain or sump pump.

2.2.4 Access to pits.

Delete and revise Section 2.2.4.1 to read as follows:

2.2.4.1 Access must be by means of the lowest hoistway door or by means of a separate pit access door, located at the level of the pit floor.

Add new Subsection (f) to Section 2.2.4.4 to read as follows:

(f) Pit doors must be labeled “DANGER: ELEVATOR PIT” with letters not less than 51 mm (2 in) high.

SECTION 2.7 **MACHINERY SPACES, MACHINE ROOMS, CONTROL SPACES, AND CONTROL ROOMS**

2.7.3 Access to machinery spaces, machine rooms, control spaces, and control rooms.

Add new Subsection (d) to Section 2.7.3.1.1 to read as follows:

(d) A control space and machinery space for elevators must only be located where working clearances required for the control space will not impede upon the path of travel in unrestricted areas. Where the elevator control space is located in a path of travel in an unrestricted area, a clear path of travel parallel to the control space must not be less than the required working clearance plus 1219 mm (48 in.) perpendicular to the control space. A permanent barricade needed to establish the working clearances for the control space

must be accessible to elevator personnel from the control space. The barricade must be deployed whenever the doors to the control space are in the open position. See figure Q-2.

Add new Subsection (d) to Section 2.7.3.4.1 to read as follows:

(d) Labeled “ELEVATOR EQUIPMENT” with letters not less than 51 mm (2 in.) high.

Delete and revise the first sentence of Section 2.7.3.4.2 to read as follows:

Access doors to machine rooms, control rooms and control spaces must be provided.

Add new Subsection (d) to Section 2.7.3.4.6 to read as follows:

(d) Labeled “DANGER: ELEVATOR HOISTWAY” with letters not less than 51 mm (2 in.) high and have an electrical safety switch that will remove power from the hoist machine and brake if the door is opened.

2.7.6 Location of machinery spaces, machine rooms, control spaces, control rooms, and equipment.

Delete and revise Section 2.7.6.2 to read as follows:

2.7.6.2 Location of machinery spaces and control spaces. Machinery spaces may be located inside or outside the hoistway. Control spaces are not permitted inside the hoistway. Control spaces are only permitted inside the building.

Delete and revise Section 2.7.6.3.4 to read as follows:

2.7.6.3.4 Where a governor is located inside the hoistway, means of access conforming to the requirements of Sections 2.7.3.3 and 2.7.3.4 for inspection and servicing the governor must be provided from outside the hoistway.

Add new sentence to the end of Section 2.7.6.4 to read as follows:

These means must be permanently installed.

Delete and revise Subsection (d) of Section 2.7.6.4.3 to read as follows:

(d) If the car is moved manually, the effort required to move the car in the direction of load imbalance must not exceed 400 N (90 lbf). If the means used is removable, it must be stored outside the hoistway and access to the means must be with a key that is Group 1 Security. It must be suitably marked to indicate the machine for which it is intended. It must also contain instructions on its use and be labeled “Machine Brake Release”.

SECTION 2.8

**EQUIPMENT IN HOISTWAYS, MACHINERY SPACES, MACHINE ROOMS,
CONTROL SPACES, AND CONTROL ROOMS**

2.8.3 Pipes, ducts, tanks, and sprinklers.

Delete and revise Section 2.8.3.3 to read as follows:

2.8.3.3 Sprinkler systems conforming to NFPA 13 must be permitted to be installed in the hoistway or machinery space, subject to Sections 2.8.3.3.1 through 2.8.3.3.4.

**SECTION 2.11
PROTECTION OF HOISTWAY OPENINGS**

2.11.1 Entrances and emergency doors required.

Delete and revise the last sentence of Section 2.11.1.1 to read as follows:

Entrances must be at least 2030 mm (80 in.) in height and 915 mm (36 in.) in width.

Delete and revise Subsection (a) of Section 2.11.1.2 to read as follows:

(a) The clear opening must be at least 915 mm (36 in.) wide and 2030 mm (80 in.) high.

2.11.2 Types of entrances.

Delete Subsection (c) of Section 2.11.2.1 in its entirety.

Delete Subsection (c) of Section 2.11.2.2 in its entirety.

2.11.6 Openings of hoistway doors.

Delete and revise Subsection (d) of Section 2.11.6.2 to read as follows:

(d) Any landing for elevator equipped with Phase II Emergency In-Car Operation when Phase II is effective.

Add new Subsection (e) to Section 2.11.6.2 to read as follows:

(e) Consecutive vacant floors.

Add new Subsection (f) to Section 2.11.6.2 to read as follows:

(f) Main lobby street floor.

Add new Section 2.11.6.5 to read as follows:

2.11.6.5 Vestibule.

2.11.6.5.1 Elevator landings provided with a zero clearance vestibule (not to exceed 150 mm (6 in.) from the elevator hoistway door) are permissible only when locking devices accessible from the car are installed exclusively on the door that separates the zero clearance vestibule from the occupied floor space.

2.11.6.5.2 Where the vestibule is not a zero clearance vestibule as defined in Section 2.11.6.5.1, locking devices at the vestibule will be permitted under any one of the following conditions:

- (a)** A red telephone is installed in the vestibule near the elevator doors to communicate with lobby fire command station or building manager's office or to central service station when the building is not attended. A sign must be posted near the telephone. The sign must read "In Case of Fire or Other Emergency Use This Phone to Contact Lobby or Building Manager or Central Service Station";
- (b)** The locking devices on the vestibule door leading to an exit are released upon activation of any detection or signaling devices, or power failure;
- (c)** At least one exit stair is located within the vestibule.

2.11.7 Glass in hoistway doors.

Delete and revise Section 2.11.7.1 to read as follows:

2.11.7.1 Vision panels. For elevators with automatic or continuous-pressure operation, manually operated or self-closing hoistway doors of the vertically or horizontally sliding type must be provided with a vision panel. In multi-section doors, the vision panel is required in one section only, but is permitted to be placed in all sections. All horizontally swinging elevator doors must be provided with vision panels. Vision panels are permitted for any type of hoistway door. Vision panels are not required at the landing of automatic operation elevators equipped with horizontally sliding car and hoistway doors.

Where required or used, vision panels must conform to Sections 2.11.7.1.1 through 2.11.7.1.7.

Delete and revise Section 2.11.7.1.1 to read as follows:

2.11.7.1.1 The area of any single vision panel must not be less than 0.008 m² (12 in²), and the total area of one or more panels in any hoistway door must not be more than 0.026 m² (40 in²).

2.11.11 Entrances, horizontal slide type.

Delete and revise Subsection (a) of Section 2.11.11.6 to read as follows:

(a) The bottom of each panel must be guided by two or more members.

2.11.15 Marking.

Delete and revise Section 2.11.15.1 to read as follows:

2.11.15.1 Labeling of tested assembly. Sections 2.11.15.1.1 and 2.11.15.1.2 apply. Where required by the *New York City Building Code*, the entire entrance assembly must be of an approved type.

SECTION 2.12 **HOISTWAY DOOR LOCKING DEVICES AND ELECTRIC CONTACTS, AND** **HOISTWAY ACCESS SWITCHES**

2.12.3 Hoistway door combination mechanical locks and electrical contacts.

Delete Section 2.12.3 in its entirety.

2.12.4 Listing/certification door locking devices and door or gate electrical contacts.

Delete and replace Section 2.12.4.1 to read as follows:

2.12.4.1 Type tests. Each type and make of hoistway-door interlock, electric contact, and door or gate electric contact must be of an approved type. Hoistway-door combination mechanical locks and electrical contacts are not permitted.

Delete and revise Subsection (b) of Section 2.12.4.3 to read as follows:

(b) Identification marking. The approved agency's name, date of approval and identifying number or symbol.

2.12.7 Hoistway access switches.

Delete and revise Section 2.12.7.3.2 to read as follows:

2.12.7.3.2 The car cannot be operated at a speed greater than 0.35 m/s (75 ft/min).

SECTION 2.13 **POWER OPERATION OF HOISTWAY DOORS AND CAR DOORS**

2.13.2 Power opening.

Delete and revise Section 2.13.2.1.2 to read as follows:

2.13.2.1.2 Collapsible car gates must not be power opened.

SECTION 2.14
CAR ENCLOSURES, CAR DOORS AND GATES, AND CAR ILLUMINATION

2.14.2 Passenger car enclosures.

Delete and revise Section 2.14.2.1.1 to read as follows:

2.14.2.1.1 Materials in their end use configuration, other than those covered by Sections 2.14.2.1.2 through 2.14.2.1.6, must conform to the following requirements, based on the tests conducted in accordance with the requirements of ASTM E 84, UL 723, or NFPA 255:

- (a) Flame spread rating of 0 to 50.
- (b) Smoke development of 0 to 100.

2.14.7 Illumination of cars and lighting fixtures.

Delete and revise Section 2.14.7.1.4 to read as follows:

2.14.7.1.4 Each elevator must be provided with a guarded electric light and convenience outlet fixture on the car top and under the car platform.

SECTION 2.18
SPEED GOVERNORS

2.18.4 Speed-governor overspeed switch.

Add a new paragraph at the end of the main paragraph of Section 2.18.4.4 to read as follows:

An access door is required when the governor is installed at the top of the hoistway for access to reset switches by elevator personnel. The access door must comply with Section 2.7.3.4.6.

Delete and revise the Note to Section 2.18.4.4 to read as follows:

NOTE: Manual reset is defined here as personal intervention by elevator personnel at the governor.

2.18.5 Governor ropes.

Delete and revise Section 2.18.5.1 to read as follows:

2.18.5.1 Material and factor of safety. Governor ropes must be a minimum of 6 mm (0.25 in.) and must comply with ASME A17.6-2010, Part 1 and ASME A17.1-2010 as referred to in ASME A17.6-2010.

SECTION 2.20 **SUSPENSION ROPES AND THEIR CONNECTIONS**

2.20.3 Factor of safety.

Delete and revise Section 2.20.3 to read as follows:

2.20.3 Factor of safety. Suspension ropes must be stranded carbon steel wire ropes (minimum 8 mm (0.3 in.)) or noncircular elastomeric coated steel suspension members. They must comply with ASME A17.6-2010, Part 1 and Part 3 and ASME A17.1-2010 as referred to in A17.6-2010. Aramid fiber ropes are not permitted.

2.20.4 Minimum number and diameter of suspension ropes.

Delete and revise Section 2.20.4 to read as follows:

2.20.4 Minimum number and diameter of suspension ropes. Suspension ropes must be stranded carbon steel wire ropes (minimum 8 mm (0.3 in.)) or noncircular elastomeric coated steel suspension members. They must comply with ASME A17.6-2010, Part 1 and Part 3 and ASME A17.1-2010 as referred to in A17.6-2010. Aramid fiber ropes are not permitted.

SECTION 2.24 **DRIVING MACHINES AND SHEAVES**

2.24.10 Means for inspection of gears.

Delete and revise Section 2.24.10 to read as follows:

2.24.10 Means for inspection of gears. Each gear case of geared machines must have access to permit inspection of the contact surfaces of the gears.

SECTION 2.25 **TERMINAL STOPPING DEVICES**

2.25.3 Final terminal stopping devices.

Add a new Subsection (d) to Section 2.25.3.1 to read as follows:

(d) Final limit switches and bracket must be permanently secured and pinned.

SECTION 2.26 **OPERATING DEVICES AND CONTROL EQUIPMENT**

2.26.1 Operation and operating devices.

Delete and revise Subsection (e) of Section 2.26.1.4.2 as follows:

(e) The inspection operating devices (see Section 2.26.1.4.1(c)) must be portable, with a cord length of the distance from the connection point to the farthest corner of the top of car, provided that

- (1) The “ENABLE” device (see Section 2.26.1.4.2(c)), and a stop switch, in addition to the stop switch required in Section 2.26.1.4.2(a) are included in the portable unit; and
- (2) The flexible cord is permanently attached so that the portable unit cannot be detached from the car top.

2.26.2 Electrical protective devices.

Delete and revise Section 2.26.2.5 to read as follows:

2.26.2.5 Emergency stop switch. On all elevators, an emergency stop switch must be provided in the car, and located in or adjacent to each car operating panel. When open (“STOP” position), this switch must cause the electric power to be removed from the elevator driving-machine motor and brake. Emergency stop switches must:

- (a) Be of the manually opened and closed type;
- (b) Have red operating handles or buttons;
- (c) Be conspicuously and permanently marked “STOP” and must indicate the “STOP” and “RUN” positions; and
- (d) While opened, cause the audible device to sound (see Section 2.27.1.2).

Delete Section 2.26.2.21 in its entirety.

Delete Section 2.26.2.33 in its entirety.

SECTION 2.27 **EMERGENCY OPERATION AND SIGNALING DEVICES**

2.27.1 Car emergency signaling devices.

Delete and revise Section 2.27.1.1.1 to read as follows:

2.27.1.1.1 A two-way communications means between the car and a location in the building that is readily accessible to authorized and emergency personnel must be provided. Means

must be provided to enable two-way voice communication between the machine, the control room, the control space and the interior of the car.

2.27.2 Emergency or standby power system.

Delete and revise Section 2.27.2.4.3 to read as follows:

2.27.2.4.3 Means must be provided adjacent to the selector switch(es) to indicate that the elevator is at the designated level with the doors in the normally open position.

2.27.3 Firefighters' emergency operation: automatic elevators.

Delete and revise Section 2.27.3 to read as follows:

2.27.3 Firefighters' emergency operation: automatic elevators. See Chapter K1 of Appendix K of the *New York City Building Code*, and replace the words "machine room" with "control room and control space".

2.27.4 Firefighters' emergency operation: nonautomatic elevators.

Delete and revise Section 2.27.4 to read as follows:

2.27.4 Firefighters' emergency operation: nonautomatic elevators. See Chapter K1 of Appendix K of the *New York City Building Code*.

2.27.5 Firefighters' emergency operation: automatic elevators with designated-attendant operation.

Delete and revise Section 2.27.5 to read as follows:

2.27.5 Firefighters' emergency operation: automatic elevators with designated attendant operation. See Chapter K1 of Appendix K of the *New York City Building Code*.

2.27.8 Switch keys.

Delete and revise Section 2.27.8 to read as follows:

2.27.8 Switch keys. See Chapter K1 of Appendix K of the *New York City Building Code*.

2.27.9 Elevator corridor call station pictograph.

Delete Section 2.27.9 in its entirety.

SECTION 2.29
IDENTIFICATION

2.29.1 Identification of equipment.

Delete and revise Section 2.29.1 to read as follows:

2.29.1 Identification of equipment. In buildings with more than one (1) elevator, each elevator must be assigned a unique alphabetical or numerical identification, a minimum of 50 mm (2 in.) in height. The identification number must be applied to the following locations:

- (a) Driving machine;
- (b) MG and / or transformers;
- (c) Controller;
- (d) Selector;
- (e) Governor;
- (f) Main line disconnect switch;
- (g) The crosshead or, where there is no crosshead, the car frame, such that it is visible from the top of the car;
- (h) The car operating panel, minimum of 13 mm (0.5 in.) in height;
- (i) Adjacent to or on every elevator entrance at the designated level, minimum of 75 mm (3 in.) height; and
- (j) Each bank of elevators must be identified by a letter.

Add new Section 2.29.1.1 to read as follows:

2.29.1.1 New York City identification number. Each elevator must be assigned a unique numerical identification a minimum of 6 mm (0.25 in.) in height. The city identification number must be applied to the following locations:

- (a) The driving machine;
- (b) MG and / or transformers;
- (c) Controller;
- (d) Main line disconnect switch;
- (e) The crosshead or, where there is no crosshead, the car frame, such that it is visible from the top of the car;

(f) The car operating panel (main panel only).

Add new Section 2.29.3 to read as follows:

2.29.3 Main line location signage. A permanent sign must be located on or adjacent to the Phase I key switch. The sign must indicate the location of the mainline disconnect switches for that bank of elevators. Lettering must be a minimum of 6 mm (0.25 in.) high in red or a color contrasting with a red background.

PART 3
HYDRAULIC ELEVATORS

SECTION 3.6
PROTECTION OF SPACES BELOW HOISTWAY

3.6.2 Counterweight safety actuation.

Delete and revise Section 3.6.2 to read as follows:

3.6.2 Car and counterweight safety actuation. Where the space referred to in Section 3.6 falls underneath the car or counterweight and/or its guides, the car and counterweight must be provided with a safety device.

SECTION 3.7
MACHINERY SPACES, MACHINE ROOMS, CONTROL SPACES, AND CONTROL ROOMS

Delete and revise the opening paragraph of Section 3.7.1 to read as follows:

3.7.1 Machinery spaces, machine rooms, control spaces, and control rooms must conform to the requirements of Sections 2.7.1 through 2.7.7 and Section 2.7.9. Hydraulic machines and controllers are not permitted in the hoistway or pit.

PART 8
GENERAL REQUIREMENTS

SECTION 8.1
SECURITY

8.1.2 Group 1: Restricted.

Add new Subsection (w) to Section 8.1.2 to read as follows:

(w) The requirements of Section 2.14.1.10 (side emergency exit doors) apply.

NONMANDATORY APPENDIX Q
EXPLANATORY FIGURES FOR THE DEFINITIONS OF ELEVATOR MACHINERY
SPACE, MACHINE ROOM, CONTROL SPACE, CONTROL ROOM, REMOTE
MACHINE ROOM, OR REMOTE CONTROL ROOM

Delete and replace Figure Q-2 with the following new Figure Q-2:

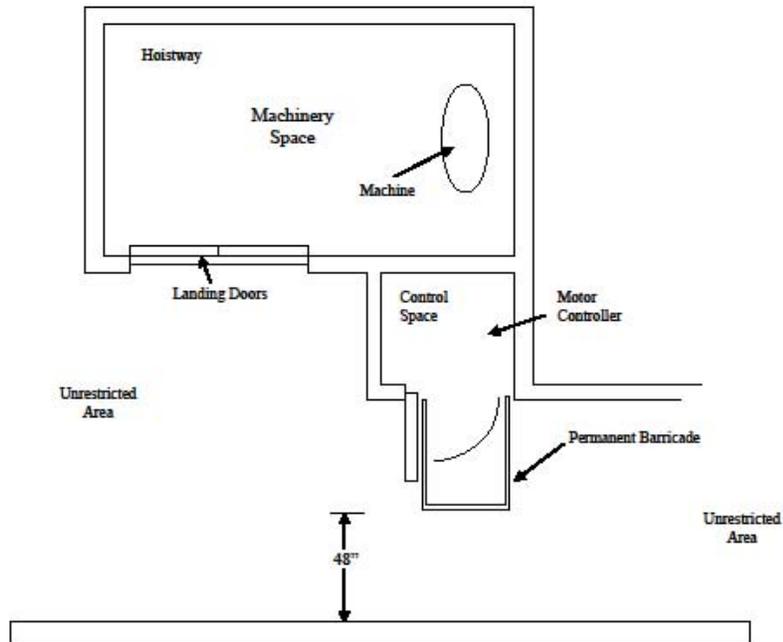

Figure Q-2

§1. Figure M103(1) of Appendix M of the New York city building code, as added by local law number 33 for the year 2007, is repealed and reenacted to read as follows:

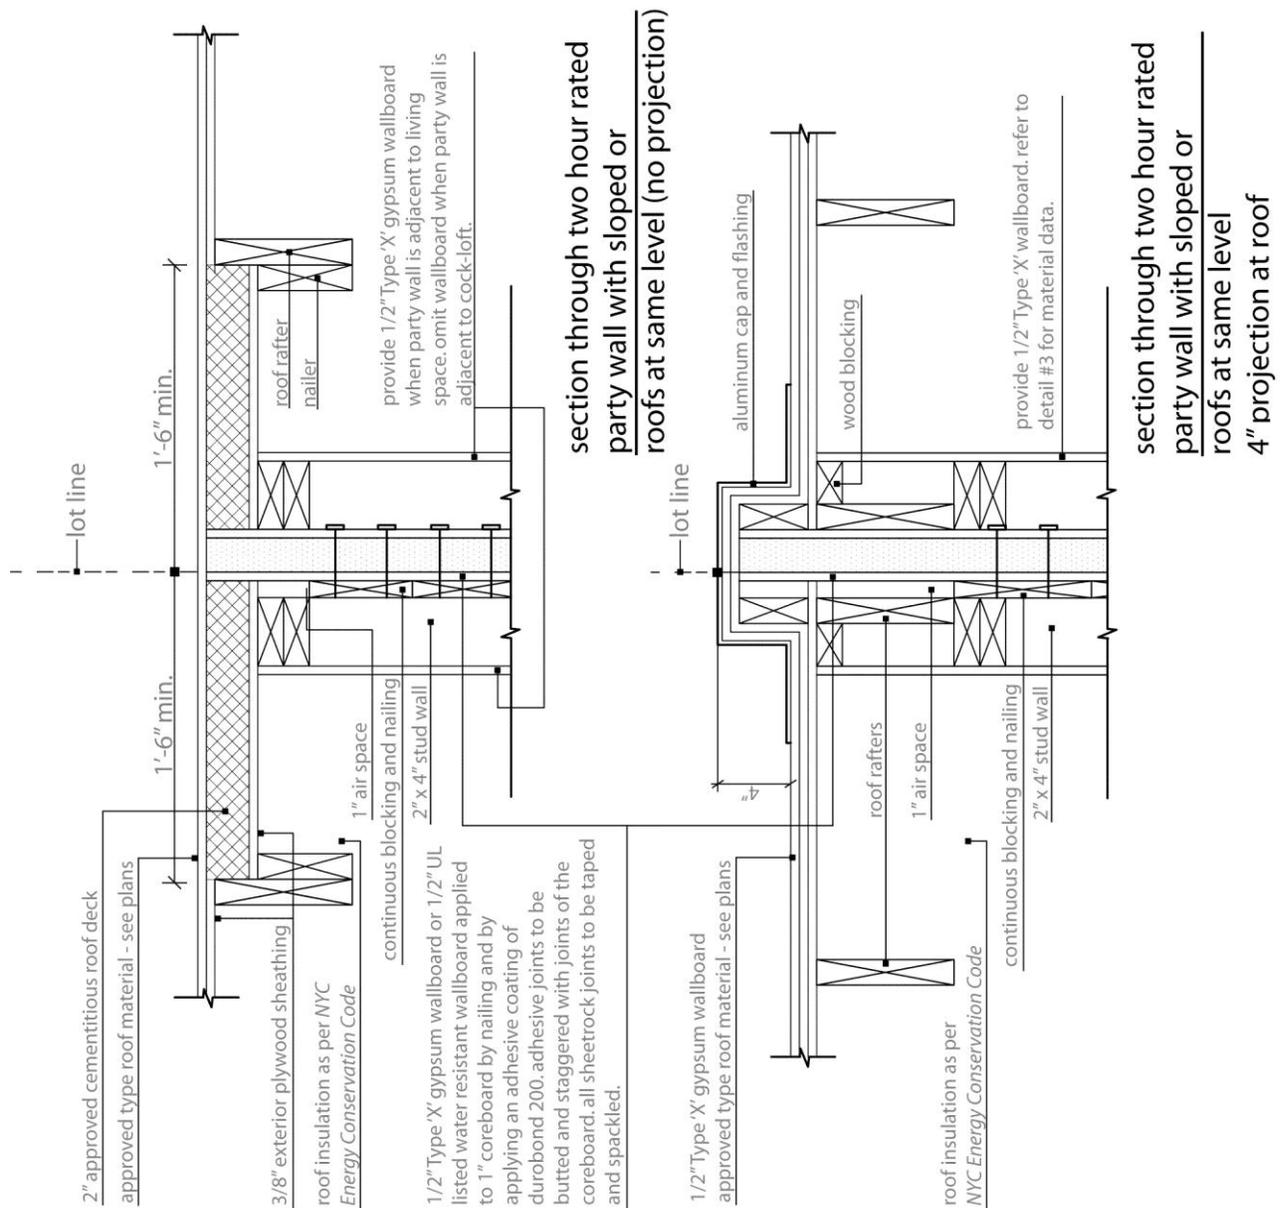

FIGURE M103(1)
PARTY WALL VERTICAL SECTION

§2. Item 1 of Section M103.1 of Appendix M of the New York city building code, as added by local law number 33 for the year 2007, is repealed and reenacted to read as follows:

1. Such wall shall consist of a solid 1-inch (25 mm) Type X gypsum wall board core covered on each side by 1/2 inch (12.7 mm) moisture-resistant Type X gypsum wall board, followed by a 1-inch (25 mm) air gap on one side. Such assembly shall be constructed between two independently supported load-bearing stud walls. See Figure [M102.1] M103(1).

Subpart 43 (Appendix P of the New York City Building Code)

§1. The title of appendix P of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

[R-2 OCCUPANCY] TYPE B+NYC UNIT TOILET AND BATHING [FACILITIES] ROOMS REQUIREMENTS

§2. Section P101.1 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

P101.1 Scope. All toilet and bathing [facilities] rooms within a dwelling unit or sleeping unit subject to Appendix P pursuant to Section 1107.2.2 shall comply with Section P102. [All fixtures within] Within each such toilet and bathing [facility] room, at least one lavatory, one water closet and either a bathtub or shower shall comply with Section P 102; additional fixtures provided within such toilet and bathing room shall comply with Sections 1004.11.3.1.1 (Lavatory), 1004.11.3.1.2 (Water Closet), and 1004.11.3.1.3 (Bathing Fixtures) of ICC A117.1. [Such toilet] Toilet and bathing fixtures shall be in a single room, such that travel between fixtures does not require travel beyond the room in which the fixture(s) of such toilet or bathing [facility] room is located.[Where a bathing fixture is omitted in] In a room [the remaining fixtures] containing only a lavatory and a water closet, such lavatory and water closet shall comply with Section P 102.

Exception: When a shower compartment is not the only bathing facility, such shower compartment shall have dimensions of 36 inches (914 mm) minimum in width and 36 inches (914 mm) minimum in depth.

§3. The title to section BC P102 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

TOILET AND BATHING [FACILITIES] ROOMS

§4. Sections P102.1 and P102.3 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, are amended to read as follows:

P102.1 Accessible route. At least one accessible route shall connect all spaces and elements with each toilet and bathing [facility] room within a dwelling unit or sleeping unit unless as permitted in Section 1107.2.5, [Exception 2 of condition] Condition 3. Accessible routes shall comply with ICC A117.1.

P102.3 Doors. Doors shall comply with Section 1107.2.1 [including maneuvering clearances as required in Section 404.2.3 of ICC A117.1. Section 1003.5, Exception 2 of ICC A117.1 shall not apply]. Doors shall not swing into the clear floor or ground space or clearance for any fixture.

Exception: Doors may swing into the clear floor or ground space or clearances for fixtures where [either:]

- [1. A] a clear floor or ground space complying with Section 305.3 of ICC A117.1 is provided within the room, beyond the arc of the door swing [; or
2. The door and frames are provided with mortised hinge and latch blanks to permit future reversal of the door on the same frames using common hand tools and without further alterations to the door and frames. Such future swing of the door shall not obstruct the maneuvering clearances required at the door or doorway].

§5. Section P102.6 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

P102.6 Lavatory. Lavatories, including those within a toilet and bathing [facility] room accessed through a private office by a single occupant, shall comply with Section 606 of ICC A117.1.

Exception: Cabinetry shall be permitted under the lavatory, provided:

1. Such cabinetry can be removed without removal or replacement of the lavatory; and
2. The finish floor extends under such cabinetry; and
3. The walls behind and surrounding cabinetry are finished.

§6. Sections P102.8.1 and P102.8.2 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, are amended to read as follows:

P102.8.1 Location. The water closet shall be positioned with a wall to the rear and to one side. The centerline of the water closet shall be [16 inches (406 mm) minimum and] 18 inches (457 mm) [maximum]from the side wall.

P102.8.2 Clearance. Clearance around the water closet shall comply with Sections P102.8.2.1 through P102.8.2.3 [and Figure P102.8.2].

§7. Figure P102.8.2, “clearance at water closet”, of section BC P102 of appendix P of the New York city building code is REPEALED.

§8. Sections P102.8.3.1 and P102.8.3.2 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, are amended to read as follows:

P102.8.3.1 Fixed side wall grab bars. Fixed side wall grab bars shall be 42 inches (1067 mm) minimum in length, located 12 inches (305 mm) maximum from the rear wall and extending 54 inches (1372 mm) minimum from the rear wall. In addition, a vertical grab bar 18 inches (457 mm) minimum in length shall be mounted with the bottom of the bar located between 39 inches (991 mm) and 41 inches (1041 mm) above the floor, and with the center of the bar located at 30 inches (762 mm) from the rear wall.

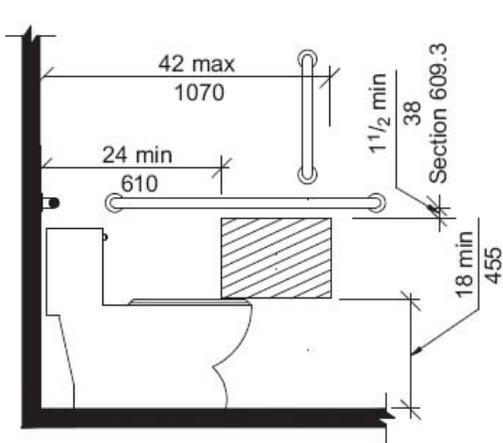

Exception: Where a side wall is not available for a 42-inch (1067 mm) grab bar, the sidewall grab bar shall be permitted to be [18] 24 inches ([457mm] 610 mm) minimum in length, located 12 inches (305mm) maximum from the rear wall [and extending 30 inches (762mm) minimum from the rear wall].

P102.8.3.2 Rear wall grab bars. [The rear wall grab bar shall be 24 inches (610 mm) minimum in length, centered on the water closet.] The rear wall grab bar shall be 36 inches (915 mm) minimum in length, and extend from the centerline of the water closet 12 inches (305 mm) minimum on the side closest to the wall, and 24 inches (610 mm) minimum on the transfer side.

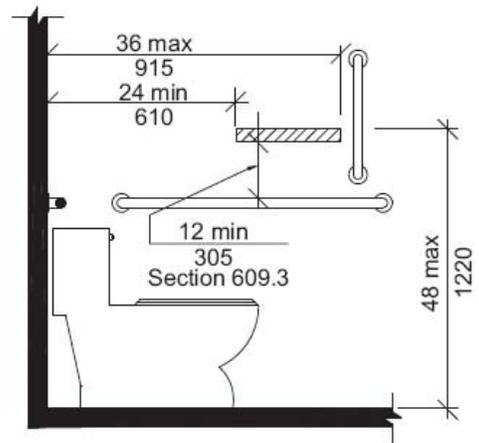

Exception: Where wall space will not permit a grab bar 36 inches (915 mm) minimum in length, reinforcement for a rear wall grab bar 24 inches (610 mm) minimum in length centered on the water closet shall be provided.

§9. Section P102.8.6 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, is amended and a new figure P102.8.6 “Dispenser outlet location” is added to read as follows:

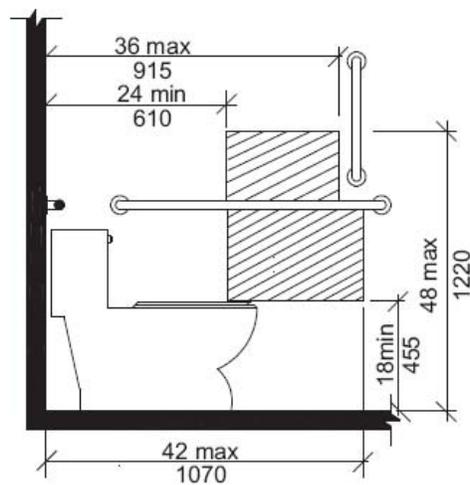

P102.8.6 Dispensers. [Toilet paper dispensers shall be 7 inches (178 mm) minimum and 9 inches (229 mm) maximum in front of the water closet measured to the centerline of the dispenser. The outlet of the dispenser shall be 14 inches (356 mm) minimum and 19 inches (483 mm) maximum above the floor, and shall not be located behind the grab bars.] Toilet paper dispensers shall comply with this section. Where the dispenser is located above the grab bar, the outlet of the dispenser shall be located within an area 24 inches (610 mm) minimum and 36 inches (915 mm) maximum from the rear wall. Where the dispenser is located below the grab bar, the outlet of the dispenser shall be located within an area 24 inches (610 mm) minimum and 42 inches (1065 mm) maximum from the rear wall. The outlet of the dispenser shall be located 18 inches (455 mm) minimum and 48 inches (1220 mm) maximum above the floor. Dispensers shall comply with Section 609.3 of ICC A117.1.

(a) Protruding Dispenser Below Grab Bar

(b) Protruding Dispenser Above Grab Bar

(c) Recessed Dispenser

FIGURE P102.8.6
DISPENSER OUTLET LOCATION

§10. Section P102.9 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

P102.9 Bathing facilities. Where provided, a bathtub [or] shall comply with Section P102.9.1, and a shower compartment [is provided, it] shall comply with Section [P102.9.1 or] P102.9.2.

P102.9.1 Bathtub. Bathtubs, including those within a toilet and bathing [facility]room accessed through a private office by a single occupant, shall comply with Section 607 of ICC A117.1. Lavatories complying with Section P102.6 shall be permitted in the clearance required by Section 607.2 of ICC A117.1. Bathtub seats shall not be required.

Exception: Where a hand shower in compliance with Section 607.6 of ICC A117.1 is not provided, the owner shall provide such a hand shower at the time a person with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by a person with physical disabilities, whichever is later, at the owner's expense.

P102.9.1.1 Grab bars. Grab bars for bathtubs, including those within a toilet and bathing [facility] room accessed through a private office by a single occupant, shall comply with Section 609 of ICC A117.1 and shall be provided in accordance with Section 607.4 of ICC A117.1.

Exception: Grab bars are not required to be installed where reinforcement for such grab bars is installed and located to permit future installation of grab bars complying with Section P102.9.1.1.

P102.9.2 Shower. Showers, including those within a toilet and bathing [facility] room accessed through a private office by a single occupant, shall comply with Section 608 of ICC A117.1.

[Exception] Exceptions:

1. For showers other than transfer-type showers, counter tops and cabinetry shall be permitted at the control end of the clearance, provided such counter tops and cabinetry can be removed and the floor finish extends under such cabinetry.
2. Where a hand shower in compliance with Section 608.5 of ICC A117.1 is not provided pursuant to the exception in such section, the owner shall provide such a hand shower at the time a person with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by a person with physical disabilities, whichever is later, at the owner's expense.

P102.9.2.1 Grab bars and seats. Grab bars and seats for showers, including those within a toilet and bathing [facility] room accessed through a private office by a single occupant, shall comply with Sections 609 and 610 of ICC A117.1 and shall be provided in accordance with Sections 608.2.3 and 608.3 [and 608.4]of ICC A117.1.

Exception: Grab bars and seats are not required to be installed where reinforcement for such grab bars and seats is installed and located to permit future installation of grab bars and seats complying with Section P102.9.2.1.

§11. Section P103.4 of appendix P of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

P103.4 Standards.

ICC A117.1- [2003] 2009 Accessible and Usable Buildings and Facilities P102.1, et. al

Subpart 44 (Appendix Q of the New York City Building Code)

§1. The title of appendix Q of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

APPENDIX Q
MODIFIED NATIONAL STANDARDS FOR AUTOMATIC SPRINKLER, STANDPIPE,
FIRE PUMP AND FIRE ALARM SYSTEMS

§2. Sections Q101, Q102, Q103, Q104, and Q105 of the New York city building code, as added by local law number 33 for the year 2007, are amended to read as follows:

SECTION BC Q101
SCOPE

Q101.1 Scope. This appendix provides the modifications to the nationally recognized standards NFPA 13, NFPA 13D, NFPA 13R, NFPA 14, NFPA 20, and NFPA 72, governing the installation and maintenance requirements of automatic sprinkler systems, standpipe and hose systems, fire pumps, and fire alarm systems. Where a referenced publication has been modified for the City of New York as by the *New York City Building Code* and the *New York City Fire Code*, every reference to such publication shall be deemed to include all such modifications.

SECTION BC Q102
INSTALLATION OF SPRINKLER SYSTEMS

Q102.1 General. Sprinkler systems, where required by this code, shall be installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, [2002] 2007 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*.

Chapter 1 - Administration No changes.

Chapter 2 - Referenced Publications

2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the *New York City Building Code* and the *New York City Fire Code*, every reference to such publication shall be deemed to include all such modifications.”

2.3.[6]7 Delete.

Chapter 3 - Definitions No changes.

Chapter 4 - General Requirements No changes.

Chapter 5 - Classification of Occupancies and Commodities No changes.

Chapter 6 - System Components

[6.3.1.4 Delete the words “and polybutylene”.]

[6.3.6.1 Delete the word “polybutylene”]

Add the following at the end of section 6.3.6.1: The use of pipe or tube other than that described above must involve consideration of many factors, including but not limited to the following:

1. Pressure rating.
2. Beam strength (hangers).
3. Corrosion (chemical and electrolytic).
4. Resistance to failure when exposed to elevated temperatures.
5. Methods of joining (strength, permanence, fire hazard).
6. Availability of fittings (for sprinkler outlets and proper routings).
7. Physical characteristics relating to integrity during earthquakes.
8. Toxicity.
9. Combustibility.
10. Movement during sprinkler operation (water distribution).

[Table 6.3.6.1 Delete the following: Specification for special listed polybutylene (PB) pipe ASTM D 3309.]

Add Section **6.3.6.5** Non-metallic piping and fittings are permitted to be used only in Group R Occupancies 6 stories or less in height.

6.4.3 Delete the word “polybutelene,”

6.8.1.3 Delete.

6.8.3 Delete.

Add Section **6.9.2.2.3** The alarm apparatus for a dry-pipe system shall also consist of approved low and high air pressure alarm attachments to the dry-pipe valve.

6.9.5 Change [“8.15.2.6”] “8.16.2.6” to [“8.16.1.10”] “8.17.1.9”.

Chapter 7 - System Requirements

Add Section **7.2.6.2.4** High / Low air pressure in the system shall be monitored so that either condition sends a supervisory signal. Such signal shall trigger an audible alarm notification appliance, and shall report to a [central] supervising station if the system is required otherwise to do so.

[**7.5.3.1**] **7.6.3.1*** Delete.

Table [7.5.3.1] 7.6.3.1 Delete.

[**7.5.3.2**] **7.6.3.2** Add the following sentence at the end of section [7.5.3.2] 7.6.3.2: Backflow Prevention Device relief discharge shall be piped to a safe location. [**7.6**]

7.7 Delete entire section including subsections.

[**7.9**] **7.10** Delete entire section including subsections.

Chapter 8 - Installation Requirements

8.2.1 Delete the first sentence and replace with the following: The maximum floor area on any one floor to be protected by a single riser from a control and alarm device shall be as follows:

[**8.14.4.4** Delete.]

[**8.14.4.1**] **8.15.4.1*** Delete the reference to section [8.14.4.4] 8.15.4.4 and add at the end of this section the following: when required by other sections of this standard or the *New York City Building Code*.

8.15.4.4 Delete.

[8.14.4.5(2)] Delete the words “NFPA 101, Life Safety Code” and add the words “provisions of the *New York City Building Code*.”

8.14.5 Delete.]

8.15.5.3* Delete the words “in elevator machine rooms or”.

[8.14.8.1.2] 8.15.8.1.2 Delete all words after and including “as defined”.

8.15.8.2* Delete and replace with the following: Closets and Pantries. Sprinklers are not required in clothes closets, linen closets, and pantries within:

(1) Dwelling units in hotels and motels where the area of the closet or pantry does not exceed 24 ft² (2.2 m²), the least dimension does not exceed 3 ft (0.9 m), and the walls and ceilings are surfaced with noncombustible or limited-combustible materials; and

(2) Dwelling units in Group R occupancies other than hotels and motels where the area of the closet or pantry does not exceed 12 ft² (1.1 m²), the room or space upon which the closet or pantry opens is equipped with sprinklers designed to afford protection to the opening of the closet or pantry, and the walls and ceilings of the closet or pantry are surfaced with noncombustible or limited-combustible materials.

[8.14.13] 8.15.14 Delete entire section.

Add Section **[8.14.19.3.5] 8.15.19.4.5** In altering existing sprinkler systems which contain ¾-inch (19 mm) pipe, the existing ¾-inch (19 mm) pipe may be retained except that extension from such ¾-inch (19 mm) pipe shall be made using pipe having a minimum diameter of one-inch (25 mm) except as provided for in sections [8.14.19.3.1] **8.15.19.4.1**, [8.14.19.3.2] **8.15.19.4.2** [and], [8.14.19.3.3] **8.15.19.4.3** and **8.15.19.4.4**.

Add section **[8.14.19.3.6] 8.15.19.4.6** Where nipples used are less than 1 in. (25 mm) diameter, nipples shall be schedule 80 and no longer than shoulder.

Add Section **[8.15.1.1.1.4] 8.16.1.1.1.4** An approved indicating shutoff valve may be used in lieu of an O.S. &Y. gate valve wherever referred to in these modifications except such valve shall not be part of the pressure reducing valve. The indicator shall be readily visible from the floor.

Add Section **[8.15.1.1.1.5] 8.16.1.1.1.5** A connection from public water system shall not extend into or through a building unless such connection is under the control of an outside indicator post or O.S.&Y. gate or under the control of an inside O.S.&Y. gate valve located near the outside wall of the building.

Add Section **[8.15.1.1.1.6] 8.16.1.1.1.6** All gate valves controlling water supplied for sprinklers shall be located where readily accessible, and when necessary, permanent ladders, clamped treads on risers, chains and wheels, or other accepted means shall be provided.

Add Section [8.15.1.1.1.7] **8.16.1.1.1.7** Floor control valves shall be provided where required, or in special cases where area or height or number of tenants is excessive, both in manufacturing and mercantile buildings, or where contents are more than ordinarily susceptible to damage. Floor valves shall be located where they are readily accessible. They are to be O.S.&Y. or indicating type located ahead of the inlet of any pressure reducing valve.

Add Section [8.15.1.1.1.8] **8.16.1.1.1.8** Valves controlling sprinkler supplied from the standpipe system shall be listed for standpipe service in the pressure zone in which it is installed. They shall be O.S.&Y. or indicating valves, and shall be located ahead of the inlet of any pressure reducing valve installed.

[8.15.1.1.2.2] **8.16.1.1.2.2** Revise to read as follows: Floor control valves in high-rise buildings shall comply with section [8.15.1.1.2.1(1)] **8.16.1.1.2.1(1)** or [8.15.1.1.2.1(2)] **8.16.1.1.2.1(2)**.

[8.15.1.1.3.5] **8.16.1.1.3.5** Delete and replace with the following: Where there is one water supply connection a check valve shall be installed. Such check valve may be a swing check, alarm check, an approved fire meter or an approved detector check.

[8.15.1.2.4] **8.16.1.2.4** Delete all words including and after the word “unless”.

[8.15.1.2.5] **8.16.1.2.5** Delete all words after and including the word “at”.

Add Section [8.15.1.1.3.6] **8.16.1.1.3.6** Where a system having only one dry-pipe valve is supplied with city water and Fire Department connection, it will be satisfactory to install the main check valve in the water supply connection in a vertical position immediately inside of the building after the main indicating valve.

Add Section [8.15.1.1.3.7] **8.16.1.1.3.7** Check valves on tank or pump connections, when located underground, may be placed inside of buildings and at a safe distance from the tank riser or pump, except in cases where the building is entirely of one fire area, in which case the check valve may be located over-head in the lowest level.

Add Section [8.15.1.1.4.4] **8.16.1.1.4.4** Where either a wet or dry pipe sprinkler system is supplied by city water and a Fire Department connection and has more than one riser with O.S.&Y. gate valve in each, and the whole system is controlled by one outside post indicator valve, the main check valve in the water supply connection may be installed immediately inside building. If the supply is controlled by an underground gate valve with a Department of Environmental Protection standard curb, roadway or sidewalk flush box, the main check valve in the water supply connection should be installed immediately after the O.S.&Y. gate valve inside the building.

Add Section [8.15.1.1.4.5] **8.16.1.1.4.5** A gate valve should be installed on each side of each check valve under conditions other than described in sections [8.15.1.1.4.1]

8.16.1.1.4.1, [8.15.1.1.4.2] 8.16.1.1.4.2, [8.15.1.1.4.3] 8.16.1.1.4.3 and [8.15.1.1.4.4] 8.16.1.1.4.4. However, this shall not apply to two-way Fire Department [siamese] check valves.

Add Section [8.15.1.1.4.6] 8.16.1.1.4.6 In a city connection serving as one source of supply the city valve in the connection may serve as one of the required gate valves. An O.S.&Y. valve or an indicator post valve should be installed on the systems (water supply) side of the check valve.

8.[15]16.1.1.5.1 Delete and replace with the following: Where a gravity tank is located on a tower in the yard, the gate valve on the tank side of the check valve shall be of O.S.&Y. type; the other shall be either an O.S.&Y. valve or other listed indicating valve. Where a gravity tank is located on a building, both gate valves shall be the O.S.&Y. type; and all fittings inside the buildings, except the drain tee fill line, and heater connections, shall be under the control of a gate valve.

Add Section [8.15.1.3.3] 8.16.1.3.3 Where sprinklers are supplied from a yard main, a listed outside indicator post gate valve shall be placed in the connecting pipe at a safe distance from the building. Indicator post valves should be located not less than 40 feet (12 192 mm) from buildings; but where necessary to place a valve close to a building, it should be located at a blank part of the wall.

Add Section [8.15.1.3.4] 8.16.1.3.4 When a building has no basement, and an outside post indicator control cannot be furnished, a short post indicator may be installed in a horizontal position in riser with handwheel projecting outside of wall.

Add Section [8.15.1.4.2.7] 8.16.1.4.2.7 Pits for underground valves except those located at the base of a tank riser, are described in the Standard for Outside Protection (ANSI/NFPA No. 24-[2002] 2010). For pits protecting valves located at the base of a tank riser, refer to section [8.15.1.4.2.6] 8.16.1.4.2.6.

Table [8.15.2.4.2] 8.16.2.4.2 Change the table to the following:

**TABLE [8.15.2.4.2] 8.16.2.4.2
SECTIONAL OR FLOOR VALVE SIZE
MINIMUM SIZE OF DRAIN CONNECTION**

Up to 2 in.	1 in.
2½ in. to 4 in	1¼ in.
5 in. and larger	2 in.

Add Section [8.16.1.5.3] 8.17.1.5.3 Identification signs shall be provided for outside alarm devices. The sign should be located near the device in a conspicuous position and shall be worded as follows: “SPRINKLER FIRE ALARM – WHEN BELL RINGS NOTIFY FIRE DEPARTMENT OR POLICE”.

[8.16.1.6] **8.17.1.6** Add at end a new item 4 as follows: (4) Refer to NFPA 72 for further requirements.

Add Section [8.16.1.9] **8.17.1.8** as follows:

[8.16.1.9] **8.17.1.8** Dry Pipe System Alarms.

[8.16.1.9.1] **8.17.1.8.1** The alarm apparatus for a dry-pipe system shall consist of approved low and high air pressure alarm attachments as well as waterflow pressure type alarm attachments to the dry-pipe valve. When a dry-pipe valve is located on the system side of an alarm valve, the actuating device of the alarms for the dry-pipe valve may be connected to the alarms on the wet-pipe system.

Add Section [8.16.1.10] **8.17.1.9** Drains for Alarm Devices.

[8.16.1.10.1] **8.17.1.9.1** Where vents are necessary for satisfactory electric alarm switch operations, such vents should be properly piped to a drain.

[8.16.1.10.2] **8.17.1.9.2** Drains from alarm devices shall be so arranged that there will be no danger of freezing, and so that there will be no overflowing at the alarm apparatus, at domestic connections or elsewhere with the sprinkler drains wide open and under pressure.

[8.16.1.10.3] **8.17.1.9.3** Drain from retarding chamber and electric alarm switch shall be permitted to discharge through an open cone and be run separate from main system drains to a safe and visible point of free discharge or to sewer or ground drain. Drain from water-motor-operated alarm device may run separately to sewer or ground drain or may be connected to drain from retarding chamber at a point between such sewer and a check valve on this drain, a union or plug being inserted in the drain from the alarm device to permit inspection. Where checks are used they shall be so located as to have the equivalent of at least a four-foot (1219 mm) head and shall not be installed in a vertical position.

[8.16.1.10.4] **8.17.1.9.4** Where drains are conveyed to a sewer, a proper trap shall be provided.

[8.16.1.10.5] **8.17.1.9.5** Where it is necessary to drain alarm valves outside the wall, an open discharge cone shall be provided inside to break the pipe line so that cold air will not conduct directly into the retarding chamber. Alternately, all drains shall have at least 4 feet (1219 mm) of pipe beyond the valves, in a warm area.

[8.16.2.2] **8.17.2.2** Delete items 1 – 3 and add the following:

(1) Systems with sprinklered areas not exceeding 2000 square feet (186 m²). (2) Systems containing 36 or fewer sprinkler heads except as otherwise required by other sections of this referenced standard.

[8.16.2.3] **8.17.2.3** Delete items 1 – [4] 3 and add the following:

(1) Minimum size of [siamese] two-way Fire Department connection is 5 in. (127mm) except for two-way Fire Department [siamese] connections supplying a single system with a riser smaller than 5 in. (127 mm) where a 4 in. (102 mm) [siamese] two-way Fire Department connection may be used.

Add Section **[8.16.4.2.1] 8.17.4.2.1** This test pipe shall be not less than 1-inch in diameter, located in the upper story, and the connection shall be permitted to be piped from the end of the most remote branch line. The discharge shall be at a point where it can be readily observed. In locations where it is not practical to terminate the test pipe outside the building, the test pipe may terminate in a drain. In such case, the test connection shall be made using a sight test connection containing a smooth bore corrosion resistant orifice giving a flow equivalent to one sprinkler. The test valve shall be located at an accessible point, and not over seven feet above the floor. The control valve on the test connection shall be located at a point not exposed to freezing.

[8.16.5.1.2] 8.17.5.1.2 Add at the end “where a Standpipe System is not otherwise required by Section 905 of the *New York City Building Code*.”

[8.16.5.1.3] 8.17.5.1.3 Delete items (1), (3), (4) and (5). Modify Item (2) by adding at the end “, separately valved and connected to each sprinkler riser for hose stations located in the area covered by the sprinkler system that such riser serves upstream of all sprinkler control valves or in lieu thereof connected to the riser of an adjacent system with areas of coverage as stated above and connected upstream of all sprinkler control valves” and renumber as item (1).

[8.16.5.1.4] 8.17.5.1.4 Add at the beginning “Where a Standpipe System is not otherwise required by Section 905 of the NYC Building Code,” and delete item (2) and renumber items (3), (4) and (5) to (2), (3) and (4), respectively.

Chapter 9 - Hangers [No changes.]

9.2.1.3.3 Delete all subsections and replace with the following:

9.2.1.3.3.1 Listed flexible hose fittings and their anchoring components intended for use in installations connecting the sprinkler system piping to sprinklers shall be rigidly fixed to the building structure at the sprinkler end of the flexible hose, independent of the ceiling suspension and support system in accordance with ASTM C 635, Section 3.1.1.10, as modified by Appendix R of the *New York City Building Code*.

Chapter 10 - Underground Piping

10.10.1 Delete and replace with the following: The installing contractor shall perform all required inspections and acceptance tests in accordance with this chapter prior to scheduling an inspection.

Figure 10.10.1 Delete.

Chapter 11 - Design Approaches

[Add Section **11.2.2.10** Where the water supply to a system sized in accordance with the pipe sizing schedules is taken from a water storage tank, the adequacy of the tank capacity shall be verified with a hydraulic calculation.]

[**11.2.3.1.1** **11.1.4.2*** Delete and replace with the following: [The minimum water supply requirements for a hydraulically designed occupancy hazard fire control sprinkler system shall be determined in accordance with the requirements of section 11.2.3.1.5.] The minimum water supply requirements for a pipe schedule designed sprinkler system shall be per the requirements of Section 11.2.2. The minimum water supply requirement for a hydraulically calculated sprinkler system shall be the calculated sprinkler system demand only, for the duration indicated in Table 11.2.3.1.2. Where gravity tanks are used as the supply or a portion of the supply to a hydraulically designed sprinkler system, it shall not be required to balance the calculated sprinkler flow and pressure demand to the outlet pressure of the gravity tank for the calculation of the water supply duration. The total water supply required shall be the product of the calculated system flow only, multiplied by the required water supply duration.

Add Section [**11.2.3.1.1.1** **11.1.4.2.1** In fully sprinklered buildings, where an Automatic Wet Standpipe System is not required by Section 905 of the *New York City Building Code*, the storage capacity of the fire reserve in the tank supplying water to the sprinkler system shall be as required for the sprinkler demand, at a minimum.

Add Section **11.2.2.10** Where the water supply to a system sized in accordance with the pipe sizing schedules is taken from a water storage tank, the adequacy of the tank capacity shall be verified with a hydraulic calculation.

Add Section **11.2.3.2.3.4** Reductions in the size of the calculated area of operation shall not be taken for the use of quick response sprinklers in the design of systems in existing buildings employing fixed duration stored water supplies of less than 5,000 gallons.

Chapter 12 – General Requirements for Storage No changes.

Chapter 13 – Miscellaneous Storage No changes.

Chapter 14 – Protection of Class I to Class IV Commodities That Are Stored Palletized, Solid Piled, Bin Boxes, or Shelf Storage No changes.

Chapter 15 – Protection of Plastic and Rubber Commodities That Are Stored Palletized, Solid Piled, Bin Boxes, or Shelf Storage No changes.

Chapter 16 – Protection of Class I Through Class IV Commodities That Are Stored on Racks No changes.

Chapter 17 – Protection of Plastic and Rubber Commodities That Are Stored on Racks
No changes.

Chapter 18 – Protection of Rubber Tire Storage No changes.

Chapter 19 – Protection of Roll Paper No changes.

Chapter 20 – Special Designs of Storage Protection No changes.

Chapter [13]21 – Special Occupancy Requirements

Add section [13.1.1.3] **21.1.1.3** The application of the requirements of this Chapter are subject to the approval of the Fire Commissioner.

[13.15.2.1.1] 21.16.2.1.1 Gravity Waste and Linen Chutes

Add the following [at the end of the first paragraph] after the heading: Sprinklers shall be provided in chute vestibules on all floors; if no vestibule exists, sprinklers shall be provided above chute doors and shall be located no more than 1-foot (25 mm) horizontally from face of chute door. All building service chute sprinkler systems shall be provided with a local water flow and valve supervisory alarm with [central] supervising station annunciation. In high rise buildings where sprinklers in chutes are supplied by a chute riser(s), such riser(s) shall be zoned to coincide with the zoning of the standpipe riser(s)[that supplies them]”.

Chapter [14]22 – Plans and Calculations

[14.1.3 (35)] **22.1.3 (35)** Add the words “if required” at the end of this line item.

Chapter [15]23 – Water Supplies

[15.1.1] **23.1.1** Add the following:

- (a) Two automatic sources of water supply shall be provided for sprinklers in:
- (1) Buildings classified in occupancy group H.
 - (2) Buildings classified in occupancy group M when the area on one floor exceeds 20,000 square feet (1858 m²).
 - (3) Buildings classified in occupancy group A-1 [when open heads are required for stages of unlimited size] with stages larger than 1000 square feet (93 m²) in floor area or with a stage height greater than 40 feet (15 240 mm).
- (b) The domestic water supply may be used to supply any sprinklers required by the *New York City Building Code* Section 903 when installed in buildings classified in occupancy groups B, E, I and R, and not classified as a high-rise building, provided that all the requirements stated in subdivision (d) of this section are met.
- (c) The domestic water supply may be used to supply water to sprinklers in cooling towers if provision is made to automatically stop the use of water through the domestic supply lines and provided that all of the requirements stated in subdivision (d) of this section are met.

(d) When the domestic water is used to supply sprinklers as permitted in subdivisions (b) and (c) of this section, all of the following conditions shall be met:

- (1) The domestic water supply line from the tank or street supply shall be at least the size of the sprinkler line and the capacity available shall be at least equal to the capacity required for the sprinklers.
- (2) The domestic water supply line from the tank or street shall have the required pressure as provided in this referenced standard.
- (3) The domestic water supply line shall be of nonferrous material except when the domestic water supply is four inches (102 mm) or more.
- (4) An O.S. & Y. valve or other listed valve having visual indication, and sealed open, shall be installed in the sprinkler supply branch, or such other valve arrangement as may be provided in this referenced standard and in referenced standards NFPA-13R or NFPA 13-D as modified for New York City, as applicable.
- (5) The pipe connecting the domestic water supply and the sprinkler control valve shall be of nonferrous material and not less than twelve inches (305 mm) long.
- (6) The number of heads in each fire section shall not exceed twenty, except that the number of heads in each fire section may exceed twenty in buildings classified in occupancy group R-2, or R-3 not exceeding six stories or 75 feet (22 860 mm) in height and in spaces classified in occupancy group R-2, or R-3 in buildings not exceeding six stories or 75 feet (22 860 mm) in height, provided that no more than 10 heads are supplied from any one domestic water riser.
- (7) The connection shall be made at the supply or riser side of any domestic branch control valves.
- (8) In connection with the above conditions, the number of fire sections having 20 or fewer heads may be unlimited; and the installation of alarms in branches supplying fire sections shall be at the option of the owner, except that such alarms shall be provided where required by referenced standards NFPA-13R and NFPA-13D as modified for New York City.
- (9) A check valve shall be installed on the sprinkler supply branch.

[15.1.3.2 (1)] 23.1.3.2 (1) Delete the words “or Class II Standpipes”.

[15.2.2] 23.2.2 Pumps.

Add the following new sections:

[15.2.2.1] 23.2.2.1 Combined Use. In light hazard occupancies with only limited ordinary hazard areas, an automatic fire pump serving the lower 300 feet (91 440 mm) of the standpipe system may be used as the primary supply to the sprinkler system, provided that an automatic switching secondary power supply is available to drive the pump, where secondary power is required by other provisions of this code, and [that and] that the pump is fully supervised as to pump running and power loss. The supervisory attachments shall be directly connected to an office where maintenance personnel are in attendance twenty-four hours a day; or, in lieu thereof, the supervisory attachment may be directly connected to the [central] supervising station of an approved operating fire alarm company.

[15.2.2.2] 23.2.2.2 In hydraulically designed sprinkler systems supplied from a gravity tank, the pressure may be increased by means of an automatic, special service fire pump. The pump shall be sized to satisfy the water supply requirements of this section and the *New York City Building Code* and shall be arranged with a bypass to permit the portion of the system so supplied to be served by the system's [siamese] two-way Fire Department connections.

If the pump is not supplied from the street side of the building service switch, the electrical service and pump operation shall be fully supervised and an automatic switching secondary power supply provided to drive the pumps, where secondary power is required by other provisions of this code.

[15.2.2.3] 23.2.2.3 Wiring for Fire Pumps. When the fire pump feeder conductors are routed through the building(s), they shall be enclosed by 2 in. (51 mm) of concrete or an assembly which has a minimum of [1] 2-hour fire resistive rating. Wiring for all fire and sprinkler pumps shall be in accordance with the *New York City Electrical Code*.

[15.2.2.4] 23.2.2.4 Sprinkler Booster Pumps. Where the pressure from the city water main is insufficient to comply with the requirements of this referenced standard, but is sufficient to provide at least 5 PSI (34 kPa) at the highest level of sprinklers as determined by test, an automatic, electrically driven pump installed for the purpose of boosting or increasing the city water pressure in the sprinkler system may be used subject to the following requirements:

- (a) Pumps shall be of approved centrifugal type, capable of delivering at least 200 gpm (757 L/m), and shall be capable of supplying the calculated flow and pressure demand of the sprinkler system.
- (b) Pumps shall be maintained under approved automatic control with closed circuit supervisory attachment. The supervisory attachments shall be directly connected to an office where maintenance personnel are in attendance twenty-four hours a day; or, in lieu thereof, the supervisory attachment may be directly connected to the [central] supervising station of an approved operating fire alarm company. The supervisory alarm services shall be arranged so as to provide positive indication at an approved central office or sprinkler alarm panel board that the pump has operated or that the source of electrical supply has failed.
- (c) Such pumps shall also comply with the applicable provisions of this Referenced Standard and the *New York City Building Code* pertaining to Fire Pumps, except that only one water supply and no enclosure shall be required.
- (d) Power to such pumps shall be supplied from the street side of the building service switch. Secondary power shall be provided where required by other provisions of this code.
- (e) If a secondary power supply is provided to drive the pump and such power supply is automatic switching, the 5 psi (34 kPa) requirement in section [15.2.2.4] 23.2.2.4 and the requirements of paragraph (d), for power to be supplied from the street side of the building service switch, may be waived.

Pressure Tanks

[15.2.3.1] **23.2.3.1** to [15.2.3.3.2] **23.2.3.3.2** Delete and replace with the following:

[15.2.3.1] **23.2.3.1** A pressure tank providing water supply in accordance with Table 11.2.2.1 or section 11.2.3 is an acceptable water supply source. The total available quantity of water in pressure tanks need not exceed 15,000 gallons (56 781 L) when there is a secondary source of water supply available from a gravity tank or a street connection. The maximum gross capacity of a single pressure tank shall be 9,000 gallons (34 069 L) and shall include the needed extra capacity to fill dry-pipe or preaction systems when installed.

[15.2.3.1.1] **23.2.3.1.1** Each tank shall be kept at a maximum of $\frac{2}{3}$ full of water and a minimum of $\frac{1}{3}$ full of air maintained under a minimum pressure of 75 psig (517 kPa). The water-to-air ratio shall be so proportioned and the tank so located that a minimum pressure of 15 psig (103 kPa) will be available on the highest line of sprinklers below the main roof when all the water has been discharged from the tank.

[15.2.3.1.2] **23.2.3.1.2** The tank supports shall be designed on the basis of a full tank. The tanks shall be supplied with water through a fixed pipe, independent of the sprinkler piping and at least 2 inch (51 mm) in size. The water supply shall be capable of supplying the tank at a rate of at least 65 gpm (4 L/s) without decreasing the pressure in the tank. The tank shall have a fixed water level plate on the end of the tank opposite the gage glass, or equivalent devices, to indicate the level of the water in the tank.

[15.2.3.1.3] **23.2.3.1.3** The air compressor shall be provided with automatic controls for maintaining the air pressure. The capacity of the compressor shall be sufficient to build up the tank pressure to 75 psig (517 kPa) within 3 hr. or less.

[15.2.3.1.4] **23.2.3.1.4** Pressure tanks shall be provided with closed circuit high and low water and high and low air pressure alarms.

[15.2.3.1.5] **23.2.3.1.5** Pressure tanks shall be located at or above the top level of sprinklers.

Gravity Tanks

[15.2.4] **23.2.4** Add at end the following: If any of the sprinkler heads are supplied from domestic water tanks, the combined water supply in the tank shall be at least 5,000 gallons (18 927 L). Further, the sprinkler water supply shall be taken from the lowest level of the tank.

Add Section [15.2.4.1] **23.2.4.1** Combined Use. In A, B, E, I and R Occupancies, with only limited ordinary hazard areas, the sprinkler and standpipe reserve may be common to both. The Reserve shall be sized for the greater demand, in accordance with NFPA 14, section 7.10.1.3. For purposes of this section, limited shall be defined as less than 30 percent of the floor area on the given floor. Buildings whose occupancies are more than 85 percent light hazard may have a light hazard water supply, provided the ordinary hazard areas are designed for ordinary hazard requirements with respect to sprinkler spacing and pipe sizing.

Add Section [15.2.4.2] 23.2.4.2 Combined standpipe and sprinkler systems may be used in Occupancies A, B, E, F, I, M, R and S. If an automatic fire pump is used as the primary supply, the requirements of section [15.2.2.1] 23.2.2.1 shall apply.

Chapter [16] 24 – Systems Acceptance

[16.1] 24.1 Delete and replace with the following: The installing contractor shall inspect and test the installation in accordance with the procedures of this chapter prior to scheduling an inspection.

24.2.1.1 Delete the words “2 hours” and replace with “1 hour”.

24.2.1.5 Delete the words “2 hours” and replace with “1 hour”.

24.2.1.10 Delete the words “150 psi (10.3 bar)” and replace with “200 psi (13.8 bar)”.

[16.3] 24.3 Delete entire section.

[16.3.1] 24.3.1 Delete.

[16.3.2] 24.3.2 Delete.

[16.3.3] 24.3.3 Delete.

[16.3.4] 24.3.4 Delete.

Chapter [17] 25 - Marine Systems No changes.

Chapter [18] 26 - System Inspection, Testing and Maintenance:

[18.1] 26.1 Delete and replace with the following: General. A sprinkler system installed in accordance with this standard shall be properly inspected, tested, and maintained in accordance with NFPA 25, *Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems* and the *New York City Fire Code*, to provide at least the same level of performance and protection as designed.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. This annex contains explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A

A.5.2 Move Occupancy Classification of Theaters and Auditoriums from Light Hazard to Ordinary Hazard Group 1.

[A.11.2.3.1.7] **A.11.1.5.2.3(3)** Delete.

Annex B – Miscellaneous Topics No changes.

Annex C – Explanation of Test Data and Procedures for Rack Storage No changes.

Annex D – Sprinkler System Information from the 1997 Edition of the *Life Safety Code* No changes.

Annex E – Informational References No changes.

**SECTION BC Q103
INSTALLATION OF SPRINKLER SYSTEMS IN ONE-
AND TWO-FAMILY DWELLINGS AND
MANUFACTURED HOMES**

Q103.1 General. Sprinkler systems, where required by this code, shall be installed in accordance with NFPA 13D, *Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes*, [2002] 2007 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*.

Chapter 1 - Administration No changes.

Chapter 2 - Referenced Publications

2.2 Add at end the following: Where a referenced publication has been modified for the City of New York by the *New York City Building Code* and the *New York City Fire Code*, every reference to such publication shall be deemed to include all such modifications.

Chapter 3 - Definitions

3.3.9.3 Delete.

3.3.9.6 Delete.

Chapter 4 - General Requirements

4.2.1 Add at end the following: The owner is responsible for the maintenance of the system.

4.3.1 Delete and replace with the following: Where a Fire Department pumper connection is not provided, the system shall be hydrostatically tested for leakage at 50 psi (344 kPa) above normal system operating pressure and checked visually for leakage at each joint or coupling.

Add new Section **4.3.3** Fire Department connections are not required for systems covered by this standard, but may be installed at the discretion of the owner. In these cases, hydrostatic tests in accordance with Reference Standard NFPA 13 [2002] 2007, as modified for New York City, are necessary. Dry systems should also be tested by placing the system under 40 pounds (2.8 bar) air pressure. Any leak that results in a drop in system pressure greater than 2 psi (0.14 bar) in 24 hours should be corrected. Check for leaks using soapy water brushed on each joint or coupling. Leaks will be shown by the presence of bubbles. This test should be made prior to concealing of piping.

Chapter 5 - System Components

5.2.1 Add at end the following: Non-metallic pipe shall be used in wet systems only.

5.2.1.3 Delete.

5.2.2.2 Delete the words “and polybutylene (PB)”.

Table 5.2.2.2 [Delete the line for “Specification for Polybutylene (PB) Pipe” and delete the reference to “ASTM D 3309”.] Delete the line for “Standard Specification for Polybutylene (PB) Plastic Hot and Cold Water Distribution Systems” and delete the reference to “ASTM D 3309”.

5.2.9.2 Delete the words “and polybutylene (PB)”.

5.3 Delete.

Chapter 6 - Water Supply

6.2 Add the following as item ([5] 6):

([5] 6) A common supply main to the building, serving both sprinklers and domestic uses, may be used if provision is made to prevent flow on the domestic water system upon operation of sprinklers, and closure of the main sprinkler control valve (the house control valve) will shut off the domestic water supply.

6.3 Delete.

Chapter 7 - Installation

7.1.1 Delete the remainder of the sentence starting with and including the word “unless”.

7.1.2 Delete and replace with the following: Except for the meter set controlling combined domestic water and fire sprinkler systems, sectional control valves and other valves if provided in supply pipes to sprinklers shall be locked open and supervised open by one of the following methods:

- (a) [Central] Supervising station, proprietary or remote station signaling service, or
- (b) Local signaling service that will cause the sounding of an audible signal.

Exception - Underground gate valves with roadway boxes need not be supervised.

7.1.3 Delete the remainder of the sentence starting with and including the word “other”.

7.6 Add at the end the following: as modified for New York City.

Chapter 8 - System Design

8.3.3.3.1.1 Delete and replace with the following: Arrangement of supply piping to an anti-freeze system shall be in accordance with NFPA-13 [2002] 2007 as modified for New York City.

8.3.3.3.1.2 Delete.

8.3.3.3.1.3 Delete.

8.3.3.3.1.4 Delete.

8.3.3.3.2 Delete.

8.3.3.3.2.1 Delete.

8.3.3.3.2.2 Delete.

8.3.3.3.2.3 Delete.

8.4.3.2 Delete the remainder of the section starting with and including the word “unless”.

8.4.3.3 Delete.

8.6.4 Add the following after the word “garages”: provided that at least one sprinkler head is located within 3 feet (914mm) of any communicating opening between the garage and the dwelling.

8.6.5 Add after the word “attics”, the words “without floors”.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. This annex contains explanatory material, numbered

to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

A.5.2.2.2 Delete.

A.5.2.9.2 Delete.

Figure A.6.2 (c) Delete the sprinkler control valve shown.

A.6.3 Delete.

Figure A.6.3 (a) Delete.

Figure A.6.3 (b) Delete.

Figure A.6.3 (c) Delete.

Figure A.6.3 (d) Delete.

[A.8.4.3.3 ([i])] A.8.4.3.3 ([1]) Delete.

Figure A.8.4.3.3(1) Delete.

Annex B – Information References No changes.

**SECTION BC Q104
INSTALLATION OF SPRINKLER SYSTEMS IN
RESIDENTIAL OCCUPANCIES UP TO AND
INCLUDING SIX STORIES IN HEIGHT**

Q104.1 General. Sprinkler systems, where required by this code, shall be installed in accordance with NFPA 13R, *Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height*, [2002] 2007 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*.

Chapter 1 - Administration

1.1 Delete the word “four” and replace with “six”.

Chapter 2 - Referenced Publications

2.2 Add at end the following: Where a referenced publication has been modified for the City of New York by the *New York City Building Code* and the *New York City Fire Code*, every reference to such publication shall be deemed to include all such modifications.

Chapter 3 - Definitions

[**3.3.5** Delete.]

3.3.6 Delete (Use definitions contained in [*NYC BC*] *New York City Building Code*).

Chapter 4 - General Requirements No changes.

Chapter 5 - System Components

5.2.1 Add at the end the following: Non-metallic pipe shall be used in wet systems only.

5.2.2.2 Delete the words “and polybutylene (PB)”.

Table 5.2.2.2 Delete “Specification for Polybutylene (PB) Pipe ASTM D 3309”.

5.2.10.2 Delete the words “and polybutylene (PB)”.

5.3.2(1) Delete and replace with the following: Antifreeze systems – Only glycerin type anti-freeze is permitted for use in systems containing non-metallic pipe or fittings.

Chapter 6 - Working Plans, Design, Installation, Acceptance Tests and Maintenance

[**6.2.2**] **6.3.2** Delete.

Figure [**6.2.2**] **6.3.2** Delete.

6.3.3 Delete.

[**6.5.3**] **6.6.3** Add the following as item (5):

(5) A common supply main to the building, serving both sprinklers and domestic uses, may be used if provision is made to prevent flow on the domestic water system upon operation of sprinklers, and closure of the main sprinkler control valve (the house control valve) will shut off the domestic water supply.

[**6.5.5**] **6.6.5** Delete.

[**6.5.6**] **6.6.6** Delete.

[**6.6.1.2**] **6.7.1.2** Delete and replace with the following:

Except for the meter set controlling combined domestic water and fire sprinkler systems, sectional control valves and other valves if provided in supply pipes to sprinklers shall be locked open and supervised open by one of the following methods:

(a) [Central] Supervising station, proprietary or remote station signaling service, or

(b) Local signaling service that will cause the sounding of an audible signal at a constantly attended point.

Exception- Underground gate valves with roadway boxes need not be supervised.

[6.6.4] **6.7.4** Delete and replace with the following:

Fire Department Connection. Except in buildings classified in occupancy group R-1, at least one 3 in. (76 mm) single inlet Fire Department connection shall be provided and located in accordance with the *New York City Building Code*. Buildings classified in occupancy group R- 1 shall be provided with [siamese] two-way Fire Department connections in accordance with the referenced standard NFPA-13-[2002] 2007 as modified for New York City. A Fire Department connection is not required in one- and two-family dwellings.

[6.6.4.1] **6.7.4.1** Delete.

[6.6.4.2] **6.7.4.2** Delete.

[6.8.5] **6.9.6*** After the word “attics” add the words: “without floors”.

Add Section [6.8.7] **6.9.8** Location of sprinklers installed in buildings classified in occupancy group R-1 shall be in accordance with the requirements of the *New York City Building Code* and NFPA -13-[2002] 2007 as modified for New York City.

[6.9.2] **6.10.2** Delete and replace with the following: Sprinkler systems shall be inspected, tested, and maintained in accordance with the *New York City Fire Code* and with the rules of the Fire Department.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. This annex contains explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

A.1.1 Delete the words “four stories” and replace with the words: “six stories”.

A.5.2.2.2 Delete.

A.5.2.10.2 Delete.

[A.6.3.2] **A.6.4.2** Delete the words “, or flexible piping such as listed polybutylene,” and delete the sentence that reads “Testing with air pressure is permitted for polybutylene piping where conducted in accordance with the testing procedures of section [16.2.2.1] 24.2.2.1 of NFPA 13, *Standard for the Installation of Sprinkler Systems.*”

[A.6.5.5] **A.6.6.5** Delete.

Table [A.6.5.5(a)] **A.6.6.5(a)** Delete.

Table [A.6.5.5(b)] **A.6.6.5(b)** Delete.

Annex B – Informational References No changes.

SECTION BC Q105 INSTALLATION OF STANDPIPE AND HOSE SYSTEMS

Q105.1 General. Standpipe and hose systems, where required by this code, shall be installed in accordance with NFPA 14, *Standard for the Installation of Standpipe and Hose Systems*, [2003] 2007 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*.

Chapter 1 – General Information No changes.

Chapter 2 – Referenced Publications

2.1 Add at end the following: Where a referenced publication has been modified for the City of New York by the *New York City Building Code* and the *New York City Fire Code*, every reference to such publication shall be deemed to include all such modifications.

Chapter 3 - Definitions

[3.3.9] **3.3.5** Add at end the following: For the purposes of this section, a penthouse of any area with an occupant load greater than 10 shall be considered a story.

[3.3.27.2] **3.3.15.2** Add at end the following: Class II standpipe systems are permitted for high pile and rack storage occupancies only.

Chapter 4 – System Components and Hardware

4.2.2 Delete and replace with the following: Pipe for buried portions of the standpipe system, whether inside or outside of the building, shall be red brass, ductile iron, hard tempered type “K” copper tubing, galvanized steel or other approved corrosion resistant material. All such pipe, other than ductile iron, shall be adequately wrapped or otherwise protected against corrosion.

Add Section **4.2.2.1** Where ductile iron pipe is installed in accordance with Table 4.2.1, it shall be lined in accordance with AWWA C 104, *Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water*.

4.2.3 Add at end the following: Piping conforming to the specifications contained in this section may only be used in buildings with floor heights not exceeding 300 feet (91 440 mm) above grade plane or in the highest 300-foot (91 440 mm) portion of other buildings. Otherwise piping conforming to the wall thicknesses specified in section 4.2.4 shall be used.

4.5.1 Add at end the following: 6 inch (152 mm) and larger sectional and riser control valves shall have a minimum $\frac{3}{4}$ inch (197 mm) valved bypass.

4.6.2.1 Change “30.5 m (100 ft)” to “38.1 m (125 ft)”.

4.6.2.2 Delete.

4.6.3.2 Delete.

4.6.5 Delete and replace with the following: **Label.** Each rack or storage facility for 40-mm (1½-in.) hose shall be provided with a label that shall include operating instructions.

4.7.2 Delete and replace with the following: Hose connections shall have nominal 2½ inch (64 mm) threads conforming to FDNY standards.

4.8.2 Delete and replace with the following: Each Fire Department connection shall have at least two 3 inch (76 mm) internally threaded swivel fittings having threads conforming to FDNY standards and be of a minimum size of 5 inches (127 mm) except where supplying a single 4 inch (102 mm) standpipe riser, in which case the minimum size shall be 4 inches (102 mm).

4.8.2.1 Add at end the following: Caps shall be painted red, except that the caps for combination standpipe and sprinkler systems shall be painted yellow, and caps for sprinkler systems only shall be painted green.

4.8.2.2 Delete and replace with the following:

[Siamese] Two-way Fire Department connections shall be provided as follows:

(a) One [siamese] two-way Fire Department connection shall be provided for each 300 feet (91 140 mm) of exterior building wall or fraction thereof facing upon each street or public space.

(b) Where buildings face upon two parallel streets or public spaces without an intersecting street or public space, one [siamese] two-way Fire Department connection shall be provided for each 300 feet (91 140 mm) of exterior building wall or fraction thereof facing upon each such parallel street or public space.

(c) Where a building faces upon two intersecting streets or public spaces and the total length

of the exterior building walls facing upon such streets or public spaces does not exceed 300 feet (91 140 mm) only one [siamese] two-way Fire Department connection need be installed provided the [siamese] two-way Fire Department connection is located within 15 feet (4572 mm) of the corner and on the street with the longest building frontage.

(d) Where a building faces on three streets or public spaces, one [siamese] two-way Fire Department connection shall be provided for each 300 feet (91 140 mm) of building wall or fraction thereof facing upon such streets or public spaces provided that at least one two-way Fire Department [siamese] connection is installed on each of the parallel streets or public spaces, and further provided that the two-way Fire Department [siamese] connections shall be located so that the distance between them does not exceed 300 feet (91 140 mm).

(e) Where a building faces upon four streets or public spaces, at least one two-way Fire Department [siamese] connection shall be provided on each street front or public space; however, only one two-way Fire Department [siamese] connection need be provided at the corner of two intersecting streets or public spaces if the two-way Fire Department [siamese] connection is located within 15 feet (4572 mm) of the corner and on the street with the longest building frontage or public space, and if the distances between two-way Fire Department [siamese] connections, in all cases, do not exceed 300 feet (91 140 mm).

(f) In any case where the exterior building walls of a building facing a street or public space are obstructed in part by another building, one two-way Fire Department [siamese] connection shall be provided for each clear three hundred feet of exterior building wall or fraction thereof facing upon such street or public space.

(g) Location.

(1) Two-way Fire Department [siamese] connections shall be placed between 18 inches (457 mm) and 36 inches (914 mm) above the sidewalk level.

(2) Two-way Fire Department [siamese] connections shall be of the flush or free standing type, and with the exception of the [swivel] swivels, caps, and plugs, shall not project beyond the street property line. The riser pipe to a free standing two-way Fire Department [siamese] connection shall be red brass. When two-way Fire Department [siamese] connections are installed in wall recesses, the recesses shall be of ample size to permit convenient hose attachment.

(h) Check valve. Each two-way Fire Department [siamese] connection shall be provided with a swing-type check valve inside of the building or in a valve pit outside of the building. In addition, each high zone two-way Fire Department [siamese] zone shall be provided with a swing-type check valve located at each connection between the high zone two-way Fire Department [siamese] express riser and the high zone standpipe system and located at the level of such connection.

(i) Drip valve. A $\frac{3}{4}$ inch (19mm) automatic ball drip valve shall be placed between the two-way Fire Department [siamese] connection and the check valve, except that on a fireboat two-way Fire Department [siamese] connection, a $\frac{1}{2}$ inch (13 mm) open drip without a shutoff may be used. Automatic ball drips shall be placed in the horizontal position.

(j) Two-way Fire Department [siamese] connections shall be provided in maximum two-way Fire Department connection [siamese] zone heights of 600 feet (15 240 mm), supplying no more than two standpipe zones. A normally closed valved interconnect shall be provided between each two-way Fire Department connection [siamese] zone.

(1) Express piping to high zone two-way Fire Department [siamese] connections shall not be installed in stairway enclosures but may be installed in any other protected shaft.

(2) Isolation valves shall be provided in all standpipe risers at 100 foot (30 480mm) vertical intervals.

4.10 Add at end the following: All interior signage shall have a red background with minimum 1 inch high white letters. All exterior signage shall have a white background with minimum 1 inch (25 mm) high red letters.

Chapter 5 – System Requirements

5.1.3 Add at end the following: and Section 905 of the *New York City Building Code*.

5.1.4 Delete.

[**5.3.2.1**] **5.3.2.2** Delete.

5.3.3.1 Delete.

5.3.3.2 Delete all after the word “required” and add the following: except where specifically required by Section 905 of the *New York City Building Code*.

5.4.1.1 Delete the words [“manual, automatic, or semiautomatic”] “any type described in Section 5.2” and replace with the words: manual-wet or automatic-wet.

5.4.1.2 Delete the words “automatic or semiautomatic” and replace with the words: automatic-wet.

[**5.4.3** Delete “or semi-automatic wet”.]

Chapter 6 – Installation requirements

6.1.2.1 Add at end the following: in accordance with the requirements of section 905 of the *New York City Building Code*.

6.1.2.2 Add at end the following: in accordance with the requirements of section 905 of the *New York City Building Code*.

6.1.2.3 Add at beginning the following: **Protection of standpipe system**

6.1.2.3.1 Add at end the following:

All parts of the standpipe systems that may be exposed to frost shall be protected from freezing by any one of the following methods:

(1) The piping shall be frostproofed with insulation having a thermal conductance of 0.1 Btu/hr. per square foot of surface per degree F at a mean temperature of 70 to 75 degrees F (21 °C to 24°C). Insulation shall be protected to prevent water infiltration, and when exposed to the weather the insulation shall be covered with a 45 pound (20 kg) roofing felt jacket or equivalent.

- (2) Steam or electric tracers may be used in conjunction with the insulation.
- (3) Tanks subject to freezing temperatures shall be protected.

[6.2.1] 6.3.1.1 Add at end the following: Check valves other than those in two-way Fire Department [siamese] and fire pump line shall be provided with an O.S. & Y. or indicating shutoff valve (with indicator readily visible from the floor) that is flanged, mechanically coupled or wafer type and connected to the inlet and outlet of such check valves. The valves on the suction and discharge of the fire pump shall be deemed to comply with this requirement when the discharge valve is placed on the discharge side of the check valve. One of the shutoff valves placed on each side of the tank check valve may be of the remote control type, and when used, shall be on the downstream side of such check valve.

[6.2.2] 6.3.2 Add at end the following:

(1) Riser control valves, shall where practical, be located within a required stair enclosure serving the entrance floor. Where the stair enclosure extends to the basement or cellar, the riser control valve may be located within the stair enclosure at or in the basement or cellar ceiling, providing that a sign indicating the valve location is installed within the stair enclosure at the entrance floor. The hose outlet valve for the entrance floor shall be located on the riser side of the riser control valve. Sectional control valves shall be provided at maximum 100 foot (30 480 mm) increments in all standpipe risers. Riser control valves or sectional valves shall not be required on a vertical line supplying one or two hose outlet valves.

(2) Where riser control or section valves are located outside of a required stair enclosure, the valves shall be of such type and so installed so as to be remotely operated by either electric motors or hydraulic means. The remote control shall be from either the entrance floor or from a fire pump room. Operating devices shall be grouped, suitably housed, and kept locked with a Fire Department lock and key. The door of the housing shall be embossed to indicate the purpose of the device. Instructions for operating the remote valves by the control device shall be legible, detailed, and complete, and shall be permanently secured to the inner face of the door.

(3) Each valve shall be so designed and installed as to permit its manual operation at the valve location. Pressure ratings and the name of the manufacturer shall be cast raised or depressed on each valve used in the system.

(4) The position of each remotely controlled valve, whether opened or closed, shall be indicated at its remote control point and also at the valve.

(5) Valves shall be readily accessible for inspection, repair, and use. If the valve is placed so that its operating mechanism is more than 7 feet (2133 mm) above a floor or stair landing, a 12 inch (3658 mm) wide wrought iron, steel or equivalent ladder securely fastened shall be provided for access to the valve. In lieu of a ladder, chain operated mechanisms are permissible and shall be padlocked securely in place.

(6) Each control valve shall be conspicuously marked with the number assigned to it on the riser diagram for the standpipe system. Metal numbered tags at least 2 inch (51 mm) in diameter shall be securely attached to the valve. Each valve shall have a metal sign stating "STANDPIPE CONTROL VALVE" securely hung from the valve.

(7) Each control valve not remotely controlled shall be electrically supervised in its normal position. If the normal position is the closed position, a metal placard stating such

fact shall be conspicuously attached to the valve.

[6.2.4] **6.3.4** Add at the end the following: Wafer type control valves may not be used in pump suction piping.

[6.2.7] **6.3.7.1** Add at end of item (3) the following: Only permissible when no fire alarm system is present and delete item (4).

[6.2.8.3] **6.3.8.3** Add at the end the following: Such sprinkler system piping supply shall only be permitted where approved by the commissioner.

[6.3.2] **6.4.2** Add at end the following: In addition, each high zone two-way Fire Department [siamese] zone shall be provided with a swing-type check valve located at each connection between the high zone two-way Fire Department [siamese] express riser and the high zone standpipe system and located at the level of such connection.

[6.3.5.2] **6.4.5.2** Delete and replace with the following: **Marking.** Each two-way Fire Department [siamese] connection shall be provided with caps painted red, and shall have the word “STANDPIPE” in letters 1 inch (25 mm) high and 1/8 inch deep cast in the body or on a nonferrous metal plate secured to the connection or mounted on the wall in a visible location, except that caps of each two-way Fire Department [siamese] connection used for combination standpipe and sprinkler systems shall be painted yellow and the words shall read “COMBINATION STANDPIPE AND SPRINKLER SYSTEMS”. Where two-way Fire Department [siamese] connections serve other than the entire building, the connections shall be marked in accordance with the specifications of this section “LOW ZONE” or “HIGH ZONE” and indicate the floors served.

[6.3.5.2.1] **6.4.5.2.1** Delete.

[6.3.6] **6.4.6** Delete “1219 mm (48 in.)” and replace with the following: 914 mm (36 in.).

Chapter 7 – Design

7.1.1 Delete.

7.2 Delete and replace with the following: The maximum pressure at any point in the system at any time shall not exceed 24.1 bar (350 psi), except for piping to high zone two-way Fire Department [siamese] connections, and shall not, in any case, be greater than the pressure rating of the system components in accordance with section 4.2 of this referenced standard. Maximum height per zone is limited to 300 feet (91 140 mm).

7.2.1.1 Change the word “regulating” to “restricting”.

7.2.1.2 Delete.

7.3.2 Delete all after the word “connections” and replace with the following: in accordance with the requirements of Section 905 of the *New York City Building Code*.

7.3.2.1 Delete.

7.3.2.2 Delete and replace with the following: At the top of the highest riser there shall be provided, above the main roof level, a three way manifold equipped with three 2½ inch (63.5 mm) hose valves with hose valve caps. The lowest valve shall be located with the hose end at least 18 inch (457 mm) above the roof and the highest valve with the hose end not more than 60 inch (1524 mm) above the roof. The manifold may be set in a horizontal or vertical position, provided the hose outlets are set back between 18 inch (457 mm) and 60 inch (1524mm) above the roof level. Where the manifold is located other than within a heated stair enclosure, the control valve shall be located in a horizontal run of piping below the roof, with a long stem extending through the roof and equipped with a wheel handle at its upper end at least 12 inch (304.8 mm) above the roof. Between the control valve and the manifold there shall be provided within the heated space a ½ inch (12.7 mm) open drip or a ¾ inch (19 mm) automatic ball drip, with the drip pipe extended to spill over a plumbing fixture or drain.

7.3.2.3 Delete.

7.3.4.1 Delete all after the word “required”.

7.3.4.1.1 Delete.

7.4 Add at end the following: and shall be provided in accordance with the requirements of Section 905 of the *New York City Building Code*.

7.5 Delete all and replace with the following:

Interconnection of Standpipes

(1) Standpipe systems that include more than one riser shall have all risers cross-connected at, or below, the street entrance floor level, except as otherwise provided in this section.

(2) Standpipe systems in buildings required by the provisions of Section 905 of this code to have one or more zones shall be so designed and installed that the risers supplied from each zone will be cross-connected below, or in, the story of the lowest hose outlets from the water source in each zone. Horizontal intermediate check valves shall be installed in the run of each riser continuing into a higher zone in such manner as to permit all upper zones of the system within each two-way Fire Department connection [siamese] zone provided in accordance with section 4.8.2.2 to be fed through one riser from the zone below and to prevent any lower zone of the system from being supplied from a zone above, except as otherwise required by this referenced standard. Two-way Fire Department connection [Siamese] zones shall be interconnected as in accordance with section 4.8.2.2(j).

(3) Risers supplied by an upper level cross connection shall be provided with manual control valves or remote control valves, so arranged that risers supplied by the upper level

cross connections may independently be shut off from the tank supplies.

(4) Cross connections shall be at least as large as the largest riser supplied by the cross connection. However, when supplying two, but not more than four 4 inch (102mm) risers, the cross connection shall not be less than 5 inches (123 mm). The cross connection shall not be less than 6 inches (152 mm) for all other riser combinations.

(5) Where there is no cellar, cross connections may be hung from the ceiling of the lowest story.

(6) Each two-way Fire Department [siamese] connection shall be connected to a riser or to a cross connection connecting other two-way Fire Department [siamese] hose connections or risers within each two-way Fire Department [siamese] zone provided in accordance with section 4.8.2.2. The pipe from the [siamese] two-way Fire Department connection to the riser or cross connection shall be five inch (123 mm) I.P.S., except that a 4 inch (102 mm) pipe shall be sufficient when such pipe supplies a single four inch (102mm) riser system. The pipe from the two-way Fire Department [siamese] connection shall be run as directly as practicable to the riser or cross connection.

(7) When tanks are used for the primary water supply, the standpipe systems may use separate riser systems serving, respectively, low and high parts of the building. Separate gravity tanks or pressure tanks may supply each zone, but in every case the standpipe system shall be so designed that every hose outlet of the entire system can be supplied through the required cross connections from every two-way Fire Department [siamese] connection within each two-way Fire Department connection [siamese] zone provided in accordance with section 4.8.2.2.

7.5.1 Delete.

7.5.2 Delete.

[**7.5.2.1** Delete.]

7.6.1 Delete and replace with the following: Class I and Class III standpipes in buildings with floor heights less than 150 feet (45 720 mm) above grade plane shall be at least 4 inches (100 mm) in size. Standpipes in buildings with floor heights greater than 150 (45 720 mm) feet above grade plane shall be no less than 6 inches (150 mm) in diameter.

7.6.3 Delete and replace with the following: In fully sprinklered buildings having a combined standpipe system that is hydraulically calculated, the minimum standpipe size in buildings with floor heights less than 150 feet (45 720 mm) above the lowest level of fire department vehicle access shall be 4 inches (102 mm).

[**7.7.4** **7.7.2** Delete the words, “or semiautomatic”.

7.7.4 Delete.

[**7.8.1.1** **7.8.1** Delete “100 psi (6.9 bar) and replace with “65 psi (4.5 bar).

7.8.2 Delete.

7.8.2.1 Delete.

Table 7.8.2.1 Delete.

7.8.2.2 Delete.

7.8.3.1 Change the word “regulating” to “restricting”.

7.8.3.2 Change the word “regulating” to “restricting”.

7.8.3.3 Change the word “regulating” to “restricting”.

7.9.1 Add after the word “pumps” the words “or tanks”. Add after the word “pump” the words “or tank”.

7.9.1.1 Delete and replace with the following: The maximum standpipe system zone height for any building is 91 440 mm (300 feet). In the lowest zone in a building, such height shall be measured from grade plane. Floors below grade plane may be included in the lowest zone, provided that the maximum two-way Fire Department connection [siamese] zone height for the two-way Fire Department connection [siamese] zone that includes the lowest zone, in accordance with section 4.8.2.2 (j), is not exceeded.

7.9.3 Delete.

7.9.3.1 Delete.

7.9.3.[1.1]2 Delete.

7.9.4.1 Delete and replace with the following: In buildings with occupied floors less than 91.4 m (300 feet) in height above the lowest level of Fire Department vehicle access, water supplies may be provided by a public waterworks system in accordance with [9.1.4(1)] 9.1.5(1), by automatic fire pumps in accordance with [9.1.4(2)] 9.1.5(2), or by gravity tanks in accordance with section [9.1.4(4)] 9.1.5(4).

Add Section **7.9.4.2** All zones servicing occupied floors located higher than 91.4 m (300 feet) above the lowest level of fire department vehicle access shall be equipped with a primary and auxiliary water supply provided by gravity tanks supplemented by pumps where necessary in accordance with section [9.1.4] 9.1.5.

Add Section **7.9.4.2.1** All zones servicing occupied floors located higher than 91.4 m (300 feet) above the lowest level of fire department vehicle access but not more than 152.4 m (500 feet) above grade plane, shall be equipped with a special service fire pump, in accordance with section [9.1.4(4)(1)] 9.1.5(4)(1), to boost supply to pressures as required by section [7.8.1.1] 7.8.1 and 7.8.3.1. A Pressure Reducing Valve (PRV) bypass shall be provided, where necessary, and arranged to provide water supply from the upper zone to the lower

zone at the required pressures. Where a PRV is not necessary to provide required pressures, a normally open bypass shall be provided.

Add Section **7.9.4.3** Where portions of a standpipe system service floors located 152.4m (500 feet) or more above the lowest level of fire department vehicle access, all portions of the system shall be provided with a primary and auxiliary means of water supply in accordance with section [9.1.4] 9.1.5 and the following:

(1) Primary water supplies shall serve one zone only as the primary supply. However, the primary water supply for one zone may be used as the auxiliary supply for no more than one other zone.

(2) Intermediate tanks, which serve as the suction source for the pumps providing primary water supply for zones located higher than 91.4 m (300 feet) above grade plane, shall be located so as to provide the auxiliary water supply for the next lowest zone at the required pressures by gravity only, and such pressures shall not exceed the minimum pressures required in such next lowest zone by more than 15 percent.

(3) The auxiliary water supply for the topmost section of the system zone shall be provided by a gravity tank in accordance with section [9.1.4(4)] 9.1.5(4) and shall be equipped with a special service fire pump, in accordance with [9.1.4(4)(1)] 9.1.5(4)(1), to boost supply to pressures as required by sections [7.8.1.1] 7.8.1 and 7.8.3.1.

(4) Zone heights shall be selected such that the topmost zone has a minimum height of 45.7 m (150 feet) so as to provide an auxiliary water supply from the intermediate or roof tank(s) to the next lowest zone at pressures as required by section [7.8.1.1] 7.8.1 and 7.8.3.1 by gravity only, and such pressures shall not exceed the minimum pressures required in such next lowest zone by more than 15 percent.

[7.12.1] 7.11.1 Delete the words “76 mm (3-in.)”. Add after the word “riser” the following: of adequate size. Add after the word “standpipe” the following: or attached sprinkler system.

[7.12.1.1] 7.11.1.1 Delete and replace with the following: The riser shall be equipped with a plug and be located on every floor.

[7.12.1.2] 7.11.1.4 Delete.

[7.13.1.1] 7.12.1.1 Delete.

[7.13.2] 7.12.2 Add at end the following: and be located in accordance with Section 4.8.2.2 of this referenced standard.

[7.13.2.1] 7.12.2.1 Delete.

7.12.3 Delete.

Chapter 8 – Plans and Calculations No changes.

Chapter 9 – Water Supplies

9.1.1 Delete the words “and semi-automatic”.

9.1.2 Add at the end the following: Where manual combination standpipe systems are provided in accordance with the provisions of section 5.4.1.1 of this referenced standard an automatic water supply sufficient to provide the required sprinkler system demand shall be provided. Where such supply is provided by an automatic fire pump, the minimum pump capacity shall be as required by the sprinkler system demand in accordance with Section 903 of the *New York City Building Code* and NFPA 13. Where such water supply is provided by pressure or gravity tanks the minimum water supply shall also be as required in accordance with the above.

9.1.3 Delete the words “[and] or semi-automatic”. [Delete the words “a secondary” and replace with “an auxiliary”.]

9.1.4 Delete the words “a secondary” and replace with “an auxiliary”.

[9.1.4] 9.1.5 Delete and replace with the following: Water supplies from the following sources shall be permitted:

(1) A public waterworks system where pressure and flow rate are adequate as confirmed by a statement by the Bureau of Water Supply of the Department of Environmental Protection.

(a) Each service directly supplying a standpipe system or a fire pump shall be equipped with a control valve located under the sidewalk in a flush sidewalk box located within two feet (610 mm) of the street line, or in such other locations as may be approved by the Department of Environmental Protection. The purpose of each such control valve shall be clearly indicated by the words. “Standpipe Supply Control,” cast in the cover of such flush sidewalk, box or, in lieu thereof, a metal sign with 1 inch lettering shall be located on the exterior building wall indicating the use and location of the valve.

(2) Automatic fire pumps connected to an approved water source in accordance with NFPA 20, *Standard for the Installation of Stationary Pumps for Fire Protection* and the following:

(a) Any required automatic fire pump shall draw from two independent street water mains in different streets, except that: (1) any automatic fire pump serving a building classified in occupancy group R-2 that is fully protected by a system of automatic sprinklers may draw from a single water main; and (2) an automatic fire pump may draw from a single water main if augmented by a suction tank or tanks, and if the valves at the meter and pump are provided with tamper switches that are wired to an approved [central] supervising station of an operating fire alarm company. Where two services are installed, one service from the street water main shall be run directly to the pump, and the other service may be used for domestic water supply. The connection from water to the mains to the pumps shall be at least six inch (152 mm) pipe size and shall be flushed before connection is made to the system. Connections shall be in accordance with the provisions of the *New York City Plumbing Code* and applicable referenced standards.

(b) In the event that two separate and distinct water mains are not available as a supply or the street mains cannot produce the required supply, there shall be provided a suction tank, or tanks suitably located and of sufficient capacity to furnish the fire pump with at least a one-half hour supply at the rated capacity of such pump. Suction tanks shall be filled by a six inch (152 mm) connection to the water main, controlled by an automatic ball float valve in the suction tank. A six inch (152 mm) bypass shall be provided so that pumps may be fed directly from the street water main.

(c) When a water service supplies both the domestic service and the fire pump, a remote control valve shall be placed on the domestic service connection at the point where such connection is taken from the city supply or service main. Such remote control valve shall be controlled from a point near the pump control panel. In lieu of a remote control valve, a manually operated valve may be installed to shut off the entire domestic water supply to the building, provided such valve is located in the fire pump room and is properly tagged for identification.

(d) Power supply for standpipe fire pumps. The type of fire pump and prime mover used in a standpipe system shall be suitable for the required service in a standpipe system provided for Fire Department use. If the prime mover employs any form of power other than an electric current supplied by a public utility, the use thereof shall be subject to the approval of the commissioner. Electrical power to the motor shall be taken from the street side of the house service switch. Where an emergency secondary power source is required, fire pumps shall be supplied from such source and power supply shall be automatic switching.

(e) When the fire pump feeder conductors are routed through the building(s), they shall be enclosed by 2 in. (51 mm) of concrete or an approved assembly which has a minimum of [1] 2-hour fire resistive rating.

(f) Fire pumps shall be placed on concrete pads at least 12 in. (305mm) above the pump room floor with a clearance of at least 3 ft. (914 mm) maintained on all sides from walls or from other equipment in the pump room. In the event of the use of a vertical shaft centrifugal fire pump, the 12 in. (305 mm) high concrete pad may be omitted, provided the bottom of the electric driving motor and all electrical appurtenances are raised at least 12 in. (305 mm) above the pump room floor.

(g) Each automatic fire pump shall be equipped with a 3 in. (76 mm) National Pipe Thread pressure relief valve installed in the pump discharge. Such relief valve shall be set to relieve below the shutoff head of the pump, but above the pressure required to maintain the operating pressure at the highest hose valve. The discharge from the relief valve may be piped back into the suction side of the pump on the pump side of the suction valve provided a visual sight glass is installed in the discharge of the relief valve. Automatic fire pumps may be provided with a time delay switch to ensure a minimum running time for the pump.

(h) The check valves in the pump discharge line shall be either swing type or spring loaded.

(i) Where a group of two or more buildings, whether connected or separated, are operated under a single ownership, one fire pump may be accepted as the water supply for the group. The pump shall be installed in the building where the maintenance personnel are located, and a metal sign with 1 inch (25 mm) lettering shall be installed in each building at all of the hose outlets on the entrance floor indicating the location of the fire pump.

(3) Pressure tanks installed in accordance with NFPA 22, *Standard for Water Tanks for Private Fire Protection* and the following:

(a) The water storage quantities required for the tanks are met with an additional volume equivalent to one-half of the required water storage space provided for the required air.

(b) An air compressor is provided with suitable automatic control and of sufficient capacity to build up air pressure of at least 75 psig (517 kPa) in the tank within three hours and to maintain thereafter an air pressure between 70 and 80 psig (482 to 552 kPa) The automatic control shall also maintain the proper air-to-water ratio in the pressure tank.

(c) Pressure tanks shall be supplied with water through a fixed pipe, independent of the standpipe riser and at least two inches (51 mm) in size. The water supply and connection shall be capable of supplying the tank at a rate of at least 75 gpm (5 L/s) without reducing the pressure in the tank. The tank shall have a fixed water level plate on the end opposite the gauge glass, or other equivalent indicating device.

(d) All pressure tanks used to provide the required primary water supply of a standpipe system shall be equipped with a high and low air pressure and a high and low water level electrical alarm system. Air-to-water ratio shall be 1 to 2 by volume and may be maintained by automatic electrical controls.

(4) Gravity tanks installed in accordance with NFPA 22, *Standard for Water Tanks for Private Fire Protection* and the following:

(a) Construction and support of tanks. Tanks for the standpipe system supply shall be constructed and supported in accordance with the provisions of Referenced Standard NFPA 22 and applicable provisions of the *New York City Building Code* for loads and structural work. Tanks with a total capacity of 15,000 gallons (56 775 L) or greater shall be multi-compartment type such that no compartment is larger than one half of the required standpipe water supply reserve plus the domestic water reserve in combination tanks. In the alternative, multiple tanks may be provided, provided that the above criteria are met.

(b) Combination tanks. Gravity tanks may be used to provide the required primary water supply to the standpipe system and may also be used to supply automatic sprinkler and/or domestic water in a building provided all the following conditions are met:

(1) The connections to the tank are made in such a manner as to provide the required sprinkler and/or fire standpipe reserve. The domestic supply is above the sprinkler and/or standpipe reserve. Where a standpipe riser is used to supply water to a combination sprinkler and standpipe system as permitted, the connection to the tank shall be made in such a manner as to provide the required sprinkler or standpipe reserve, whichever is greater.

(2) The connections to the system are made outside of the tank. When connections or piping are installed inside the tank, the piping shall be assembled without couplings and shall be of red brass or approved equivalent material in accordance with the *New York City Plumbing Code* and applicable referenced standards.

(3) The tank is filled by means of an automatic pump at a rate of not less than 65 gpm (4 L/s).

(c) Filling of tanks.

(1) Pressure or gravity tanks shall be filled at the rate of at least 65 gpm (4 L/s). Pipes used to fill the tanks shall not be used for any other purpose; nor shall required fire pumps be used for filling purposes.

(2) Where there is sufficient pressure in the city water main to fill tanks at the required rate during all hours of each day, and a filling pump is not provided, the connection to the city water supply shall be made near the point where the city water service enters the building.

(3) A combined fire standpipe reserve and domestic water tank shall only be filled by direct public water connection or separate fill pumps, or direct connection to equipment, or pumps used to supply domestic water systems in accordance with the *New York City Plumbing Code* and applicable referenced standards.

(d) Emergency drains on standpipe tanks. Each standpipe tank shall be provided with a drain of at least 4 in. (102 mm). National Pipe Thread. Each drain pipe shall be controlled by a manually operated gate valve located so as to be readily accessible. The drain shall be installed in accordance with the *New York City Plumbing Code* and applicable referenced standards.

(e) Heating of standpipe tanks.

(1) Where the water in the tank is subject to freezing, the tank shall be equipped with a tank heater in accordance with the provisions of NFPA 22.

(2) Where the standpipe supply and domestic water supply are combined in a single tank, heating of such tank shall not be required in hotels, multiple dwellings, hospitals, or other occupancies where the domestic supply is drawn upon during all hours of every day of the week.

(f) Strainer.

(1) Every standpipe gravity or suction tank shall be provided with a brass or bronze strainer at the discharge to risers or to pump supply lines.

(2) Each strainer shall have clear openings with an aggregate area equal to, or more than, the required area of the pipe into which the tank discharges. Openings shall be not more than 1 in. (25 mm) nor less than ½ in. (13 mm) in diameter.

(g) Overflow pipe for standpipe tanks. Each gravity standpipe tank shall be provided with an overflow in accordance with the *New York City Plumbing Code* and applicable referenced standards.

(h) Access to standpipe tanks. Access to the top of each gravity tank shall be by means of a steel, wrought iron or approved equivalent material gooseneck ladder, constructed of flat side bars at least 2 in. by ¾ in. (51 by 10mm), or equivalent, spaced at least 14 in. (355 mm) apart, with round or square rungs at least 5/8 in. (16 mm) thick spaced not more than 12 in. (305 mm) on centers. The ladder shall be rigidly braced and shall not tip outward from the vertical at any point. When ladders exceed 25 ft. (7620 mm) in height, body irons spaced not more than 2 ft. (610 mm) on center and a metal platform at least 14 in. (355 mm) square, rigidly secured to the stringers of the ladder or other type of enclosed safe access, shall be provided near the top of the tank.

(i) Gravity tanks shall be equipped with a high and low water level electrical alarm system.

(j) Where a group of two or more buildings, connected or separated, is operated under a single control, a single gravity tank may be accepted as the primary water supply for the several standpipe systems of such group, provided a dead riser is carried from the bottom of the tank to an underground header or cross connection system and provided each building unit has a post indicator type control valve outside or an O.S. & Y. control valve inside the building at a readily accessible location. The underground cross

connection may not cross any public street without the approval of the city departments having jurisdiction.

(k) The bottom of the topmost zone gravity tanks shall be located above the highest hose outlet in the zone that such tank supplies, excepting the roof manifold and those hose outlets in a penthouse enclosing mechanical equipment. Pressures may be boosted by use of automatic special service or other fire pump(s) to provide the hose outlet pressures required by section [7.8.1.1] 7.8.1 of this referenced standard. Tanks in intermediate zones may be sufficiently elevated to provide the pressures required by section [7.8.1.1] 7.8.1 provided that they are also installed in accordance with sections 7.9.4.2 and 7.9.4.3.

(l) The special service pump, as required by this standard, may be located anywhere in the zone served, provided that an express piped suction supply is installed from the gravity tank(s) that supply such pump, and such pump is located at a lower elevation than the gravity tank. Special service pumps are to be installed in accordance with the requirements of sections [9.1.4(2)] 9.1.5(2) - (d), (e), (f) and (h).

9.2 Add at end the following: except where manual standpipe systems are permitted in accordance with section 5.4.1.2, water supplies shall be provided in accordance with section 9.1.3 of this referenced standard.

Add Section **9.4 Minimum Supply for Group R-2 Occupancies**. The water supply servicing standpipe systems in Group R-2 occupancies shall [not be less than] be 500 gpm (32 L/s) per zone [, and the minimum] with a stored water supply in any gravity tank or intermediate tank [shall not be less than] of 15,000 gallons [(56 775 L) per zone]. Water supplies shall be permitted to comply with the requirements of Section 7.9.4 for primary and auxiliary water supplies.

Chapter 10 – Water Supply Testing No changes.

Chapter 11 – System Acceptance

11.4.1* Delete the words “200 psi (13.8 bar)” and replace with “300 psi (20.7 bar)”. Delete the words “2 hours” and replace with “1 hour”. Delete the words “150 psi (10.3 bar)” and replace with “250 psi (17.3 bar)”

[11.5.6] 11.5.4 Delete.

[11.5.6.1] 11.5.4.1 Delete.

[11.5.6.2] 11.5.4.2 Delete.

Chapter 12 – Buildings Under Construction

12.1 Delete the words “Where required by the authority having jurisdiction”. Add at the end of the last sentence: “or demolition. Provision shall be made for the use of such standpipe by the Fire Department when the height of building construction or demolition exceeds 75 feet.”

12.2 Delete and replace with the following: The standpipe shall be provided with a readily accessible [siamese] two-way Fire Department connection at street level. The location of the two-way Fire Department [siamese] hose connection shall be placarded, kept free from obstruction, and identified by a red light.

12.3 Add the following:

Temporary risers shall be at least 4 inches in (102 mm) diameter for structures less than 450 feet high (137 160 mm) and at least 6 inches (152 mm) in diameter for structures 450 feet (137 160 mm) high or more. There shall be as many risers as will be, or were, required for the permanent system. Each such riser shall be connected to a cross connection that is supplied through two-way Fire Department [siamese] hose connections at the street level, and shall be equipped on each floor with a 2½ inch (64 mm) hose outlet valve. The installations shall be made so that each riser, cross connection, and branch line can be plugged or capped when work is not being done on the system.

[**12.8** Delete.

12.8.1 Delete.]

12.8.2 Delete the words “is permitted by the authority having jurisdiction”.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. This annex contains explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A - Explanatory Material

§3. Section Q106 of Appendix Q of the New York city building code, as added by local law number 33 for the year 2007, is REPEALED and a new section Q106 is added to read as follows:

SECTION BC Q106
INSTALLATION OF STATIONARY FIRE PUMPS

Q106.1 General. Fire pumps, systems, where required by this code, shall be installed in accordance with NFPA 20, *Standard for the Installation of Stationary Fire Pumps for Fire Protection*, 2007 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the *Administrative Code*.

Chapter 1 – Administration No changes.

Chapter 2 – Referenced Publications No changes.

Chapter 3 – Definitions

3.3.37.5 Add the following sentence at the end: This definition is for use with this referenced standard only.

Chapter 4 – Reserved

Chapter 5 – General Requirements

5.12.1.1.1* Delete “by 2-hour fire-rated construction” and replace with the following: as required by the *New York City Building Code*.

5.12.1.1.2 Delete “by fire-rated construction in accordance with Table 5.12.1.1.2” and replace with the following: as required by the *New York City Building Code*.

Table 5.12.1.1.2 Delete.

5.16.1 Delete “by one of the following methods” and replace with the following: *in accordance with the requirements of Sections 903, 905 and 907 of the New York City Building Code*. Delete items (1) through (4).

5.18.1.2* Add the following language after “by this standard”: and as required by Q105.1 – 9.1.5 (2)(g).

5.28.2 Add the following sentence at the end: and the requirements of the *New York City Electrical Code*.

Chapter 6 – Centrifugal Pumps No changes.

Chapter 7 – Vertical Shaft Turbine/205 Type Pumps No changes.

Chapter 8 – Positive Displacement Pumps No changes.

Chapter 9 – Electric Drive for Pumps

9.1.3 Add the following sentence at the end: and the requirements of the *New York City Electrical Code*.

9.2.2* (5) Add the following sentence at the end: and the requirements of the *New York City Electrical Code*.

9.3.1 Delete and replace with the following: where required by the New York City building code, an alternate power source shall be provided and installed in accordance with *New York City Electrical Code*.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A – Explanatory Material No changes.

Annex B – Possible Causes of Pump Troubles No changes.

Annex C – Informational References No changes.

Annex D – Material Extracted by NFPA 70, Article 695 Delete.

Subpart 45 (Appendix R of the New York City Building Code)

§1. Section R101.1 of Appendix R of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

R101.1 General. Where required by Section [803.9] 808 of this code, the provisions of ASTM C635 and ASTM C636, as modified by this appendix, shall govern the design and installation of ceiling suspension systems used to support acoustical tiles, or acoustical lay-in panels weighing less than four pounds per square foot (191.5 Pa), not contributing to the fire-resistance rating of a floor or roof assembly and not used for meeting the noise control requirements of the building code. Refer to the rules of the department for any subsequent additions, modifications or

deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Subpart 46 (Appendix S of the New York City Building Code)

§1. The New York city building code is amended by adding a new appendix S, to read as follows:

APPENDIX S
SUPPLEMENTARY FIGURES FOR LUMINOUS EGRESS PATH MARKINGS

SECTION BC S101
GENERAL

S101.1 Scope. The figures of this appendix shall supplement the provisions of luminous egress path markings in Section 1024 and are intended for illustrative purposes. Where there is a conflict between the figures and the provisions in Section 1024, the provisions in Section 1024 shall govern.

Part D (Chapter 8 of Title 28 - New York City Mechanical Code)

§1. The first unnumbered paragraph of section 28-801.2 of chapter 8 of title 28 of the administrative code of the city of New York, as added by local law number 33 for the year 2007, is amended to read as follows:

The New York city mechanical code based on the 2003 edition of the International Mechanical Code published by the International Code Council, with changes that reflect the unique character of the city and amendments that bring it up to date with the 2009 edition of such International Mechanical Code, is hereby adopted to read as follows:

Subpart 1 (Chapter 1 of the New York City Mechanical Code)

§1. Chapter 1 of the New York city mechanical code, as added by local law number 33 for the year 2007, section 101.3 as amended by local law number 49 for the year 2010, items 2 and 4 of section 106.4 as amended by local law number 8 for the year 2008, and section 106.10 as amended by local law number 85 for the year 2009, is amended to read as follows:

**CHAPTER 1
ADMINISTRATION
SECTION MC 101
GENERAL**

101.1 Title. This code shall be known and may be cited as the “*New York City Mechanical Code*,” “NYCMC” or “MC.” All section numbers in this code shall be deemed to be preceded by the designation “MC.”

101.2 Scope. This code shall regulate the design, installation, maintenance, alteration and inspection of mechanical systems that are permanently installed and utilized to provide control of environmental conditions and related processes within buildings. This code shall also regulate those mechanical systems, system components, equipment and appliances specifically addressed herein. The installation of fuel gas distribution piping and equipment, fuel gas-fired appliances and fuel gas-fired appliance venting systems shall be regulated by the *New York City Fuel Gas Code*.

101.3 Intent. The purpose of this code is to provide minimum standards to safeguard life or limb, health, property, public welfare and the environment by regulating and controlling the design,

construction, installation, quality of materials, location, operation and maintenance or use of mechanical systems.

101.4 Severability. If a section, subsection, sentence, clause or phrase of this code is, for any reason, held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this code.

SECTION MC 102 APPLICABILITY

102.1 General. [The provisions of this code shall apply to all matters affecting or relating to structures and premises, as set forth in Section 101]. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern. Where, in a specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive shall govern.

102.2 Existing installations. Except as otherwise provided for in this chapter or elsewhere in this code, a provision in this code shall not require the removal, alteration or abandonment of, nor prevent the continued utilization and maintenance of, a mechanical system lawfully in existence on the effective date of this code.

102.3 Maintenance. Mechanical systems, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe and sanitary condition. Devices or safeguards that are required by this code shall be maintained in compliance with the applicable provisions under which they were installed.

102.3.1 Owner responsibility. The owner shall be responsible for maintenance of mechanical systems. To determine compliance with this provision, the commissioner shall have the authority to require existing mechanical systems to be inspected.

102.4 Additions, alterations or repairs. Additions, alterations, renovations or repairs to a mechanical system shall conform to requirements for a new mechanical system without requiring the existing mechanical system to comply with all of the requirements of this code. Additions, alterations or repairs shall not cause an existing mechanical system to become unsafe, hazardous or overloaded.

102.4.1 Minor additions, alterations, renovations and repairs. Minor additions, alterations, renovations and repairs to existing mechanical systems shall meet the provisions for new construction, unless such work is done in the same manner and arrangement as was in the existing system, is not hazardous and is approved.

102.4.2 Special provisions for prior code buildings. In addition to the requirements of Sections 102.4 and 102.4.1, the provisions of Sections 102.4.2.1 through 102.4.2.6 shall apply to prior code buildings.

102.4.2.1 Fire and smoke dampers. In cases where the building's passive fire-resistance protection design, including rated construction, corridors and fire separations, complies with 1968 or prior codes, the determination as to whether a fire or smoke damper is required shall be permitted to be made pursuant to the *1968 Building Code*, or at the election of the applicant, the *New York City Mechanical Code*.

102.4.2.2 Guards and access to roofs and elevated structures. The provisions of Section 304.10 relating to guards and Section 306.5 relating to permanent means of access shall not apply where the equipment or appliances replace existing equipment or appliances in the same location.

102.4.2.3 Vibration isolators for cooling towers. Where a replacement cooling tower is installed and physical limitations prohibit compliance with the vibration isolator requirements of Section 928.3.7, such isolators may be omitted provided the devices shall comply with the *New York City Noise Control Code*.

102.4.2.4 Noncombustible fill for cooling towers. Where an existing exterior cooling tower with combustible fill within 15 feet (4572 mm) of the lot line is replaced, such replacement shall be permitted to have combustible fill, notwithstanding the provisions of Section 908.3.2.

102.4.2.5 Seismic supports. The determination as to whether seismic requirements apply to an alteration shall be made in accordance with the *1968 Building Code* and interpretations by the department relating to such determinations. Any applicable seismic loads and requirements shall be permitted to be determined in accordance with Chapter 16 of the *New York City Building Code* or the *1968 Building Code* and Reference Standard RS 9-6 of such code.

102.4.2.6 Wind resistance. Equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with Chapter 16 of the *New York City Building Code*.

102.5 Change in occupancy. Refer to Chapter 1 of Title 28 of the *Administrative Code*.

102.6 Reserved.

102.7 Reserved.

102.8 Referenced standards. The standards referenced herein shall be those that are listed in Chapter 15 and in the rules of the department and such standards shall be considered as part of the requirements of this code to the prescribed extent of each such reference. Where differences occur between provisions of this code and the referenced standards, the provisions of this code shall apply. Refer to Article 103 of Chapter 1 of Title 28 of the *Administrative Code* for additional provisions relating to referenced standards.

102.8.1 Editions of referenced standards. References to standards in this code shall be to the editions of those standards provided for in Chapter 15 of this code, or as otherwise provided by rule.

102.9 Requirements not covered by this code. Requirements necessary for the strength, stability or proper operation of an existing or proposed mechanical system, or for the public safety, health and general welfare, not specifically covered by this code, shall be determined by the commissioner.

102.10 Application of references. Reference to chapter section numbers, or to provisions not specifically identified by number, shall be construed to refer to such chapter, section or provision of this code.

SECTION MC 103 DEPARTMENT OF BUILDINGS

103.1 General. Refer to the New York City Charter and Chapter 1 of Title 28 of the *Administrative Code*.

SECTION MC 104 DUTIES AND POWERS OF THE COMMISSIONER OF BUILDINGS

104.1 General. The commissioner shall have the authority to render interpretations of this code and to adopt rules, [establishing] policies, and procedures in order to clarify and implement [the] its provisions [of this code]. Such interpretations, policies, procedures, and rules shall be in compliance with the intent and purpose of this code. [Refer to] See the New York City Charter and Chapter 1 of Title 28 of the *Administrative Code* for additional provisions relating to the authority of the Commissioner of Buildings.

SECTION MC 105 PERMITS

105.1 General. Permits shall comply with this section, with Article 105 of Chapter 1 of Title 28 of the *Administrative Code*, and with requirements found elsewhere in this code.

105.2 Required. Any owner or authorized agent who intends to construct, add to, alter, repair, move, demolish, or change the occupancy of a building or structure, or to erect, install, add to, alter, repair, remove, convert or replace any gas, mechanical or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application for construction document approval in accordance with Chapter 1 of Title 28 of the *Administrative Code* and this chapter and obtain the required permit.

105.3 Work exempt from permit. Exemptions from permit requirements of this code as authorized in Chapter 1 of Title 28 of the *Administrative Code* and the rules of the department

shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or rules.

105.4 Validity of permit. The issuance or granting of a permit shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of any other law. Permits presuming to give authority to violate or cancel the provisions of this code or other law shall not be valid. The issuance of a permit based on construction documents and other data shall not prevent the commissioner from requiring the correction of errors in the construction documents and other data. The commissioner is also authorized to prevent occupancy or use of a structure where in violation of this code or of any other law.

SECTION MC 106 CONSTRUCTION DOCUMENTS

106.1 General. Construction documents shall comply with Article 104 of Chapter 1 of Title 28 of the *Administrative Code* and other applicable provisions of this code and its referenced standards. Such construction documents shall be coordinated with architectural, structural and means of egress plans.

106.2 Required documents. The applicant shall submit all of the documents specified in Sections 106.3 through 106.10 as appropriate to the nature and extent of the work proposed. Construction documents shall indicate the heating, ventilation, refrigeration, and other mechanical work to be performed, so drawn as to conform to the architectural and structural aspects of the building and to show in detail compliance with this code.

106.2.1 Composite plans. Composite plans showing compliance of architectural, structural, and mechanical parts of a building may be submitted provided that a clear understanding of each part is not impaired.

106.3 Lot diagram. The lot diagram shall be provided where applicable to the work proposed, including but not limited to the installation of exterior or rooftop equipment.

106.4 Building classification statement. Where applicable to the proposed work, the statement shall identify:

1. The occupancy group or groups that apply to parts of the building in accordance with Section 302 of the *New York City Building Code*;
2. The occupancy group of the main use or dominant occupancy of the building;
3. The construction class of the building in accordance with Section 602 of the *New York City Building Code*;
4. The structural occupancy/risk category in accordance with Table 1604.5 of the *New York City Building Code*;

5. The height of the building as defined in Section 502.1 of the *New York City Building Code*;
6. The applicable measurements to the highest and lowest level of fire department access;
and
7. Whether the building is inside or outside of the fire districts.

106.5 Fuel-burning and fuel-oil storage equipment plans. Construction documents for fuel-burning and fuel-oil storage equipment shall contain plans that include the following data and information:

1. Diagrams of all distribution piping, including vent and fill piping for oil systems, and all safety cut-off and relief devices and valves in piping; indications of the sizes of distribution piping to be used and the fire-resistive ratings of the shafts or spaces containing distribution piping where required to be fire rated.
2. Diagrammatic floor plans showing the size, location, material for all fuel oil and transfer distribution piping and related equipment.
3. Floor plans or partial floor plans showing the location, layout, size, and listing information for all fuel-burning equipment, tanks, vents, and chimneys. The plans shall also indicate the method or means of providing air to the equipment space, including duct and opening sizes.
4. Plans indicating the location and type of any relevant smoke and heat detectors, alarm and fire extinguishing systems.
5. Seismic protection and restraint details for piping and equipment as required by Chapter 16 of the *New York City Building Code*.
6. Details indicating the location, size and materials for all breechings; the thickness and type of insulation materials; and the clearances from combustible walls, partitions, and ceiling; and the fire-resistive ratings of rooms and spaces containing the equipment.
7. Details describing the type, material, listing information, height, and termination distances to adjacent properties and structures for chimneys and vents.
8. Details showing structural supports for fuel-burning equipment where required.
9. A statement as to the kind or grade of fuel to be used.
10. Plans indicating the location, arrangement, size, load, and maximum capacity of the burning, storage and fuel-pumping equipment.

11. In areas of special flood hazards, construction documents shall comply with Appendix G of the *New York City Building Code*.

106.6 Heating systems. Construction documents for heating systems shall include the temperature to be maintained in every room and the output capacity in BTU per hour of the central heating source.

106.7 Boilers. Construction documents for boiler installations shall indicate the output capacity in BTU per hour, the operating weight of each boiler, the pressure setting of the relief valves, and such other data and information as required by this code.

106.8 Air-conditioning and ventilating systems. Construction documents for air-conditioning and ventilating systems shall contain plans that include the following data and information:

1. The location and sizes of all ducts; the location of all fire and smoke dampers, motors, fans, and filters; the type, air capacity, and size of all equipment; and where not shown on accompanying structural plans, the operating weight and manner of support of equipment.
2. The locations of smoke detecting devices.
3. The location and size of the fresh air intake, the design population, and the required ventilation for each room or space.
4. The amount of air to be exhausted or supplied from each outlet for each room or space.
5. In the case of ventilating or exhaust systems for ranges, fryers, ovens, and other similar types of restaurant or bakery equipment, for which a hood is required, the plans shall also show the type of extinguishing system, the location of heat detection devices, nozzles, piping, gas controls, manual and automatic control valves, method of joining ducts, method and location of discharging exhaust from building, the location of break-glass controls, and the quantity in cfm designed for each hood.

106.9 Refrigerating systems. Construction documents for refrigerating systems shall contain plans that include the following data and information:

1. The location of all machinery; the horsepower of compressors; the type and number of pounds of refrigerant to be used; and the air quantities for, and means of, ventilating the machinery space.
2. The location of emergency switches for compressors and for ventilation in the machinery rooms.
3. The location of pressure relief piping and any city water connections and water-saving devices.

4. The tonnage capacity of the machine and the suction and discharge pressures at which the machine is rated.
5. The operating weight of the equipment.
6. The [class] safety group classification of refrigerant utilized.
7. The refrigerant concentration limit calculations for any refrigerating system that contains more than 6.6 pounds (3.0 kg) of refrigerant.

106.10 Energy efficiency. Construction documents shall include compliance documentation as required by the *New York City Energy Conservation Code*.

SECTION MC 107 INSPECTIONS AND TESTING

107.1 General. Except as otherwise [specifically provided] specified, inspections required by this code or by the department during the progress of work may be performed on behalf of the owner by approved agencies or, if applicable, by special inspectors. However, in the interest of public safety, the commissioner may direct that any of such inspections be performed by the department. All inspections shall be performed at the sole cost and expense of the owner. Refer to Article 116 of Chapter 1 of Title 28 of the *Administrative Code* for additional provisions relating to inspections.

107.2 Required inspections and testing. In addition to any inspections otherwise required by this code or applicable rules, the following inspections shall be required:

1. Progress inspections.

- 1.1. Underground inspection shall be made after trenches or ditches are excavated and bedded, piping installed, and before backfill is put in place. When excavated soil contains rocks, broken concrete, frozen chunks and other rubble that would damage or break the piping or cause corrosive action, clean backfill shall be on the job site.

Exception: Ground-source heat pump loop systems tested in accordance with Section 1208.1.1 shall be permitted to be backfilled prior to inspection.

- 1.2. Rough-in inspection shall be made after the roof, framing, fireblocking and bracing are in place and all ducting and other components to be concealed are complete, and prior to the installation of wall or ceiling membranes.

- 1.3 Inspections required by the *New York City Energy Conservation Code* shall be made in accordance with rules of the department, as applicable.

2. **Special inspections.** Special inspections shall be performed in accordance with this code and Chapter 17 of the *New York City Building Code*.
3. **Final inspection.** Refer to Article 116 of Chapter 1 of Title 28 of the *Administrative Code*.
4. **Issuance of [Certificate] certificate of [Compliance] compliance.** Upon satisfactory inspection of service equipment and the satisfaction of all the requirements for sign-off, the department shall issue a certificate of compliance as applicable for the following service equipment:
 - 4.1. Air conditioning and ventilation systems,
 - 4.2. Fuel-burning and fuel-oil storage equipment, including generators,
 - 4.3. Refrigeration systems,
 - 4.4. Heating systems, and
 - 4.5. Boilers.

The requirements of Section [107.1] 107.2 shall not be considered to prohibit the operation of any heating equipment or appliances installed to replace existing heating equipment or appliances serving an occupied portion of a structure provided that a request for inspection of such heating equipment or appliances has been filed with the department not more than 48 hours after such replacement work is completed, and before any portion of such equipment or appliances is concealed by any permanent portion of the structure.

[107.1.1] 107.2.1 Approved inspection agencies. Refer to Articles 114 and 115 of Chapter 1 of Title 28 of the *Administrative Code*.

[107.1.2] 107.2.2 Inspection of prefabricated construction assemblies. Prior to the approval of a prefabricated construction assembly having concealed mechanical work and the issuance of a permit, the department shall require the submittal of an evaluation report by an approved agency on each prefabricated construction assembly, indicating the complete details of the mechanical system, including a description of the system and its components, the basis upon which the system is being evaluated, test results and similar information, and other data as necessary for the commissioner to determine conformance to this code.

[107.1.2.1] 107.2.2.1 Test and inspection records. Required test and inspection records shall be available to the commissioner at all times during the fabrication of the mechanical system and the erection of the building; or such records as the commissioner designates shall be filed.

[107.2] **107.3 Testing.** Mechanical systems shall be tested as required in this code and in accordance with Sections [107.2.1] **107.3.1** through [107.2.3] **107.3.3**. Tests shall be made by the permit holder and witnessed by the department or an approved agency.

[107.2.1] **107.3.1 New, altered, extended or repaired systems.** New mechanical systems and parts of existing systems, that have been altered, extended, renovated or repaired, shall be tested as prescribed herein to disclose leaks and defects.

[107.2.2] **107.3.2 Apparatus, material and labor for tests.** Apparatus, material and labor required for testing a mechanical system or part thereof shall be furnished by the permit holder.

[107.2.3] **107.3.3 Reinspection and testing.** Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made so as to achieve compliance with this code. The work or installation shall then be resubmitted to the department for inspection and testing.

[107.3] **107.4 Sign-off of completed work.** Refer to Article 116 of Chapter 1 of Title 28 of the *Administrative Code*.

[107.4] **107.5 Temporary connection.** The commissioner shall have the authority to authorize the temporary connection of a mechanical system to the sources of energy for the purpose of testing mechanical systems or for use under a temporary certificate of occupancy.

SECTION MC 108 VIOLATIONS

108.1 General. Refer to Chapters 2 and 3 of Title 28 of the *Administrative Code*.

Subpart 2 (Chapter 2 of the New York City Mechanical Code)

§1. Section 202 of the New York city mechanical code, as added by local law number 33 for the year 2007, the definition of “Steam-heating boiler” as amended by local law number 8 for the year 2008, the definition of “Unusually tight construction” as amended by local law number 85 of 2009, is amended to read as follows:

SECTION MC 202 GENERAL DEFINITIONS

1968 OR PRIOR CODE BUILDINGS OR STRUCTURES (PRIOR CODE BUILDINGS).
See Section 28-101.5 of the *Administrative Code*.

ABRASIVE MATERIALS. Moderately abrasive particulate in high concentrations, and highly abrasive particulate in moderate and high concentrations, such as alumina, bauxite, iron silicate, sand and slag.

ABSORPTION SYSTEM. A refrigerating system in which refrigerant is pressurized by pumping a chemical solution of refrigerant in absorbent, and then separated by the addition of heat in a generator, condensed (to reject heat), expanded, evaporated (to provide refrigeration), and reabsorbed in an absorber to repeat the cycle; the system may be single or multiple effect, the latter using multiple stages or internally cascaded use of heat to improve efficiency.

ACCESS (TO). That which enables a device, appliance or equipment to be reached by ready access or by a means that first requires the removal or movement of a panel, door or similar obstruction [](see also “Ready access (to)”)[].

AIR. All air supplied to mechanical equipment and appliances for combustion, ventilation, cooling, etc. Standard air is air at standard temperature and pressure, namely, 70°F (21°C) and 29.92 inches of mercury (101.3 kPa).

AIR CONDITIONING. The treatment of air so as to control simultaneously the temperature, humidity, cleanness and distribution of the air to meet the requirements of a conditioned space.

AIR-CONDITIONING SYSTEM. A system that consists of heat exchangers, blowers, filters, supply, exhaust and return ducts, and shall include any apparatus installed in connection therewith.

AIR DISPERSION SYSTEM. Any diffuser system designed to both convey air within a room, space or area and diffuse air into that space while operating under positive pressure. Systems are commonly constructed of, but not limited to, fabric or plastic film.

AIR DISTRIBUTION SYSTEM. Any system of ducts, plenums and air-handling equipment that circulates air within a space or spaces and includes systems made up of one or more air-handling units.

AIR, EXHAUST. Air being removed from any space, appliance or piece of equipment and conveyed directly to the atmosphere by means of openings or ducts.

AIR-HANDLING UNIT. A blower or fan used for the purpose of distributing supply air to a room, space or area.

AIR, INTAKE. Air supplied from the outdoors to any space, appliance or piece of equipment.

AIR, MAKEUP. Air that is provided to replace air being exhausted.

AIR, RELIEF. Air removed from any space, appliance or piece of equipment.

AIR TRANSFER OPENING. An opening designed to allow the movement of environmental air between two contiguous spaces.

ALTERATION. Any construction, addition, change of use or occupancy, or renovation to a building or structure in existence. See Section 28-101.5 of the *Administrative Code*.

APPLIANCE. A device or apparatus that is manufactured and designed to utilize energy and for which this code provides specific requirements.

APPLIANCE, EXISTING. Any appliance regulated by this code which was legally installed prior to the effective date of this code, or for which a permit to install has been issued.

APPLIANCE, FUEL-FIRED. An appliance that burns solid, liquid and/or gaseous fuel, including but not limited to wood stoves, household cooking ranges, furnaces, boilers, water heaters, clothes dryers and gas-fired refrigerators.

APPLIANCE, GAS (EQUIPMENT). Any apparatus or equipment that uses gas as a fuel or raw material to produce light, heat, power, refrigeration or air conditioning.

APPLIANCE TYPE.

High-heat appliance. Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature greater than 2,000°F (1093°C).

Low-heat appliance (residential appliance). Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of 1,000°F (538°C) or less.

Medium-heat appliance. Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of more than 1,000°F (538°C), but not greater than 2,000°F (1093°C).

APPLIANCE, VENTED. An appliance designed and installed in such a manner that all of the products of combustion are conveyed directly from the appliance to the [outside] outdoor atmosphere through an approved chimney or vent system.

APPROVED. [Acceptable to the commissioner.] In reference to construction documents, the determination by the department after full examination that submitted construction documents comply with this code and other applicable laws and rules. In reference to materials, the determination by the commissioner that material is acceptable for its intended use. See Section 28-101.5 of the *Administrative Code*.

APPROVED AGENCY. An established and recognized agency, or other qualified person, [regularly] engaged in conducting tests or furnishing inspection services, when approved

pursuant to department rules as qualified to perform or witness identified testing or inspection services. See Chapter 1 of Title 28 of the *Administrative Code*.

APPROVED INSPECTION AGENCY. An approved agency that is approved by the department as qualified to perform one or more of the inspections required by this code. See Chapter 1 of Title 28 of the *Administrative Code*.

APPROVED TESTING AGENCY. An approved agency that is approved by the department as qualified to test and evaluate the performance of one or more of the materials regulated in their use by this code. Such term shall include, when approved pursuant to department rules, a third-party testing or certification agency, evaluation agency, testing laboratory, testing service, licensed concrete testing laboratory, or other entity concerned with product evaluation. See Chapter 1 of Title 28 of the *Administrative Code*.

ARCHITECT. A person licensed and registered to practice the profession of architecture under the *Education Law of the State of New York*.

AUTOMATIC BOILER. Any class of boiler that is equipped with the controls and limit devices specified in Chapter 10.

BATHROOM. A room containing a bathtub, shower, spa or similar bathing fixture.

BOILER, HIGH-PRESSURE. An appliance (equipment) for supplying steam [of] or hot water that, for a steam boiler, operates at a pressure of more than 15 psig (103 kPa gauge), and for a hot water boiler, operates at a pressure exceeding 160 psig (1103 kPa gauge) or at a temperature exceeding 250°F (121°C).

BOILER, LOW-PRESSURE. A self-contained appliance for supplying steam or hot water as follows:

Hot water heating boiler. A boiler in which no steam is generated, from which hot water is circulated for heating purposes and then returned to the boiler, and that operates at water pressures not exceeding 160 pounds per square inch gauge (psig) (1103 kPa gauge) and at water temperatures not exceeding 250°F (121°C) at or near the boiler outlet.

Hot water supply boiler. A boiler, completely filled with water, which furnishes hot water to be used externally to itself, and that operates at water pressures not exceeding 160 psig (1103 kPa gauge) and at water temperatures not exceeding 250°F (121°C) at or near the boiler outlet.

Steam heating boiler. A boiler in which steam is generated and that operates at a steam pressure not exceeding 15 psig (103 kPa gauge).

[**Steam-heating boiler.** See “Steam-heating boiler.”]

BOILER ROOM. A room primarily utilized for the installation of a boiler.

BRAZED JOINT. A gas-tight joint obtained by the joining of metal parts with metallic mixtures or alloys which melt at a temperature above 1,000°F (538°C), but lower than the melting temperature of the parts to be joined.

BRAZING. A metal joining process wherein coalescence is produced by the use of a nonferrous filler metal having a melting point above 1,000°F (538°C), but lower than that of the base metal being joined. The filler material is distributed between the closely fitted surfaces of the joint by capillary attraction.

BREATHING ZONE. The region within an occupied space between planes 3 and 72 inches (76 and 1829 mm) above the floor and more than 2 feet (610 mm) from the walls of the space or from fixed air-conditioning equipment.

BTU. Abbreviation for British thermal unit, which is the quantity of heat required to raise the temperature of 1 pound (454 g) of water 1°F (0.56°C) (1 Btu = 1055 J).

BUILDING. Any structure used or intended for supporting or sheltering any use or occupancy. The term shall be construed as if followed by the phrase “structure, premises, lot or part thereof” unless otherwise indicated by the text. See Section 28-101.5 of the *Administrative Code*.

CEILING RADIATION DAMPER. [A device installed to limit radiant heat transfer through an air outlet or air inlet opening in the ceiling of a floor-ceiling or roof-ceiling assembly, which device has not less than a 1-hour fire-resistance rating] A listed device installed in a ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly to limit automatically the radiative heat transfer through an air inlet/outlet opening.

CHIMNEY. A primarily vertical structure containing one or more flues, for the purpose of carrying gaseous products of combustion and air from a fuel-burning appliance to the [outside] outdoor atmosphere.

Factory-built chimney. A listed and labeled chimney composed of factory-made components, assembled in the field in accordance with manufacturer’s instructions and the conditions of the listing.

Masonry chimney. A field-constructed chimney composed of solid masonry units, bricks, stones or concrete.

Metal chimney. A field-constructed chimney composed of metal.

CHIMNEY CONNECTOR. A pipe [or metal breeching] that connects a fuel-burning appliance to a chimney.

CLEARANCE. The minimum distance through air measured between the heat-producing surface of the mechanical appliance, device or equipment and the surface of the combustible material or assembly.

CLOSED COMBUSTION SOLID-FUEL-BURNING APPLIANCE. A heat-producing appliance that employs a combustion chamber that has no openings other than the flue collar, fuel charging door and adjustable openings provided to control the amount of combustion air that enters the combustion chamber.

CLOTHES DRYER. An appliance used to dry wet laundry by means of heat. Dryer classifications are as follows:

Type 1. Factory-built package, multiple production. Primarily used in family living environment. Usually the smallest unit physically and in function output.

Type 2. Factory-built package, multiple production. Used in business with direct intercourse of the function with the public. Not designed for use in individual family living environment.

COMBINATION FIRE/SMOKE DAMPER. A listed device installed in ducts and air transfer openings designed to close automatically upon the detection of heat and resist the passage of flame and smoke. The device is installed to operate automatically, be controlled by a smoke detection system, and where required, is capable of being positioned from a fire command center.

COMBUSTIBLE ASSEMBLY. Wall, floor, ceiling or other assembly constructed of one or more component materials that are not defined as noncombustible.

COMBUSTIBLE LIQUIDS. Any liquids having a closed cup flash point at or above 100°F (38°C), and that are divided into the following classifications:

Class II. Liquids having closed cup flash points at or above 100°F (38°C) and below 140°F (60°C).

Class IIIA. Liquids having closed cup flash points at or above 140°F (60°C) and below 200°F (93°C).

Class IIIB. Liquids having closed cup flash points at or above 200°F (93°C).

COMBUSTIBLE MATERIAL. Any material not defined as noncombustible.

COMBUSTION. In the context of this code, refers to the rapid oxidation of fuel accompanied by the production of heat or heat and light.

COMBUSTION AIR. Air necessary for complete combustion of a fuel, including theoretical air and excess air.

COMBUSTION CHAMBER. The portion of an appliance within which combustion occurs.

COMBUSTION PRODUCTS. Constituents resulting from the combustion of a fuel with the oxygen of the air, including the inert gases, but excluding excess air.

COMMERCIAL COOKING APPLIANCES. Appliances used in a commercial food service establishment for heating or cooking food and which produce grease vapors, steam, fumes, smoke or odors that are required to be removed through a local exhaust ventilation system. Such appliances include deep fat fryers; upright broilers; griddles; broilers; steam-jacketed kettles; hot-top ranges; under-fired broilers (charbroilers); ovens; barbecues; rotisseries; and similar appliances. For the purpose of this definition, a food service establishment shall include any building or a portion thereof used for the preparation and serving of food.

COMMERCIAL COOKING RECIRCULATING SYSTEM. Self-contained system consisting of the exhaust hood, the cooking equipment, the filters[,] and the fire suppression system. The system is designed to capture cooking vapors and residues generated from commercial cooking equipment. The system removes contaminants from the exhaust air and recirculates the air to the space from which it was withdrawn.

[**COMMERCIAL COOKING APPLIANCES.** Appliances used in a commercial food service establishment for heating or cooking food and which produce grease vapors, steam, fumes, smoke or odors that are required to be removed through a local exhaust ventilation system. Such appliances include deep fat fryers; upright broilers; griddles; broilers; steam-jacketed kettles; hot-top ranges; under-fired broilers (charbroilers); ovens; barbecues; rotisseries; and similar appliances. For the purpose of this definition, a food service establishment shall include any building or a portion thereof used for the preparation and serving of food.]

COMMERCIAL KITCHEN EXHAUST HOODS.

Backshelf Hood. A backshelf hood is also referred to as a low-proximity hood, or as a sidewall hood where wall mounted. Its front lower lip is low over the appliance(s) and is “set back” from the front of the appliance(s). It is always closed to the rear of the appliances by a panel where free-standing, or by a panel or wall where wall mounted, and its height above the cooking surface varies. (This style of hood can be constructed with partial end panels to increase its effectiveness in capturing the effluent generated by the cooking operation).

Double island canopy hood. A double island canopy hood is placed over back-to-back appliances or appliance lines. It is open on all sides and overhangs both fronts and the sides of the appliance(s). It could have a wall panel between the backs of the appliances. (The fact that exhaust air is drawn from both sides of the double canopy to meet in the center causes each side of this hood to emulate a wall canopy hood, and thus it functions much the same with or without an actual wall panel between the backs of the appliances).

Eye-brow hood. An eyebrow hood is mounted directly to the face of an appliance, such as an oven and dishwasher, above the opening(s) or door(s) from which effluent is emitted, extending past the sides and overhanging the front of the opening to capture the effluent.

Pass-over hood. A pass-over hood is a free-standing form of a backshelf hood constructed low enough to pass food over the top.

Single island canopy hood. A single island canopy hood is placed over a single appliance or appliance line. It is open on all sides and overhangs the front, rear and sides of the appliance(s). A single island canopy is more susceptible to cross drafts and requires a greater exhaust air flow than an equivalent sized wall-mounted canopy to capture and contain effluent generated by the cooking operation(s).

Wall canopy hood. A wall canopy [exhaust] hood is mounted against a wall above a single appliance or line of appliance(s), or it could be free-standing with a back panel from the rear of the appliances to the hood. It overhangs the front and sides of the appliance(s) on all open sides. The wall acts as a back panel, forcing the makeup air to be drawn across the front of the cooking equipment, thus increasing the effectiveness of the hood to capture and contain effluent generated by the cooking operation(s).

COMMISSIONER. The Commissioner of Buildings of the City of New York or his or her duly authorized representative. See Section 28-101.5 of the *Administrative Code*.

COMPENSATING HOODS. Compensating hoods are those having integral (built-in) makeup air supply. The makeup air supply for such hoods is generally supplied from: short-circuit flow from inside the hood, air curtain flow from the bottom of the front face, and front face discharge from the outside front wall of the hood. The compensating makeup airflow can also be supplied from the rear or side of the hood, or the rear, front[,] or sides of the cooking equipment. The makeup airflow can be one or a combination of methods.

COMPRESSOR. A specific machine, with or without accessories, for compressing a gas.

COMPRESSOR, POSITIVE DISPLACEMENT. A compressor in which increase in pressure is attained by changing the internal volume of the compression chamber.

COMPRESSOR UNIT. A compressor with its prime mover and accessories.

CONCEALED LOCATION. A location that cannot be accessed without damaging permanent parts of the building structure or finished surface. Spaces above, below or behind readily removable panels or doors shall not be considered as concealed.

CONDENSATE. The liquid that condenses from a gas (including flue gas) caused by a reduction in temperature or increase in pressure.

CONDENSER. A heat exchanger designed to liquefy refrigerant vapor by removal of heat.

CONDENSING UNIT. A specific refrigerating machine combination for a given refrigerant, consisting of one or more power-driven compressors, condensers, liquid receivers (when required)[,] and the regularly furnished accessories.

CONDITIONED SPACE. An area, room or space being heated or cooled by any equipment or appliance.

CONFINED SPACES. A space having a volume less than 50 cubic feet per 1,000 British thermal units per hour (Btu/h) ($4.8 \text{ m}^3/\text{kW}$) of the aggregate input rating of all appliances installed in that space.

CONSTRUCTION DOCUMENTS. Plans and specifications and other written, graphic and pictorial documents, prepared or assembled for describing the design, location, [and] physical characteristics [of the] and other elements of the project necessary for obtaining a building permit. See Section 28-101.5 of the *Administrative Code*. [.]

CONTROL. A manual or automatic device designed to regulate the gas, air, water or electrical supply to, or operation of, a mechanical system.

CONVERSION BURNER. A burner designed to supply gaseous fuel to an appliance originally designed to utilize another fuel.

COOKING APPLIANCE. See “Commercial cooking appliances.”

DAMPER. A manually or automatically controlled device to regulate draft or the rate of flow of air or combustion gases.

Volume damper. A device that, when installed, will restrict, retard or direct the flow of air in a duct, or the products of combustion in a heat-producing appliance, its vent connector, vent or chimney therefrom.

DECORATIVE SHROUD. A partial non-combustible enclosure for aesthetic purposes that is installed at the termination of a venting system that surrounds or conceals the chimney or vent cap.

DESIGN WORKING PRESSURE. The maximum allowable working pressure for which a specific part of a system is designed.

DIRECT REFRIGERATION SYSTEM. A system in which the evaporator or condenser of the refrigerating system is in direct contact with the air or other substances to be cooled or heated.

DIRECT-VENT APPLIANCES. Appliances that are constructed and installed so that all air for combustion is derived from the [outside] outdoor atmosphere and all flue gases are discharged to the [outside] outdoor atmosphere.

DRAFT. The pressure difference existing between the [equipment] appliance or any component part and the atmosphere, that causes a continuous flow of air and products of combustion through the gas passages of the appliance to the atmosphere.

Induced draft. The pressure difference created by the action of a fan, blower or ejector, that is located between the appliance and the chimney or vent termination.

Natural draft. The pressure difference created by a vent or chimney because of its height, and the temperature difference between the flue gases and the atmosphere.

DRIP. The container placed at a low point in a system of piping to collect condensate and from which the condensate is removable.

DRY CLEANING SYSTEMS. Dry cleaning plants or systems are classified as follows:

Type I. Those systems using Class I flammable liquid solvents having a flash point below 100°F (38°C).

Type II. Those systems using Class II combustible liquid solvents having a flash point at or above 100°F (38°C) and below 140°F (60°C).

Type III. Those systems using Class III combustible liquid solvents having a flash point at or above 140°F (60°C).

Types IV and V. Those systems using Class IV nonflammable liquid solvents.

DUCT. A tube or conduit utilized for conveying air. The air passages of self-contained systems are not to be construed as air ducts.

DUCT FURNACE. A warm-air furnace normally installed in an air distribution duct to supply warm air for heating. This definition shall apply only to a warm-air heating appliance that, for air circulation, depends on a blower not furnished as part of the furnace.

DUCT SYSTEM. A continuous passageway for the transmission of air that, in addition to ducts, includes duct fittings, dampers, plenums, fans and accessory air-handling equipment and appliances.

DWELLING. A building or structure [that] which is occupied in whole or in part as the home, residence or sleeping place of one or more families.

DWELLING UNIT. A single unit consisting of one or more habitable rooms and occupied or arranged to be occupied as a unit separate from all other units within a dwelling.

ELECTRIC HEATING APPLIANCE. An appliance that produces heat energy to create a warm environment by the application of electric power to resistance elements, refrigerant compressors or dissimilar material junctions.

ENERGY RECOVERY VENTILATION SYSTEM. Systems that employ air-to-air heat exchangers to recover energy from or reject energy to exhaust air for the purpose of preheating, precooling, humidifying or dehumidifying outdoor ventilation air prior to supplying such air to a space, either directly or as part of an HVAC system.

ENGINEER. A person licensed and registered to practice the profession of engineering under the *Education Law of the State of New York*.

ENGINEERED SMOKE CONTROL SYSTEM. Refer to Smoke Control System in Section 909 of the *New York City Building Code*.

ENVIRONMENTAL AIR. Air that is supplied, returned, recirculated, or exhausted from a space for the purpose of modifying the existing atmosphere within a building.

EQUIPMENT. All piping, ducts, vents, control devices and other components of systems other than appliances which are permanently installed and integrated to provide control of environmental conditions for buildings. This definition shall also include other systems specifically regulated in this code.

EQUIPMENT, EXISTING. Any equipment regulated by this code which was legally installed prior to the effective date of this code, or for which a permit to install has been issued.

EVAPORATIVE COOLER. A device used for reducing the sensible heat of air for cooling by the process of evaporation of water into an airstream.

EVAPORATIVE COOLING SYSTEM. The equipment and appliances intended or installed for the purpose of environmental cooling by an evaporative cooler from which the conditioned air is distributed through ducts or plenums to the conditioned area.

EVAPORATOR. That part of the system in which liquid refrigerant is vaporized to produce refrigeration.

EXCESS AIR. The amount of air provided in addition to theoretical air to achieve complete combustion of a fuel, thereby preventing the formation of dangerous products of combustion.

EXHAUST SYSTEM. An assembly of connected ducts, plenums, fittings, registers, grilles and hoods through which air is conducted from a space or spaces and exhausted to the out[side]door atmosphere.

EXTRA-HEAVY-DUTY COOKING APPLIANCE. Extra-heavy-duty cooking appliances include appliances utilizing solid fuel such as wood, charcoal, briquettes, and [mesquite as the primary source] mesquite to provide all or part of the heat source for cooking.

FIELD ERECTED BOILER. A boiler where the pressure vessel is constructed partially or totally in the field. Field erected boilers do not include cast iron sectional boilers which are considered factory built since each section is a separate pressure vessel.

FIRE DAMPER. A listed device installed in ducts and air transfer openings designed to close automatically upon detection of heat and to restrict the passage of flame. Fire dampers are classified for use in either static systems that will automatically shut down in the event of a fire, or in dynamic systems that continue to operate during a fire. A dynamic fire damper is tested and rated for closure under elevated temperature airflow.

FIREPLACE. An assembly consisting of a hearth and fire chamber of noncombustible material and provided with a chimney, for use with solid fuels.

Factory-built fireplace. A listed and labeled fireplace and chimney system composed of factory-made components, and assembled in the field in accordance with manufacturer's instructions and the conditions of the listing.

Masonry fireplace. A field-constructed fireplace composed of solid masonry units, bricks, stones or concrete.

FIREPLACE STOVE. A free-standing chimney-connected solid-fuel-burning heater, designed to be operated with the fire chamber doors in either the open or closed position.

FLAME SAFEGUARD. A device that will automatically shut off the fuel supply to a main burner or group of burners when the means of ignition of such burners becomes inoperative, and when flame failure occurs on the burner or group of burners.

FLAME SPREAD INDEX. The numerical value assigned to a material tested in accordance with ASTM E 84 or UL 723.

FLAMMABILITY CLASSIFICATION. Refrigerants shall be assigned to one of the three classes—1, 2 or 3—in accordance with ASHRAE 34.

FLAMMABLE LIQUIDS. Any liquid that has a closed cup flash point below 100°F (38°C), and has a vapor pressure not exceeding 40 psia (276 kPa) at 100°F (38°C). Flammable liquids shall be known as Class I liquids and shall be divided into the following classifications:

Class IA. Liquids having a closed cup flash point below 73°F (23°C) and a boiling point below 100°F (38°C).

Class IB. Liquids having a closed cup flash point below 73°F (23°C) and a boiling point at or above 100°F (38°C).

Class IC. Liquids having a closed cup flash point at or above 73°F (23°C) and below 100°F (38°C).

FLAMMABLE VAPOR OR FUMES. Mixtures of gases in air at concentrations equal to or greater than the LFL and less than or equal to the upper flammability limit (UFL).

FLASH POINT. The minimum temperature [corrected to a pressure of 14.7 psia (101 kPa)] at which the application of a test flame causes the vapors of a portion of the sample to ignite under the conditions specified by the test procedures and apparatus. The flash point of a liquid shall be determined in accordance with ASTM D 56, ASTM D 93 or ASTM D 3278.

FLOOR AREA, NET. The actual occupied area, not including unoccupied accessory areas or thicknesses of walls.

FLOOR FURNACE. A completely self-contained furnace suspended from the floor of the space being heated, taking air for combustion from outside such space and with means for observing flames and lighting the appliance from such space.

FLUE. A passageway within a chimney or vent through which gaseous combustion products pass.

FLUE CONNECTION (BREECHING). A passage for connecting the products of combustion from a fuel-fired appliance to the vent or chimney (see also “Chimney connector” and “Vent connector”).

FLUE GASES. Products of combustion and excess air.

FLUE LINER (LINING). A system or material used to form the inside surface of a flue in a chimney or vent, for the purpose of protecting the surrounding structure from the effects of combustion products and conveying combustion products without leakage [in]to the atmosphere.

FUEL GAS. A natural gas, manufactured gas, liquefied petroleum gas or a mixture of these.

FUEL OIL. Kerosene or any hydrocarbon oil having a flash point not less than 100°F (38°C).

FUEL-OIL PIPING SYSTEM. A closed piping system that connects a combustible liquid from a source of supply to a fuel-oil-burning appliance.

FURNACE. A completely self-contained heating unit that is designed to supply heated air to spaces remote from or adjacent to the appliance location.

FURNACE ROOM. A room primarily utilized for the installation of fuel-burning, space-heating and water-heating appliances other than boilers (see also “Boiler room”).

FUSIBLE PLUG. A device arranged to relieve pressure by operation of a fusible member at a predetermined temperature.

GROUND SOURCE HEAT PUMP LOOP SYSTEM. Piping buried in horizontal or vertical excavations or placed in a body of water for the purpose of transporting heat transfer liquid to and from a heat pump. Included in this definition are closed loop systems in which the liquid is recirculated and open loop systems in which the liquid is drawn from a well or other source.

HAZARDOUS LOCATION. Any location considered to be a fire hazard for flammable vapors, dust, combustible fibers or other highly combustible substances. The location is not necessarily categorized in the *New York City Building Code* as a high-hazard use group classification.

HEAT EXCHANGER. A device that transfers heat from one medium to another.

HEAT PUMP. A refrigeration system that extracts heat from one substance and transfers it to another portion of the same substance or to a second substance at a higher temperature for a beneficial purpose.

HEAT TRANSFER LIQUID. The operating or thermal storage liquid in a mechanical system, including water or other liquid base, and additives at the concentration present under operating conditions used to move heat from one location to another. Refrigerants are not included as heat transfer liquids.

HEAVY-DUTY COOKING APPLIANCE. Heavy-duty cooking appliances include electric under-fired broilers, electric chain (conveyor) broilers, gas under-fired broilers, gas chain (conveyor) broilers, gas open-burner ranges (with or without oven), electric and gas wok ranges, and electric and gas over-fired (upright) broilers and salamanders.

HIGH-PROBABILITY SYSTEMS. A refrigeration system in which the basic design or the location of components is such that a leakage of refrigerant from a failed connection, seal or component will enter an occupancy classified area, other than the machinery room.

HIGH-SIDE PRESSURE. The parts of a refrigerating system subject to condenser pressure.

HOOD. An air-intake device used to capture by entrapment, impingement, adhesion or similar means, grease, moisture, heat and similar contaminants before they enter a duct system.

Type I. A kitchen hood for collecting and removing grease vapors and smoke. Such hoods are equipped with a fire suppression system.

Type II. A general kitchen hood for collecting and removing steam, vapor, heat, odors and [odors] products of combustion.

HOOD, FUME. A hood used for hazardous exhaust systems.

HYDROGEN GENERATING APPLIANCE. A self-contained package or factory-matched packages of integrated systems for generating gaseous hydrogen. Hydrogen generating appliances utilize electrolysis, reformation, chemical, or other processes to generate hydrogen.

IGNITION SOURCE. A flame, spark or hot surface capable of igniting flammable vapors or fumes. Such sources include appliance burners, burner ignitors and electrical switching devices.

IMMEDIATELY DANGEROUS TO LIFE OR HEALTH (IDLH). The concentration of airborne contaminants that poses a threat of death, immediate or delayed permanent adverse health effects, or effects that could prevent escape from such an environment. This contaminant concentration level is established by the National Institute of Occupational Safety and Health (NIOSH) based on both toxicity and flammability. It is generally expressed in parts per million by volume (ppm v/v) or milligrams per cubic meter (mg/m³).

INDIRECT REFRIGERATION SYSTEM. A system in which a secondary coolant cooled or heated by the refrigerating system is circulated to the air or other substance to be cooled or heated. Indirect systems are distinguished by the method of application shown below:

Closed system. A system in which a secondary fluid is either cooled or heated by the refrigerating system and then circulated within a closed circuit in indirect contact with the air or other substance to be cooled or heated.

Double-indirect open-spray system. A system in which the secondary substance for an indirect open-spray system is heated or cooled by an intermediate coolant circulated from a second enclosure.

Open-spray system. A system in which a secondary coolant is cooled or heated by the refrigerating system and then circulated in direct contact with the air or other substance to be cooled or heated.

Vented closed system. A system in which a secondary coolant is cooled or heated by the refrigerating system and then passed through a closed circuit in the air or other substance to be cooled or heated, except that the evaporator or condenser is placed in an open or appropriately vented tank.

INTEGRAL VENT APPLIANCES. Appliances designed for outdoor installation that have built-in natural or mechanical venting means and are constructed and installed so that all air for combustion is derived from the outdoor atmosphere and all flue gases are discharged to the outdoor atmosphere through an integral vent termination.

INTERLOCK. A device actuated by another device with which it is directly associated, to govern succeeding operations of the same or allied devices. A circuit in which a given action cannot occur until after one or more other actions have taken place.

JOINT, FLANGED. A joint made by bolting together a pair of flanged ends.

JOINT, FLARED. A metal-to-metal compression joint in which a conical spread is made on the end of a tube that is compressed by a flare nut against a mating flare.

JOINT, MECHANICAL. A general form of gas-tight joints obtained by the joining of metal parts through a positive-holding mechanical construction, such as flanged joint, screwed joint or flared joint.

JOINT, PLASTIC ADHESIVE. A joint made in thermoset plastic piping by the use of an adhesive substance which forms a continuous bond between the mating surfaces without dissolving either one of them.

JOINT, PLASTIC HEAT FUSION. A joint made in thermoplastic piping by heating the parts sufficiently to permit fusion of the materials when the parts are pressed together.

JOINT, PLASTIC SOLVENT CEMENT. A joint made in thermoplastic piping by the use of a solvent or solvent cement which forms a continuous bond between the mating surfaces.

JOINT, SOLDERED. A gas-tight joint obtained by the joining of metal parts with metallic mixtures of alloys which melt at temperatures between 400°F (204°C) and 1,000°F (538°C).

JOINT, WELDED. A gas-tight joint obtained by the joining of metal parts in molten state.

LABEL. Identification applied to material by the manufacturer or an approved agency that contains the name of the manufacturer, the function and performance characteristics of the material, and the name and identification of the approved agency that conducted the evaluation of a representative sample of such material.

LABELED. Material or product to which has been attached a label, symbol or other identifying mark of the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of an approved agency and that indicates that a representative sample of the material has been tested and evaluated by an approved agency for compliance with nationally recognized standards or tests to determine suitable usage in a specified manner. See Section 28-101.5 of the *Administrative Code*.

LIGHT-DUTY COOKING APPLIANCE. Light-duty cooking appliances include gas and electric ovens (including standard, bake, roasting, revolving, retherm, convection, combination convection/steamer, [conveyor] countertop conveyORIZED baking/finishing, deck [or deck-style pizza,]and pastry), electric and gas steam-jacketed kettles, electric and gas pasta cookers, electric and gas compartment steamers (both pressure and atmospheric) and electric and gas cheesemelters.

LIMIT CONTROL. A device responsive to changes in pressure, temperature or level for turning on, shutting off or throttling the gas supply to an appliance.

LIMITED CHARGE SYSTEM. A system in which, with the compressor idle, the design pressure will not be exceeded when the refrigerant charge has completely evaporated.

LIMITED COMBUSTIBLE MATERIAL. A building construction material not complying with the definition of noncombustible material, which, in the form in which it is used, has a potential heat value not exceeding 3500 Btu/lb (8141 kj/kg) and complies with the following: Materials, in the form and thickness used, having neither a flame spread index/rating greater than 25 nor evidence of continued combustion, and of such composition that surfaces that would be exposed by cutting through the material on any plane would have neither a flame spread index/rating greater than 25 nor evidence of continued progressive combustion. Materials subject to increase in combustibility or flame spread index/rating beyond the limits herein established through the effects of age, moisture, or other atmospheric condition shall be considered combustible.

LISTED. Material identified in a list published by an approved agency that maintains periodic inspection of production of listed material or periodic evaluation of services and whose listing states either that the material meets identified nationally recognized standards or has been tested and found suitable for a specified purpose when installed in accordance with the manufacturer's installation instructions. See Section 28-101.5 of the *Administrative Code*.

LIVING SPACE. Space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes.

LOWER EXPLOSIVE LIMIT (LEL). See "LFL."

LOWER [FLAMMABILITY] FLAMMABLE LIMIT (LFL). The minimum concentration of refrigerant that is capable of propagating a flame through a homogeneous mixture of refrigerant and air.

LOW-PRESSURE HOT-WATER-HEATING BOILER. A boiler furnishing hot water at pressures not exceeding 160 psig (1103 kPa) and at temperatures not exceeding 250°F (121°C).

LOW-PRESSURE STEAM-HEATING BOILER. A boiler furnishing steam at pressures not exceeding 15 psig (103 kPa).

LOW-PROBABILITY SYSTEMS. A refrigeration system in which the basic design or the location of components is such that a leakage of refrigerant from a failed connection, seal or component will not enter an occupancy-classified area, other than the machinery room.

LOW-SIDE PRESSURE. The parts of a refrigerating system subject to evaporator pressure.

MACHINERY ROOM. A room meeting prescribed safety requirements and in which refrigeration systems or components thereof are located (see Sections 1105 and 1106 of this code, and Section 1015.4 of the *New York City Building Code*).

MECHANICAL DRAFT SYSTEM. A venting system designed to remove flue or vent gases by mechanical means, that consists of an induced-draft portion under nonpositive static pressure or a forced-draft portion under positive static pressure.

Forced-draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under positive static pressure.

Induced-draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under nonpositive static vent pressure.

Power venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under positive static vent pressure.

MECHANICAL EQUIPMENT/APPLIANCE ROOM. A room or space in which nonfuel-fired mechanical equipment and appliances are located.

MECHANICAL EXHAUST SYSTEM. A system for removing air from a room or space by mechanical means.

MECHANICAL JOINT. A connection between pipes, fittings, or pipes and fittings, which is neither screwed, caulked, threaded, soldered, solvent cemented, brazed nor welded. Also, a joint in which compression is applied along the centerline of the pieces being joined. Some joints are part of a coupling, fitting or adapter. These joints include both the press-type and push-fit joining systems.

MECHANICAL SYSTEM. A system specifically addressed and regulated in this code and composed of components, devices, appliances and equipment which become part of the building.

MEDIUM-DUTY COOKING APPLIANCE. Medium-duty cooking appliances include electric discrete element ranges (with or without oven), electric and gas hot-top ranges, electric and gas griddles, electric and gas double-sided griddles, electric and gas fryers (including open deep fat fryers, donut fryers, kettle fryers[,] and pressure fryers), electric and gas [pasta cookers, electric and gas] conveyor pizza ovens, electric and gas tilting skillets (braising pans) and electric and gas rotisseries.

MODULAR BOILER. A steam or hot-water-heating assembly consisting of a group of individual boilers called modules intended to be installed as a unit with no intervening stop valves. Modules are under one jacket or are individually jacketed. The individual modules shall be limited to a maximum input rating of 400,000 Btu/h (117 228 W[h]) gas, 3 gallons per hour (gph) (11.4 L/h) oil, or 115 kW (electric).

NATURAL DRAFT SYSTEM. A venting system designed to remove flue or vent gases under nonpositive static vent pressure entirely by natural draft.

NATURAL VENTILATION. The movement of air into and out of a space through intentionally provided openings, such as windows and doors, or through nonpowered ventilators.

NET OCCUPIABLE FLOOR AREA. The floor area of an occupiable space defined by the inside surfaces of its walls but excluding shafts, column enclosures and other permanently

enclosed, inaccessible and unoccupiable areas. Obstructions in the space such as furnishings, display or storage racks and other obstructions, whether temporary or permanent, shall not be deducted from the space area.

NONABRASIVE/ABRASIVE MATERIALS. Nonabrasive particulate in high concentrations, moderately abrasive particulate in low and moderate concentrations, and highly abrasive particulate in low concentrations, such as alfalfa, asphalt, plaster, gypsum and salt.

NONCOMBUSTIBLE MATERIALS. Materials that, when tested in accordance with ASTM E 136, have at least three of four specimens tested meeting all of the following criteria:

1. The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than 54°F (30°C) above the furnace temperature at the beginning of the test.
2. There shall not be flaming from the specimen after the first 30 seconds.
3. If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.

OCCUPANCY. The purpose or activity for which a building or space is used or is designed, arranged or intended to be used.

OCCUPIABLE SPACE. An enclosed space intended for human activities, excluding those spaces intended primarily for other purposes, such as storage rooms and equipment rooms, that are only intended to be occupied occasionally and for short periods of time.

OFFSET (VENT). A combination of approved bends that make two changes in direction bringing one section of the vent out of line but into a line parallel with the other section.

OUTDOOR AIR. Air taken from the outdoors, and therefore not previously circulated through the system.

OUTDOOR OPENING. A door, window, louver or skylight openable to the [outside] outdoor atmosphere.

OUTLET, GAS. A threaded connection or bolted flange in a piping system to which a gas-burning appliance is attached.

PANEL HEATING. A method of radiant space heating in which heat is supplied by large heated areas of room surfaces. The heating element usually consists of warm water piping, warm air ducts, or electrical resistance elements embedded in or located behind ceiling, wall or floor surfaces.

PELLET FUEL-BURNING APPLIANCE. A closed-combustion, vented appliance equipped with a fuel-feed mechanism for burning processed pellets of solid fuel of a specified size and composition.

PIPING. Where used in this code, “piping” refers to either pipe or tubing, or both.

Pipe. A rigid conduit of iron, steel, copper, brass or plastic.

Tubing. Semirigid conduit of copper, aluminum, plastic or steel.

PLASTIC, THERMOPLASTIC. A plastic that is capable of being repeatedly softened by increase of temperature and hardened by decrease of temperature.

PLASTIC, THERMOSETTING. A plastic that is capable of being changed into a substantially infusible or insoluble product when cured under application of heat or chemical means.

PLENUM. A compartment or chamber located in one story only to which one or more air ducts are connected and which forms part of the air supply or return system and may be part of the building construction, such as the concealed space above a ceiling.

PORTABLE FUEL CELL APPLIANCE. A fuel cell generator of electricity, which is not fixed in place. A portable fuel cell appliance utilizes a cord and plug connection to a grid-isolated load and has an integral fuel supply.

POWER BOILER. See “Boiler.”

PREMISES. Land, improvements thereon, or any part thereof.

PRESSURE, FIELD TEST. A test performed in the field to prove system tightness.

PRESSURE-LIMITING DEVICE. A pressure-responsive mechanism designed to stop automatically the operation of the pressure-imposing element at a predetermined pressure.

PRESSURE RELIEF DEVICE. A pressure-actuated valve or rupture member designed to relieve excessive pressure automatically.

PRESSURE RELIEF VALVE. A pressure-actuated valve held closed by a spring or other means and designed to relieve pressure automatically in excess of the device’s setting.

PRESSURE VESSELS. Closed containers, tanks or vessels that are designed to contain liquids or gases, or both, under pressure.

PRESSURE VESSELS—REFRIGERANT. Any refrigerant-containing receptacle in a refrigerating system. This does not include evaporators where each separate section does not exceed 0.5 cubic foot (0.014 m³) of refrigerant-containing volume, regardless of the maximum inside dimensions, evaporator coils, controls, headers, pumps and piping.

PROTECTIVE ASSEMBLY (REDUCED CLEARANCE). Any noncombustible assembly that is labeled or constructed in accordance with Table 308.6 and is placed between combustible materials or assemblies and mechanical appliances, devices or equipment, for the purpose of reducing required airspace clearances. Protective assemblies attached directly to a combustible assembly shall not be considered as part of that combustible assembly.

PURGE. To clear of air, water or other foreign substances.

PUSH-FIT JOINTS. A type of mechanical joint consisting of elastomeric seals and corrosion-resistant tube grippers. Such joints are permanent or removable depending on the design.

QUICK-OPENING VALVE. A valve that opens completely by fast action, either manually or automatically controlled. A valve requiring one-quarter round turn or less is considered to be quick opening.

RADIANT HEATER. A heater designed to transfer heat primarily by direct radiation.

READY ACCESS (TO). That which enables a device, appliance or equipment to be directly reached, without requiring the removal or movement of any panel, door or similar obstruction [[] (see “Access (to)”) [[]].

RECEIVER, LIQUID. A vessel permanently connected to a refrigeration system by inlet and outlet pipes for storage of liquid refrigerant.

RECIRCULATED AIR. Air removed from a conditioned space and intended for reuse as supply air.

RECLAIMED REFRIGERANTS. Refrigerants reprocessed to the same specifications as for new refrigerants by means including distillation. Such refrigerants have been chemically analyzed to verify that the specifications have been met. Reclaiming usually implies the use of processes or procedures that are available only at a reprocessing or manufacturing facility.

RECOVERED REFRIGERANTS. Refrigerants removed from a system in any condition without necessarily testing or processing them.

RECYCLED REFRIGERANTS. Refrigerants from which contaminants have been reduced by oil separation, removal of noncondensable gases, and single or multiple passes through devices that reduce moisture, acidity and particulate matter, such as replaceable core filter dryers. These procedures usually are performed at the field job site or in a local service shop.

REFRIGERANT. [A substance utilized to produce refrigeration by its expansion or vaporization.] A substance used for heat transfer in a refrigerating system; the refrigerant absorbs heat and transfers it at a higher temperature and higher pressure, usually with a change of state.

REFRIGERANT SAFETY CLASSIFICATIONS. Groupings that indicate the toxicity and flammability classes in accordance with ASHRAE 34.

REFRIGERATED ROOM OR SPACE. A room or space in which an evaporator or brine coil is located for the purpose of reducing or controlling the temperature within the room or space to below 68°F (20°C).

REFRIGERATING SYSTEM. A combination of interconnected refrigerant-containing parts constituting one closed refrigerant circuit in which a refrigerant is circulated for the purpose of extracting heat.

REFRIGERATION MACHINERY ROOM. See “Machinery room.”

REFRIGERATION SYSTEM, ABSORPTION. A heat-operated, closed-refrigeration cycle in which a secondary fluid (the absorbent) absorbs a primary fluid (the refrigerant) that has been vaporized in the evaporator.

Direct system. A system in which the evaporator is in direct contact with the material or space refrigerated, or is located in air-circulating passages communicating with such spaces.

Indirect system. A system in which a brine coil cooled by the refrigerant is circulated to the material or space refrigerated, or is utilized to cool the air so circulated. Indirect systems are distinguished by the type or method of application.

REFRIGERATION SYSTEM CLASSIFICATION. Refrigeration systems are classified according to the degree of probability that leaked refrigerant from a failed connection, seal or component will enter an occupied area. The distinction is based on the basic design or location of the components.

REFRIGERATION SYSTEM, MECHANICAL. A combination of interconnected refrigeration-containing parts constituting one closed refrigerant circuit in which a refrigerant is circulated for the purpose of extracting heat and in which a compressor is used for compressing the refrigerant vapor.

REFRIGERATION SYSTEM, SELF-CONTAINED. A complete factory-assembled and tested system that is shipped in one or more sections and has no refrigerant-containing parts that are joined in the field by other than companion or block valves.

REGISTERED DESIGN PROFESSIONAL. Refer to Chapter 1 of Title 28 of the *New York City Administrative Code*.

RETURN AIR. Air removed from an approved conditioned space or location and recirculated or exhausted [to the outside atmosphere] outdoors.

RETURN AIR SYSTEM. An assembly of connected ducts, plenums, fittings, registers and grilles through which air from the space or spaces to be heated or cooled is conducted back to the supply unit (see also “Supply air system”).

ROOM HEATER VENTED. A free-standing heating unit burning solid or liquid fuel for direct heating of the space in and adjacent to that in which the unit is located.

SAFETY VALVE. A valve that relieves pressure in a steam boiler by opening fully at the rated discharge pressure. The valve is of the spring-pop type.

SELF-CONTAINED EQUIPMENT. Complete, factory-assembled and tested, heating, air-conditioning or refrigeration equipment installed as a single unit, and having all working parts, complete with motive power, in an enclosed unit of said machinery.

SHAFT. An enclosed space extending through one or more stories of a building, connecting vertical openings in successive floors, or floors and the roof.

SHAFT ENCLOSURE. The walls or construction forming the boundaries of a shaft.

SLEEPING UNIT. A dwelling unit, which may contain either toilet or kitchen facilities but not both. Any sleeping unit housing more than one family shall also be classified as a congregate living unit. The creation of or conversion to sleeping units shall be limited by Section 27-2077 of the New York City Housing Maintenance Code.

SMOKE DAMPER. A listed device [that i] installed in ducts and air transfer openings designed to resist the passage of [air and] smoke. The device is [arrange] installed to operate automatically, controlled by a smoke detection system, and [when] where required, is capable of being positioned [manually] from a [remote] fire command [station] center.

SMOKE-DEVELOPED INDEX. A numerical value assigned to a material tested in accordance with ASTM E 84.

SOLID FUEL (COOKING APPLICATIONS). Applicable to commercial food service operations only, solid fuel is any bulk material such as hardwood, mesquite, charcoal or briquettes that is combusted to produce heat for cooking operations.

SOURCE CAPTURE SYSTEM. A mechanical exhaust system designed and constructed to capture air contaminants at their source and to exhaust such contaminants to the outdoor atmosphere.

STATIONARY FUEL CELL POWER PLANT. A self-contained package or factory-matched package[s] which constitute an automatically operated assembly of integrated systems for generating useful electrical energy and recoverable thermal energy that is permanently connected and fixed in place.

[STEAM-HEATING BOILER. A boiler operated at pressures not exceeding 15 psig (103 kPa gage) for steam.]

STOP VALVE. A shutoff valve for controlling the flow of liquid or gases.

STORY. That portion of a building included between the upper surface of a floor and the upper surface of the floor next above, except that the topmost story shall be that portion of a building included between the upper surface of the topmost floor and the ceiling or roof above.

STRENGTH, ULTIMATE. The highest stress level that the component will tolerate without rupture.

SUPPLY AIR. That air delivered to each or any space supplied by the air distribution system or the total air delivered to all spaces supplied by the air distribution system, which is provided for ventilating, heating, cooling, humidification, dehumidification and other similar purposes.

SUPPLY AIR SYSTEM. An assembly of connected ducts, plenums, fittings, registers and grilles through which air, heated or cooled, is conducted from the supply unit to the space or spaces to be heated or cooled (see also “Return air system”).

THEORETICAL AIR. The exact amount of air required to supply oxygen for complete combustion of a given quantity of a specific fuel.

THERMAL RESISTANCE (*R*). A measure of the ability to retard the flow of heat. The *R*-value is the reciprocal of thermal conductance.

TLV-TWA (THRESHOLD LIMIT VALUE-TIME WEIGHTED AVERAGE). The time-weighted average concentration of a refrigerant or other chemical in air for a normal 8-hour workday and a 40-hour workweek, to which nearly all workers are repeatedly exposed, day after day, without adverse effects, as adopted by the American Conference of Government Industrial Hygienists (ACGIH).

TOILET ROOM. A room containing a water closet and, frequently, a lavatory, but not a bathtub, shower, spa or similar bathing fixture.

TOXICITY CLASSIFICATION. Refrigerants shall be classified for toxicity to one of two classes in accordance with ASHRAE 34.

TRANSITION FITTINGS, PLASTIC TO STEEL. An adapter for joining plastic pipe to steel pipe. The purpose of this fitting is to provide a permanent, pressure-tight connection between two materials which cannot be joined directly one to another.

UNCONFINED SPACE. A space having a volume not less than 50 cubic feet per 1,000 Btu/h (4.8m³/kW) of the aggregate input rating of all appliances installed in that space. Rooms communicating directly with the space in which the appliances are installed, through openings not furnished with doors, are considered a part of the unconfined space.

UNIT HEATER. A self-contained appliance of the fan type, designed for the delivery of warm air directly into the space in which the appliance is located.

UNUSUALLY TIGHT CONSTRUCTION. Construction meeting all of the following requirements:

1. Walls exposed to the outside atmosphere having a continuous water vapor retarder with a rating of 1 perm ($57 \text{ ng/s} \cdot \text{m}^2 \cdot \text{Pa}$) or less with openings gasketed or sealed; and
2. Openable windows and doors meeting the air leakage requirements of the *New York City Energy Conservation Code*, Section [802.3.1] 502.4.1; and
3. Caulking or sealants are applied to areas, such as joints around window and door frames, between sole plates and floors, between wall-ceiling joints, between wall panels, at penetrations for plumbing, electrical and gas lines, and at other openings.

VENT. A pipe or other conduit composed of factory-made components, containing a passageway for conveying combustion products and air to the atmosphere, listed and labeled for use with a specific type or class of appliance.

Pellet vent. A vent listed and labeled for use with listed pellet-fuel-burning appliances.

Type L vent. A vent listed and labeled for use with the following:

1. Oil-burning appliances that are listed for use with Type L vents.
2. Gas-fired appliances that are listed for use with Type B vents.

VENT CONNECTOR. The pipe that connects an approved fuel-fired appliance to a vent.

VENT DAMPER DEVICE, AUTOMATIC. A device intended for installation in the venting system, in the outlet of an individual automatically operated fuel-burning appliance that is designed to open the venting system automatically when the appliance is in operation and to close off the venting system automatically when the appliance is in a standby or shutdown condition.

VENTILATION. The natural or mechanical process of supplying conditioned or unconditioned air to, or removing such air from, any space.

VENTILATION AIR. That portion of supply air that comes from the outside (outdoors), plus any recirculated air that has been treated to maintain the desired quality of air within a designated space.

VENTING SYSTEM. A continuous open passageway from the flue collar of an appliance to the outside atmosphere for the purpose of removing flue or vent gases. A venting system is usually

composed of a vent or a chimney and vent connector, if used, assembled to form the open passageway.

WATER HEATER. Any heating appliance or equipment that heats potable water and supplies such water to the potable hot water distribution system.

ZONE. One occupiable space or several occupiable spaces with similar occupancy classification (see Table 403.3), occupant density, zone air distribution effectiveness and zone primary airflow rate per unit area.

Subpart 3 (Chapter 3 of the New York City Mechanical Code)

§1. Chapter 3 of the New York city mechanical code, as added by local law number 33 for the year 2007, sections 301.2, 303.3 and 312.1 as amended by local law number 85 for the year 2009, is amended to read as follows:

CHAPTER 3 GENERAL REGULATIONS SECTION MC 301 GENERAL

301.1 Scope. This chapter shall govern the approval and installation of all equipment and appliances that comprise parts of the building mechanical systems regulated by this code in accordance with Section 101.2.

301.2 Energy utilization. Heating, ventilating and air-conditioning systems of all structures shall be designed and installed for efficient utilization of energy in accordance with the *New York City Energy Conservation Code*.

301.3 Fuel gas appliances and equipment. The approval and installation of fuel gas distribution piping and equipment, fuel gas-fired appliances and fuel gas-fired appliance venting systems shall be in accordance with the *New York City Fuel Gas Code*.

301.4 Listed and labeled. [All appliances] Appliances regulated by this code shall be listed and labeled for the application in which they are installed.

Exception: Listing and labeling of equipment and appliances used for refrigeration shall be in accordance with Section 1101.2.

301.5 Testing of materials [and equipment]. Refer to Section 28-113 of the *Administrative Code*.

301.6 Label information. A permanent factory-applied name-plate(s) shall be affixed to appliances on which shall appear in legible lettering, the manufacturer's name or trademark,

the model number, serial number and the seal or mark of the approved agency. A label shall also include the following:

1. Electrical equipment and appliances: Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts, motor phase; Btu/h (W) output; and required clearances.
2. Absorption units: Hourly rating in Btu/h (W); minimum hourly rating for units having step or automatic modulating controls; type of fuel; type of refrigerant; cooling capacity in Btu/h (W); and required clearances.
3. Fuel-burning units: Hourly rating in Btu/h (W); type of fuel approved for use with the appliance; and required clearances.
4. Electric comfort heating appliances: Name and trademark of the manufacturer; the model number or equivalent; the electric rating in volts, ampacity and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; required clearances from combustibles; and a seal indicating approval of the appliance by an approved agency.

301.7 Electrical. Electrical wiring, controls and connections to equipment and appliances regulated by this code shall be in accordance with the *New York City Electrical Code*.

301.8 Plumbing connections. Potable water supply and building drainage system connections to equipment and appliances regulated by this code shall be in accordance with the *New York City Plumbing Code*.

301.9 Fuel types. Fuel-fired appliances shall be designed for use with the type of fuel to which they will be connected and the altitude at which they are installed. Appliances that comprise parts of the building mechanical system shall not be converted for the usage of a different fuel, except where approved and converted in accordance with the manufacturer's instructions. The fuel input rate shall not be increased or decreased beyond the limit rating for the altitude at which the appliance is installed.

301.10 Vibration isolation. Where vibration isolation of equipment and appliances is employed, supplemental restraint shall be used to accomplish the support and restraint.

301.11 Repair. Defective material or parts shall be replaced or repaired in such a manner so as to preserve the original approval or listing.

301.12 Wind resistance. Mechanical equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with the *New York City Building Code*.

301.13 Flood hazard. For structures located in areas of special flood hazard, mechanical systems, equipment and appliances shall comply with Appendix G of the *New York City Building Code*.

301.14 Rodent proofing. Buildings or structures and the walls enclosing habitable or occupiable rooms and spaces in which persons live, sleep or work, or in which feed, food or foodstuffs are stored, prepared, processed, served or sold, shall be constructed to protect against the entrance of rodents in accordance with the *New York City Building Code*.

301.15 Seismic resistance. When earthquake loads are applicable in accordance with the *New York City Building Code*, mechanical system supports shall be designed and installed for the seismic forces in accordance with the *New York City Building Code*.

SECTION MC 302 PROTECTION OF STRUCTURE

302.1 Structural safety. The building or structure shall not be weakened by the installation of mechanical systems. Where floors, walls, ceilings or any other portion of the building or structure are required to be altered or replaced in the process of installing or repairing any system, the building or structure shall be left in a safe structural condition in accordance with the *New York City Building Code*.

302.2 Penetrations of floor/ceiling assemblies and fire-resistance-rated assemblies. Penetrations of floor/ceiling assemblies and assemblies required to have a fire-resistance rating shall be protected in accordance with the *New York City Building Code*.

302.3 Cutting, notching and boring in wood framing. The cutting, notching and boring of wood framing members shall comply with Sections 302.3.1 through 302.3.4.

302.3.1 Joist notching. Notches on the ends of joists shall not exceed one-fourth the joist depth. Holes bored in joists shall not be within 2 inches (51 mm) of the top or bottom of the joist, and the diameter of any such hole shall not exceed one-third the depth of the joist. Notches in the top or bottom of joists shall not exceed one-sixth the depth and shall not be located in the middle third of the span.

302.3.2 Stud cutting and notching. In exterior walls and bearing partitions, any wood stud is permitted to be cut or notched not to exceed 25 percent of its depth. Cutting or notching of studs not greater than 40 percent of their depth is permitted in nonbearing partitions supporting no loads other than the weight of the partition.

302.3.3 Bored holes. A hole not greater in diameter than 40 percent of the stud depth is permitted to be bored in any wood stud. Bored holes not greater than 60 percent of the depth of the stud are permitted in nonbearing partitions or in any wall where each bored stud is doubled, provided not more than two such successive doubled studs are so bored. In no case shall the edge of the bored hole be nearer than 0.625 inch (15.9 mm) to the edge of the stud. Bored holes shall not be located at the same section of stud as a cut or notch.

302.3.4 Engineered wood products. Cuts, notches and holes bored in trusses, [laminated] structural composite veneer lumber, structural glue-laminated members and I-joists are prohibited except where permitted by the manufacturer's recommendations or where the effects of such alterations are specifically considered in the design of the member.

302.4 Alterations to trusses. Truss members and components shall not be cut, drilled, notched, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, water heaters) shall not be permitted without verification that the truss is capable of supporting such additional loading.

302.5 Cutting, notching and boring in steel framing. The cutting, notching and boring of steel framing members shall comply with Sections 302.5.1 through 302.5.3.

302.5.1 Cutting, notching and boring holes in structural steel framing. The cutting, notching and boring of holes in structural steel framing members shall be as prescribed by the registered design professional.

302.5.2 Cutting, notching and boring holes in cold-formed steel framing. Flanges and lips of load-bearing cold-formed steel framing members shall not be cut or notched. Holes in webs of load-bearing cold-formed steel framing members shall be permitted along the centerline of the web of the framing member and shall not exceed the dimensional limitations, penetration spacing or minimum hole edge distance as prescribed by the registered design professional. Cutting, notching and boring holes of steel floor/roof decking shall be as prescribed by the registered design professional.

302.5.3 Cutting, notching and boring holes in nonstructural cold-formed steel wall framing. Flanges and lips of nonstructural cold-formed steel wall studs shall not be cut or notched. Holes in webs of nonstructural cold-formed steel wall studs shall be permitted along the center[-]line of the web of the framing member, shall not exceed [1.5] $1\frac{1}{2}$ inches (38 mm) in width or 4 inches (102 mm) in length, and shall not be spaced less than 24 inches (610mm) center to center from another hole or less than 10 inches (254 mm) from the bearing end.

SECTION MC 303 EQUIPMENT AND APPLIANCE LOCATION

303.1 General. Equipment and appliances shall be located as required by this section, specific requirements elsewhere in this code and the conditions of the equipment and appliance listing.

303.2 Hazardous locations. Appliances shall not be located in a hazardous location unless listed and approved for the specific installation.

303.3 Prohibited locations. [Fuel-fired appliances shall not be located in, or obtain combustion air from, any of the following rooms or spaces:] Appliances shall not be located in sleeping rooms.

bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following exceptions:

- [1. Rooms occupied for sleeping purposes.
- [2. Bathrooms.]
- [3. Toilet rooms.]
- [4. Storage closets.]
- [5. Surgical rooms.]

[Exception] Exceptions: This section shall not apply to the following appliances:

1. In rooms other than those used for sleeping purposes, [Direct-vent] direct-vent appliances that obtain all combustion air directly from the outdoors and are installed in accordance with the conditions of the listing and manufacturer's instructions.
2. [Solid fuel-fired appliances, provided that the room is not a confined space and the building is not of unusually tight construction.] In rooms other than those used for sleeping purposes, vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces that are installed in rooms that meet the required volume criteria of Section 702.
3. Appliances installed in a dedicated enclosure in which all combustion air is taken directly from the outdoors, in accordance with Section 703. Access to such enclosure shall be through a solid door, weather-stripped in accordance with the exterior door air leakage requirements of the *New York City Energy Conservation Code* and equipped with an approved self-closing device.

303.4 Protection from physical damage. Appliances shall not be installed in a location where subject to [mechanical] physical damage, including vehicular impact, unless protected by [suitable] approved barriers meeting the requirements of the *New York City Fire Code*.

303.5 Indoor locations. Fuel-fired furnaces, water heaters and boilers installed in closets and alcoves shall be listed for such installation. For purposes of this section, a closet or alcove shall be defined as a room or space having a volume less than 12 times the total volume of fuel-fired appliances other than boilers and less than 16 times the total volume of boilers. Room volume shall be computed using the gross floor area and the actual ceiling height up to a maximum computation height of 8 feet (2438 mm).

303.6 Outdoor locations. Appliances installed in other than indoor locations shall be listed and labeled for outdoor installation.

303.7 Pit locations. Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil. The sides of the pit or excavation shall be held back a minimum of 12 inches (305 mm) from the appliance. Where the depth exceeds 12 inches (305 mm) below

adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry. Such concrete or masonry shall extend a minimum of 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. The appliance shall be protected from flooding.

303.8 Elevator shafts. Mechanical systems shall not be located in an elevator shaft.

SECTION MC 304 INSTALLATION

304.1 General. Equipment and appliances shall be installed as required by the terms of their approval, in accordance with the conditions of the listing, the manufacturer's installation instructions and this code. Manufacturer's installation instructions shall be available on the job site at the time of inspection.

304.2 Conflicts. Where conflicts between this code and the conditions of listing or the manufacturer's installation instructions occur, the provisions of this code shall apply.

Exception: Where a code provision is less restrictive than the conditions of the listing of the equipment or appliance or the manufacturer's installation instructions, the conditions of the listing and the manufacturer's installation instructions shall apply.

304.3 Elevation of ignition source. Equipment and appliances having an ignition source and located in hazardous locations and public garages, private garages, repair garages, automotive motor[-]fuel-dispensing facilities and parking garages shall be elevated such that the source of ignition is not less than 18 inches (457 mm) above the floor surface on which the equipment or appliance rests. [Such equipment and appliances shall not be installed in Group H occupancies or control areas where open use, handling or dispensing of combustible, flammable or explosive materials occurs.] For the purpose of this section, rooms or spaces that are not part of the living space of a dwelling unit and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

304.3.1 Parking garages. Connection of a parking garage with any room in which there is a fuel-fired appliance shall be by means of a vestibule providing a two-doorway separation, except that a single door is permitted where the sources of ignition in the appliance are elevated in accordance with Section 304.3.

Exception: This section shall not apply to appliance installations complying with Section 304.6.

304.4 Prohibited equipment and appliance location. Equipment and appliances having an ignition source shall not be installed in Group H occupancies or control areas where open use, handling or dispensing of combustible, flammable or explosive materials occurs.

[304.4] 304.5 Hydrogen generating and refueling operations. Hydrogen [generation] generating and refueling operations shall be prohibited except as permitted by the Commissioner of the Fire Department.

[304.5] 304.6 Public garages. Appliances located in public garages, [motor-fuel-dispensing] motor fueling-dispensing facilities, repair garages or other areas frequented by motor vehicles, shall be installed a minimum of 8 feet (2438 mm) above the floor. Where motor vehicles [exceed 6 feet (1829 mm) in height and] are capable of passing under an appliance, [appliances] the appliance shall be installed [a minimum of 2 feet (610 mm)] at the clearances required by the appliance manufacturer and not less than 1 foot (305 mm) higher [above the floor] than the [height of the] tallest vehicle garage door opening.

Exception: The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 304.3 of this code and NFPA [88B] 30A.

[304.6] 304.7 Private garages. Appliances located in private garages and carports shall be installed with a minimum clearance of 6 feet (1829 mm) above the floor.

Exception: The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 304.3.

[304.7] 304.8 Construction and protection. Boiler rooms and furnace rooms shall be protected as required by the *New York City Building Code*.

[304.8] 304.9 Clearances to combustible construction. Heat-producing equipment and appliances shall be installed to maintain the required clearances to combustible construction as specified in the listing and manufacturer's instructions. Such clearances shall be reduced only in accordance with Section 308. Clearances to combustibles shall include such considerations as door swing, drawer pull, overhead projections or shelving and window swing, shutters, coverings and drapes. Devices such as doorstops or limits, closers, drapery ties or guards shall not be used to provide the required clearances.

[304.9] 304.10 Clearances from grade. Equipment and appliances installed at grade level shall be supported on a level concrete slab or other approved material extending not less than 3 inches (76 mm) above adjoining grade or shall be suspended [a minimum of] not less than 6 inches (152 mm) above adjoining grade. Such support shall be in accordance with the manufacturer's installation instructions.

[304.10] 304.11 Guards. Guards shall be provided where appliances, equipment, fans or other components that require service and roof hatch openings are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of such [appliance] appliances, equipment, [fan or component] fans, components and roof hatch openings and the top of the guard shall be located not less than 42 inches (1067 mm) above the elevated surface adjacent to the guard.

The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the *New York City Building Code*.

[304.11] **304.12 Area served.** Appliances serving different areas of a building other than where they are installed shall be permanently marked in an approved manner that uniquely identifies the appliance and the area it serves.

304.13 Rooftop access and obstructions. Equipment and appliances installed on rooftops of buildings shall be installed in accordance with the requirements of the *New York City Fire Code* regarding rooftop access and obstructions, and shall not obstruct or interfere with firefighting operations or the operation of any doors, windows, fire escapes, or other means of egress or other building components requiring operation or access.

SECTION MC 305 PIPING SUPPORT

305.1 General. All mechanical system piping shall be supported in accordance with this section.

305.2 Materials. Pipe hangers and supports shall have sufficient strength to withstand all anticipated static and specified dynamic loading conditions associated with the intended use. Pipe hangers and supports that are in direct contact with piping shall be of materials that are compatible with the piping and that will not promote galvanic action.

305.3 Structural attachment. Hangers and anchors shall be attached to the building structure.

305.4 Interval of support. Piping shall be supported at distances not exceeding the spacing specified in Table 305.4, or in accordance with MSS SP-69.

**TABLE 305.4
PIPING SUPPORT SPACING^{a, b, c}**

PIPING MATERIAL	MAXIMUM HORIZONTAL [SPACE] SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
ABS pipe	4	10 ^c
Aluminum pipe and tubing	10	15
Brass pipe	10	10
Brass tubing, 1¼-inch diameter and smaller	6	10
Brass tubing, 1½-inch diameter and larger	10	10
Cast-iron pipe ^b	5	15
Copper or copper-alloy pipe	12	10
Copper or copper-alloy tubing, 1¼-inch diameter and smaller	6	10
Copper or copper-alloy tubing, 1½-inch diameter and larger	10	10
CPVC pipe or tubing, 1 inch and smaller	3	10 ^c
CPVC pipe or tubing, 1¼-inch and larger	4	10 ^c
[Steel tubing]	[8]	[10]
[Steel pipe]	[12]	[15]
Lead pipe	Continuous	4
PB pipe or tubing	2 ² / ₃ (32 inches)	4
PEX tubing	2 ² / ₃	10 ^c
<u>Polypropylene (PP) pipe or tubing, 1 inch or smaller</u>	<u>2²/₃ (32 inches)</u>	<u>10^c</u>
<u>Polypropylene (PP) pipe or tubing, 1¼ inches or larger</u>	<u>4</u>	<u>10^c</u>
PVC pipe	4	10 ^c
<u>Steel tubing</u>	<u>8</u>	<u>10</u>
<u>Steel pipe</u>	<u>12</u>	<u>15</u>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. See Section [301.14] 301.15.
- b. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10 [feet] foot lengths of pipe are installed.
- c. Mid-story guide.

305.5 Protection against physical damage. In concealed locations where piping, other than cast-iron or steel, is installed through holes or notches in studs, joists, rafters or similar members less than [1.5] 1 ½ inches (38 mm) from the nearest edge of the member, the pipe shall be protected by shield plates. Protective steel shield plates [shall be] having a minimum thickness of [0.062-inch-thick] 0.0575-inch [(1.6 mm)] (1.463 mm) (No. 16 gage) shall cover the area of the pipe where the member is notched or bored, and shall extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

SECTION MC 306 ACCESS AND SERVICE SPACE

306.1 [Clearances] Access for maintenance and replacement. [Clearances around appliances to elements of permanent construction, including other installed equipment and appliances, shall be sufficient to allow] Appliances shall be accessible for inspection, service, repair [or] and replacement without [removing such elements of permanent construction or] disabling the function of a [required] fire-resistance-rated assembly or removing permanent construction, other appliances, venting systems or any other piping or ducts not connected to the appliance being inspected, serviced, repaired or replaced. A level working space at least 30 inches deep and 30 inches wide (762mm by 762mm) shall be provided in front of the control side to service an appliance. Clearance shall also be provided as required by the *New York City Electrical Code*.

306.1.1 Central furnaces. Central furnaces within compartments or alcoves shall have a minimum working space clearance of 3 inches (76mm) along the sides, back and top with a total width of the enclosing space being at least 12 inches (305 mm) wider than the furnace. Furnaces having a firebox open to the atmosphere shall have at least 6 inches (152 mm) working space along the front combustion chamber side. Combustion air openings at the rear or side of the compartment shall comply with the requirements of Chapter 7.

Exception: This section shall not apply to replacement appliances installed in existing compartments and alcoves where the working space clearances are in accordance with the equipment or appliance manufacturer's installation instructions.

306.2 Appliances in rooms. Rooms containing appliances [requiring access] shall be provided with a door and an unobstructed passageway measuring not less than 36 inches (914mm) wide and 80 inches (2032 mm) high.

Exception: Within a dwelling unit, appliances installed in a compartment, alcove, basement or similar space shall be accessed by an opening or door and an unobstructed passageway measuring not less than 24 inches (610 mm) wide and large enough to allow removal of

the largest appliance in the space, provided that a level service space of not less than 30 inches (762 mm) deep and the height of the appliance, but not less than 30 inches (762 mm), is present at the front or service side of the appliance with the door open.

306.3 Appliances in attics. Attics containing appliances [requiring access] shall be provided with an opening and unobstructed passageway large enough to allow removal of the largest appliance. The passageway shall not be less than 30 inches (762mm) high and 22 inches (559mm) wide and not more than 20 feet (6096 mm) in length measured along the centerline of the passageway from the opening to the appliance. The passageway shall have continuous solid flooring not less than 24 inches (610 mm) wide. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the appliance. The clear access opening dimensions shall be a minimum of 20 inches by 30 inches (508 mm by 762 mm), [where such dimensions are] and large enough to allow removal of the largest appliance.

[Exception] Exceptions:

1. The passageway and level service space are not required where the appliance is capable of being serviced and removed through the required opening.
2. Where the passageway is unobstructed and not less than 6 feet (1829 mm) high and 22 inches (559 mm) wide for its entire length, the passageway shall be not greater than 50 feet (15 250 mm) in length.

306.3.1 Electrical requirements. A [lighting fixture] luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the appliance location in accordance with the *New York City Electrical Code*.

306.4 Appliances under floors. Under-floor spaces containing appliances [requiring access] shall be provided with an access opening and unobstructed passageway large enough to remove the largest appliance. The passageway shall not be less than 30 inches (762 mm) high and 22 inches (559 mm) wide, nor more than 20 feet (6096 mm) in length measured along the centerline of the passageway from the opening to the appliance. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the appliance. If the depth of the passageway or the service space exceeds 12 inches (305 mm) below the adjoining grade, the walls of the passageway shall be lined with concrete or masonry. Such concrete or masonry shall extend a minimum of 4 inches (102 mm) above the adjoining grade and shall have sufficient lateral-bearing capacity to resist collapse. The clear access opening dimensions shall be a minimum of 22 inches by 30 inches (559 mm by 762 mm), [where such dimensions are] and large enough to allow removal of the largest appliance.

[Exception] Exceptions:

- [2.] 1. The passageway is not required where the level service space is present when the access is open and the appliance is capable of being serviced and removed through the required opening.

2. Where the passageway is unobstructed and not less than 6 feet (1829 mm) high and 22 inches (559 mm) wide for its entire length, the passageway shall not be limited in length.

306.4.1 Electrical requirements. A [lighting fixture] luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the appliance location in accordance with the *New York City Electrical Code*.

306.5 Equipment and appliances on roofs or elevated structures. Where equipment and appliances requiring access are installed on roofs or elevated structures at a height exceeding 16 feet (4877 mm), such access shall be provided by a permanent approved means of access, the extent of which shall be from grade or floor level to the equipment and appliances' level service space. Such access shall not require climbing over obstructions greater than 30 inches (762mm) high or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.

Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).
2. Ladders shall have a rung spacing not to exceed [14] 12 inches [(356 mm) 305 mm] on center.
3. Ladders shall have a toe spacing not less than [6] 7 inches [(152 mm) 177.8 mm] deep.
4. There shall be a minimum of 18 inches (457 mm) between rails.
5. Rungs shall have a minimum 0.75-inch (19 mm) diameter and be capable of withstanding a 300-pound (136.1 kg) load.
6. Where a cage, well or ladder safety device is provided, [Ladders] ladders over [30] 20 feet [(9144 mm)] (6096 mm) in height shall be provided with [offset sections and landings] landing platforms for each 30 feet (9144 mm) of height. Where a cage, well or ladder safety device is not provided, ladders over 20 feet (6096 mm) in height shall be provided with landing platforms for each 20 feet (6096 mm) of height. Landings shall be capable of withstanding 100 pounds (488.2 kg/m²) per square foot (488.2 kg/m²). Landing dimensions shall be not less than 30 inches (762 mm) in length and not less than 24 inches (610 mm) in width. A guard rail and toeboard shall be provided on all open sides of the landing.

7. Where ladder extensions are installed, the side rails of through or side-step ladder extensions shall extend 3 ½ feet (1067 mm) above the parapets and landings. For through ladder extensions, the rungs shall be omitted from the extensions and shall have not less than 18 (457 mm) nor more than 24 inches (610 mm) of clearance between rails. For side-step or offset fixed ladder sections, at landings, the side rails and rungs shall be carried to the next regular rung beyond or above the 3 ½ feet (1067 mm) minimum.

8. Ladders shall be protected against corrosion.

9. Catwalks installed to provide the required access shall be not less than 24 inches (610 mm) wide and shall have railings as required for service platforms.

Exception: This section shall not apply to Group R-3 occupancies.

[306.6] 306.5.1 Sloped roofs. Where appliances, equipment, fans or other components that require service are installed on a roof having a slope of 3 units vertical in 12 units horizontal (25-percent slope) or greater and having an edge more than 30 inches (762 mm) above grade at such edge, a level platform shall be provided on each side of the appliance or equipment to which access is required [by the manufacturer's installation instructions] for service, repair or maintenance. The platform shall be not [be] less than 30 inches (762 mm) in any dimension and shall be provided with guards [in accordance with Section 304.10]. The guards shall extend not less than 42 inches (1067 mm) above the platform, shall be constructed so as to prevent the passage of a 21-inch diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the *New York City Building Code*. Access shall not require walking on roofs having a slope greater than four units vertical in 12 units horizontal (33-percent slope). Where access involves obstructions greater than 30 inches (762 mm) in height, such obstructions shall be provided with ladders installed in accordance with Section 306.5 or stairs installed in accordance with the requirements specified in the *New York City Building Code* in the path of travel to and from appliances, fans or equipment requiring service.

306.5.2 Electrical requirements. A receptacle outlet shall be provided at or near the equipment location in accordance with the *New York City Electrical Code*.

SECTION MC 307 CONDENSATE DISPOSAL

307.1 Fuel-burning appliances. Liquid combustion by-products of condensing appliances shall be collected and discharged to a plumbing fixture or disposal area in accordance with the manufacturer's installation instructions. Condensate piping shall be of corrosion-resistant material and shall not be smaller than the drain connection on the appliance. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than 1/8 unit vertical in 12 units horizontal (1-percent slope).

307.1.1 Condensate disposal. Condensate from all fuel-burning appliances and associated flues shall be neutralized to a pH of at least 6 and no more than 8 prior to disposal to a sanitary system.

307.2 Evaporators and cooling coils. Condensate drain systems shall be provided for equipment and appliances containing evaporators or cooling coils. Condensate drain systems shall be designed, constructed and installed in accordance with Sections 307.2.1 through 307.2.4.

307.2.1 Condensate disposal. Condensate from all cooling coils and evaporators shall be conveyed from the drain pan outlet to [a] an approved place of disposal. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than one-eighth unit vertical in 12 units horizontal (1-percent slope). Condensate shall not discharge into a street, alley or other areas so as to cause a nuisance.

307.2.2 Drain pipe materials and sizes. Components of the condensate disposal system shall be cast iron, galvanized steel, copper, cross-linked polyethylene, polybutylene, polyethylene, ABS, CPVC or PVC pipe or tubing. All components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the *New York City Plumbing Code* relative to the material type. Condensate waste and drain line size shall be not less than $\frac{3}{4}$ inch (19 mm) internal diameter and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized [accordingly. All horizontal sections of drain piping shall be installed in uniform alignment at a uniform slope] in accordance with Table 307.2.2.

TABLE 307.2.2
CONDENSATE DRAIN SIZING

<u>EQUIPMENT CAPACITY</u>	<u>MINIMUM CONDENSATE PIPE DIAMETER</u>
<u>Up to 20 tons of refrigeration</u>	<u>$\frac{3}{4}$ inch</u>
<u>Over 20 tons to 40 tons of refrigeration</u>	<u>1 inch</u>
<u>Over 40 tons to 90 tons of refrigeration</u>	<u>1$\frac{1}{4}$ inch</u>

<u>Over 90 tons to 125 tons of refrigeration</u>	<u>1½ inch</u>
<u>Over 125 tons to 250 tons of refrigeration</u>	<u>2 inch</u>

For SI: 1 inch = 25.4 mm, 1 ton = 3.517 kW.

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, [a secondary drain or auxiliary drain pan shall be required for each cooling or evaporator coil] where damage to any building components [will] could occur as a result of overflow from the equipment [drain pan or stoppage in the] primary condensate [drain piping. One] removal system, one of the following auxiliary protection methods shall be [used] provided for each cooling coil or fuel-fired appliance that produces condensate:

1. An auxiliary drain pan with a separate drain shall be provided under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The pan shall have a minimum depth of [1.5] 1½ inches (38 mm), shall not be less than 3 inches (76 mm) larger than the unit or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. Metallic pans shall have a minimum thickness of not less than [0.0276-inch (0.7 mm)] 0.0236 inches (0.6010 mm) (No. 24 gage) for galvanized sheet metal pans, .0179 inches (0.4546 mm) (No. 26 gage) for stainless steel pans, or 0.0320 inches (0.8128 mm) (No. 20 gage) for aluminum pans. Nonmetallic pans shall have a minimum thickness of not less than 0.0625 inch [(1.59 mm)] (1.6 mm).

[1.] 2. A separate overflow drain line shall be connected to the drain pan provided with the equipment. Such overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.

[2.] 3. An auxiliary drain pan without a separate drain line shall be provided under the coils on which condensate will occur. Such pan shall be equipped with a water-level detection device that will shut off the equipment served prior to overflow of the pan. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.

4. A water-level detection device shall be provided that will shut off the equipment served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

Exception: Fuel-fired appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

307.2.3.1 Water-level monitoring devices. On down-flow units and all other coils that do not have a secondary drain or provisions to install a secondary or auxiliary drain pan, a water-level monitoring device shall be installed inside the primary drain pan. This device shall shut off the equipment served in the event that the primary drain becomes restricted. Devices installed in the drain line shall not be permitted.

307.2.3.2 Appliance, equipment or insulation in pans. Where an appliance, equipment or insulation is subject to water damage when auxiliary drain pans fill, that portion of the appliance, equipment or insulation shall be installed above the rim of the pans. Supports located inside of the pans to support the appliance or equipment or insulation shall be water resistant and approved.

307.2.4 Traps. Condensate drains shall be trapped as required by the equipment or appliance manufacturer.

307.3 Exceptions. This section applies to permanently installed equipment. Window units and through-the-wall air-conditioning units are exempt from the requirements of this section.

SECTION MC 308 CLEARANCE REDUCTION

308.1 Scope. This section shall govern the reduction in required clearances to combustible materials and combustible assemblies for chimneys, vents, kitchen exhaust equipment, mechanical appliances, and mechanical devices and equipment.

308.2 Listed appliances and equipment. The reduction of the required clearances to combustibles for listed and labeled appliances and equipment shall be in accordance with the requirements of this section, except that such clearances shall not be reduced where reduction is specifically prohibited by the terms of the appliance or equipment listing.

308.3 Protective assembly construction and installation. Reduced clearance protective assemblies, including structural and support elements, shall be constructed of noncombustible materials. Spacers utilized to maintain an airspace between the protective assembly and the protected material or assembly shall be noncombustible. Where a space between the protective assembly and protected combustible material or assembly is specified, the same space shall be provided around the edges of the protective assembly and the spacers shall be placed so as to allow air circulation by convection in such space. Protective assemblies shall not be placed less than 1 inch (25 mm) from the mechanical appliances, devices or equipment, regardless of the allowable reduced clearance.

308.4 Allowable reduction. The reduction of required clearances to combustible assemblies or combustible materials shall be based on the utilization of a reduced clearance protective assembly in accordance with Section 308.5 or 308.6.

308.5 Labeled assemblies. The allowable clearance reduction shall be based on a reduced clearance protective assembly that has been tested and bears the label of an approved agency.

308.6 Reduction table. The allowable clearance reduction shall be based on one of the methods specified in Table 308.6. Where required clearances are not listed in Table 308.6, the reduced clearances shall be determined by linear interpolation between the distances listed in the table. Reduced clearances shall not be derived by extrapolation below the range of the table.

**TABLE 308.6
CLEARANCE REDUCTION METHODS^b**

TYPE OF PROTECTIVE ASSEMBLY ^a	REDUCED CLEARANCE WITH PROTECTION							
	Horizontal combustible assemblies				Horizontal combustible assemblies			
	Required clearance to combustibles				Required clearance to combustibles			
	36	18	9	6	36	18	9	6
Galvanized sheet steel, having a minimum thickness of 0.0296 inch (.75 mm) (No. 22 Gage), mounted on 1-inch glass fiber or mineral wool batt reinforced with wire on the back, 1 inch off the combustible assembly	18	9	5	3	12	6	3	3
Two layers of galvanized sheet steel, having a minimum thickness of 0.0236 inch (0.6010 mm) (No. 24 gage), having a 1-inch airspace between layers, spaced 1 inch off the combustible assembly	18	9	5	3	12	6	3	3
Two layers of galvanized sheet steel, having a minimum thickness of 0.0236 inch (0.6010 mm) (No. 24 gage), having 1 inch of fiberglass insulation between layers, spaced 1 inch off the combustible assembly	18	9	5	3	12	6	3	3
0.5-inch inorganic insulating board, over 1 inch of fiberglass or mineral wool batt, against the combustible assembly	24	12	6	4	18	9	5	3
3½-inch brick wall, spaced 1 inch off the combustible wall	—	—	—	—	12	6	6	6
3½ -inch brick wall, against the combustible wall	—	—	—	—	24	12	6	5

For SI: 1 inch = 25.4 mm, °C = [(°F)-32]/1.8, 1 pound per cubic foot = 16.02 kg/m³, 1.0 Btu •in/ft² •h•°F = 0.144 W/m²•K.

- a. Mineral wool and glass fiber batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of 1,500°F. Insulation material utilized as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu in./(ft² •h •°F) or less. Insulation board shall be formed of noncombustible material.
- b. For limitations on clearance reduction for solid fuel-burning appliances, masonry chimneys, connector pass-throughs, masonry fireplaces and kitchen ducts, see Sections 308.7 through 308.11.

308.7 Solid fuel-burning appliances. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the clearance required for solid fuel-burning appliances that are labeled for installation with clearances of 12 inches (305 mm) or less. Where appliances are labeled for installation with clearances of greater than 12 inches (305 mm), the clearance reduction methods of Table 308.6 shall not reduce the clearance to less than 12 inches (305 mm).

308.8 Masonry chimneys. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the clearances required for masonry chimneys as specified in Chapter 8 of this code and the *New York City Building Code*.

308.9 Chimney connector pass-throughs. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the clearances required for chimney connector pass-throughs as specified in Section 803.10.4.

308.10 Masonry fireplaces. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the clearances required for masonry fireplaces as specified in Chapter 8 of this code and the *New York City Building Code*.

308.11 Kitchen exhaust ducts. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the minimum clearances required by Section 506.3.10 for kitchen exhaust ducts enclosed in a shaft.

SECTION MC 309 TEMPERATURE CONTROL

309.1 Space-heating systems. Interior spaces intended for human occupancy shall be provided with active or passive space-heating systems capable of maintaining a minimum indoor temperature of 68°F (20°C) at a point 3 feet (914 mm) above floor on the design heating day. The installation of portable space heaters shall not be used to achieve compliance with this section. Refer to Section 1204 of the *New York City Building Code*.

Exception: Interior spaces where the primary purpose is not associated with human comfort.

**SECTION MC 310
EXPLOSION CONTROL**

310.1 Required. Structures occupied for purposes involving explosion hazards shall be provided with explosion control in compliance with rules of the Commissioner of the Fire Department. Explosion control systems shall be designed and installed in accordance with the *New York City Fire Code*.

**SECTION MC 311
SMOKE AND HEAT VENTS**

311.1 Required. Approved smoke and heat vents shall be installed in the roofs of one-story buildings where required by the *New York City Fire Code*. Smoke and heat vents shall be designed and installed in accordance with the *New York City Fire Code*.

**SECTION MC 312
HEATING AND COOLING LOAD CALCULATIONS**

312.1 Load calculations. Heating and cooling system design loads for the purpose of sizing systems, appliances and equipment shall be determined in accordance with the procedures described in the ASHRAE Handbook of Fundamentals. Heating and cooling loads shall be adjusted to account for load reductions that are achieved when energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE Handbook - HVAC Systems and Equipment. Alternatively, design loads shall be determined by an approved equivalent computation procedure, using the design parameters specified in Chapter 3 of the *New York City Energy Conservation Code*. Heating and cooling system design loads for the purpose of sizing systems, appliances and equipment shall also comply with the requirements of Section 1204 of the *New York City Building Code*.

Subpart 4 (Chapter 4 of the New York City Mechanical Code)

§1. Chapter 4 of the New York city mechanical code, as added by local law number 33 for the year 2007, section 403 as amended by local law number 8 for the year 2008, is amended to read as follows:

**CHAPTER 4
VENTILATION**

**SECTION MC 401
GENERAL**

401.1 Scope. This chapter shall govern the ventilation of spaces within a building intended to be occupied. Mechanical exhaust systems, including exhaust systems serving clothes dryers and cooking appliances; hazardous exhaust systems; dust, stock and refuse conveyor systems;

subslab soil exhaust systems; smoke control systems; energy recovery ventilation systems and other systems specified in Section 502 shall comply with Chapter 5. [This chapter does not govern the requirements for smoke control systems. See Section 513 of this code.]

401.2 Ventilation required. Every [occupied] occupiable space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. Every habitable space shall be ventilated by natural means in accordance with Section 402, and, if required by Table 403.3, by mechanical means in accordance with Section 403.

401.3 When required. Ventilation shall be provided during the periods that the room or space is occupied.

[401.4 Exits. Equipment and ductwork for exit enclosure ventilation shall comply with one of the following items:

1. Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the exit enclosure by ductwork enclosed in construction as required by the *New York City Building Code* for shafts.
2. Where such equipment and ductwork is located within the exit enclosure, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or such air shall be conveyed through ducts enclosed in construction as required by the *New York City Building Code* for shafts.
3. Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required by the *New York City Building Code* for shafts.

In each case, openings into fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by self-closing fire-resistance-rated devices in accordance with the *New York City Building Code* for enclosure wall opening protectives. Exit enclosure ventilation systems shall be independent of other building ventilation systems.]

[401.5] 401.4 Intake opening location. Air intake openings shall comply with the following:

1. [Outside air exhaust and intake] Intake openings shall be located a minimum of 10 feet (3048 mm) from lot lines or buildings on the same lot. For buildings on lots measuring less than 20 feet (6096 mm) in width, intake openings shall be located at the centerline between lot lines. Where openings front on a street or public way, the distance shall be measured to the centerline of the street or public way.
2. Outdoor intakes for high-rise office buildings having occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access serving

spaces above the second story and serving spaces greater than 10,000 square feet (929 m²) of floor area shall be located at least 20 feet (6096 mm) above ground level, at least 30 feet (9144mm) from exhaust outlets and other exhaust discharges, and at least 20 feet (6096 mm) from areas that may collect vehicular exhaust, such as off street loading bays.

3. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, exhausts (including but not limited to exhaust from dry cleaning establishments, spray booths, and cooling towers), streets, alleys, parking lots and loading docks, except as specified in Item 3 of Section 501.2.1.
4. Where the requirements of Item 3 above cannot be achieved, intake openings shall be located not less than 3 feet (914 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening.
5. Intake openings in Group I occupancies shall comply with ANSI/ASHRAE/ASHE 170, as required.
6. Intake openings on structures in flood hazard areas shall comply with Appendix G of the *New York City Building Code*.

Exception: Group R-3 occupancies are not required to comply with Section 401.4.

[401.5.1] 401.4.1 [Intake] Required dampers in intake openings. [Mechanical and gravity outside air intake openings, shall be located a minimum of 20 feet (6096 mm) from any hazardous or noxious contaminant such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks, except as otherwise specified in this code. Where a source of contaminant is located within 20 feet (6096 mm) of an intake opening, such opening shall be located a minimum of 2 feet (610mm) below the contaminant source.] An outdoor air intake opening with gross area of more than 144 square inches (0.0929 m²) shall be provided with fire dampers and smoke dampers, or combined fire and smoke dampers when such opening is located as follows:

1. Less than 30 feet (9144 mm) above grade.
2. Less than 30 feet (9144mm) in any direction from any opening in another building.
3. Less than 15 feet (4572 mm) from a lot line.
4. Less than 50 feet (15240mm) above and less than 50 feet (15 240 mm) in any direction from a roof constructed of combustible material or a building in which the exterior walls are constructed wholly or partly of wood.
5. Where fire dampers are required by Section 607.5.6.

Exceptions:

1. Smoke dampers shall not be required for outdoor air intake openings installed in any construction required to have a fire-resistance rating that is less than 2 hours.
2. Smoke dampers shall not be required for outdoor air intake openings of systems greater than 15,000 cfm (7.1 m³/s) which are provided with smoke dampers in accordance with Chapter 6 of this code and arranged so as to not introduce smoke into the building or space in which the equipment is located.

[401.5.2 Exhaust openings. To minimize the hazard from fires and from noxious, toxic or obnoxious discharges to structures, any exhaust air discharge to the outside atmosphere shall terminate at or above the roof or setback roof of the buildings or in an exterior wall adjoining a street, yard or court. Exhaust air discharges shall be at least 10 feet (3048 mm) above the sidewalk or ground and shall terminate at least 10 feet (3048 mm) from any window in another building or from any window in a residential portion of the same building, or from any fire escape, exterior stair, or balcony. Exhaust system openings shall be provided with vanes or louvers constructed so as to direct the air away from windows, other openings, and pedestrians.

Exception: In Occupancy Groups R-2 and R-3 each dwelling unit may be individually exhausted directly to the outdoors with a dedicated, continuously operated exhaust fan and shall comply with the following:

1. The exhaust system for the kitchen and the toilet/baths may be combined to the inlet of a single fan, provided such exhaust system serves only one dwelling unit.
2. The dedicated exhaust from each dwelling unit shall be directed away from any window serving the same dwelling unit from which the exhaust is taken, and in addition, such exhaust opening shall terminate at least:
 - 2.1. Two feet (610 mm) from any window serving the same dwelling unit.
 - 2.2. Four feet (1219 mm) from any window serving an adjoining dwelling unit.
 - 2.3. Four feet (1219 mm) from any window serving another occupancy group in the same building.
 - 2.4. Ten feet (3048 mm) from any outdoor air intake opening.
 - 2.5. Ten feet (3048 mm) above the public sidewalk adjoining the same building.
3. All other minimum distances described in Section 401.5 shall be met.

401.5.3 Flood hazard. For structures located in areas of special flood hazard, outdoor exhaust openings shall comply with Appendix G of the *New York City Building Code*.]

[401.6] 401.5 [Outdoor] Intake opening protection. Air [exhaust and] intake openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in louvers, grilles and screens shall be sized in accordance with Table 401.5, and shall be protected against local weather conditions. Outdoor air [exhaust and] intake openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the *New York City Building Code*.

**TABLE [401.6] 401.5
OPENING SIZES IN LOUVERS, GRILLES AND
SCREENS PROTECTING AIR INTAKE OPENINGS**

OUTDOOR OPENING TYPE	MINIMUM AND MAXIMUM OPENING SIZES IN LOUVERS, GRILLES AND SCREENS MEASURED IN ANY DIRECTION
[Exhaust openings]	Not < ¼ inch and not > than ½ inch]
Intake openings in residential occupancies	Not less than ¼ inch and not greater than ½ inch
Intake openings in other than residential occupancies	<u>Not</u> less than ¼ inch and not greater than 1 inch

For SI: 1 inch = 25.4 mm.

[401.7] 401.6 Contaminant sources. Stationary local sources producing airborne particulates, heat, odors, fumes, spray, vapors, smoke or gases in such quantities as to be irritating or injurious to health shall be provided with an exhaust system in accordance with Chapter 5 or a means of collection and removal of the contaminants. Such exhaust shall discharge directly to an approved location at the exterior of the building.

**SECTION MC 402
NATURAL VENTILATION**

402.1 General. Natural ventilation of [an] occupied [space] and habitable spaces shall comply with Chapter 12 of the *New York City Building Code*.

402.2 Reserved.

402.3 Reserved.

402.4 Reserved.

SECTION MC 403 MECHANICAL VENTILATION

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or exhaust air. The amount of supply air shall be approximately equal to the amount of return and exhaust air. The system shall not be prohibited from producing negative or positive pressure. The system to convey ventilation air shall be designed and installed in accordance with Chapter 6.

403.2 Outdoor air required. The minimum outdoor airflow rate shall be determined in accordance with Section 403.3. Ventilation supply systems shall be designed to deliver the required rate of [supply air to the occupied] outdoor airflow to the breathing zone within [an occupied space. The occupied zone shall have boundaries measured at 3 inches (76 mm) and 72 inches (1829 mm) above the floor and 24 inches (610 mm) from the enclosing walls.] each occupiable space.

[**403.2 Outdoor air required.** The minimum ventilation rate of required outdoor air shall be determined in accordance with Section 403.3.]

Exception: Where a registered design professional demonstrates that an engineered ventilation system design will prevent the maximum concentration of contaminants from exceeding that obtainable by the rate of outdoor air ventilation determined in accordance with Section 403.3, the minimum required rate of outdoor air shall be reduced in accordance with such engineered system design.

403.2.1 Recirculation of air. The outdoor air required by Section 403.3 shall not be recirculated. Air in excess of that required by Section 403.3 shall not be prohibited from being recirculated as a component of supply air to building spaces, except that:

1. Ventilation air shall not be recirculated from one dwelling unit to another or to dissimilar occupancies.
2. Supply air to a swimming pool and associated deck areas shall not be recirculated unless such air is dehumidified to maintain the relative humidity of the area at 60 percent or less. Air from this area shall not be recirculated to other [spaces] uses or

occupancies.

3. Where mechanical exhaust is required by Note b of Table 403.3, recirculation of air from such spaces shall be prohibited. All air supplied to such spaces shall be exhausted, including any air in excess of that required by Table 403.3.
4. Where mechanical exhaust is required by Note g of Table 403.3, mechanical exhaust is required and recirculation is prohibited.

403.2.2 Transfer air. Except where recirculation from such spaces is prohibited by Table 403.3, air transferred from [occupied] occupiable spaces is not prohibited from serving as makeup air for required exhaust systems in such spaces as kitchens, baths, toilet rooms, elevators and smoking lounges. The amount of transfer air and exhaust air shall be sufficient to provide the flow rates as specified in [Sections] Section 403.3 [and 403.3.1]. The required outdoor [air] airflow rates specified in Table 403.3 shall be introduced directly into such spaces or into the occupied spaces from which air is transferred or a combination of both.

403.3 [Ventilation] Outdoor airflow rate. Ventilation systems shall be designed to have the capacity to supply the minimum outdoor airflow rate determined in accordance with [Table 403.3 based on the occupancy of the space and the occupant load or other parameter as stated therein] this section. The occupant load utilized for design of the ventilation system shall not be less than the number determined from the estimated maximum occupant load rate indicated in Table 403.3. Ventilation rates for occupancies not represented in Table 403.3 shall be those for a listed occupancy classification that is most similar in terms of occupant density, activities and building construction; or shall be determined by an approved engineering analysis. The ventilation system shall be designed to supply the required rate of ventilation air continuously during the period the building is occupied, except as otherwise stated in other provisions of the code.

With the exception of smoking lounges, the ventilation rates in Table 403.3 are based on the absence of smoking in occupiable spaces. Where smoking is anticipated in a space other than a smoking lounge, the ventilation system serving the space shall be designed to provide ventilation over and above that required by Table 403.3 in accordance with accepted engineering practice.

Exceptions:

1. The occupant load is not required to be determined, based on the estimated maximum occupant load rate indicated in Table 403.3, where approved statistical data documents the accuracy of an alternate anticipated occupant density.
2. The occupant load used in computing the required ventilation shall be the maximum number who will occupy the room or space simultaneously during any 2-hour period.

3. Dynamic reset (Demand Controlled Ventilation). The system may be designed to reset the design outdoor air intake airflow and/or space or zone airflow as operating conditions change. These conditions include, but are not limited to:

3.1. Variations in occupancy or ventilation airflow in one or more individual zones for which ventilation airflow requirements will be reset. Note: Examples of measures for estimating such variations include: occupancy scheduled by time of day, a direct count of occupants, or an estimate of occupancy or ventilation rate per person using occupancy sensors such as those based on indoor CO₂ concentrations.

3.2. Variations in the efficiency with which outdoor air is distributed to the occupants under different ventilation system airflows and temperatures.

3.3. A higher fraction of outdoor air in the air supply due to intake of additional outdoor air for free cooling or exhaust air makeup.

**[TABLE 403.3

For SI: 1 cubic foot per minute = 0.0004719 m³/s, 1 ton = 908 kg,

1 cubic foot per minute per square foot = 0.00508 m³/(s • m²),

°C = [(°F) -32] /1.8, 1 square foot = 0.0929m².

a. Based upon net floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces as permitted by Section 403.2.1 is prohibited (see Section 403.2.1).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404. A mechanical ventilation system shall not be required in garages having a floor area not exceeding 850 square feet and used for the storage of not more than four vehicles or trucks of 1 ton maximum capacity.

e. Where the ventilation rate is expressed in cfm/ft², such rate is based upon cubic feet per minute per square foot of the floor area being ventilated.

- f. The sum of the outdoor and transfer air from adjacent spaces shall be sufficient to provide an exhaust rate of not less than 1.5 cfm/ft².
- g. Transfer air permitted in accordance with Section 403 .2.2.
- h. Nonproduction chemical laboratories subject to Section 419 of the *New York City Building Code*.]

For SI: 1 cubic foot per minute = 0.0004719 m³/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508m³/(s m²).

$C = ((F) - 32) / 1.8$, 1 square foot = 0.0929m².

a. Based upon net occupiable floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited (see Section 403.2.1, Item 4).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet or urinal. The higher rate shall be provided where periods of heavy use are expected to occur, such as toilets in theaters, schools and sports facilities. The lower rate shall be permitted where periods of heavy use are not expected.

- f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted where the exhaust system is designed to operate continuously during normal hours of use.
- g. Mechanical exhaust is required and recirculation is prohibited.
- h. For nail salons, the required exhaust shall include ventilation tables or other systems that capture the contaminants and odors at their source and are capable of exhausting a minimum of 50 cfm/ft² per station.
- i. For R-2 buildings less than 125 feet in height, outdoor ventilation air provided by mechanical means serving dwelling units designed to exceed 100 cfm per dwelling unit, whether intermittent or continuous, shall be required. For buildings 125 feet and greater, outdoor ventilation air shall be provided by mechanical means when the sum of the exhaust designed to exceed 75 cfm, whether continuous or intermittent, per dwelling unit. Manually operated openable exterior wall openings shall not be used to provide outside ventilation air except where calculations are submitted showing that such openings are located at or below the lowest calculated neutral pressure plane (calculated at the winter outdoor design temperature, and taking into account a composite mass flow air balance of the building including all mechanical systems.)
- j. During unoccupied hours the ventilation rate and exhaust rates may be reduced to 0.5 cfm/ft².
- k. When an educational science laboratory is occupied and hoods are not in use and hazardous materials are not present, then ventilation rates shall be consistent with actual use of the space, but not less than 0.5 cfm/ft².
- l. See Section 502.6 for additional requirements.

403.3.1 [System operation. The minimum flow rate of outdoor air that the ventilation system must be capable of supplying during its operation shall be permitted to be based on the rate per person indicated in Table 403.3 and the actual number of occupants present. Intermittent exhaust shall be permitted where an individual exhaust duct and fan are provided and the operation of the fan is controlled by occupants of the space being vented.] **Zone outdoor airflow.** The minimum outdoor airflow required to be supplied to each zone shall be determined as a function of occupancy classification and space air distribution effectiveness in accordance with Sections 403.3.1.1 through 403.3.1.3.

403.3.1.1 Breathing zone outdoor airflow. The outdoor airflow rate required in the breathing zone (V_{bz}) of the occupiable space or spaces in a zone shall be determined in accordance with Equation 4-1.

$$\underline{V_{bz} = R_p P_z + R_a A_z} \quad \text{(Equation 4-1)}$$

where:

A_z = Zone floor area: the net occupiable floor area of the space or spaces in the zone.

P_z = Zone population: the number of people in the space or spaces in the zone.

R_p = People outdoor air rate: the outdoor airflow rate required per person from Table 403.3.

R_a = Area outdoor air rate: the outdoor airflow rate required per unit area from Table 403.3.

403.3.1.2 Zone air distribution effectiveness. The zone air distribution effectiveness (E_z) shall be determined using Table 403.3.1.2.

TABLE 403.3.1.2
ZONE AIR DISTRIBUTION EFFECTIVENESS^{a,b,c,d,e}

<u>Air Distribution Configuration</u>	<u>E_z</u>
<u>Ceiling or floor supply of cool air</u>	<u>1.0^f</u>
<u>Ceiling or floor supply of warm air and floor return</u>	<u>1.0</u>
<u>Ceiling supply of warm air and ceiling return</u>	<u>0.8^g</u>
<u>Floor supply of warm air and ceiling return</u>	<u>0.7</u>
<u>Makeup air drawn in on the opposite side of the room from the exhaust and/or return</u>	<u>0.8</u>
<u>Makeup air drawn in near to the exhaust and/or return location</u>	<u>0.5</u>

For SI: 1 foot = 304.8 mm, 1 foot per minute = 0.00506 m/s,

$^{\circ}\text{C} = ((^{\circ}\text{F}) - 32) / 1.8.$

- a. “Cool air” is air cooler than space temperature.
- b. “Warm air” is air warmer than space temperature.
- c. “Ceiling” includes any point above the breathing zone.
- d. “Floor” includes any point below the breathing zone.
- e. “Makeup air” is air supplied or transferred to a zone to replace air removed from the zone by exhaust or return systems.
- f. Zone air distribution effectiveness of 1.2 shall be permitted for systems with a floor supply of cool air and ceiling return, provided that low-velocity displacement ventilation achieves unidirectional flow and thermal stratification.
- g. Zone air distribution effectiveness of 1.0 shall be permitted for systems with a ceiling supply of warm air, provided that supply air temperature is less than 15°F above space temperature and provided that the 150 foot-per-minute supply air jet reaches to within 4½ feet of floor level.

403.3.1.3 Zone outdoor airflow. The zone outdoor air flow rate (V_{oz}), shall be determined in accordance with Equation 4-2.

$$\underline{V_{oz} = \frac{V_{bz}}{Ez}} \quad \text{(Equation 4-2)}$$

403.3.2 [Common ventilation system. Where spaces having different ventilation rate requirements are served by a common ventilation system, the ratio of outdoor air to total supply air for the system shall be determined based on the space having the largest outdoor air requirement or shall be determined in accordance with the following formula:] **System outdoor airflow.** The outdoor air required to be supplied by each ventilation system shall be determined in accordance with Sections 403.3.2.1 through 403.3.2.3 as a function of system type and zone outdoor airflow rates.

$$[Y=X/(1+X-Z) \quad \text{(Equation 4-1)}$$

where:

$Y = V_{oc}/V_{so}$ = Corrected fraction of outdoor air in system supply.

$X = V_{on}/V_{zl}$ = Uncorrected fraction of outdoor air in system supply.

$Z = V_{oc}/V_{zc}$ = Fraction of outdoor air in critical space. The critical space is that space with the greatest required fraction of outdoor air in the supply to this space.

V_{oc} = Corrected total outdoor airflow rate.

V_{zl} = Total supply flow rate, ie., the sum of all supply for all branches of the system.

V_{ox} = Sum of outdoor airflow rates for all branches on system.

V_{oc} = Outdoor airflow rate required in critical spaces.

V_{zc} = Supply flow rate in critical space.]

403.3.2.1 Single zone systems. Where one air handler supplies a mixture of outdoor air and recirculated return air to only one zone, the system outdoor air intake flow rate (V_{ot}) shall be determined in accordance with Equation 4-3.

$$\underline{V_{ot} = V_{oz}} \quad \text{(Equation 4-3)}$$

403.3.2.2 100-percent outdoor air systems. Where one air handler supplies only outdoor air to one or more zones, the system outdoor air intake flow rate (V_{ot}) shall be determined using Equation 4-4.

$$\underline{V_{ot} = \sum \text{all zones } V_{oz}} \quad \text{(Equation 4-4)}$$

403.3.2.3 Multiple zone recirculating systems. Where one air handler supplies a mixture of outdoor air and recirculated return air to more than one zone, the system outdoor air intake flow rate (V_{ot}) shall be determined in accordance with Sections 403.3.2.3.1 through 403.3.2.3.4.

403.3.2.3.1 Primary outdoor air fraction. The primary outdoor air fraction (Z_p) shall be determined for each zone in accordance with Equation 4-5.

$$Z_p = \frac{V_{oz}}{V_{pz}} \quad \text{(Equation 4-5)}$$

where:

V_{pz} = Primary airflow: The airflow rate supplied to the zone from the air-handling unit at which the outdoor air intake is located. It includes outdoor intake air and recirculated air from that air-handling unit but does not include air transferred or air recirculated to the zone by other means. For design purposes, V_{pz} shall be the zone design primary airflow rate, except for zones with variable air volume supply and V_{pz} shall be the lowest expected primary air-flow rate to the zone when it is fully occupied.

403.3.2.3.2 System ventilation efficiency. The system ventilation efficiency (E_v) shall be determined using Table 403.3.2.3.2 or Appendix A of ASHRAE 62.1.

TABLE 403.3.2.3.2
SYSTEM VENTILATION EFFICIENCY^{a,b}

<u>Max (Z_p)</u>	<u>E_v</u>
<u><0.15</u>	<u>1</u>
<u><0.25</u>	<u>0.9</u>
<u><0.35</u>	<u>0.8</u>
<u><0.45</u>	<u>0.7</u>
<u><0.55</u>	<u>0.6</u>
<u><0.65</u>	<u>0.5</u>
<u><0.75</u>	<u>0.4</u>
<u>>0.75</u>	<u>0.3</u>

- a. Max (Z_p) is the largest value of Z_p calculated using Equation 4-5 among all the zones served by the system.
- b. Interpolating between table values shall be permitted.

403.3.2.3.3 Uncorrected outdoor air intake. The uncorrected outdoor air intake flow rate (V_{ou}) shall be determined in accordance with Equation 4-6.

$$V_{ou} = D \sum \text{all zones } R_p P_z + \sum \text{all zones } R_a A_z \quad \text{(Equation 4-6)}$$

where:

D = Occupant diversity: the ratio of the system population to the sum of the zone populations, determined in accordance with Equation 4-7.

$$D = \frac{P_s}{\sum \text{all zones } P_z} \quad \text{(Equation 4-7)}$$

where:

P_s = System population: The total number of occupants in the area served by the system. For design purposes, P_s shall be the maximum number of occupants expected to be concurrently in all zones served by the system.

403.3.2.3.4 Outdoor air intake flow rate. The outdoor air intake flow rate (V_{ot}) shall be determined in accordance with Equation 4-8.

$$V_{ot} = \frac{V_{ou}}{Ev} \quad \text{(Equation 4-8)}$$

[403.3.3 Variable air volume system control. Variable air volume air distribution systems, other than those designed to supply only 100-percent outdoor air, shall be provided with controls to regulate the flow of outdoor air. Such control systems shall be designed to maintain the flow of outdoor air at a rate of not less than that required by Section 403 over the entire range of supply air operating rates.

403.3.4 Balancing. Ventilation systems shall be balanced by an approved method. Such balancing shall verify that the ventilation system is capable of supplying the airflow rates required by Section 403.]

403.4 Short-term conditions. If it is known that peak occupancy will be of short duration and/or ventilation will be varied or interrupted for a short period of time, the design may be based on the average conditions over a time period T determined by Equation 4-9.

$$T = 3v/Vbz \quad \text{(Equation 4-9) (US)}$$

$$T = 50v/Vbz \quad \text{(Equation 4-9) (SI)}$$

where:

T = averaging time period, minutes

V = the volume of the zone of which averaging is being applied, cubic feet

Vbz = the breathing zone outdoor airflow calculated using equation 4-1 and design valve of the zone population P_z , cfm

Acceptable design adjustments based on this optional provision include the following:

1. Zone with fluctuating occupancy: the zone population (P_z) may be averaged over time T.
2. Zone with intermittent interruption of supply air: the average outdoor airflow supplied to breathing zone over time T shall be no less than the breathing zone outdoor airflow (V_{bz}) calculated using equation 4-1.
3. A system with intermittent closure of outdoor air intake: the average outdoor air intake over time T shall be no less than the minimum outdoor air intake (V_{ot}) calculated using equation 4-3, 4-4 or 4-8 as appropriate.

403.5 Exhaust ventilation. Exhaust airflow rate shall be provided in accordance with the requirements in Table 403.3. Exhaust makeup air shall be permitted to be any combination of outdoor air, recirculated air and transfer air, except as limited in accordance with Section 403.2.

403.6 System operation. The minimum flow rate of outdoor air that the ventilation system must be capable of supplying during its operation shall be permitted to be based on the rate per person indicated in Table 403.3 and the actual number of occupants present.

403.7 Variable air volume system control. Variable air volume air distribution systems, other than those designed to supply only 100-percent outdoor air, shall be provided with controls to regulate the flow of outdoor air. Such control system shall be designed to maintain the flow rate of outdoor air at a rate of not less than that required by Section 403.3 over the entire range of supply air operating rates.

403.8 Balancing. The ventilation air distribution system shall be provided with means to adjust the system to achieve at least the minimum ventilation airflow rate as required by Sections 403.3 and 403.4. Ventilation systems shall be balanced by an approved method. Such balancing shall verify that the ventilation system is capable of supplying and exhausting the airflow rates required by Sections 403.3 and 403.4.

SECTION MC 404 ENCLOSED PARKING GARAGES

404.1 Enclosed parking garages. Mechanical ventilation systems for enclosed parking garages [are not required to operate continuously] shall be permitted to operate intermittently where the system is arranged to operate automatically upon detection of a concentration of carbon monoxide of 25 parts per million (ppm) by approved automatic detection devices.

404.2 Minimum ventilation. Automatic operation of the system shall not reduce the ventilation airflow rate below 0.05 cfm per square foot ($0.00025 \text{ m}^3/\text{s} \cdot \text{m}^2$) of the floor area and the system shall be capable of producing a ventilation airflow rate of [1.5] 0.75 cfm per square foot ($0.00[76]38 \text{ m}^3/\text{s} \cdot \text{m}^2$) of floor area.

404.3 Occupied spaces accessory to public garages. Connecting offices, waiting rooms, ticket booths and similar uses that are accessory to a public garage shall be maintained at a positive pressure and shall be provided with ventilation in accordance with Section 403.3.

SECTION MC 405 SYSTEMS CONTROL

405.1 General. Mechanical ventilation systems shall be provided with manual or automatic controls that will operate such systems whenever the spaces are occupied. Air-conditioning systems that supply required ventilation air shall be provided with controls designed to automatically maintain the required outdoor air supply rate during occupancy.

405.2 Manual control. Each air distribution system shall be provided with not less than one manual control to stop the operation of the supply, return, and exhaust fans(s) in an emergency. The manual control shall be provided at an approved location. A disconnect switch shall not be considered a manual control.

405.2.1 Office buildings. Any building where the main use or dominant occupancy is classified in Occupancy Group B having occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, where a system serves a floor or floors other than the floor on which the equipment is located, shall be provided with the following controls, in addition to the controls required by this chapter:

1. Manual controls for operating individually each air supply and each exhaust or return fan in the system located as follows:
 - 1.1. At the Fire Command Center, and
 - 1.2. In the room containing the affected air-handling fans.
2. Manual controls for operating individually or in groups each remote control reversible fire shutter, when such shutters are provided in accordance with the provisions of the *New York City Building Code*, or each smoke damper provided in accordance with the provisions of the *New York City Building Code*. Such controls shall be located at the Fire Command Center.

SECTION MC 406 VENTILATION OF UNINHABITED SPACES

406.1 General. Uninhabited spaces, such as crawl spaces and attics, shall be provided with natural ventilation openings as required by the *New York City Building Code* or shall be provided with a mechanical exhaust and supply air system. The mechanical exhaust rate shall be not less than 0.02 cfm per square foot ($0.00001 \text{ m}^3/\text{s} \cdot \text{m}^2$) of horizontal area and shall be automatically controlled to operate when the relative humidity in the space served exceeds 60 percent.

406.1.1 Methane and radon venting. The design and materials used in the installation of the methane and radon vent systems shall be approved by the commissioner and shall comply with all applicable rules of the Fire Department.

**SECTION MC 407
VENTILATION OF NONPRODUCTION CHEMICAL
LABORATORIES**

407.1 General. Nonproduction chemical laboratories complying with the hazardous materials quantity limitations of Section [419] 424 of the *New York City Building Code* shall provide a mechanical ventilation system in accordance with Table 403.3 of this code and NFPA 45, except that ducts constructed of combustible materials shall not be permitted.

Subpart 5 (Chapter 5 of the New York City Mechanical Code)

§1. Chapter 5 of the New York city mechanical code, as added by local law number 33 for the year 2007, item 1.2 of section 502.7.3.2, section 509.1 and section 513.5.1 as amended by and table 510.8.2 as added by local law number 8 for the year 2008, section 513.11 as amended by local law number 111 for the year 2013, and section 514.1 as amended by local law number 85 for the year 2009, is amended to read as follows:

**CHAPTER 5
EXHAUST SYSTEMS**

**SECTION MC 501
GENERAL**

501.1 Scope. This chapter shall govern the design, construction and installation of mechanical exhaust systems, including exhaust systems serving clothes dryers and cooking appliances; hazardous exhaust systems; dust, stock and refuse conveyor systems[,] [exhaust systems serving commercial cooking appliances and] subslab soil exhaust systems; smoke control systems; energy recovery ventilation systems; and other systems specified in Section 502.

501.2 [Outdoor] Exhaust discharge. The air removed by every mechanical exhaust system shall be discharged outdoors at a point where it will not cause a nuisance and the air shaft will be located not less than the distances specified in Section 501.2.1. The air shall be discharged to a location from which it cannot again be readily drawn in by a ventilating system. Air shall not be exhausted into an attic or crawl space.

[Exception] Exceptions:

1. Whole-house ventilation-type attic fans [that] shall be permitted to discharge into the attic space of dwelling units having private attics.
2. Commercial cooking recirculating systems.

501.2.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located within the following minimum distances:

1. For ducts conveying noxious, toxic, explosive or flammable vapors, fumes or dusts (including but not limited to exhaust from dry cleaning establishments and spray booths): 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings which are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade. Additional requirements may apply to Hazardous Exhaust Systems; see Section 510.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade; 10 feet from any exterior fire escape, stair, or balcony.
3. For all environmental air exhaust outlets: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust outlets shall not be considered hazardous or noxious.
4. Exhaust outlets and openings serving structures in flood hazard areas shall be installed in accordance with Appendix G of the *New York City Building Code*.
5. For specific systems see the following sections:
 - 5.1. Clothes dryer exhaust, Section 504.4.
 - 5.2. Kitchen hoods and other kitchen exhaust equipment, Sections 506.3.12, 506.4 and 506.5.
 - 5.3. Dust stock and refuse conveying systems, Section 511.
 - 5.4. Subslab soil exhaust systems, Section 512.4.
 - 5.5. Smoke control systems, Section 513.10.3.
 - 5.6. Refrigerant discharge, Section 1105.7.
 - 5.7. Machinery room discharge, Section 1105.6.1.
6. In Occupancy Groups R-2 and R-3 each dwelling unit may be individually exhausted directly to the outdoors with a dedicated, exhaust fan and shall comply with the following:

6.1. The exhaust system for the kitchen and the toilet/baths may be combined to the inlet of a continuously operated single fan, provided such exhaust system serves only one dwelling unit.

6.2. The dedicated exhaust from each dwelling unit shall be directed away from any window serving the same dwelling unit from which the exhaust is taken, and in addition, such exhaust opening shall terminate at least:

6.2.1. Two feet (610 mm) from any operational window or door serving the same dwelling unit.

6.2.2. Three feet (1219 mm) from any operational window or door serving an adjoining dwelling unit.

6.2.3. Three feet (1219 mm) from any operational window or door serving another occupancy group in the same building.

6.2.4. Ten feet (3048 mm) from any outdoor air intake opening.

6.2.5. Ten feet (3048 mm) above the public sidewalk adjoining the same building.

6.2.6 All other minimum distances prescribed in items 1 through 5 of Section 501.2.1 shall be satisfied

501.2.1.1 Exhaust discharge. Exhaust air shall not be directed onto walkways.

501.2.2 Exhaust opening protection. Exhaust openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in screens, louvers and grilles shall be sized not less than $\frac{1}{4}$ inch (6 mm) and not larger than $\frac{1}{2}$ inch (13 mm). Openings shall be protected against local weather conditions. Outdoor openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with the *New York City Building Code*.

501.3 Pressure equalization. Mechanical exhaust systems shall be sized to remove the quantity of air required by this chapter to be exhausted. The system shall operate when air is required to be exhausted. Where mechanical exhaust is required in a room or space in other than occupancies in [Group] R-3, such space shall be maintained with a neutral or negative pressure. If a greater quantity of air is supplied by a mechanical ventilating supply system than is removed by a mechanical exhaust [system] for a room, adequate means shall be provided for the natural [exit] or mechanical exhaust of the excess air supplied. If only a mechanical exhaust system is installed for a room or if a greater quantity of air is removed by a mechanical exhaust system than is supplied by a mechanical ventilating supply system for a room, adequate [means shall be provided for the natural] makeup air consisting of supply [of] air, transfer air or outdoor air shall be provided to satisfy the deficiency [in the air supplied]. The calculated

building infiltration rate and openable area shall not be used to satisfy the requirements of this section.

501.4 Ducts. Where exhaust duct construction is not specified in this chapter, such construction shall comply with Chapter 6 [of this code].

501.5 Independent system required.

1. Single or combined mechanical exhaust systems from bath, toilet, urinal, locker, service sink closets and similar rooms shall be independent of all other exhaust systems, except as permitted in Section [401.5.2] 501.2.1.
2. A separate grease duct system shall be provided for each Type I hood except as provided in Section 506.3.5.
3. Hazardous exhaust systems shall be independent of other types of exhaust systems as provided in Section 510.

**SECTION MC 502
REQUIRED SYSTEMS**

502.1 General. An exhaust system shall be provided, maintained and operated as specifically required by this section and for all occupied areas where machines, vats, tanks, furnaces, forges, salamanders and other appliances, equipment and processes in such areas produce or throw off dust or particles sufficiently light to float in the air, or which emit heat, odors, fumes, spray, gas or smoke, in such quantities so as to be irritating or injurious to health or safety.

502.1.1 Exhaust location. The inlet to an exhaust system shall be located in the area of heaviest concentration of contaminants.

502.1.2 Fuel-dispensing areas. The bottom of an air inlet or exhaust opening in fuel-dispensing areas shall be located not more than 18 inches (457 mm) above the floor.

502.[]1.3 Equipment, appliance and service rooms. Equipment, appliance and system service rooms that house sources of odors, fumes, noxious gases, smoke, steam, dust, spray or other contaminants shall be designed and constructed so as to prevent spreading of such contaminants to other occupied parts of the building.

502.1.4 Hazardous exhaust. The mechanical exhaust of high concentrations of dust or hazardous vapors shall conform to the requirements of Section 510.

502.2 Aircraft fueling and defueling. Compartments housing piping, pumps, air eliminators, water separators, hose reels and similar equipment used in aircraft fueling and defueling operations shall be adequately ventilated in an approved manner at floor level or within the floor itself.

502.3 Battery-charging areas for powered vehicles and equipment. Ventilation shall be provided in an approved manner in battery-charging areas to prevent a dangerous accumulation of flammable gases.

502.4 Stationary [lead-acid] storage battery systems. [Ventilation shall be provided for stationary lead-acid battery systems] Stationary storage battery systems, as regulated by Section 608 of the *New York City Fire Code*, shall be provided with ventilation in accordance with this chapter and Section 502.4.1 or 502.4.2.

Exception: Lithium-ion batteries shall not require ventilation.

502.4.1 Hydrogen limit in rooms. [The] For flooded lead acid, flooded nickel cadmium and VRLA batteries, the ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the room.

502.4.2 Ventilation rate in rooms. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (cfm/ft²) [$(0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))$] of floor area of the room.

502.5 Valve-regulated lead-acid batteries in cabinets. Valve-regulated lead-acid (VRLA) battery systems installed in cabinets, as regulated by Section 608.6.2 of the *New York City Fire Code*, shall be provided with ventilation in accordance with Section 502.5.1 or 502.5.2 [for rooms and in accordance with Section 502.5.3 or 502.5.4 for cabinets].

502.5.1 Hydrogen limit in [rooms] cabinets. The cabinet ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the [room] cabinet during the worst-case event of simultaneous boost charging of all batteries in the [room] cabinet.

502.5.2 Ventilation rate in [rooms] cabinets. Continuous cabinet ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (cfm/ft²) [$(0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))$] of floor area [of the room] covered by the cabinet. The room in which the cabinet is installed shall also be ventilated as required by Section 502.4.1 or 502.4.2.

[**502.5.3 Hydrogen limit in cabinets.** The ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the cabinet during the worst-case event of simultaneous boost charging of all batteries in the cabinet.]

[**502.5.4 Ventilation rate in cabinets.** Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (cfm/ft²) [$0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2)$] of the floor area covered by the cabinet. The room in which the cabinet is installed shall also be ventilated as required by Section 502.5.1 or 502.5.2.]

502.6 Dry cleaning plants. Mechanical ventilation in dry cleaning plants shall be provided and shall be adequate to protect employees and the public in accordance with this section and

DOL 29 CFR Part 1910.1000, where applicable. Dry cleaning separations must comply with the requirements of Section 415.6.4 of the *New York City Building Code* and NFPA 32.

502.6.1 Type II and III systems. Type II and III dry cleaning systems shall be provided with a mechanical ventilation system that is designed to exhaust 1 cubic foot of air per minute for each square foot of floor area (1 cfm/ft²) $[(0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))]$ in dry cleaning rooms and in drying rooms. The ventilation system shall operate automatically when the dry cleaning equipment is in operation and shall have manual controls at an approved location.

502.6.2 Type IV and V systems. Type IV and V dry cleaning systems shall be provided with an automatically activated exhaust ventilation system to maintain a minimum of 100 feet per minute ([0.5] 0.51 m/s) air velocity through the loading door when the door is opened.

Exception: Dry cleaning units are not required to be provided with exhaust ventilation where an exhaust hood is installed immediately outside of and above the loading door which operates at an airflow rate as follows:

$$Q = 100 \times A_{LD} \quad \text{(Equation 5-1)}$$

where:

Q = Flow rate exhausted through the hood, cubic feet per minute.

A_{LD} = Area of the loading door, square feet.

502.6.3 Spotting and pretreating. Scrubbing tubs, scouring, brushing or spotting operations shall be located such that solvent vapors are captured and exhausted by the ventilating system.

502.7 Application of flammable finishes. Mechanical exhaust as required by this section shall be provided for operations involving the application of flammable finishes and shall comply with the *New York City Fire Code*.

502.7.1 During construction. Ventilation shall be provided for operations involving the application of materials containing flammable solvents in the course of construction, alteration or demolition of a structure.

502.7.2 Limited spraying spaces. Positive mechanical ventilation which provides a minimum of six complete air changes per hour shall be installed in limited spraying spaces. Such system shall meet the requirements of the *New York City Fire Code* for handling flammable vapors. Explosion venting is not required.

502.7.3 [Spraying] Flammable vapor areas. Mechanical ventilation of [spraying areas and resin application] flammable vapor areas shall be provided in accordance with Sections 502.7.3.1 through [502.7.3.7] 502.7.3.6.

502.7.3.1 Operation. Mechanical ventilation shall be kept in operation at all times while spraying operations are being conducted and for a sufficient time thereafter to allow vapors from drying coated articles and finishing material residue to be exhausted. Spraying equipment shall be interlocked with the ventilation of the [spraying] flammable vapor area such that spraying operations cannot be conducted unless the ventilation system is in operation.

502.7.3.2 Recirculation. Air exhausted from spraying operations shall not be recirculated.

Exceptions:

1. Air exhausted from spraying operations shall be permitted to be recirculated as makeup air for unmanned spray operations provided that:
 - 1.1. Solid particulate has been removed.
 - 1.2. The vapor concentration is less than 25 percent of the lower flammable limit (LFL).
 - 1.3. Approved equipment is used to monitor the vapor concentration.
 - 1.4. An alarm is sounded and spray operations are automatically shut down if the vapor concentration exceeds 25 percent of the LFL.
 - 1.5. [The spray booths, spray spaces or spray rooms involved in any recirculation process shall be provided with mechanical ventilation that shall automatically exhaust 100 percent of the required air volume in the event of shutdown by approved equipment used to monitor vapor concentrations.] In the event of shutdown of the vapor concentration monitor, 100 percent of the air volume specified in Section 510 is automatically exhausted.
2. Air exhausted from spraying operations [shall be permitted] is allowed to be recirculated as makeup air to manned spraying operations [if] where all of the conditions provided in Exception 1 are included in the installation and documents have been prepared to show that the installation does not [present] pose life safety hazards to personnel inside the spray booth, [spray] spraying space or spray room.

502.7.3.3 Air velocity. Ventilation systems shall be designed, installed and maintained such that the average air velocity over the open face of the booth, or booth cross section in

the direction of airflow during spraying operations, is not less than 100 feet per minute (0.51 m/s).

502.7.3.4 Ventilation obstruction. Articles being sprayed shall be positioned in a manner that does not obstruct collection of overspray.

502.7.3.5 Independent ducts. Each spray booth and spray room shall have an independent exhaust duct system discharging to the outdoors.

Exceptions:

- 1) Multiple spray booths having a combined frontal area of 18 square feet (1.67m²) or less are allowed to have a common exhaust where identical spray-finishing material is used in each booth. If more than one fan serves one booth, such fans shall be interconnected so that all fans operate simultaneously.
- 2) Where treatment of exhaust is necessary for air pollution control or energy conservation, ducts shall be allowed to be manifolded if all of the following conditions are met:
 - 2.1. The sprayed materials used are compatible and will not react or cause ignition of the residue in the ducts.
 - 2.2. Nitrocellulose-based finishing material shall not be used.
 - 2.3. A filtering system shall be provided to reduce the amount of overspray carried into the duct manifold.
 - 2.4. Automatic sprinkler protection shall be provided at the junction of each booth exhaust with the manifold, in addition to the protection required by this chapter.

[502.7.3.6 Termination point. The termination point for exhaust ducts discharging to the atmosphere shall be located with the following minimum distances.

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from the property line; 10 feet (3048 mm) from openings into the building; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and openings into the building which are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property line; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from openings into the building; 10 feet (3048 mm) above adjoining grade.

3. For environmental air duct exhaust: 3 feet (914 mm) from the property line; 3 feet (914 mm) from openings into the building.]

502.7.3.6 [502.7.3.7] Fan motors and belts. Electric motors driving exhaust fans shall not be placed inside booths or ducts. Fan rotating elements shall be nonferrous or nonsparking or the casing shall consist of, or be lined with, such material. Belts shall not enter the duct or booth unless the belt and pulley within the duct are tightly enclosed.

502.7.4 Dipping operations. [Vapor] Flammable vapor areas of dip tank operations shall be provided with mechanical ventilation adequate to prevent the dangerous accumulation of vapors. Required ventilation systems shall be so arranged that the failure of any ventilating fan will automatically stop the dipping conveyor system.

502.7.5 Electrostatic apparatus. The [spraying] flammable vapor area in spray-finishing operations involving electrostatic apparatus and devices shall be ventilated in accordance with Section 502.7.3.

502.7.6 Powder coating. Exhaust ventilation for powder-coating operations shall be sufficient to maintain the atmosphere below one-half of the minimum explosive concentration for the material being applied. Nondeposited, air-suspended powders shall be removed through exhaust ducts to the powder recovery [cyclone or receptacle] system.

502.7.7 Floor resurfacing operations. To prevent the accumulation of flammable vapors during floor resurfacing operations, mechanical ventilation at a minimum rate of 1 cfm/ft² $[(0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))]$ of area being finished shall be provided. Such [ventilation] exhaust shall be by approved temporary or portable means. Vapors shall be exhausted to the [outdoors] exterior of the building. Such [ventilation] exhaust equipment shall be kept in operation while the floor finishing operations are conducted and until any flammable vapors have been exhausted to the exterior of the building.

502.7.8 Resin application areas. Exhaust ventilation for resin application areas shall comply with Section 502.7.3.

Exception: Mechanical ventilation is not required for buildings that are unenclosed for at least 75 percent of the perimeter.

502.8 Hazardous materials—general requirements. Exhaust ventilation systems for structures containing hazardous materials shall be provided as required in Sections 502.8.1 through 502.8.5 and shall comply with the *New York City Fire Code*.

502.8.1 Storage in excess of the maximum allowable quantities. Indoor storage areas and storage buildings for hazardous materials in amounts exceeding the maximum allowable quantity per control area shall be provided with mechanical exhaust ventilation or natural ventilation where natural ventilation can be shown to be acceptable for the materials as stored.

Exception: Storage areas for flammable solids complying with the *New York City Fire Code*.

502.8.1.1 System requirements. Exhaust ventilation systems shall comply with all of the following:

2. The installation shall be in accordance with this code.
3. Mechanical ventilation shall be provided at a rate of not less than 1 cfm/ft² [(0.00508 m³/(s • m²))] of floor area over the storage area.
3. The systems shall operate continuously unless alternate designs are approved.
4. A manual shutoff control shall be provided outside of the room in a position adjacent to the access door to the room or in another approved location. The switch shall be [of the] a break-glass or other approved type and shall be labeled: VENTILATION SYSTEM EMERGENCY SHUTOFF.
5. The exhaust ventilation [system] shall be designed to consider the density of the potential fumes or vapors released. For fumes or vapors that are heavier than air, exhaust shall be taken from a point within 12 inches ([304] 305 mm) of the floor. For fumes or vapors that are lighter than air, exhaust shall be taken from a point within 12 inches (305 mm) of the highest point of the room.
6. The location of both the exhaust and inlet air openings shall be designed to provide air movement across all portions of the floor or room to prevent the accumulation of vapors.
7. The exhaust [ventilation] air shall not be recirculated [within the room or building] to occupied areas if the materials stored are capable of emitting hazardous vapors and contaminants have not been removed. Air contaminated with explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive materials shall not be recirculated.

502.8.2 Gas rooms, exhausted enclosures and gas cabinets. The ventilation system for gas rooms, exhausted enclosures and gas cabinets for any quantity of hazardous material shall be designed to operate at a negative pressure in relation to the surrounding area. Highly toxic and toxic gases shall also comply with Sections 502.9.7.1, 502.9.7.2 and 502.9.8.4.

502.8.3 Indoor dispensing and use. Indoor dispensing and use areas for hazardous materials in amounts exceeding the maximum allowable quantity per control area shall be provided with exhaust ventilation in accordance with Section 502.8.1.

Exception: Ventilation is not required for dispensing and use of flammable solids other than finely divided particles.

502.8.4 Indoor dispensing and use-point sources. Where gases, liquids or solids in amounts exceeding the maximum allowable quantity per control area and having a hazard ranking of 3 or 4 in accordance with NFPA 704 are dispensed or used, mechanical exhaust ventilation shall be provided to capture gases, fumes, mists or vapors at the point of generation.

Exception: Where it can be demonstrated that the gases, liquids or solids do not create harmful gases, fumes, mists or vapors.

502.8.5 Closed systems. Where closed systems for the use of hazardous materials in amounts exceeding the maximum allowable quantity per control area are designed to be opened as part of normal operations, ventilation shall be provided in accordance with Section 502.8.4.

502.9 Hazardous materials—requirements for specific materials. Exhaust ventilation systems for specific hazardous materials shall be provided as required in Section 502.8 and Sections 502.9.1 through 502.9.11 and shall comply with the *New York City Fire Code*.

502.9.1 Compressed gases medical gas systems. Rooms for the storage of compressed medical gases in amounts exceeding the maximum allowable exempt quantity per control area, and which do not have an exterior wall, shall be exhausted through a duct to the exterior of the building. Each space shall be separately exhausted, and each exhaust air stream shall be enclosed in a 1-hour-rated shaft enclosure from the room to the exterior. Approved mechanical ventilation shall be provided at a minimum rate of 1 cfm/ft² ($0.00508 \text{ m}^3/\text{s} \cdot \text{m}^2$) of the area of the room.

Gas cabinets for the storage of compressed medical gases in amounts exceeding the maximum allowable exempt quantity per control area shall be connected to an exhaust system. The average velocity of ventilation at the face of access ports or windows shall be not less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s) at any point at the access port or window.

502.9.2 Corrosives. Where corrosive materials in amounts exceeding the maximum allowable quantity per control area are dispensed or used, mechanical exhaust ventilation in accordance with Section 502.8.4 shall be provided.

502.9.3 Cryogenics. Storage areas for stationary or portable containers of cryogenic fluids in any quantity shall be ventilated in accordance with Section 502.8. Indoor areas where cryogenic fluids in any quantity are dispensed shall be ventilated in accordance with the requirements of Section 502.8.4 in a manner that captures any vapor at the point of generation.

Exception: Ventilation for indoor dispensing areas is not required where it can be demonstrated that the cryogenic fluids do not create harmful vapors.

502.9.4 Explosives. Squirrel cage blowers shall not be used for exhausting hazardous fumes, vapors or gases in operating buildings and rooms for the manufacture, assembly or testing of explosives. Only nonferrous fan blades shall be used for fans located within the ductwork and through which hazardous materials are exhausted. Motors shall be located outside the duct.

502.9.5 Flammable and combustible liquids. Exhaust ventilation systems shall be provided as required by Sections 502.9.5.1 through 502.9.5.5 for the storage, use, dispensing, mixing and handling of flammable and combustible liquids. Unless otherwise specified, this section shall apply to any quantity of flammable and combustible liquids.

Exception: This section shall not apply to flammable and combustible liquids that are exempt from the *New York City Fire Code*.

502.9.5.1 Vaults. Vaults that contain tanks of Class I liquids shall be provided with continuous ventilation at a rate of not less than 1 cfm/ft² of floor area $[(0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))]$, but not less than 150 cfm (4 m³/min). Failure of the exhaust airflow shall automatically shut down the dispensing system. The exhaust system shall be designed to provide air movement across all parts of the vault floor. Supply and exhaust ducts shall extend to a point not greater than 12 inches (305 mm) and not less than 3 inches (76 mm) above the floor. The exhaust system shall be installed in accordance with the provisions of NFPA 91. Means shall be provided to automatically detect any flammable vapors and to automatically shut down the dispensing system upon detection of such flammable vapors in the exhaust duct at a concentration of 25 percent of the LFL.

502.9.5.2 Storage rooms and warehouses. Liquid storage rooms and liquid storage warehouses for quantities of liquids exceeding those specified in the *New York City Fire Code* shall be ventilated in accordance with Section 502.8.1.

502.9.5.3 Cleaning machines. Areas containing machines used for parts cleaning in accordance with the *New York City Fire Code* shall be adequately ventilated to prevent accumulation of vapors.

502.9.5.4 Use, dispensing and mixing. Continuous mechanical ventilation shall be provided for the use, dispensing and mixing of flammable and combustible liquids in open or closed systems in amounts exceeding the maximum allowable quantity per control area and for bulk transfer and process transfer operations. The ventilation rate shall be not less than 1 cfm/ft² $[(0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))]$ of floor area over the design area. Provisions shall be made for the introduction of makeup air in a manner that will include all floor areas or pits where vapors can collect. Local or spot ventilation shall be provided where needed to prevent the accumulation of hazardous vapors.

502.9.5.5 Bulk plants or terminals. Ventilation shall be provided for portions of properties where flammable and combustible liquids are received by tank vessels, pipelines, tank cars or tank vehicles and which are stored or blended in bulk for the purpose of distributing such liquids by tank vessels, pipelines, tank cars, tank vehicles or containers as required by Sections 502.9.5.5.1 through 502.9.5.5.3.

502.9.5.5.1 General. Ventilation shall be provided for rooms, buildings and enclosures in which Class I liquids are pumped, used or transferred. Design of ventilation systems shall consider the relatively high specific gravity of the vapors. Where natural ventilation is used, adequate openings in outside walls at floor level, unobstructed except by louvers or coarse screens, shall be provided. Where natural ventilation is inadequate, mechanical ventilation shall be provided. The natural ventilation design shall be approved for each specific application by the commissioner prior to installation and/or use.

502.9.5.5.2 Basements and pits. Class I liquids shall not be stored or used within a building having a basement or pit into which flammable vapors can travel, unless such area is provided with ventilation designed to prevent the accumulation of flammable vapors therein.

502.9.5.5.3 Dispensing of Class I liquids. Containers of Class I liquids shall not be drawn from or filled within buildings unless a provision is made to prevent the accumulation of flammable vapors in hazardous concentrations. Where mechanical ventilation is required, it shall be kept in operation while flammable vapors could be present.

502.9.6 Highly toxic and toxic liquids. Ventilation exhaust shall be provided for highly toxic and toxic liquids as required by Sections 502.9.6.1 and 502.9.6.2.

502.9.6.1 Treatment system. This provision shall apply to indoor and outdoor storage and use of highly toxic and toxic liquids in amounts exceeding the maximum allowable quantities per control area. Exhaust scrubbers or other systems for processing vapors of highly toxic liquids shall be provided where a spill or accidental release of such liquids can be expected to release highly toxic vapors at normal temperature and pressure.

502.9.6.2 Open and closed systems. Mechanical exhaust ventilation shall be provided for highly toxic and toxic liquids used in open systems in accordance with Section 502.8.4. Mechanical exhaust ventilation shall be provided for highly toxic and toxic liquids used in closed systems in accordance with Section 502.8.5.

Exception: Liquids or solids that do not generate highly toxic or toxic fumes, mists or vapors.

502.9.7 Highly toxic and toxic compressed gases—Any quantity. Ventilation exhaust shall be provided for highly toxic and toxic compressed gases in any quantity as required by Sections 502.9.7.1 and 502.9.7.2.

502.9.7.1 Gas cabinets. Gas cabinets containing highly toxic or toxic compressed gases in any quantity shall comply with Section 502.8.2 and the following requirements:

1. The average ventilation velocity at the face of gas cabinet access ports or windows shall be not less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s) at any point at the access port or window.
2. Gas cabinets shall be connected to an exhaust system.
3. Gas cabinets shall not be used as the sole means of exhaust for any room or area.

502.9.7.2 Exhausted enclosures. Exhausted enclosures containing highly toxic or toxic compressed gases in any quantity shall comply with Section 502.8.2 and the following requirements:

1. The average ventilation velocity at the face of the enclosure shall be not less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s).
2. Exhausted enclosures shall be connected to an exhaust system.
3. Exhausted enclosures shall not be used as the sole means of exhaust for any room or area.

502.9.8 Highly toxic and toxic compressed gases—quantities exceeding the maximum allowable quantity per control area. Ventilation exhaust shall be provided for highly toxic and toxic compressed gases in amounts exceeding the maximum allowable quantities per control area as required by Sections 502.9.8.1 through 502.9.8.6.

502.9.8.1 Ventilated areas. The room or area in which indoor gas cabinets or exhausted enclosures are located shall be provided with exhaust ventilation. Gas cabinets or exhausted enclosures shall not be used as the sole means of exhaust for any room or area.

502.9.8.2 Local exhaust for portable tanks. A means of local exhaust shall be provided to capture leakage from indoor and outdoor portable tanks. The local exhaust shall consist of portable ducts or collection systems designed to be applied to the site of a leak in a valve or fitting on the tank. The local exhaust system shall be located in a gas room. Exhaust shall be directed to a treatment system where required by the *New York City Fire Code*.

502.9.8.3 Piping and controls—stationary tanks. Filling or dispensing connections on indoor stationary tanks shall be provided with a means of local exhaust. Such exhaust shall be designed to capture fumes and vapors. The exhaust shall be directed to a treatment system where required by the *New York City Fire Code*.

502.9.8.4 Gas rooms. The ventilation system for gas rooms shall be designed to operate at a negative pressure in relation to the surrounding area. The exhaust ventilation from gas rooms shall be directed to an exhaust system.

502.9.8.5 Treatment system. The exhaust ventilation from gas cabinets, exhausted enclosures and gas rooms, and local exhaust systems required in Sections 502.9.8.2 and 502.9.8.3 shall be directed to a treatment system where required by the *New York City Fire Code*.

502.9.8.6 Process equipment. Effluent from indoor and outdoor process equipment containing highly toxic or toxic compressed gases which could be discharged to the atmosphere shall be processed through an exhaust scrubber or other processing system. Such systems shall be in accordance with the *New York City Fire Code*.

502.9.9 Ozone gas generators. Ozone cabinets and ozone gas-generator rooms for systems having a maximum ozone-generating capacity of one-half pound (0.23 kg) or more over a 24-hour period shall be mechanically ventilated at a rate of not less than six air changes per hour. For cabinets, the average velocity of ventilation at makeup air openings with cabinet doors closed shall be not less than 200 feet per minute (1.02 m/s).

502.9.10 LP-gas distribution facilities. LP-gas distribution facilities shall conform to the requirements of the *New York City Fire Code*.

502.9.11 Silane gas. Exhausted enclosures and gas cabinets for the indoor storage of silane gas in amounts exceeding the maximum allowable quantities per control area shall comply with this section.

1. Exhausted enclosures and gas cabinets shall be in accordance with Section 502.8.2.
2. The velocity of ventilation across unwelded fittings and connections on the piping system shall not be less than 200 feet per minute (1.02 m/s).
3. The average velocity at the face of the access ports or windows in the gas cabinet shall not be less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s) at any point at the access port or window.[†]

502.10 Hazardous production materials (HPM). Exhaust ventilation systems and materials for ducts utilized for the exhaust of [RPM] HPM shall comply with this section, other applicable provisions of this code, the *New York City Building Code* and the *New York City Fire Code*.

502.10.1 Where required. Exhaust ventilation systems shall be provided in the following locations in accordance with the requirements of this section and the *New York City Building Code*:

1. Fabrication areas: Exhaust ventilation for fabrication areas shall comply with the *New York City Building Code*. Additional manual control switches shall be provided where required by the commissioner.
2. Workstations: A ventilation system shall be provided to capture and exhaust gases, fumes and vapors at workstations.
3. Liquid storage rooms: Exhaust ventilation for liquid storage rooms shall comply with Section 502.8.1.1 and the *New York City Building Code*.
4. [RPM] HPM rooms: Exhaust ventilation for [RPM] HPM rooms shall comply with Section 502.8.1.1 and the *New York City Building Code*.
5. Gas cabinets: Exhaust ventilation for gas cabinets shall comply with Section 502.8.2. The gas cabinet ventilation system is allowed to connect to a workstation ventilation system. Exhaust ventilation for gas cabinets containing highly toxic or toxic gases shall also comply with Sections 502.9.7 and 502.9.8.
6. Exhausted enclosures: Exhaust ventilation for exhausted enclosures shall comply with Section 502.8.2. Exhaust ventilation for exhausted enclosures containing highly toxic or toxic gases shall also comply with Sections 502.9.7 and 502.9.8.
7. Gas rooms: Exhaust ventilation for gas rooms shall comply with Section 502.8.2. Exhaust ventilation for gas cabinets containing highly toxic or toxic gases shall also comply with Sections 502.9.7 and 502.9.8.

502.10.2 Penetrations. Exhaust ducts penetrating fire barrier assemblies shall be contained in a shaft of equivalent fire-resistive construction. Exhaust ducts shall not penetrate building separation fire walls. Fire dampers shall not be installed in exhaust ducts.

502.10.3 Treatment systems. Treatment systems for highly toxic and toxic gases shall comply with the *New York City Fire Code*.

502.11 Motion picture projectors. Motion picture projectors shall be exhausted in accordance with Section 502.11.1 or 502.11.2.

502.11.1 Projectors with an exhaust discharge. Projectors equipped with an exhaust discharge shall be directly connected to a mechanical exhaust system. The exhaust system shall operate at an exhaust rate as indicated by the manufacturer's installation instructions.

502.11.2 Projectors without exhaust connection. Projectors without an exhaust connection shall have contaminants exhausted through a mechanical exhaust system. The exhaust rate for electric arc projectors shall be a minimum of 200 cubic feet per minute (cfm) (0.09 m³/s) per lamp. The exhaust rate for xenon projectors shall be a minimum of 300 cfm (0.14 m³/s) per lamp. Xenon projector exhaust shall be at a rate such that the exterior temperature of the lamp housing does not exceed 130°F (54°C). The lamp and projection room exhaust

systems, whether combined or independent, shall not be interconnected with any other exhaust or return system within the building.

502.12 Organic coating processes. Enclosed structures involving organic coating processes in which Class I liquids are processed or handled shall be ventilated at a rate of not less than 1 cfm/ft² $[(0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))]$ of solid floor area. Ventilation shall be accomplished by exhaust fans that intake at floor levels and discharge to a safe location outside the structure. Noncontaminated intake air shall be introduced in such a manner that all portions of solid floor areas are provided with continuous uniformly distributed air movement.

502.13 Public garages. Mechanical exhaust systems for public garages, as required in Chapter 4, shall operate continuously or in accordance with Section 404.

502.14 Motor vehicle operation. In areas where motor vehicles operate, mechanical ventilation shall be provided in accordance with Section 403. Additionally, areas in which stationary motor vehicles are operated shall be provided with a source capture system that connects directly to the motor vehicle exhaust systems.

Exceptions:

1. This section shall not apply where the motor vehicles being operated or repaired are electrically powered.
2. This section shall not apply to one- and two-family dwellings.
3. This section shall not apply to motor vehicle service areas where engines are operated inside the building only for the duration necessary to move the motor vehicles in and out of the building.

502.15 Repair garages. Where Class I liquids or LP-gas are stored or used within a building having a basement or pit wherein flammable vapors could accumulate, the basement or pit shall be provided with ventilation [at a minimum rate of 1.5 cubic feet per minute per square foot (cfm/ft²) $[(0.008 \text{ m}^3/(\text{s} \cdot \text{m}^2))]$] designed to prevent the accumulation of flammable vapors therein.

502.16 Repair garages for natural gas- and hydrogen-fueled vehicles. Repair garages used for the repair of natural gas- or hydrogen-fueled vehicles shall be provided with an approved mechanical ventilation system. The mechanical ventilation system shall be in accordance with Sections 502.16.1 and 502.16.2.

Exception: Where approved by the commissioner, natural ventilation shall be permitted in lieu of mechanical ventilation.

[F] 502.16.1 Design. Indoor locations shall be ventilated utilizing air supply inlets and exhaust outlets arranged to provide uniform air movement to the extent practical. Inlets shall

be uniformly arranged on exterior walls near floor level. Outlets shall be located at the high point of the room in exterior walls or the roof.

3. Ventilation shall be by a continuous mechanical ventilation system or by a mechanical ventilation system activated by a continuously monitoring natural gas detection system, or for hydrogen, a continuously monitoring flammable gas detection system, each activating at a gas concentration of [not more than] 25 percent of the lower flammable limit (LFL). In all cases, the system shall shut down the fueling system in the event of failure of the ventilation system.
4. The ventilation rate shall be at least 1 cubic foot per minute per 12 cubic feet $[(0.00138 \text{ m}^3/(\text{s} \cdot \text{m}^3))]$ of room volume.

502.16.2 Operation. The mechanical ventilation system shall operate continuously.

Exceptions:

1. Mechanical ventilation systems that are interlocked with a gas detection system designed in accordance with the *New York City Building Code*.
2. Mechanical ventilation systems in garages that are used only for the repair of vehicles fueled by liquid fuels or odorized gases, such as CNG, where the ventilation system is electrically interlocked with the lighting circuit.

502.17 Tire rebuilding or recapping. Each room where rubber cement is used or mixed, or where flammable or combustible solvents are applied, shall be ventilated in accordance with the applicable provisions of NFPA 91.

502.17.1 Buffing machines. Each buffing machine shall be connected to a dust-collecting system that prevents the accumulation of the dust produced by the buffing process.

502.18 Specific rooms. Specific rooms, including bathrooms, locker rooms, smoking lounges and toilet rooms, shall be exhausted in accordance with the ventilation requirements of Chapter 4.

502.19 Domestic kitchen exhaust systems. In all Group R occupancies a minimum of No. 18 Gage galvanized sheet metal shall be used, except that ductwork that complies with Section 603.6.1.2 shall be permitted for independent apartment exhaust systems providing general exhaust ventilation of kitchen and toilet areas.

502.20 Nonproduction chemical laboratories. Nonproduction chemical laboratories shall comply with Section [419] 424 of the *New York City Building Code* and NFPA 45.

502.21 Indoor firing ranges. Ventilation shall be provided in an approved manner in areas utilized as indoor firing ranges.

SECTION MC 503 MOTORS AND FANS

503.1 General. Motors and fans shall be sized to provide the required air movement. Motors in areas that contain flammable vapors or dusts shall be of a type approved for such environments. A manually operated remote control installed at an approved location shall be provided to shut off fans or blowers in flammable vapor or dust systems. Electrical equipment and appliances used in operations that generate explosive or flammable vapors, fumes or dusts shall be interlocked with the ventilation system so that the equipment and appliances cannot be operated unless the ventilation fans are in operation. Motors for fans used to convey flammable vapors or dusts shall be located outside the duct or shall be protected with approved shields and dustproofing. Motors and fans shall be provided with a means of access for servicing and maintenance.

503.2 Fans. Parts of fans in contact with explosive or flammable vapors, fumes or dusts shall be of nonferrous or nonsparking materials, or their casing shall be lined or constructed of such material. When the size and hardness of materials passing through a fan are capable of producing a spark, both the fan and the casing shall be of nonsparking materials. When fans are required to be spark resistant, their bearings shall not be within the airstream, and all parts of the fan shall be grounded. Fans in systems-handling materials that are capable of clogging the blades, and fans in buffing or woodworking exhaust systems, shall be of the radial-blade or tube-axial type.

503.3 Equipment and [appliances] appliance identification plate. Equipment and appliances used to exhaust explosive or flammable vapors, fumes or dusts shall bear an identification plate stating the ventilation rate for which the system was designed.

503.4 Corrosion-resistant fans. Fans located in systems conveying corrosives shall be of materials that are resistant to the corrosive or shall be coated with corrosion-resistant materials.

503.5 Fan location. Fans exhausting noxious, toxic, hot vapor or grease-laden air shall be located as close to the terminus as practicable, at the roof or within a mechanical equipment room, immediately below the roof.

Exception: Where the fan is listed or approved for such an application.

SECTION MC 504 CLOTHES DRYER EXHAUST

504.1 Installation. Clothes dryers shall be exhausted in accordance with the manufacturer's instructions. Dryer exhaust systems shall be independent of all other systems and shall convey the moisture and any products of combustion to the outside of the building. For the installation of gas dryers, refer to Section 614 of the *New York City Fuel Gas Code*.

Exception: This section shall not apply to listed and labeled condensing (ductless) electric clothes dryers.

504.2 Exhaust penetrations. Where a clothes dryer exhaust duct penetrates a wall or ceiling membrane, the annular space shall be sealed with noncombustible material, approved fire caulking or a noncombustible dryer exhaust duct wall receptacle. Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draftstopping or any wall, floor/ceiling or other assembly required by the *New York City Building Code* to be fire-resistance rated, unless such duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating is maintained in accordance with the *New York City Building Code*. Fire dampers, combination fire/smoke dampers and any similar devices that will obstruct the exhaust flow[,] shall be prohibited in clothes dryer exhaust ducts.

504.3 Cleanout. Each vertical riser shall be provided with a means for cleanout.

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building. [and] Single dryer installations shall be equipped with a backdraft damper. Multiple dryer installations shall not have a backdraft damper. Screens shall not be installed at the duct termination. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

504.5 Makeup air. Installations exhausting more than 200 cfm (0.09m³/s) shall be provided with makeup air. Where a closet is designed for the installation of a clothes dryer, an opening having an area of not less than 100 square inches (0.0645 m²) shall be provided in the closet enclosure or makeup air shall be provided by other approved means.

504.6 Domestic clothes dryer ducts. Exhaust ducts for domestic clothes dryers shall [be constructed of metal and shall have a smooth interior finish. The exhaust duct shall be a minimum nominal size of 4 inches (102 mm) in diameter. The entire exhaust system shall be supported and secured in place. The male end of the duct at overlapped duct joints shall extend in the direction of airflow. Clothes dryer transition ducts used to connect the appliance to the exhaust duct system shall be limited to single lengths not to exceed 8 feet (2438 mm) and shall be listed and labeled for the application. Transition ducts shall not be concealed within construction] conform to the requirements of Sections 504.6.1 through 504.6.7.

504.6.1 [Maximum length. The maximum length of a clothes dryer exhaust duct shall not exceed 25 feet (7620 mm) from the dryer location to the outlet terminal. The maximum length of duct shall be reduced 2¹/₂ feet (762 mm) for each 45-degree (0.79 rad) bend and 5 feet (1524 mm) for each 90-degree (1.6 rad) bend. The maximum length of the exhaust duct does not include the transition duct.] **Material and size.** Exhaust ducts shall have a smooth interior finish and shall be constructed of metal a minimum 0.016 inch (0.4 mm) thick. The exhaust duct size shall be 4 inches (102 mm) nominal in diameter.

Exception: Where the make and model of the clothes dryer to be installed is known and the manufacturer's installation instructions for such dryer are provided, the

maximum length of the exhaust duct, including any transition duct, shall be permitted to be in accordance with the dryer manufacturer's installation instructions.

504.6.2 [Rough-in required. Where a compartment or space for a domestic clothes dryer is provided, an exhaust duct system shall be installed in accordance with Sections 504.6 and 504.6.1.] **Duct installation.** Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude into the inside of the duct.

504.6.3 Transition ducts. Transition ducts used to connect the dryer to the exhaust duct system shall be a single length that is listed and labeled in accordance with UL 2158A. Transition ducts shall be a maximum of 8 feet (2438 mm) in length and shall not be concealed within construction.

504.6.4 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Section 504.6.4.1 or 504.6.4.2.

504.6.4.1 Specified length. The maximum length of the exhaust duct shall be 35 feet (10 668 mm) from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table 504.6.4.1.

**TABLE 504.6.4.1
DRYER EXHAUST DUCT FITTING EQUIVALENT LENGTH**

DRYER EXHAUST DUCT FITTING TYPE	EQUIVALENT LENGTH
4" radius mitered 45-degree elbow	2 feet 6 inches
4" radius mitered 90-degree elbow	5 feet
6" radius smooth 45-degree elbow	1 foot
6" radius smooth 90-degree elbow	1 foot 9 inches
8" radius smooth 45-degree elbow	1 foot
8" radius smooth 90-degree elbow	1 foot 7 inches
10" radius smooth 45-degree elbow	9 inches
10" radius smooth 90-degree elbow	1 foot 6 inches

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 degree = 0.0175 rad.

504.6.4.2 Manufacturer's instructions. The maximum length of the exhaust duct shall be determined by the dryer manufacturer's installation instructions. The code official shall be provided with a copy of the installation instructions for the make and model of

the dryer. Where the exhaust duct is to be concealed, the installation instructions shall be provided to the code official prior to the concealment inspection. In the absence of fitting equivalent length calculations from the clothes dryer manufacturer, Table 504.6.4.1 shall be used.

504.6.5 Length identification. Where the exhaust duct is concealed within the building construction, the equivalent length of the exhaust duct shall be identified on a permanent label or tag. The label or tag shall be located within 6 feet (1829 mm) of the exhaust duct connection.

504.6.6 Exhaust duct required. Where space for a clothes dryer is provided, an exhaust duct system shall be installed. Where the clothes dryer is not installed at the time of occupancy, the exhaust duct shall be capped at the location of the future dryer.

Exception: Where a listed condensing clothes dryer is installed prior to occupancy of structure.

504.6.7 Protection required. Protective shield plates shall be placed where nails or screws from finish or other work are likely to penetrate the clothes dryer exhaust duct. Shield plates shall be placed on the finished face of all framing members where there is less than 1¹/₄ inches (32 mm) between the duct and the finished face of the framing member. Protective shield plates shall be constructed of steel, have a thickness of 0.062 inch (1.6 mm) and extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

504.7 Commercial clothes dryers. The installation of dryer exhaust ducts serving Type 2 clothes dryers shall comply with the appliance manufacturer's installation instructions. Exhaust fan motors installed in exhaust systems shall be located outside of the airstream. In multiple installations, the fan shall operate continuously or be interlocked to operate when any individual unit is operating. Ducts shall have a minimum clearance of 6 inches (152 mm) to combustible materials. Clothes dryer transition ducts used to connect the appliance to the exhaust duct system shall be limited to single lengths not to exceed 8 feet (2438 mm) in length and shall be listed and labeled for the application. Transition ducts shall not be concealed within construction.

504.8 Common exhaust systems for clothes dryers located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of the system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the *New York City Building Code*.
2. Dampers shall be prohibited in the exhaust duct.
3. Rigid metal ductwork shall be installed within the shaft to convey the exhaust. The ductwork shall be constructed of sheet steel having a minimum thickness of 0.0187 inch

(0.47 mm) (No. 26 gage) and in accordance with SMACNA Duct Construction Standards.

4. Exhaust ducts 20 square inches or less connected into dryer exhaust shafts shall not require fire dampers when the exhaust fan runs continuously. Exhaust ducts greater than 20 square inches shall not be connected into a common shaft with other laundry exhausts.
5. The exhaust fan motor design shall be in accordance with Section 503.2.
6. The exhaust fan motor shall be located outside of the airstream.
7. The exhaust fan shall run continuously, and shall be connected to a standby power source, where a building standby power source is required per the *New York City Building Code*.
8. Exhaust fan operation shall be monitored in an approved location and shall initiate an audible or visual signal when the fan is not in operation.
9. Makeup air shall be provided for the exhaust system.
10. A cleanout opening shall be located at the base of the shaft and all offsets to provide access to the duct to allow for cleaning and inspection. The finished opening shall be not less than 12 inches by 12 inches (305 mm by 305 mm).
11. Screens shall not be installed at the termination.

SECTION MC 505 DOMESTIC KITCHEN EQUIPMENT EXHAUST

505.1 Domestic systems. Where domestic range hoods and domestic appliances equipped with downdraft exhaust are located within dwelling units, such hoods and appliances shall discharge to the outdoors through ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls and shall be air tight and equipped with a backdraft damper. Such exhaust system shall be installed in strict compliance with the manufacturer's recommendations as well as the requirements of the listing.

Exceptions:

1. Where installed in accordance with the manufacturer's installation instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.

2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
 - 2.1. The duct shall be installed under a concrete slab poured on grade.
 - 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
 - 2.3. The PVC duct shall extend not greater than 1 inch (25 mm) above the indoor concrete floor surface.
 - 2.4. The PVC duct shall extend not greater than 1 inch (25 mm) above grade outside of the building.
 - 2.5. The PVC ducts shall be solvent cemented.

505.2 Makeup air required. Exhaust hood systems capable of exhausting in excess of 400 cfm (0.19 m³/s) shall be provided with makeup air at a rate in accordance with Table 403.3. Such makeup air systems shall be equipped with a means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system.

SECTION MC 506 COMMERCIAL KITCHEN HOOD VENTILATION SYSTEM DUCTS AND EXHAUST EQUIPMENT

506.1 General. Commercial kitchen hood ventilation ducts and exhaust equipment shall comply with the requirements of this section. Commercial kitchen grease ducts shall be designed for the type of cooking appliance and hood served. All ducts shall lead directly to the exterior of the building and terminate as required by Section 506.3.12 for Type 1 hoods and Section 506.4.2 for Type II hoods.

506.2 Corrosion protection. Ducts exposed to the outside atmosphere or subject to a corrosive environment shall be protected against corrosion in [an approved manner] accordance with the following.

- [1. The exterior portion of the ductwork shall be vertical wherever possible and shall be installed and adequately supported on the exterior of a building. Bolts, screws, rivets, and other mechanical fasteners shall not penetrate duct walls. Clearance of any vertical or horizontal ducts to any other material or construction shall comply with Section 506.3.6 and to any additional clearance requirements as may be applicable in accordance with Section 506.5.4.]
- [2. All exterior ducts shall be constructed of stainless steel not less than 0.043-inch (1.09 mm) (No. 18 Gage) in thickness.] 1. At the base of each duct and at its termination point a

clearly identifiable permanent sign shall be installed identifying the facility from which the duct [4]originates. All exterior ducts shall be protected on the exterior by paint or other weatherproof protective coating. Stainless steel ducts shall not require paint or weatherproof protective coating.

- [3.] 2. No portion of an exterior metal duct shall be nearer than 24 inches (610 mm) to any door or window or to any exit, or located where it would be readily accessible to the public, unless it is insulated or shielded to avoid injury to any person coming in contact with the duct.

Exception: Listed and labeled factory-built commercial kitchen grease ducts may be used when installed in accordance with Section 304.1.

506.3 Ducts serving Type I hoods. Type I exhaust ducts shall be independent of all other exhaust systems except as provided in Section 506.3.5. Commercial kitchen duct systems serving Type I hoods shall be designed, constructed and installed in accordance with Sections 506.3.1 through 506.3.12.3.

506.3.1 Duct materials. Ducts serving Type I hoods shall be constructed of materials in accordance with Sections 506.3.1.1 and 506.3.1.2.

506.3.1.1 Grease duct materials. Grease ducts serving Type I hoods, and located within buildings, shall be constructed as follows:

1. Ducts with a cross-sectional area up to and including 155 square inches (100 000 mm²) shall be constructed of 0.0598-inch (1.52 mm) No. 16 Gage steel;
2. Ducts with a cross-sectional area over 155 square inches (100 000 mm²), but not more than 200 square inches (0.129 m²) shall be constructed of 0.074-inch (1.9 mm) No. 14 Gage steel; and
3. Ducts with a cross-sectional area equal to or more than 200 square inches (0.129 m²) shall be constructed of 0.1046-inch (2.66 mm) No. 12 Gage steel.

If stainless steel is used for ducts of any of the cross-sectional areas [shown] listed above, the Gage steel may be increased upwards (resulting in a smaller thickness) by 1 even Gage size.

Exception: Listed and labeled factory-built commercial kitchen grease ducts shall be listed and labeled in accordance with UL 1978 and installed in accordance with Section 304.1 and as approved by the commissioner.

506.3.1.2 Makeup air ducts. Make up air ducts connecting to or within 18 inches (457 mm) of a Type I hood shall be constructed and installed in accordance with Sections 603.1, 603.3, 603.4, 603.9, 603.10, and 603.12. Duct insulation installed within 18

inches (457 mm) of a Type I hood shall be noncombustible or shall be listed for the application.

506.3.2 Joints, seams and penetrations of grease ducts. Joints, seams and penetrations of grease ducts shall be made with a continuous liquid-tight weld or braze made on the external surface of the duct system.

Exceptions:

1. Penetrations shall not be required to be welded or brazed where sealed by devices that are listed for the application.
2. Internal welding or brazing shall not be prohibited provided that the joint is formed or ground smooth and is provided with ready access for inspection.
3. [Listed and labeled factory] Factory-built commercial kitchen grease ducts listed and labeled in accordance with UL 1978 and installed in accordance with Section 304.1.

506.3.2.1 Duct joint types. Duct joints shall be butt joints, welded flange joints with a maximum flange depth of ½ inch (12.7 mm) or overlapping duct joints of either the telescoping or bell type. Overlapping joints shall be installed to prevent ledges and obstructions from collecting grease or interfering with gravity drainage to the intended collection point. The difference between the inside cross-sectional dimensions of overlapping sections of duct shall not exceed [0.25] ¼ inch (6.4 mm). The length of overlap for overlapping duct joints shall not exceed 2 inches (51 mm).

506.3.2.2 Duct-to-hood joints. Duct-to-hood joints shall be made with continuous internal or external liquid-tight welded or brazed joints. Such joints shall be smooth, accessible for inspection, and without grease traps.

Exceptions: This section shall not apply to:

1. A vertical duct-to-hood collar connection made in the top plane of the hood in accordance with all of the following:
 - 1.1. The hood duct opening shall have a 1-inch-deep (25 mm), full perimeter, welded flange turned down into the hood interior at an angle of 90 degrees (1.57 rad) from the plane of the opening.
 - 1.2. The duct shall have a 1-inch-deep (25 mm) flange made by a 1-inch by 1-inch (25 mm by 25mm) angle iron welded to the full perimeter of the duct not less than 1 inch (25 mm) above the bottom end of the duct.
 - 1.3. A gasket rated for use at not less than 1,500°F (815°C) is installed between the duct flange and the top of the hood.

1.4. The duct-to-hood joint shall be secured by stud bolts not less than [0.25] $\frac{1}{4}$ inch (6.4 mm) in diameter welded to the hood with a spacing not greater than 4 inches (102 mm) on center for the full perimeter of the opening. All bolts and nuts are to be secured with lockwashers.

2. Listed and labeled duct-to-hood collar connections installed in accordance with Section 304.1.

506.3.2.3 Duct-to-exhaust fan connections. Duct-to-exhaust fan connections shall be flanged and gasketed at the base of the fan for vertical discharge fans; shall be flanged, gasketed and bolted to the inlet of the fan for side-inlet utility fans; and shall be flanged, gasketed and bolted to the inlet and outlet of the fan for in-line fans. Approved flexible connectors may be provided.

506.3.2.4 Vibration isolation. A vibration isolation connector for connecting a duct to a fan shall consist of noncombustible packing in a metal sleeve joint of approved design or shall be a coated-fabric flexible duct connector listed and labeled for the application. Vibration isolation connectors shall be installed only at the connection of a duct to a fan inlet or outlet.

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The duct installer shall be responsible for providing the necessary equipment and performing the grease duct leakage test. A duct leakage test, in accordance with this section, shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested.

To determine the tightness of the grease duct construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The test shall be performed in the presence of the special inspector.

2. The grease duct shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs. A static pressure equal to or not less than 2" wg shall be maintained throughout the test. The test shall be applied for a length of time sufficient to permit the inspection of the grease duct.

3. If the test shows any evidence of leakage or other defects, such defects shall be corrected in accordance with the requirements of this chapter, and the test shall be repeated until there is no visible smoke observed.

506.3.3 Grease duct supports. Grease duct bracing and supports shall be of noncombustible material securely attached to the structure and designed to carry gravity

and seismic loads within the stress limitations of the *New York City Building Code*. Bolts, screws, rivets and other mechanical fasteners shall not penetrate duct walls.

506.3.4 Air velocity. Grease duct systems serving a Type I hood shall be designed and installed to provide an air velocity within the duct system of not less than 500 feet per minute ([2.54] 2.5 m/s).

Exception: The velocity limitations shall not apply within duct transitions utilized to connect ducts to differently sized or shaped openings in hoods and fans, provided that such transitions do not exceed 3 feet (914 mm) in length and are designed to prevent the trapping of grease.

506.3.5 Separation of grease duct system. A separate grease duct system shall be provided for each Type I hood.

Exceptions:

1. A separate grease duct system is not required where all of the following conditions are met:
 - 1.1. All interconnected hoods are located within the same story, provided that they are part of the same facility and under the control of one owner or tenant.
 - 1.2. All interconnected hoods are located within the same room or in adjoining rooms, provided that they are part of the same facility and under the control of one owner or tenant.
 - 1.3. Interconnecting ducts do not penetrate assemblies required to be fire-resistance rated.
 - 1.4. The grease duct system does not serve solid fuel-fired appliances.
2. Branch ducts from other equipment in the same kitchen area, [for which hoods and filters are not required] or from registers exhausting the kitchen space in general, may be connected to the main hood exhaust duct if the following requirements are complied with:
 - 2.1. A fusible link fire damper of the same gage as the hood exhaust duct shall be added at the point of connection of the branch duct to the exhaust duct.
 - 2.2. If the branch connection is made to the portion of the ductwork that will contain the fire-extinguishing medium, then the fire dampers required in Exception [Item] 2.1 shall be arranged to close automatically upon the operation of the fire-extinguishing system.

- 2.3. The branch connection shall be made in either the top or sides of the main duct in a manner to prevent grease from flowing into the branch duct.
- 2.4. The branch ducts shall be constructed of steel, aluminum, or copper of the gages and weights required in Chapter 6, and they shall be insulated with 2 inches (51 mm) of magnesia or other material having equivalent insulative and fire resistance qualities.
- 2.5. All registers in these branches shall have fusible link actuated dampers.
- 2.6. Where branch ductwork is to be used to exhaust vapors from dishwashers, pot sinks, or other similar equipment of a commercial type from which moisture is emitted, copper or aluminum of the minimum gage and weights required in Chapter 6 shall be used. Such ductwork shall be installed so that condensate cannot leak from it.
- 2.7 Type I and Type II exhaust systems can be interconnected downstream of filters with a fire damper at the connection to the exhaust system.

506.3.6 Grease duct clearances. [Grease] Where enclosures are not required, grease duct systems and exhaust equipment serving a Type I hood shall have a clearance to combustible construction of not less than 18 inches (457 mm), and shall have a clearance to noncombustible construction and gypsum wallboard attached to noncombustible structures of not less than 3 inches (76 mm).

Exceptions:

1. [Listed and labeled factory] For factory-built commercial kitchen grease ducts [and exhaust equipment installed in accordance with Section 304.1 and the manufacturer's instructions] listed and labeled in accordance with UL 1978, the required clearance shall be in accordance with the listing of such material and as approved by the commissioner.
2. Listed and labeled exhaust equipment installed in accordance with Section 304.1.
3. Where commercial kitchen grease ducts are continuously covered on all sides with a listed and labeled field-applied grease duct enclosure material, system, product or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336, the required clearance shall be in accordance with the listing of such material, system, product or method.
- [2] 4. [Protected] Grease ducts protected with a minimum insulation covering of 2 inches (51 mm) of magnesium or calcium silicate block, with staggered joints, attached with galvanized steel wire or material assembly equivalent in insulating and fire-resistant qualities which cannot be penetrated by grease.

Such protection shall be applied to all ducts inside of the building as approved by the commissioner.

506.3.7 Prevention of grease accumulation in grease ducts. Duct systems serving a Type I hood shall be constructed and installed so that grease cannot collect in any portion thereof, and the system shall slope not less than one-fourth unit vertical in 12 units horizontal (2-percent slope) toward the hood or toward an approved grease reservoir. Where horizontal ducts exceed 75 feet (22 860 mm) in length, the slope shall not be less than one unit vertical in 12 units horizontal (8.3-percent slope). Dampers shall not be installed in the grease duct systems, except as required by Section 506.3.5, Exception [Item] 2.

506.3.7.1 Residue trap. A residue trap shall be provided at the base of each vertical riser with provision for cleanout in accordance with NFPA 96.

506.3.8 Grease duct cleanouts and other openings. Grease duct systems shall not have openings therein other than those required for proper operation and maintenance of the system. Any portion of such system having sections not provided with access from the duct entry or discharge shall be provided with cleanout openings. Cleanout openings shall be provided at every change indirection, within 3 feet (914 mm) of the exhaust fan, and as required under Section 506.3.9. Cleanout openings shall be equipped with tight-fitting doors constructed of steel having a thickness not less than that required for the duct. Doors shall be equipped with a substantial method of latching, sufficient to hold the door tightly closed. Doors shall be designed so that they are operable without the use of a tool. Door assemblies shall have a gasket or sealant that is noncombustible and liquid tight, and shall not have fasteners that penetrate the duct. Listed and labeled access door assemblies shall be installed in accordance with the terms of the listing. Signage shall be provided at all required access doors and openings in accordance with Section 506.3.11.

506.3.8.1 Personnel entry. Where ductwork is large enough to allow entry of personnel, not less than one approved or listed opening having dimensions not less than [20] 22 inches by 20 inches ([508] 559 mm by 508 mm) shall be provided in the horizontal sections, and in the top of vertical risers. Where such entry is provided, the duct and its supports shall be capable of supporting the additional load and the cleanouts specified in Section 506.3.8 are not required. Where personnel entry is not possible[, access] for cleaning the interior of vertical ducts [shall be provided on each floor, and], suitable provisions shall be made to clean the vertical duct in its entirety as well as for cleaning the base of the vertical riser.

506.3.8.2 Cleanouts serving in-line fans. A suitable cleanout shall be provided for both the inlet side and outlet side of an in-line fan except where a duct does not connect to the fan. Such cleanouts shall be located within 3 feet (914 mm) of the fan duct connections to permit a thorough cleaning of the inlet and discharge ducts connected to the in-line fan as well as the interior of the fan itself.

Exception: Where suitable cleanouts for in-line fans cannot be provided, the in-line fan shall be of “clam shell” construction which shall permit the fan to be opened and thoroughly cleaned while remaining in place.

506.3.9 Grease duct horizontal cleanouts. Cleanouts located on horizontal sections of ducts shall be spaced not more than 20 feet (6096 mm) apart, unless the opening prescribed by Section 506.3.8.1 is not possible, in which case openings large enough to permit thorough cleaning shall be provided at 12-foot (3658 mm) intervals. The cleanouts shall be located on the side of the duct with the opening not less than 1.5 inches (38 mm) above the bottom of the duct, and not less than 1 inch (25 mm) below the top of the duct. The opening minimum dimensions shall be 12 inches (305 mm) on each side. Where the dimensions of the side of the duct prohibit the cleanout installation prescribed herein, the openings shall be on the top of the duct or the bottom of the duct. Where located on the top of the duct, the opening edges shall be a minimum of 1 inch (25 mm) from the edges of the duct. Where located in the bottom of the duct, cleanout openings shall be designed to provide internal damming around the opening, shall be provided with gasketing to preclude grease leakage, shall provide for drainage of grease down the duct around the dam and shall be approved for the application. Where the dimensions of the sides, top or bottom of the duct preclude the installation of the prescribed minimum-size cleanout opening, the cleanout shall be located on the duct face that affords the largest opening dimension and shall be installed with the opening edges at the prescribed distances from the duct edges as previously set forth in this section.

506.3.10 Grease duct enclosure. A grease duct serving a Type I hood that penetrates a ceiling, wall or floor shall be enclosed from the first point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *New York City Building Code*. [Ducts shall be enclosed in accordance with the *New York City Building Code* requirements for shaft construction. The duct enclosure shall be sealed around the duct at the point of penetration and vented to the outside of the building through the use of weather-protected openings. Clearance from the duct to the interior surface of enclosures of combustible construction shall be not less than 18 inches (457 mm). Clearance from the duct to the interior surface of enclosures of noncombustible construction or gypsum wallboard attached to noncombustible structures shall be not less than 6 inches (152 mm). The duct enclosure shall serve a single grease exhaust duct system and shall not contain any other ducts, piping, wiring or systems.] The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be either field-applied or factory-built. Duct enclosures shall have a fire-resistance rating not less than that of the fire-resistance rated assembly penetrated, but need not exceed 2 hours. Duct enclosures shall be as prescribed by Section 506.3.10.1, 506.3.10.2 or 506.3.10.3.

506.3.10.1 Shaft enclosure. Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be permitted to be enclosed in accordance with the *New York City Building Code* requirements for shaft construction. Such grease duct systems and exhaust equipment shall have a clearance to combustible construction of not less than 18 inches (457 mm), and shall have a clearance to noncombustible construction and

gypsum wallboard attached to noncombustible structures of not less than 6 inches (152 mm). Duct enclosures shall be sealed around the duct at the point of penetration and vented to the outside of the building through the use of weather-protected openings.

Exceptions:

1. The shaft enclosure provisions of this section shall not be required where a duct penetration is protected with a through-penetration firestop system classified in accordance with ASTM E 814 and having an [.]“F” and [.]“T”[.] rating equal to the fire-resistance rating of the assembly being penetrated and where the surface of the duct is continuously covered on all sides from the point at which the duct penetrates a ceiling, wall or floor to the outlet terminal with a classified and labeled material, system, method of construction or product specifically evaluated for such purpose, which material, system, method of construction or product is approved by the commissioner and installed according to the manufacturer’s instructions. Exposed duct wrap systems shall be protected where subject to physical damage.
2. As an alternative to Exception [Item] 1 of this section, a minimum insulation covering of 2 inches (51 mm) of magnesium or calcium silicate block, with staggered joints, attached with galvanized steel wire or material assembly equivalent in insulating and fire-resistant qualities which cannot be penetrated by grease, and as approved by the commissioner, shall be applied to all ducts inside of the building.
3. A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.
4. A listed and labeled factory-built commercial kitchen grease duct system, evaluated as an enclosure system for reduced clearances to combustibles, and approved by the commissioner and installed according to manufacturer’s instructions.

506.3.10.2 Field-applied grease duct enclosure. Commercial kitchen grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by a field-applied grease duct enclosure that is a listed and labeled material, system, product or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall be protected with a through-penetration firestop system classified in accordance with ASTM E 814 or UL 1479 and having an “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated. Such systems shall be installed in accordance with the listing and the manufacturer’s installation instructions. Exposed duct wrap systems shall be protected where subject to physical damage.

506.3.10.3 Factory-built grease duct assemblies. Factory-built grease duct assemblies incorporating integral enclosure materials shall be listed and labeled for use as commercial

kitchen grease duct assemblies in accordance with UL 2221. Duct penetrations shall be protected with a through-penetration firestop system classified in accordance with ASTM E 814 or UL 1479 and having an “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated. Such assemblies shall be installed in accordance with the listing and the manufacturer’s installation instructions.

506.3.10.4 Duct enclosure not required. A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.

506.3.11 Grease duct fire-resistive access opening. Where cleanout openings are located in ducts within a fire-resistance-rated enclosure, access openings shall be provided in the enclosure at each cleanout point. Access openings shall be equipped with tight-fitting sliding or hinged doors that are equal in fire-resistive protection to that of the shaft or enclosure. An approved sign shall be placed on access opening panels with wording as follows: “ACCESS PANEL. DO NOT OBSTRUCT.” Cleanout openings provided in ducts that are not located within a fire-resistance-rated enclosure shall be provided with sign- age at the required opening that contains the same wording.

506.3.12 Exhaust outlets serving Type I hoods. Exhaust outlets for grease ducts serving Type I hoods shall conform to the requirements of Sections 506.3.12.1 through 506.3.12.3.

506.3.12.1 Termination above the roof. Exhaust outlets that terminate above the roof shall have the discharge opening located not less than 40 inches (1016 mm) above the roof surface. The exhaust flow shall be directed away from the surface of the roof.

506.3.12.2 Termination through an exterior wall. Exhaust outlets shall be permitted to terminate through exterior walls where the smoke, grease, gases, vapors[,] and odors in the discharge from such terminations do not create a public nuisance or a fire hazard. Such terminations shall not be located where protected openings are required by the *New York City Building Code*. Other exterior openings shall not be located within 3 feet (914 mm) of such terminations.

506.3.12.3 Termination location. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from parts of the same or contiguous buildings, adjacent buildings and adjacent property lines and [air intake openings into any building and] shall be located not less than 10 feet (3048 mm) above the adjoining grade level. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from and not less than 3 feet (914 mm) above air intake openings into any building.

Exception: Exhaust outlets shall terminate not less than 5 feet (1524 mm) from parts of the same or contiguous building, an adjacent building, adjacent property line and air intake openings into a building where air from the exhaust outlet discharges away from such locations.

506.4 Ducts serving Type II hoods. Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems. Commercial kitchen exhaust systems serving Type II hoods shall comply with Sections 506.4.1 and 506.4.2.

[506.4.1 Type II exhaust outlets. Exhaust outlets for ducts serving Type II hoods shall comply with Sections 401.5 and 401.5.2. Such outlets shall be protected against local weather conditions and shall meet the provisions for exterior wall opening protectives in accordance with the *New York City Building Code*.

506.4.2] 506.4.1 Ducts. Ducts and plenums serving Type II hoods shall be constructed of rigid metallic materials. Duct construction, installation, bracing and supports shall comply with Chapter 6. Ducts subject to positive pressure and ducts conveying moisture-laden or waste-heat-laden air shall be constructed, joined and sealed in an approved manner.

506.4.2 Type II terminations. Exhaust outlets serving Type II hoods shall terminate in accordance with the hood manufacturer's installation instructions and shall comply with all of the following:

1. Exhaust outlets shall terminate not less than 3 feet (914 mm) in any direction from openings into the building.
2. Outlets shall terminate not less than 10 feet (3048 mm) from property lines or buildings on the same lot.
3. Outlets shall terminate not less than 10 feet (3048 mm) above grade.
4. Outlets that terminate above a roof shall terminate not less than 30 inches (762 mm) above the roof's surface.
5. Outlets shall terminate not less than 30 inches (762 mm) from exterior vertical walls.
6. Outlets shall be protected against local weather conditions.
7. Outlets shall not be directed onto walkways.
8. Outlets shall be in accordance with the provisions for exterior wall opening protectives in the *New York City Building Code*.

506.4.2.1 Cooking spaces. For all buildings other than those classified as residential occupancy, a minimum of No. 16 Gage for galvanized sheet duct shall be used for nongrease duct exhaust applications.

506.5 Exhaust equipment. Exhaust equipment, including fans and grease reservoirs, shall comply with Section 506.5.1 through 506.5.5 and shall be of an approved design or shall be listed for the application.

506.5.1 Exhaust fans. Exhaust fan housings serving a Type I hood shall be constructed as required for grease ducts in accordance with Section 506.3.1.1.

Exception: Fans listed and labeled in accordance with UL 762.

506.5.1.1 Fan motor. Exhaust fan motors shall be located outside of the exhaust airstream.

506.5.2 Exhaust fan discharge. Exhaust fans shall be positioned so that the discharge will not impinge on the roof, other equipment or appliances or parts of the structure. A vertical discharge fan serving a Type 1 hood shall be manufactured with an approved drain outlet at the lowest point of the housing to permit drainage of grease to an approved grease reservoir.

506.5.3 Exhaust fan mounting. An upblast fan shall be hinged and supplied with a flexible weatherproof electrical cable to permit inspection and cleaning. The ductwork shall extend a minimum of 18 inches (457 mm) above the roof surface.

[506.5.4 Clearances. Exhaust equipment serving a Type I hood shall have a clearance to combustible construction of not less than 18 inches (457 mm).

Exception: Factory-built exhaust equipment installed in accordance with Section 304.1 and listed for a lesser clearance.]

506.5.4 Reserved.

506.5.5 Termination location. The outlet of exhaust equipment serving Type I hoods, shall be in accordance with Section [506.3.12.3] 506.3.12.

Exception: The minimum horizontal distance between vertical discharge fans and parapet-type building structures shall be 2 feet (610 mm) provided that such structures are not higher than the top of the fan discharge opening.

506.5.6 Exhaust fan operation. The operation of the exhaust fan shall be in accordance with the following requirements:

1. The hood exhaust fan(s) shall continue to operate after the [exhausting] extinguishing system has been activated unless fan shutdown is required by a listed component of the ventilation system or by the design of the extinguishing system.
2. The hood exhaust fan shall not be required to start automatically upon activation of the extinguishing system if the exhaust fan and all cooking equipment served by the fan have previously been shut down.

3. The cooking appliances shall be interlocked with the exhaust hood system to prevent appliance operation when the exhaust hood system is not operating.

506.6 Exterior duct installations. The installation of exterior ducts shall comply with the following requirements:

1. The exterior portion of the ductwork shall be vertical wherever possible and shall be installed and supported on the exterior of a building.
2. Bolts, screws, rivets, and other mechanical fasteners shall not penetrate duct walls.
3. Clearance of any ducts shall comply with Section 506.3.6.
4. All ducts shall be protected on the exterior by paint or other suitable weather-protective coating.
5. Ducts constructed of stainless steel shall not be required to have additional paint or weather-protective coatings.
6. Ductwork subject to corrosion shall have minimal contact with the building surface.

506.7 Identification of ducts. All duct systems serving Type I and Type II exhaust equipment shall be permanently labeled: “CAUTION: KITCHEN EXHAUST SYSTEM.”

[**506.8 Type I and Type II hoods.** All exhaust ducts serving Type I or II hoods shall have a minimum insulation covering of 2 inches (51 mm) of magnesium or calcium silicate block, attached with galvanized steel wire or construction equivalent in insulating and fire-resistance qualities, and shall be applied to all ducts inside of the building. The insulation shall be applied up to the outer face of the discharge from the building and shall also be applied to the housing of the exhaust fan when it is located inside of the building. Care shall be taken to insure that the insulation extends through the walls and roofs to separate the ducts from the building construction. Masonry or concrete ducts shall not require insulation.]

SECTION MC 507 COMMERCIAL KITCHEN HOODS

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or Type II and shall be designed to capture and confine cooking vapors and residues. Commercial kitchen exhaust hood systems shall operate at all times while cooking equipment is in operation. For additional interlock requirements pertaining to gas appliances, refer to Section 505.1 of the *New York City Fuel Gas Code*.

Exceptions:

1. Factory-built commercial exhaust hoods which are tested in accordance with UL 710, listed, labeled and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.7, 507.11, 507.12, 507.13, 507.14 and 507.15.
2. Hoods used with electric cooking equipment shall be in accordance with UL 710B and have a grease removal and fire suppression system.
3. Net exhaust volumes for hoods shall be permitted to be reduced during [no] part-load cooking conditions, where engineered or listed multispeed or variable-speed controls automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall not be below that required to maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode.

507.2 Where required. A Type I or Type II hood shall be installed at or above all commercial cooking appliances in accordance with Sections 507.2.1 and 507.2.2. Where any cooking appliance at or under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.

507.2.1 Type I hoods. Type I hoods shall be installed where cooking appliances produce grease or smoke[, such as occurs with griddles, fryers, broilers, ovens, ranges and wok ranges]. Type I hoods shall be installed over medium-duty, heavy-duty and extra-heavy-duty cooking appliances. Type I hoods shall be installed over light-duty cooking appliances that produce grease or smoke.

507.2.1.1 Operation. Type I hood systems shall be designed and installed to automatically activate the exhaust fan whenever cooking operations occur. The activation of the exhaust fan shall occur through an interlock with the cooking appliances, by means of heat sensors or by means of other approved methods. Commercial cooking appliances equipped with integral down draft exhaust shall meet the requirements of Section 507.2

507.2.2 Type II hoods. Type II hoods shall be installed [where cooking or dishwashing] above dishwashers and light-duty appliances that produce heat or [steam] moisture and do not produce grease or smoke, [such as steamers, kettles, pasta cookers and dishwashing machines.] except where the heat and moisture loads from such appliances are incorporated into a separate removal system. Type II hoods shall be installed above all light-duty appliances that produce products of combustion and do not produce grease or smoke. Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual appliance that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m²). Type II hoods or heat and water exhaust systems installed in accordance with the manufacturer's recommendations are required for commercial dishwashers and pot washer equipment.

[Exceptions:

1. Under-counter-type commercial dishwashing machines.
2. A Type II hood is not required for dishwashers and potwashers that are provided with heat and water vapor exhaust systems that are supplied by the appliance manufacturer and are installed in accordance with the manufacturer's instructions.]

507.2.3 Domestic cooking appliances used for commercial purposes. Domestic cooking appliances utilized for commercial purposes shall be provided with Type I or Type II hoods as required for the type of appliances and processes in accordance with Sections 507.2, 507.2.1 and 507.2.2.

507.2.4 [Solid fuel] Extra-heavy-duty. Type I hoods for use over [solid fuel-burning] extra-heavy-duty cooking appliances shall not cover heavy-, medium- or light-duty appliances. Such hoods shall discharge to an exhaust system that is independent of other exhaust systems.

507.3 Fuel-burning appliances. Where vented fuel-burning appliances are located in the same room or space as the hood, provisions shall be made to prevent the hood system from interfering with normal operation of the appliance vents.

507.4 Type I materials. Type I hoods shall be constructed of steel [not less than] having a minimum thickness of [0.043] 0.0466 inch ([1.09] 1.18 mm) (No. 18 [MSG] in thickness,) gage) or stainless steel not less than [0.037] 0.0335 inch ([0.94] 0.8525 mm) (No. 20 MSG) in thickness.

507.5 Type II hood materials. Type II hoods shall be constructed of steel [not less than] having a minimum thickness of [0.030] 0.0296 inch ([0.76] 0.7534 mm) (No. 22 [Gage] in thickness,) gage) or stainless steel not less than [0.024] 0.0220 inch ([0.61] 0.5550 mm) (No. 24 [Gage] gage) in thickness, copper sheets weighing not less than 24 ounces per square foot (7.3 kg/m²)[,] or of other approved material and gage.

507.6 Supports. Type I hoods shall be secured in place by noncombustible supports. All Type I and Type II hood supports shall be adequate for the applied load of the hood, the unsupported ductwork, the effluent loading[,], and the possible weight of personnel working in or on the hood.

507.7 Hood joints, seams and penetrations. Hood joints, seams and penetrations shall comply with Sections 507.7.1 and 507.7.2.

507.7.1 Type I hoods. External hood joints, seams and penetrations for Type I hoods shall be made with a continuous external liquid-tight weld or braze to the lowest outermost perimeter

of the hood. Internal hood joints, seams, penetrations, filter support frames[,] and other appendages attached inside the hood shall not be required to be welded or brazed but shall be otherwise sealed to be grease tight.

Exceptions:

1. Penetrations shall not be required to be welded or brazed where sealed by devices that are listed for the application.
2. Internal welding or brazing of seams, joints[,] and penetrations of the hood shall not be prohibited provided that the joint is formed smooth or ground so as to not trap grease, and is readily cleanable.

507.7.2 Type II hoods. Joints, seams and penetrations for Type II hoods shall be constructed as set forth in Chapter 6, shall be sealed on the interior of the hood and shall provide a smooth surface that is readily cleanable and water tight.

507.8 Cleaning and grease gutters. A hood shall be designed to provide for thorough cleaning of the entire hood. Grease gutters shall drain to an approved collection receptacle that is fabricated, designed and installed to allow access for cleaning.

507.9 Clearances for Type I hood. A Type I hood shall be installed with a clearance to combustibles of not less than 18 inches (457 mm).

Exception: Clearance shall not be required from gypsum wallboard or 1/2-inch (12.7 mm) or thicker cementitious wallboard attached to noncombustible structures provided that a smooth, cleanable, nonabsorbent and noncombustible material is installed between the hood and the gypsum or cementitious wallboard over an area extending not less than 18 inches (457 mm) in all directions from the hood.

507.10 Hoods penetrating a ceiling. Type I hoods or portions thereof penetrating a ceiling, wall or furred space shall comply with all the requirements of Section 506.3.10.

507.11 Grease filters. Type I hoods shall be equipped with UL 1046 listed grease filters designed for the specific purpose. Grease-collecting equipment shall be provided with access for cleaning. The lowest edge of a grease filter located above the cooking surface shall be not less than the height specified in Table 507.11.

**TABLE 507.11
MINIMUM DISTANCE BETWEEN THE LOWEST EDGE OF A
GREASE FILTER AND THE COOKING SURFACE OR THE
HEATING SURFACE**

TYPE OF COOKING APPLIANCES	HEIGHT ABOVE COOKING SURFACE (feet)
Without exposed flame	0.5
Exposed flame and burners	2
Exposed charcoal and charbroil type	3.5

For SI: 1 foot = 304.8 mm.

507.11.1 Criteria. Filters shall be of such size, type and arrangement as will permit the required quantity of air to pass through such units at rates not exceeding those for which the filter or unit was designed or approved. Filter units shall be installed in frames or holders so as to be readily removable without the use of separate tools, unless designed and installed to be cleaned in place and the system is equipped for such cleaning in place. Removable filter units shall be of a size that will allow them to be cleaned in a dishwashing machine or pot sink. Filter units shall be arranged in place or provided with drip-intercepting devices to prevent grease or other condensate from dripping into food or on food preparation surfaces.

507.11.2 Mounting position. Filters shall be installed at an angle of not less than 45 degrees (0.79 rad) from the horizontal and shall be equipped with a drip tray beneath the lower edge of the filters.

507.11.3 Filter servicing. Filters shall be serviced and replaced regularly by qualified employees of the owner or by a cleaning agency. A record indicating the name of the person or firm doing the servicing and the dates when filters were cleaned or replaced shall be available for inspection by the commissioner. They shall be cleaned or replaced as frequently as necessary, but at least every 3 months, and no exhaust system shall be operated while cooking is being carried on without the filters installed in place.

507.12 Canopy size and location. The inside lower edge of canopy-type Type I and II commercial [cooking] hoods shall overhang or extend a horizontal distance of not less than 6 inches (152 mm) beyond the edge of the [cooking] top horizontal surface[,] of the appliance on all open sides. The vertical distance between the front lower lip of the hood and [the cooking] such surface shall not exceed 4 feet (1219 mm).

Exception: The hood shall be permitted to be flush with the outer edge of the cooking surface where the hood is closed to the appliance side by a noncombustible wall or panel.

507.13 Capacity of hoods. Commercial food service hoods shall exhaust a minimum net quantity of air determined in accordance with this section and Sections 507.13.1 through [507.13.4] 507.13.5. The net quantity of exhaust air shall be calculated by subtracting any airflow supplied directly to a hood cavity from the total exhaust flow rate of a hood. Where any combination of [extra-heavy-duty,] heavy-duty, medium-duty[,] and light-duty cooking appliances are utilized under a single hood, the [highest] exhaust rate required by this section for the heaviest duty appliance covered by the hood shall be used for the entire hood.

507.13.1 Extra-heavy-duty cooking appliances. The minimum net airflow for [Type I] hoods, as determined by Section 507.2, used for extra-heavy-duty cooking appliances shall be determined as follows:

Type of Hood	CFM per linear foot of hood
[Wall-mounted canopy	550]
[Single island canopy	700]
[Double island canopy (per side)	550]
Backshelf/pass-over	Not allowed
<u>Double island canopy</u>	
<u>(per side)</u>	<u>550</u>
Eyebrow	Not allowed
<u>Single island canopy</u>	<u>700</u>
<u>Wall-mounted canopy</u>	<u>550</u>

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.13.2 Heavy-duty cooking appliances. The minimum net airflow for [Type I] hoods, as determined by Section 507.2, used for heavy-duty cooking appliances shall be determined as follows:

Type of Hood	CFM per linear foot of hood
[Wall-mounted canopy	400]
[Single island canopy	600]
[Double island canopy (per side)	400]
Backshelf/pass-over	400
<u>Double island canopy</u>	
<u>(per side)</u>	<u>400</u>
Eyebrow	Not allowed
<u>Single island canopy</u>	<u>600</u>
<u>Wall-mounted canopy</u>	<u>400</u>

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.13.3 Medium-duty cooking appliances. The minimum net airflow for [Type I] hoods, as determined by Section 507.2, used for medium-duty cooking appliances shall be determined as follows:

Type of Hood	CFM per linear foot of hood
<u>Backshelf/pass-over</u>	300
<u>Double island canopy</u> (per side)	300
<u>Eyebrow</u>	250
Wall-mounted canopy	300
Single island canopy	500
[Double island canopy (per side)	300]
[Backshelf/pass-over	300]
[Eyebrow	250]

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.13.4 Light-duty cooking appliances. The minimum net airflow for [Type I] hoods, as determined by Section 507.2, used for light-duty cooking appliances and food service preparation [and cooking operations approved for use under a Type II hood] shall be determined as follows:

Type of Hood	CFM per linear foot of hood
<u>Backshelf/pass-over</u>	250
<u>Double island canopy</u> (per side)	250
<u>Eyebrow</u>	250
<u>Single island canopy</u>	400
Wall-mounted canopy	200
[Single island canopy	400]
Double island canopy (per side)	250
Backshelf/pass-over	250
Eyebrow	250]

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.13.5 Dishwashing appliances. The minimum net airflow for Type II hoods used for dishwashing appliances shall be 100 CFM per linear foot of hood length.

Exception: Dishwashing appliances and equipment installed in accordance with Section 507.2.2.

507.14 Noncanopy size and location. Noncanopy-type hoods shall be located a maximum of 3 feet (914 mm) above the cooking surface. The edge of the hood shall be set back a maximum of 1 foot (305 mm) from the edge of the cooking surface.

507.15 Exhaust outlets. Exhaust outlets located within the hood shall be located so as to optimize the capture of particulate matter. Each outlet shall serve not more than a 12-foot (3658 mm) section of hood.

507.16 Performance test. A performance test shall be conducted upon completion and witnessed by a representative of the Fire Department before final approval of the installation of a ventilation system serving commercial cooking appliances. The test shall verify the rate of exhaust airflow required by Section 507.13, makeup airflow required by Section 508, and proper operation as specified in this chapter. The permit holder shall furnish the necessary test equipment and devices required to perform the tests.

SECTION MC 508 COMMERCIAL KITCHEN MAKEUP AIR

508.1 Makeup air. Makeup air shall be supplied during the operation of commercial kitchen exhaust systems that are provided for commercial cooking appliances. The amount of makeup air supplied to the building from all sources shall be approximately equal to the amount of exhaust air for all exhaust systems for the building. The makeup air shall not reduce the effectiveness of the exhaust system. Makeup air shall be provided by gravity or mechanical means or both. [For mechanical makeup air systems, the exhaust and] Mechanical makeup air systems shall be [electrically interlocked to insure that makeup air is provided whenever the exhaust system is in operation] automatically controlled to start and operate simultaneously with the exhaust system. Makeup air intake opening locations shall comply with [Sections 401.5 and 401.5.1] Section 401.4.

508.1.1 Makeup air temperature. The temperature differential between makeup air and the air in the conditioned space shall not exceed 10°F (6°C) except where the added heating and cooling loads of the makeup air do not exceed the capacity of the HVAC system.

[Exceptions:

1. Makeup air that is part of the air-conditioning system.
2. Makeup air that does not decrease the comfort conditions of the occupied space.]

508.2 Compensating hoods. Manufacturers of compensating hoods shall provide a label indicating minimum exhaust flow and/or maximum makeup airflow that provides capture and containment of the exhaust effluent.

Exception: Compensating hoods with makeup air supplied only from the front face discharge and side face discharge openings shall not be required to be labeled with the maximum makeup airflow.

SECTION MC 509 FIRE SUPPRESSION SYSTEMS

509.1 Where required. Commercial cooking appliances required by Section 507.2.1 to have a Type I hood shall be provided with an approved automatic fire suppression system complying with the *New York City Building Code* and the *New York City Fire Code*.

SECTION MC 510 HAZARDOUS EXHAUST SYSTEMS

510.1 General. This section shall govern the design and construction of duct systems for hazardous exhaust and shall determine where such systems are required. Hazardous exhaust systems are systems designed to capture and control hazardous emissions generated from product handling or processes, and convey those emissions to the outdoors. Hazardous emissions include flammable vapors, gases, fumes, mists or dusts, and volatile or air[-]borne materials[, including but not limited to perchloroethylene,] posing a health hazard, such as toxic or corrosive materials. For the purposes of this section, the health hazard rating of materials shall be as specified in NFPA 704.

For the purposes of the provisions of Section 510, a laboratory shall be defined as a building or portion thereof wherein chemicals or gases are used or synthesized on a nonproduction basis for testing, research, experimental, instructional or educational purposes.

510.2 Where required. A hazardous exhaust system shall be required wherever operations involving the handling or processing of hazardous materials, in the absence of such exhaust systems and under normal operating conditions, have the potential to create one of the following conditions:

6. A flammable vapor, gas, fume, mist or dust is present in concentrations exceeding 25 percent of the lower flammability limit of the substance for the expected room temperature.
7. A vapor, gas, fume, mist or dust with a health-hazard rating of 4 is present in any concentration.
8. A vapor, gas, fume, mist or dust with a health-hazard rating of 1, 2 or 3 is present in concentrations exceeding 1 percent of the median lethal concentration of the substance for acute inhalation toxicity.

Exception: Laboratories, as defined in Section 510.1, except where the concentrations listed in Item 1 are exceeded, or a vapor, gas, fume, mist or dust with a health-hazard rating of 1, 2, 3 or 4 is present in concentrations exceeding 1 percent of the median lethal concentration of the substance for acute inhalation toxicity.

510.2.1 Lumber yards and woodworking facilities.

Equipment or machinery located inside buildings at lumber yards and woodworking facilities which generates or emits combustible dust shall be provided with an approved dust-collection and exhaust system installed in conformance with this section and the *New*

York City Fire Code. Equipment and systems that are used to collect, process or convey combustible dusts shall be provided with an approved explosion-control system.

510.2.2 Combustible fibers. Equipment or machinery within a building which generates or emits combustible fibers shall be provided with an approved dust-collecting and exhaust system. Such systems shall comply with this code and the *New York City Fire Code*.

510.3 Design and operation. The design and operation of the exhaust system shall be such that flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust flow below 25 percent of the contaminant's lower flammability limit.

510.4 Independent system. Hazardous exhaust systems shall be independent of other types of exhaust systems. Incompatible materials, as defined in the *New York City Fire Code*, shall not be exhausted through the same hazardous exhaust system. Hazardous exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

Exception: The provision of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:

1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
3. Each control branch has a flow regulating device.
4. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.
5. Radioisotope hoods are equipped with filtration and/or carbon beds where required by the registered design professional.
6. Biological safety cabinets are filtered.
7. Provision is made for continuous maintenance of negative static pressure in the ductwork.

Contaminated air shall not be recirculated to [occupied] occupiable areas [unless the contaminants have been removed]. Air [contaminated with] containing explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive material shall [not be recirculated] be considered to be contaminated.

510.5 Design. Systems for removal of vapors, gases and smoke shall be designed by the constant velocity or equal friction methods. Systems conveying particulate matter shall be designed employing the constant velocity method.

510.5.1 Balancing. Systems conveying explosive or radioactive materials shall be prebalanced by duct sizing. Other systems shall be balanced by duct sizing with balancing devices, such as dampers. Dampers provided to balance air flow shall be provided with securely fixed minimum-position blocking devices to prevent restricting flow below the required volume or velocity.

510.5.2 Emission control. The design of the system shall be such that the emissions are confined to the area in which they are generated by air currents, hoods or enclosures and shall be exhausted by a duct system to a safe location or treated by removing contaminants.

510.5.3 Hoods required. Hoods or enclosures shall be used where contaminants originate in a limited area of a space. The design of the hood or enclosure shall be such that air currents created by the exhaust systems will capture the contaminants and transport them directly to the exhaust duct.

510.5.4 Contaminant capture and dilution. The velocity and circulation of air in work areas shall be such that contaminants are captured by an airstream at the area where the emissions are generated and conveyed into a product-conveying duct system. Contaminated air from work areas where hazardous contaminants are generated shall be diluted below the thresholds specified in Section 510.2 with air that does not contain other hazardous contaminants.

510.5.5 Makeup air. Makeup air shall be provided at a rate approximately equal to the rate that air is exhausted by the hazardous exhaust system. Makeup[-]air intakes shall be located so as to avoid recirculation of contaminated air.

510.5.6 Clearances. The minimum clearance between hoods and combustible construction shall be the clearance required by the duct system.

510.5.7 Ducts. Hazardous exhaust duct systems shall extend directly to the exterior of the building and shall not extend into or through ducts and plenums.

510.6 Penetrations. Penetrations of structural elements by a hazardous exhaust system shall conform to Sections 510.6.1 through [510.6.3] 510.6.4.

Exception: Duct penetrations within H-5 occupancies as allowed by the *New York City Building Code*.

510.6.1 Fire dampers and smoke dampers. Fire dampers and smoke dampers are prohibited in hazardous exhaust ducts.

510.6.2 Floors. Hazardous exhaust systems that penetrate a floor/ceiling assembly shall be enclosed in a fire-resistance-rated shaft constructed in accordance with the *New York City Building Code*.

[510.6.2] 510.6.3 Wall assemblies. Hazardous exhaust duct systems that penetrate fire-resistance-rated wall assemblies shall be enclosed in fire-resistance-rated construction from the [first] point of penetration to the outlet terminal, except where the interior of the duct is equipped with an approved automatic fire suppression system. Ducts shall be enclosed in accordance with the *New York City Building Code* requirements for shaft construction and such enclosure shall have a minimum fire-resistance-rating of not less than the highest fire-resistance-rated wall assembly penetrated.

[510.6.3] 510.6.4 Fire walls. Ducts shall not penetrate a fire wall.

510.7 Suppression required. Ducts shall be protected with an approved automatic fire suppression system installed in accordance with the *New York City Building Code*.

Exceptions:

1. An approved automatic fire suppression system shall not be required in ducts conveying materials, fumes, mists and vapors that are nonflammable and noncombustible under all conditions and at any concentrations.
2. An approved automatic fire suppression system shall not be required in ducts where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).
3. For laboratories, as defined in Section 510.1, approved automatic fire suppression systems shall not be required in laboratory hoods or exhaust systems.

510.8 Duct construction. Ducts utilized to convey hazardous exhaust shall be constructed of approved G90 galvanized sheet steel, with a minimum nominal thickness as specified in Table 510.8.

Nonmetallic ducts utilized in systems exhausting nonflammable corrosive fumes or vapors shall be listed and labeled. Nonmetallic [duct] ducts shall have a flame spread index of 25 or less and a smoke-developed index of 50 or less, when tested in accordance with ASTM E 84 or UL 723. Ducts shall be approved for installation in such an exhaust system.

Where the products being exhausted are detrimental to the duct material, the ducts shall be constructed of alternative materials that are compatible with the exhaust.

TABLE 510.8
MINIMUM DUCT THICKNESS

DIAMETER OF DUCT OF MAXIMUM SIDE DIMENSION	MINIMUM NOMINAL THICKNESS		
	Nonabrasive materials	Nonabrasive/ Abrasive materials	Abrasive materials
0-8 inches	0.028 inch (No. 24 Gage)	0.034 inch (No. 22 Gage)	0.040 inch (No. 20 Gage)
9-18 inches	0.034 inch (No. 22 Gage)	0.040 inch (No. 20 Gage)	0.052 inch (No. 18 Gage)
19-30 inches	0.040 inch (No. 20 Gage)	0.052 inch (No. 18 Gage)	0.064 inch (No. 16 Gage)
<u>Over 30 inches</u>	<u>0.052 inch</u> <u>(No. 18 gage)</u>	<u>0.064 inch</u> <u>(No. 16 gage)</u>	<u>0.079 inch</u> <u>(No. 14 inch)</u>

For SI: 1 inch = 25.4 mm.

510.8.1 Duct joints. Ducts shall be made tight with lap joints having a minimum lap of 1 inch (25 mm).

510.8.2 Clearance to combustibles. Ducts shall have a clearance to combustibles in accordance with Table 510.8.2. Exhaust gases having temperatures in excess of 600°F (316°C) shall be exhausted to a chimney in accordance with Section 511.2.

**TABLE 510.8.2
CLEARANCE TO COMBUSTIBLES**

TYPE OF EXHAUST OR TEMPERATURE OF EXHAUST (°F)	CLEARANCE TO COMBUSTIBLES (inches)
Less than 100	1
100-600	12
Flammable vapors	6

For SI: 1 inch = 25.4 mm, °C = [(°F) - 32]/1.8.

510.8.3 Explosion relief. Systems exhausting potentially explosive mixtures shall be protected with an approved explosion relief system or by an approved explosion prevention system designed and installed in accordance with NFPA 69. An explosion relief system shall be designed to minimize the structural and mechanical damage resulting from an explosion or deflagration within the exhaust system. An explosion prevention system shall be designed to prevent an explosion or deflagration from occurring.

510.9 Supports. Ducts shall be supported at intervals not exceeding 10 feet (3048 mm). Supports shall be constructed of noncombustible material.

SECTION MC 511 DUST, STOCK AND REFUSE CONVEYING SYSTEMS

511.1 Dust, stock and refuse conveying systems. Dust, stock and refuse conveying systems shall comply with the provisions of Section 510 and Sections 511.1.1 through 511.2.

511.1.1 Collectors and separators. [Cyclone collectors] Collectors and separators involving such systems as centrifugal separators, bag filter systems and similar devices, and associated supports shall be constructed of noncombustible materials and shall be located on the exterior of the building or structure. A collector or separator shall not be located nearer than 10 feet (3048 mm) to combustible construction or to an unprotected wall or floor opening, unless the collector is provided with a metal vent pipe that extends above the highest part of any roof within a distance of 30 feet (9144 mm).

Exceptions:

1. Collectors such as “Point of Use” collectors, close extraction weld fume collectors, spray finishing booths, stationary grinding tables, sanding booths, and integrated or machine-mounted collectors shall be permitted to be installed indoors provided the installation is in accordance with the *New York City Fire Code* and NFPA 70.
2. Collectors in independent exhaust systems handling combustible dusts shall be permitted to be installed indoors provided that such collectors are installed in compliance with the *New York City Fire Code* and NFPA 70.

511.1.2 Discharge pipe. Discharge piping shall conform to the requirements for ducts, including clearances required for high-heat appliances, as contained in this code. A delivery pipe from a [cyclone] centrifugal separator collector shall not convey refuse directly into the firebox of a boiler, furnace, dutch oven, refuse burner, incinerator or other appliance.

511.1.3 Conveying [system] systems exhaust discharge. An exhaust system shall discharge to the outside of the building either directly by flue[,] or indirectly through the [separator], bin or vault into which the system discharges except where the contaminants have been removed. Exhaust system discharge shall be permitted to be recirculated

provided that the solid particulate has been removed at a minimum efficiency of 99.9 percent at 10 microns (10.01 mm), vapor concentrations are less than 25 percent of the LFL, and approved equipment is used to monitor the vapor concentration.

511.1.4 Spark protection. The outlet of an open-air exhaust terminal shall be protected with an approved metal or other noncombustible screen to prevent the entry of sparks.

511.1.5 Explosion relief vents. A safety or explosion relief vent shall be provided on all systems that convey combustible refuse or stock of an explosive nature, in accordance with the requirements of the *New York City Building Code*.

511.1.5.1 Screens. Where a screen is installed in a safety relief vent, the screen shall be attached so as to permit ready release under the explosion pressure.

511.1.5.2 Hoods. The relief vent shall be provided with an approved noncombustible cowl or hood, or with a counterbalanced relief valve or cover arranged to prevent the escape of hazardous materials, gases or liquids.

511.2 Exhaust outlets. Outlets for exhaust that exceed 600°F (315°C) shall be designed as a chimney in accordance with Table 511.2.

[The termination point for exhaust ducts discharging to the atmosphere shall not be less than the following:

1. Ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property line; 10 feet (3048 mm) from openings into the building; 6 feet (1829 mm) from exterior walls or roofs; 30 feet (9144 mm) from combustible walls or openings into the building which are in the direction of the exhaust discharge; and 10 feet (3048 mm) above adjoining grade.
2. Other product-conveying outlets: 10 feet (3048 mm) from property line; 3 feet (914 mm) from exterior wall or roof; 10 feet (3048 mm) from openings into the building; and 10 feet (3048 mm) above adjoining grade.
3. Environmental air duct exhaust: 3 feet (914 mm) from property line; and 3 feet (914 mm) from openings into the building.]

TABLE 511.2
CONSTRUCTION, CLEARANCE AND TERMINATION REQUIREMENTS FOR SINGLE-WALL METAL DUST, STOCK AND REFUSE CONVEYING SYSTEMS

<u>SERVING TEMPERATURE RANGE</u>	<u>MINIMUM THICKNESS</u>		<u>TERMINATION</u>		<u>CLEARANCE</u>	
			<u>Above</u>	<u>Above any part of building within (feet)</u>	<u>Combustible construction (inches)</u>	<u>Noncombustible construction</u>

	<u>(inch)</u>		<u>roof opening (feet)</u>	<u>10</u>	<u>25</u>	<u>50</u>	<u>Interior inst.</u>	<u>Exterior inst.</u>	<u>Interior inst.</u>	<u>Exterior inst.</u>
<u>High-heat appliances (Over 2,000°F)^a</u>	0.127 (No. 10 MSG)	4 ¹ / ₂ ' laid on 4 ¹ / ₂ ' bed	20	=	=	20	See Note c			
<u>Low-heat appliances (1,000°F normal operation)</u>	0.127 (No. 10 MSG)	None	3	2	=	=	18	6	Up to 18' diameter, 2' Over 18' diameter, 4'	
<u>Medium-heat appliances (2,000°F maximum)^b</u>	0.127 (No. 10 MSG)	Up to 18' dia. — 2 ¹ / ₂ ' Over 18'-4 ¹ / ₂ ' On 4 ¹ / ₂ ' bed	10	=	10	=	36	24	Up to 18' diameter, 2' Over 18' diameter, 4'	

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, °C = [(°F)-32]/1.8.

a. Lining shall extend from bottom to top of outlet.

b. Lining shall extend from 24 inches below connector to 24 feet above.

c. Clearance shall be as specified by the design engineer and shall have sufficient clearance from buildings and structures to avoid overheating combustible materials (maximum 160°F).

SECTION MC 512 SUBSLAB SOIL EXHAUST SYSTEMS

512.1 General. When a subslab soil exhaust system is provided, the duct shall conform to the requirements of this section.

512.2 Materials. Subslab soil exhaust system duct material shall be air duct material listed and labeled to the requirements of UL 181 for Class 0 air ducts, or any of the following piping materials that comply with the *New York City Plumbing Code* as building sanitary drainage and vent pipe: cast iron; galvanized steel; brass or copper pipe; copper tube of a weight not less than that of copper drainage tube, Type DWV; and plastic piping.

512.3 Grade. Exhaust system ducts shall not be trapped and shall have a minimum slope of one-eighth unit vertical in 12 units horizontal (1-percent slope).

512.4 Termination. Subslab soil exhaust system ducts shall extend through the roof and terminate at least 6 inches (152 mm) above the roof and at least 10 feet (3048 mm) from any operable openings or air intake.

512.5 Identification. Subslab soil exhaust ducts shall be permanently identified within each floor level by means of a tag, stencil or other approved marking.

**SECTION MC 513
SMOKE CONTROL SYSTEMS**

513.1 Scope and purpose. This section applies to mechanical and passive smoke control systems that are required by the *New York City Building Code*. The purpose of this section is to establish minimum requirements for the design, installation and acceptance testing of smoke control systems that are intended to provide a tenable environment for the evacuation or relocation of occupants. These provisions are not intended for the preservation of contents, the timely restoration of operations, or for assistance in fire suppression or overhaul activities. Smoke control systems regulated by this section serve a different purpose than the smoke- and heat-venting provisions found in Section 910 of the *New York City Building Code*.

513.2 General design requirements. Buildings, structures, or parts thereof required by this code to have a smoke control system or systems shall have such systems designed in accordance with the applicable requirements of Section 909 of the *New York City Building Code* and the generally accepted and well-established principles of engineering relevant to the design. The construction documents shall include sufficient information and detail to describe adequately the elements of the design necessary for the proper implementation of the smoke control systems. These documents shall be accompanied with sufficient information and analysis to demonstrate compliance with these provisions.

513.3 Special inspection and test requirements. In addition to the ordinary inspection and test requirements which buildings, structures and parts thereof are required to undergo, smoke control systems subject to the provisions of Section 909 of the *New York City Building Code* shall undergo special inspections and tests sufficient to verify the proper commissioning of the smoke control design in its final installed condition. The design submission accompanying the construction documents shall clearly detail procedures and methods to be used and the items subject to such inspections and tests. Such commissioning shall be in accordance with generally accepted engineering practice and, where possible, based on published standards for the particular testing involved. The special inspections and tests required by this section shall be conducted under the same terms as found in Section 1704 of the *New York City Building Code*.

513.4 Analysis. A rational analysis supporting the types of smoke control systems to be employed, their methods of operation, the systems supporting them, and the methods of construction to be utilized shall accompany the submitted construction documents and shall include, but not be limited to, the items indicated in Sections 513.4.1 through 513.4.6.

**[TABLE 511.2
CONSTRUCTION, CLEARANCE AND TERMINATION REQUIREMENTS FOR
SINGLE-WALL METAL DUST, STOCK AND REFUSE CONVEYING SYSTEMS**

SERVING TEMPERATURE RANGE	MINIMUM THICKNESS	TERMINATION	CLEARANCE
---------------------------------	----------------------	-------------	-----------

	Walls (inch)	Lining	Above roof opening (feet)	Above any part of building within (feet)			Combustible construction (inches)		Noncombustible construction	
				10	25	50	Interior inst.	Exterior inst.	Interior inst.	Exterior inst.

Medium-heat appliances (2,000°F maximum) ^b	0.127 (No. 10 MSG)	Up to 18' dia.—2 ¹ / ₂ ' Over 18'-4 ¹ / ₂ ' On 4 ¹ / ₂ ' bed	10	—	10	—	36	24	Up to 18' diameter, 2' Over 18' diameter, 4'	
High-heat appliances (Over 2,000°F) ^a	0.127 (No. 10 MSG)	4 ¹ / ₂ ' laid on 4 ¹ / ₂ ' bed	20	—	—	20	See Note c			

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, °C = [(°F)-32]/1.8.

Lining shall extend from bottom to top of outlet.

Lining shall extend from 24 inches below connector to 24 feet above.

Clearance shall be as specified by the design engineer and shall have sufficient clearance from buildings and structures to avoid overheating combustible materials (maximum 160°F).]

513.4.1 Stack effect. The system shall be designed such that the maximum probable normal or reverse stack effects will not adversely interfere with the system's capabilities. In determining the maximum probable stack effects, altitude, elevation, weather history and interior temperatures shall be used.

513.4.2 Temperature effect of fire. Buoyancy and expansion caused by the design fire in accordance with Section 513.9 shall be analyzed. The system shall be designed such that these effects do not adversely interfere with its capabilities.

513.4.3 Wind effect. The design shall consider the adverse effects of wind. Such consideration shall be consistent with the wind-loading provisions of the *New York City Building Code*.

513.4.4 HVAC systems. The design shall consider the effects of the heating, ventilating and air-conditioning (HVAC) systems on both smoke and fire transport. The analysis shall include all permutations of systems' status. The design shall consider the effects of fire on the HVAC systems.

513.4.5 Climate. The design shall consider the effects of low temperatures on systems, property and occupants. Air inlets and exhausts shall be located so as to prevent snow or ice blockage.

513.4.6 Duration of operation. All portions of active or passive smoke control systems shall be capable of continued operation after detection of the fire event for a period of not less than 20 minutes and 1.5 times the calculated egress time, whichever is less.

513.5 Smoke barrier construction. Smoke barriers shall comply with the *New York City Building Code*. Smoke barriers shall be constructed and sealed to limit leakage areas exclusive of protected openings. The maximum allowable leakage area shall be the aggregate area calculated using the following leakage area ratios:

1. Walls: $A/A_w = 0.00100$
2. Exit enclosures: $A/A_w = 0.00035$
3. All other shafts: $A/A_w = 0.00150$
4. Floors and roofs: $A/A_F = 0.00050$ where:

A = Total leakage area, square feet (m^2).

A_F = Unit floor or roof area of barrier, square feet (m^2).

A_w = Unit wall area of barrier, square feet (m^2).

The leakage area ratios shown do not include openings due to doors, operable windows or similar gaps. These shall be included in calculating the total leakage area.

513.5.1 Leakage area. Total leakage area of the barrier is the product of the smoke barrier gross area times the allowable leakage area ratio, plus the area of other openings such as gaps and operable windows. Compliance shall be determined by achieving the minimum air pressure difference across the barrier with the system in the smoke control mode for mechanical smoke control systems. Passive smoke control systems tested using other approved means such as door fan testing shall be as approved by the commissioner.

513.5.2 Opening protection. Openings in smoke barriers shall be protected by automatic-closing devices actuated by the required controls for the mechanical smoke control system. Door openings shall be protected by door assemblies complying with the requirements of the *New York City*[±] *Building Code* for doors in smoke barriers.

Exceptions:

1. Passive smoke control systems with automatic-closing devices actuated by spot-type smoke detectors listed for releasing service installed in accordance with the *New York City Building Code*.
2. Fixed openings between smoke zones which are protected utilizing the airflow method.
3. In Group I-2 where such doors are installed across corridors, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with approved fire-rated glazing materials in approved fire-rated frames, the area of which shall not exceed that tested. The doors shall be close-fitting within operational tolerances, and shall not have undercuts, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and automatic-closing devices. Positive latching devices are not required.
4. Group I-3.
5. Openings between smoke zones with clear ceiling heights of 14 feet (4267 mm) or greater and bank down capacity of greater than 20 minutes as determined by the design fire size.

513.5.2.1 Ducts and air transfer openings. Ducts and air transfer openings are required to be protected with a minimum Class II, 250°F (121°C) smoke damper complying with the *New York City Building Code*.

513.6 Pressurization method. The primary mechanical means of controlling smoke shall be by pressure differences across smoke barriers. Maintenance of a tenable environment is not required in the smoke control zone of fire origin.

513.6.1 Minimum pressure difference. The minimum pressure difference across a smoke barrier shall be 0.05-inch water Gage (12.4 Pa) in fully sprinklered buildings. In buildings permitted to be other than fully sprinklered, the smoke control system shall be designed to achieve pressure differences at least two times the maximum calculated pressure difference produced by the design fire.

513.6.2 Maximum pressure difference. The maximum air pressure difference across a smoke barrier shall be determined by required door-opening or closing forces. The actual force required to open exit doors when the system is in the smoke control mode shall be in accordance with the *New York City Building Code*. Opening and closing forces for other doors shall be determined by standard engineering methods for the resolution of forces and reactions. The calculated force to set a side-hinged, swinging door in motion

shall be determined by:

$$F = F_{dc} + K(WA\Delta P)/2(W-d) \quad \text{(Equation 5-2)}$$

where:

- A = Door area, square feet (m²).
- d = Distance from door handle to latch edge of door, feet (m).
- F = Total door opening force, pounds (N).
- F_{dc} = Force required to overcome closing device, pounds (N).
- K = Coefficient 5.2 (1.0).
- W = Door width, feet (m).
- ΔP = Design pressure difference, inches (Pa) water gage.

513.7 Airflow design method. When approved by the commissioner, smoke migration through openings fixed in a permanently open position, which are located between smoke control zones by the use of the airflow method, shall be permitted. The design airflows shall be in accordance with this section. Airflow shall be directed to limit smoke migration from the fire zone. The geometry of openings shall be considered to prevent flow reversal from turbulent effects.

513.7.1 Velocity. The minimum average velocity through a fixed opening shall not be less than:

$$v = 217.2 [h(T_f - T_o)/(T_f + 460)]^{1/2} \quad \text{(Equation 5-3)}$$

For SI: $v = 119.9 [h(T_f - T_o)/T_f]^{1/2}$

where:

- H = Height of opening, feet (m).
- T_f = Temperature of smoke, °F (K).
- T_o = Temperature of ambient air, °F (K).
- v = Air velocity, feet per minute (m/minute).

513.7.2 Prohibited conditions. This method shall not be employed where either the quantity of air or the velocity of the airflow will adversely affect other portions of the smoke control system, unduly intensify the fire, disrupt plume dynamics or interfere with exiting. In no case shall airflow toward the fire exceed 200 feet per minute (1.02 m/s). Where the formula in Section 513.7.1 requires airflow to exceed this limit, the airflow method shall not be used.

513.8 Exhaust method. When approved by the commissioner, mechanical smoke control for large enclosed volumes, such as in [atria] atriums or malls, shall be permitted to utilize the exhaust method. [The design exhaust volumes] Smoke control systems using the exhaust method shall be designed in accordance with [this section] NFPA 92B.

513.8.1 Exhaust rate. The height of the lowest horizontal surface of the accumulating smoke layer shall be maintained at least [10] 6 feet ([3048] 1829 mm) above any walking surface which forms a portion of a required egress system within the smoke zone. [The required exhaust rate for the zone shall be the largest of the calculated plume mass flow rates for the possible plume configurations. Provisions shall be made for natural or mechanical supply of outside air from outside or adjacent smoke zones to make up for the air exhausted. Makeup airflow rates, when measured at the potential fire location, shall not exceed 200 feet per minute (1.02m/s) toward the fire. The temperature of the makeup air shall be such that it does not expose temperature-sensitive fire protection systems beyond their limits.]

[513.8.2 Axisymmetric plumes. The plume mass flow rate (m_p), in pounds per second (kg/s), shall be determined by placing the design fire center on the axis of the space being analyzed. The limiting flame height shall be determined by:]

$$[z_i = 0.533Q_c^{2/5} \quad \text{(Equation 5-4)}$$

$$\text{For SI: } z_i = 0.166Q_c^{2/5}$$

where:

$M p$ = Plume mass flow rate, pounds per second (kg/s).

Q = Total heat output.

Q_c = Convective heat output, British thermal units per second (k/W).

(The value of Q_c shall not be taken as less than 0.70 Q).

z = Height from top of fuel surface to bottom of smoke layer, feet (m).

z_i = Limiting flame height, feet (m). The z_i value must be greater than the fuel equivalent diameter (see Section 513.9).

for $z > z_i$

$$m_p = 0.022Q_c^{1/3} z^{5/3} + 0.0042Q_c$$

For SI: $m_p = 0.071Q_c^{1/3} z^{5/3} + 0.0018Q_c$

for $z = z_i$

$$M_p = 0.011Q_c$$

For SI: $m_p = 0.035Q_c$

for $z > z_i$

$$M_p = 0.0208Q_c^{3/5} z$$

For SI: $m_p = 0.032Q_c^{3/5} z$

[To convert m_p from pounds per second of mass flow to a volumetric rate, the following formula shall be used:

$$V = 60m_p/P \quad \text{(Equation 5-5)}$$

where

V = Volumetric flow rate, cubic feet per minute (m^3/s).

R = Density of air at the temperature of the smoke layer, pounds per cubic feet (T : in °F)[kg/m^3 (T : in °C)].]

[513.8.3 Balcony spill plumes. The plume mass flow rate (m_p) for spill plumes shall be determined using the geometrically probable width based on architectural elements and projections in the following formula:

$$M_p = 0.124(QW^2)^{1/3}(zb + 0.25H) \quad \text{(Equation 5-6)}$$

For SI: $m_p = 0.36(QW^2)^{1/3}(zb + 0.25H)$

where:

H = Height above fire to underside of balcony, feet (m).

M_p = Plume mass flow rate, pounds per second (kg/s).

Q = Total heat output

W = Plume width at point of spill, feet (m).]

[513.8.4 Window plumes. The plume mass flow rate (m_p) shall be determined from:

$$m_p = 0.077(A, H, 1/2)^{1/3}(z, + a)^{5/3} + 0.18A, H, 1/2 \quad \text{(Equation 5-7)}$$

For SI: $m_p = 0.68(A, H, 1/2)^{1/3}(z, + a)^{5/3} + 1.5A, H, 1/2$

where:

A , = Area of the opening, square feet (m^2).

H , = Height of the opening, feet (m).

M_p = Plume mass flow rate, pounds per second (kg/s).

z , = Height from the top of the window or opening to

the bottom of the smoke layer, feet (m).

$$a = 2.4A, 2/5H, 1/5 - 2.1H,]$$

[513.8.5 Plume contact with walls. When a plume contacts one or more of the surrounding walls, the mass flow rate shall be adjusted for the reduced entrainment resulting from the contact provided that the contact remains constant. Use of this provision requires calculation of the plume diameter, that shall be calculated by:

$$d = 0.48 [(T_c + 460)/(T_a + 460)]^{1/2} z \quad \text{(Equation 5-8)}$$

For SI: $d = 0.48(T_c/T_a)^{1/2} z$

where:

d = Plume diameter, feet (m).

T_a = Ambient air temperature, °F (°K).

T_c = Plume centerline temperature, °F (°K).

$$= 0.6 (T_a + 460) Q c^2 / 3 z^{-5.13} + T_a$$

z = Height at which T_c is determined, feet (m).

For SI: $T_c = 0.08 T z Q c^2 / 3 z^{-5.13} + T_a$

513.9 Design fire. The design fire shall be based on [a Q of not less than 5,000 Btu per second (5275 kW) unless] a rational analysis [is] performed by the registered design professional and approved by the commissioner. The design fire shall be based on the analysis in accordance with Section 513.4 and this section.

513.9.1 Factors considered. The engineering analysis shall include the characteristics of the fuel, fuel load, effects included by the fire, and whether the fire is likely to be steady or unsteady.

513.9.2 [Separation distance. Determination of the design fire shall include consideration of the type of fuel, fuel spacing and configuration. The ratio of the separation distance to the fuel equivalent radius shall not be less than 4. The fuel equivalent radius shall be the radius of a circle of equal area to floor area of the fuel package. The design fire shall be increased if other combustibles are within the separation distance as determined by:]

$$[R = [Q / (12\pi Q'')]^{1/2} \quad \text{(Equation 5-9)}$$

where:

Q'' = Incident radiant heat flux required for nonpiloted ignition, Btu/ft² • s (W/m²).

Q = Heat release from fire, Btu/s (kW).

R = Separation distance from target to center of fuel package, feet (m).]

Design fire fuel. Determination of the design fire shall include consideration of the type of fuel, fuel spacing and configuration.

513.9.3 Heat-release assumptions. The analysis shall make use of the best available data from approved sources and shall not be based on excessively stringent limitations of combustible material.

513.9.4 Sprinkler effectiveness assumptions. A documented engineering analysis shall be provided for conditions that assume fire growth is halted at the time of sprinkler activation.

513.10 Equipment. Equipment such as, but not limited to, fans, ducts, automatic dampers and balance dampers shall be suitable for their intended use, suitable for the probable exposure temperatures that the rational analysis indicates, and as approved by the commissioner.

513.10.1 Exhaust fans. Components of exhaust fans shall be rated and certified by the manufacturer for the probable temperature rise to which the components will be exposed. This temperature rise shall be computed by:

$$Ts = (Q/mc) + (Ta) \quad \text{(Equation [5-10] 5-4)}$$

where:

c = Specific heat of smoke at smoke-layer temperature, Btu/lb°F (kJ/kg × K).

m = Exhaust rate, pounds per second (kg/s).

Q_c = Convective heat output of fire, Btu/s (kW).

T_a = Ambient temperature, °F (K).

T_s = Smoke temperature, °F (K).

Exception: Reduced T_s as calculated based on the assurance of inadequate dilution air.

513.10.2 Ducts. Duct materials and joints shall be capable of withstanding the probable temperatures and pressures to which they are exposed as determined in accordance with Section 513.10.1. Ducts shall be constructed and supported in accordance with Chapter 6. Ducts shall be leak tested to 1.5 times the maximum design operating pressure in accordance with nationally accepted practices. Measured leakage shall not exceed 5 percent of design flow. Results of such testing shall be a part of the documentation procedure. Ducts shall be supported directly from fire-resistance-rated structural elements of the building by substantial, noncombustible supports.

Exception: Flexible connections, for the purpose of vibration isolation, that are constructed of approved fire-resistance-rated materials.

513.10.3 Equipment, inlets and outlets. Equipment shall be located so as to not expose uninvolved portions of the building to an additional fire hazard. Outdoor air inlets shall be located so as to minimize the potential for introducing smoke or flame into the building. Exhaust outlets shall be so located as to minimize reintroduction of smoke into the building and to limit exposure of the building or adjacent buildings to an additional fire hazard.

513.10.4 Automatic dampers. Automatic dampers, regardless of the purpose for which they are installed within the smoke control system, shall be listed and conform to the requirements of approved recognized standards.

513.10.5 Fans. In addition to other requirements, belt-driven fans shall have 1.5 times the number of belts required for the design duty with the minimum number of belts being two. Fans shall be selected for stable performance based on normal temperature and, where applicable, elevated temperature. Calculations and manufacturer's fan curves shall be part of the documentation procedures. Fans shall be supported and restrained by noncombustible devices in accordance with the structural design requirements of the *New York City Building Code*. Motors driving fans shall not be operating beyond their nameplate horsepower (kilowatts) as determined from measurement of actual current draw. Motors driving fans shall have a minimum service factor of 1.15.

513.11 Power systems. The smoke control system shall be supplied with two sources of power. Primary power shall be the normal building power systems. Secondary power shall be from an approved standby power source complying with the *New York City Electrical Code*. The standby

power source and its transfer switches shall be in a room separate[room] from the normal power transformers and switch gear and [shall be enclosed in a room constructed of not less than 1-hour fire-resistance-rated fire barriers, ventilated directly to and from the exterior] ventilated directly to and from the exterior. The room shall be enclosed with not less than 2-hour fire-resistance-rated fire barriers constructed in accordance with Section 707 of the *New York City Building Code* or horizontal assemblies constructed in accordance with Section 712 of *New York City Building Code*, or both. Power distribution from the two sources shall be by independent routes. Transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power. The systems shall comply with the *New York City Electrical Code*.

513.11.1 Power sources and power surges. Elements of the smoke management system relying on volatile memories or the like shall be supplied with integral uninterruptible power sources of sufficient duration to span 15-minute primary power interruption. Elements of the smoke management system susceptible to power surges shall be suitably protected by conditioners, suppressors or other approved means.

513.12 Detection and control systems. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Chapter 9 of the *New York City Building Code* and NFPA 72. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.

Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override, the presence of power downstream of all disconnects and, through a preprogrammed weekly test sequence report, abnormal conditions audibly, visually and by printed report.

513.12.1 Wiring. In addition to meeting the requirements of the *New York City Electrical Code*, all wiring, regardless of voltage, shall be fully enclosed within continuous raceways.

513.12.2 Activation. Smoke control systems shall be activated in accordance with the *New York City Building Code*.

513.12.3 Automatic control. Where completely automatic control is required or used, the automatic control sequences shall be initiated from an appropriately zoned automatic sprinkler system complying with Chapter 9 of the *New York City Building Code* or from manual controls that are readily accessible to the Fire Department, and any smoke detectors required by engineering analysis.

513.13 Control-air tubing. Control-air tubing shall be of sufficient size to meet the required response times. Tubing shall be flushed clean and dry prior to final connections. Tubing shall be adequately supported and protected from damage. Tubing passing through concrete or masonry shall be sleeved and protected from abrasion and electrolytic action.

513.13.1 Materials. Control-air tubing shall be hard-drawn copper, Type L, ACR in accordance with ASTM B 42, ASTM B 43, ASTM B 68, ASTM B 88, ASTM B 251 and ASTM B 280. Fittings shall be wrought copper or brass, solder type in accordance with ASME B 16.18 or ASME B 16.22. Changes in direction shall be made with appropriate tool bends. Brass compression-type fittings shall be used at final connection to devices; other joints shall be brazed using a BCuP5 brazing alloy with [solidus] solids above 1,100°F (593°C) and liquids below 1,500°F (816°C). Brazing flux shall be used on copper-to-brass joints only.

Exception: Nonmetallic tubing used within control panels and at the final connection to devices provided all of the following conditions are met:

1. Tubing shall be listed by an approved agency for flame and smoke characteristics.
2. Tubing and connected device shall be completely enclosed within a galvanized or paint-grade steel enclosure [of not less than 0.030 inch (0.76 mm) (No.22 galvanized sheet Gage)] having a minimum thickness of 0.0296 inch (0.7534 mm) (No. 22 gage). Entry to the enclosure shall be by copper tubing with a protective grommet of neoprene or [teflon] Teflon or by suitable brass compression to male barbed adapter.
3. Tubing shall be identified by appropriately documented coding.
4. Tubing shall be neatly tied and supported within the enclosure. Tubing bridging cabinets and doors or moveable devices shall be of sufficient length to avoid tension and excessive stress. Tubing shall be protected against abrasion. Tubing serving devices on doors shall be fastened along hinges.

513.13.2 Isolation from other functions. Control tubing serving other than smoke control functions shall be isolated by automatic isolation valves or shall be an independent system.

513.13.3 Testing. Test control-air tubing at three times the operating pressure for not less than 30 minutes without any noticeable loss in gauge pressure prior to final connection to devices.

513.14 Marking and identification. The detection and control systems shall be clearly marked at all junctions, accesses and terminations.

513.15 Control diagrams. Identical control diagrams shall be provided and maintained as required by the *New York City Fire Code*.

513.16 Fire fighter's smoke control panel. A fire fighter's smoke control panel for Fire Department emergency response purposes only shall be provided in accordance with the *New York City Fire Code*.

513.17 System response time. Smoke control system activation shall comply with the *New York City Fire Code*.

513.18 Acceptance testing. Devices, equipment, components and sequences shall be tested in accordance with the *New York City Fire Code*.

513.19 System acceptance. Acceptance of the smoke control system shall be in accordance with the *New York City Fire Code*.

[513.20 Underground building smoke exhaust system. Where required by the *New York City Building Code* for underground buildings, a smoke exhaust system shall be provided in accordance with this section.]

[513.20.1 Exhaust capability. Where compartmentation is required, each compartment shall have an independent smoke exhaust system capable of manual operation. The system shall have an air supply and smoke exhaust capability that will provide a minimum of six air changes per hour.]

[513.20.2 Operation. The smoke exhaust system shall be operated in accordance with Section 909 of the *New York City Building Code*.]

[513.20.3 Alarm required. Activation of the smoke exhaust system shall activate an audible alarm at a constantly attended location in accordance with the *New York City Fire Code*.]

SECTION MC 514 ENERGY RECOVERY VENTILATION SYSTEMS

514.1 General. Energy recovery ventilation systems shall be installed in accordance with this section. Where required for purposes of energy conservation, energy recovery ventilation systems shall also comply with the *New York City Energy Conservation Code*.

514.2 Prohibited applications. Energy recovery ventilation systems shall not be used in the following systems, unless specifically designed and/or listed for the specific applications and as part of an engineered system.

12. Hazardous exhaust systems covered in Section 510.
2. Dust, stock and refuse systems that convey explosive or flammable vapors, fumes or dust [covered in Section 511].
3. Smoke control systems covered in Section 513.

4. Commercial kitchen exhaust systems serving Type I and Type II hoods [covered in Section 506].
5. Clothes dryer exhaust systems covered in Section 504.

514.3 Access. A means of access shall be provided to the heat exchanger and other components of the system as required for service, maintenance, repair or replacement.

SECTION MC 515 POSTFIRE SMOKE PURGE SYSTEMS

515.1 General. Postfire smoke purge systems shall be provided as required by Chapter 9 of the *New York City Building Code*.

Subpart 6 (Chapter 6 of the New York City Mechanical Code)

§1. Chapter 6 of the New York city mechanical code, as added by local law number 33 for the year 2007, sections 603.9 and 604.1 as amended by local law number 85 for the year 2009, section 605.2.1 as added by local law 72 for the year 2011, and exceptions item 3.1 of Section 609.1 as amended by local law 8 for the year 2008, is amended to read as follows:

CHAPTER 6 DUCT SYSTEMS SECTION MC 601 GENERAL

601.1 Scope. Duct systems used for the movement of air in air-conditioning, heating, ventilating and exhaust systems shall conform to the provisions of this chapter except as otherwise specified in Chapters 5 and 7.

Exception: Ducts discharging combustible material directly into any combustion chamber shall conform to the requirements of NFPA 82.

601.2 Air movement in corridors. Corridors shall not be used as a portion of direct supply, return, or exhaust air system serving adjoining areas. Air transfer opening(s) shall not be permitted in walls or in doors separating public corridors from adjoining areas.

Exceptions:

1. Where located within dwelling units, the use of corridors for conveying return air shall not be prohibited.

2. Where located within tenant spaces of 1,000 square feet (93 m²) or less in area, [utilization] the use of corridors for conveying return air is permitted.
3. Corridors in Group B office buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *New York City Building Code*.
4. Incidental air movement from pressurized rooms within health care facilities, provided that the corridor is not the primary source of supply or return to the room.
- [4.] 5. Air transfer openings serving toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces opening onto the public corridor.
- [5.] 6. Group I-3 detention and correctional occupancies with corridor separations of open construction (e.g., grating doors or grating partitions).
- [6.] 7. Air transfer in openings because of pressure differential in Group I-2 health care occupancies from corridors is permitted.
- [7.] 8. Where door clearances do not exceed those specified for fire doors in the *New York City Building Code*, air transfer caused by pressure differentials shall be permitted.
- [8.] 9. Use of egress corridors as part of an engineered smoke control system is permitted.

601.2.1 Corridor ceiling. Use of the space between the corridor ceiling and the floor or roof structure above as a return air plenum is permitted for one or more of the following conditions:

1. The corridor is not required to be of fire-resistance-rated construction;
2. The corridor is separated from the plenum by fire-resistance-rated construction;
3. The air-handling system serving the corridor is shut down upon activation of the air-handling unit smoke detectors required by this code;
4. The air-handling system serving the corridor is shut down upon detection of sprinkler waterflow where the building is equipped throughout with an automatic sprinkler system; or
5. The space between the corridor ceiling and the floor or roof structure above the corridor is used as a component of an approved engineered smoke control system.

601.3 Exits. Equipment and ductwork for exit enclosure ventilation shall comply with one of the following items:

1. Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the exit enclosure by ductwork enclosed in construction as required by the *New York City Building Code* for shafts.
2. Where such equipment and ductwork is located within the exit enclosure, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or such air shall be conveyed through ducts enclosed in construction as required by the *New York City Building Code* for shafts.
3. Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required by the *New York City Building Code* for shafts.

In each case, openings into fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by self-closing fire-resistance-rated devices in accordance with the *New York City Building Code* for enclosure wall opening protectives. Exit enclosure ventilation systems shall be independent of other building ventilation systems.

601.4 Contamination prevention. Exhaust ducts under positive pressure, chimneys, and vents shall not extend into or pass through ducts or plenums.

SECTION MC 602 PLENUMS

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a finished ceiling or below the finished floor, attic spaces and mechanical equipment rooms. Plenums shall be limited to one fire area. Fuel-fired appliances shall not be installed within a plenum.

602.2 Construction. Plenum enclosures shall be constructed of materials permitted for the type of construction classification of the building. The temperature of air delivered to or through these plenums shall not exceed 250°F (121°C), except where used as part of an engineered smoke control system.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125°F (52°C) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the air stream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

602.2.1 Materials [exposed] within plenums. Except as required by Sections 602.2.1.1 through [602.2.1.5] 602.2.1.6, materials [exposed] within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. [This section shall not apply to materials] Materials exposed within plenums in one- and two-family dwellings.
4. [This section shall not apply to smoke] Smoke detectors.
5. Combustible materials fully enclosed in [within] continuous noncombustible (i) raceways or enclosures, (ii) approved gypsum board assemblies or [enclosed in] (iii) materials listed and labeled for such application.

602.2.1.1 Wiring. Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable, and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with *New York City Electrical Code*.

602.2.1.2 Fire sprinkler piping. Plastic fire sprinkler piping exposed within a plenum shall be used only in wet pipe systems and shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1887. Piping shall be listed and labeled.

602.2.1.3 Pneumatic tubing. Combustible pneumatic tubing exposed within a plenum shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread of not greater than 5 feet (1524 mm) when tested in accordance with UL 1820. Combustible pneumatic tubing shall be listed and labeled.

602.2.1.4 [Combustible electrical] Electrical equipment in plenums. [Combustible electrical] Electrical equipment exposed within a plenum shall [have a peak rate of heat release not greater than 100 kilowatts, a peak optical density not greater than 0.50_ and an average optical density not greater than 0.15 when tested in accordance with UL 2043. Combustible electrical equipment shall be listed and labeled] comply with Sections 602.2.1.4.1 and 602.2.1.4.2.

602.2.1.4.1 Equipment in metallic enclosures. Electrical equipment with metallic enclosures exposed within a plenum shall be permitted.

602.2.1.4.2 Equipment in combustible enclosures. Electrical equipment with combustible enclosures exposed within a plenum shall be listed and labeled for such use in accordance with UL 2043.

602.2.1.5 Foam plastic insulation. Foam plastic insulation used as wall or ceiling finish in plenums shall exhibit a flame spread index of 75 or less and a smoke developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with Section 602.2.1.5.1, 602.2.1.5.2 or 602.2.1.5.3.

602.2.1.5.1 Separation required. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the *New York City Building Code*.

602.2.1.5.2 Approval. The foam plastic insulation shall be approved based on tests conducted in accordance with Section [2603.8] 2603.9 of the *New York City Building Code*.

602.2.1.5.3 Covering. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm).

602.2.1.6 Semiconductor fabrication areas. Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area shall not be subject to the provisions of Section 602.2.1.

602.3 Stud cavity and joist space plenums. Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:

1. Such cavities or spaces shall not be utilized as a plenum for supply air.
2. Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.
3. Stud wall cavities shall not convey air from more than one floor level.
4. Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the *New York City Building Code*.

Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by approved fireblocking as required in the *New York City Building Code*.

602.4 Flood hazard. For structures located in areas of special flood hazard, plenum spaces shall comply with Appendix G of the *New York City Building Code*.

602.5 Firestopping. Where required by the *New York City Building Code*, through penetrations shall be firestopped in accordance with Section [712] 713 of the *New York City Building Code*.

602.6 Materials. Materials used in the construction of a plenum shall be suitable for continuous exposure to the temperature and humidity conditions of the environmental air in the plenum.

SECTION MC 603 DUCT CONSTRUCTION AND INSTALLATION

603.1 General. An air distribution system shall be designed and installed to supply the required distribution of air. The installation of an air distribution system shall not affect the fire protection requirements specified in the *New York City Building Code*. Ducts shall be constructed, braced, reinforced and installed to provide structural strength and durability.

603.2 Duct sizing. Ducts installed within a single dwelling unit shall be sized in accordance with ACCA Manual D or other approved methods. Ducts installed within all other buildings shall be sized in accordance with the ASHRAE Handbook of Fundamentals or other equivalent computation procedure.

603.3 Duct classification. Ducts shall be classified based on the maximum operating pressure of the duct at pressures of positive or negative 0.5, 1.0, 2.0, 3.0, 4.0, 6.0 or 10.0 inches of water column. The pressure classification of ducts shall equal or exceed the design pressure of the air distribution in which the ducts are utilized.

603.4 Metallic ducts. All metallic ducts shall be constructed as specified in the SMACNA HVAC Duct Construction Standards—Metal and Flexible.

Exception: Ducts installed within single dwelling units shall have a minimum thickness as specified in Table 603.4.

**TABLE 603.4
DUCT CONSTRUCTION MINIMUM SHEET METAL THICKNESSES
FOR SINGLE DWELLING UNITS**

DUCT SIZE	GALVANIZED		[APPROXIMATE ALUMINUM B & S GAGE] <u>ALUMINUM MINIMUM THICKNESS (inches)</u>
	Minimum thickness (inches)	Equivalent Galvanized Gage No.	
Round ducts and enclosed Rectangular ducts			
14[" inches or less	[0.013] 0.0157	[30] 28	[26] 0.0175
[Over 14[" 16 and 18 inches	[0.016] 0.0187	[28] 26	[24] 0.018
20 inches or over	0.0236	24	0.023
Exposed rectangular ducts			
14 [" inches or less	[0.016] 0.0157	28	[24] 0.0175
[Over] 14 [" inches ^a	[0.019] 0.0187	26	[22] 0.018

For SI: 1 inch = 25.4 mm. 1 inch water gage – 249 Pa.

a. For duct gages and reinforcements at static pressures of ½-inch, 1-inch and 2-inch w.g. SMACNA *HVAC Duct Construction Standards*, Tables 2-1, 2-2 and 2-3, shall apply.

603.4.1 Minimum fasteners. Round metallic ducts shall be mechanically fastened by means of at least three sheet metal screws or rivets spaced equally around the joint.

Exception: Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion so as to prevent a hinge effect.

603.5 Nonmetallic ducts. Nonmetallic ducts shall be constructed with Class 0 or Class 1 duct material in accordance with UL 181. Fibrous duct construction shall conform to the SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards. The maximum air temperature within nonmetallic ducts shall not exceed 250°F (121°C).

603.6 Air ducts and air connectors. Air ducts, both metallic and nonmetallic, shall comply with Section[s] 603.6.1 [and 603.6.1.1]. Air connectors, both metallic and nonmetallic, shall comply with Sections 606.6.2 and 603.6.3.

603.6.1 Air ducts. Air ducts shall be permitted to be rigid or flexible and shall be constructed of materials that are reinforced and sealed to satisfy the requirements for the use of the air duct system, such as the supply air system, the return or exhaust air system, and the variable volume/pressure air system.

603.6.1.1 Materials. All air duct materials shall be suitable for continuous exposure to the temperature and humidity conditions of the environmental air in the air duct. Air ducts shall be constructed of any of the following materials:

1. Iron, steel, aluminum, copper, concrete, masonry or clay tile.
2. Class 0 or Class 1 rigid or flexible air ducts tested in accordance with UL 181 and installed in conformance with the conditions of the listing.

Exceptions:

1. Class 0 or Class 1 rigid or flexible air duct shall not be used as a vertical air duct that is more than two stories in height.
2. Class 0 or Class 1 rigid or flexible air ducts shall not be used for air ducts containing air at temperatures in excess of 250°F (121°C).
3. Where the temperature of the conveyed air does not exceed 125°F (52°C) in normal service, negative pressure exhaust or return air ducts shall be permitted to be constructed of gypsum board having a maximum flame spread index/rating of 25 without evidence of continued progressive combustion and a maximum smoke developed index/rating of 50. Air ducts formed by gypsum boards shall have a surface temperature maintained above the air stream dew-point temperature, and shall not be used in air-handling systems utilizing evaporative coolers.

Exception: The maximum conveyed air temperature of 125°F (52°C) shall not apply to gypsum board material used for [emergency] post-fire smoke [exhaust air ducts] purge.

603.6.1.2 Installation. The materials, thickness, construction, and installation of ducts shall provide structural strength and durability in conformance with recognized good practice. Air ducts shall be considered to be in compliance with this requirement where constructed and installed in accordance with the *New York City Building Code*. Where no standard exists for the construction of air ducts, they shall be constructed to withstand both the positive and negative pressures of the system.

603.6.2 Air connectors. Air connectors are limited-use, flexible air ducts that are required to conform to other provisions applicable to air ducts and shall meet the following requirements:

1. Air connectors shall conform to the requirements for Class 0 or Class 1 connectors when tested and approved in accordance with UL 181.

2. Class 0 or Class 1 air connectors shall not be used for ducts containing air at temperatures in excess of 250°F (121°C).
3. Air connector runs shall not exceed 14 feet (4267 mm) in length.
4. Air connectors shall not penetrate any rated wall, partition, or shaft that is required to have a fire-resistance rating of 1 hour or more.
5. Air connectors shall not pass through floors.

603.6.3 Flexible air duct and air connector clearance. Flexible air ducts and air connectors shall be installed with a minimum clearance to an appliance as specified in the appliance manufacturer's installation instructions.

603.7 Rigid duct penetrations. Duct system penetrations of walls, floors, ceilings and roofs and air transfer openings in such building components shall be protected as required by Section 607. Ducts in a private garage and ducts penetrating the walls or ceilings separating a dwelling from a private garage shall be continuous and constructed of a minimum 26 gage 0.0187 inch (0.4712 mm) galvanized sheet metal and shall not have openings into the garage. Fire and smoke dampers are not required in such ducts passing through the wall or ceiling separating a dwelling from a private garage except where required by Chapter 7 of the New York City Building Code.

603.8 Underground ducts. Ducts shall be approved for underground installation. Metallic ducts not having an approved protective coating shall be completely encased in a minimum of 2 inches (51 mm) of concrete.

603.8.1 Slope. Ducts shall have a minimum slope of 1/8 inch per foot (10.4 mm/m) to allow drainage to a point provided with access.

603.8.2 Sealing. Ducts shall be sealed and secured prior to pouring the concrete encasement.

603.8.3 Plastic ducts and fittings. Plastic ducts shall be constructed of PVC having a minimum pipe stiffness of 8 psi (55 kPa) at 5[-] percent deflection when tested in accordance with ASTM D 2412. Plastic duct fittings shall be constructed of either PVC or high-density polyethylene. Plastic duct and fittings shall be utilized in underground installations only. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C).

603.9 Joints, seams and connections. All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC Duct Construction Standards—Metal and Flexible and [SMACNA Fibrous Glass Duct Construction Standards or] NAIMA Fibrous Glass Duct Construction Standards. All [longitudinal and transverse] joints;[,] and longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed [in accordance] with [the *Energy Conservation*

Code of the New York State] welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Closure systems used to seal ductwork listed and labeled in accordance with UL 181A shall be marked “181A-P” for pressure-sensitive tape, “181 A-M” for mastic or “181 A-H” for heat-sensitive tape. Closure systems used to seal flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked “181B-FX” for pressure-sensitive tape or “181B-M” for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked “181B-C.” Closure systems used to seal metal ductwork shall be installed in accordance with the manufacturer’s installation instructions. Unlisted duct tape is not permitted as a sealant on any metal ducts.

Exception: Continuously welded and locking-type longitudinal joints and seams in ducts operating at static pressures less than 2 inches of water column (500 Pa) pressure classification shall not require additional closure systems.

603.10 Supports. Ducts shall be supported with approved hangers at intervals not exceeding 10 feet (3048 mm) or by other approved duct support systems designed in accordance with the *New York City Building Code*. Flexible and other factory-made ducts shall be supported in accordance with the manufacturer’s installation instructions. Ducts shall not be hung from or supported by suspended ceilings.

603.11 Furnace connections. Ducts connecting to a furnace shall have a clearance to combustibles in accordance with the furnace manufacturer’s installation instructions.

603.11.1 Air duct at heat sources. Where heat sources from electrical equipment, fossil fuel-burning equipment, or solar energy collection equipment are installed in air ducts, the installation shall avoid the creation of a fire hazard. Air ducts rated as Class 1 in accordance with UL 181, air duct coverings, and linings shall be interrupted at the immediate area of operation of such heat sources in order to meet the clearances specified in the equipment listing.

Exceptions:

1. Appliances listed for zero clearance from combustibles where installed with the conditions of their listings.
2. Insulation specifically suitable for the maximum temperature that reasonably can be anticipated on the duct surface shall be permitted to be installed at the immediate area of operation of such appliances.

603.12 Condensation. Provisions shall be made to prevent the formation of condensation on the exterior of any duct.

603.13 Flood hazard areas. For structures in areas of special flood hazard, ducts shall comply with Appendix G of the *New York City Building Code*.

603.14 Location. Ducts shall not be installed in or within 4 inches (102 mm) of the earth, except where such ducts comply with Section 603.8.

603.15 Mechanical protection. Ducts installed in locations where they are exposed to mechanical damage by vehicles or from other causes shall be protected by approved vehicle barriers as required by the *New York City Building Code*.

603.16 Weather protection. All ducts including linings, coverings and vibration isolation connectors installed on the exterior of the building shall be adequately protected against the elements.

603.17 Registers, grilles and diffusers. Duct registers, grilles and diffusers shall be installed in accordance with the manufacturer's installation instructions. [Balancing] Volume dampers or other means of supply air adjustment shall be provided in the branch ducts or at each individual duct register, grille or diffuser. Each volume damper or other means of supply air adjustment used in balancing shall be accessible.

603.17.1 Floor registers. Floor registers shall resist, without structural failure, a 200[-] pound (90.8 kg) concentrated load on a 2-inch-diameter (51 mm) disc applied to the most critical area of the exposed face.

603.17.2 Prohibited locations. Duct registers, grilles and diffusers shall be prohibited in the toilet and bathing room floors and their upward extensions, to the extent those areas are required by the *New York City Building Code* to have smooth, hard and nonabsorbent surfaces.

Exception: In R-3 occupancies.

603.18 Vibration isolation connectors. Vibration isolation connectors in duct systems shall be made of an approved flame-retardant fabric or shall consist of sleeve joints with packing of approved material, each having a maximum flame spread index/rating of 25 and a maximum smoke-developed rating of 50. The fabric shall have a maximum length of 10 inches (254 mm) in the direction of airflow.

SECTION MC 604 INSULATION

604.1 General. Duct insulation shall conform to the requirements of Sections 604.2 through 604.13 and the *New York City Energy Conservation Code*.

604.2 Surface temperature. Ducts that operate at temperatures exceeding 120°F (49°C) shall have sufficient thermal insulation to limit the exposed surface temperature to 120°F (49°C).

604.3 Coverings and linings. Coverings and linings, including adhesives when used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C).

604.4 Foam plastic insulation. Foam plastic used as duct coverings and linings shall conform to the requirements of Section 604.

604.5 Appliance insulation. Listed and labeled appliances that are internally insulated shall be considered as conforming to the requirements of Section 604.

604.6 Penetration of assemblies. Duct coverings shall not penetrate a wall or floor required to have a fire-resistance rating or required to be fireblocked.

604.7 Identification. External duct insulation, except spray polyurethane foam, and factory-insulated flexible duct shall be legibly printed or identified at intervals not greater than 36 inches (914 mm) with the name of the manufacturer, the thermal resistance *R*-value at the specified installed thickness and the flame spread and smoke-developed indexes of the composite materials. All duct insulation product *R*-values shall be based on insulation only, excluding air films, vapor retarders or other duct components, and shall be based on tested *C*-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The installed thickness of duct insulation used to determine its *R*-values shall be determined as follows:

1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the nominal insulation thickness shall be used.
2. For duct wrap, the installed thickness shall be assumed to be 75 percent (25 percent compression) of nominal thickness.
3. For factory-made flexible air ducts, the installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.
4. For spray polyurethane foam, the aged *R*-value per inch, measured in accordance with recognized industry standards, shall be provided to the customer in writing at the time of foam application.

604.8 Lining installation. Linings shall be interrupted at the area of operation of a fire damper and at a minimum of 6 inches (152 mm) upstream of and 6 inches (152 mm) downstream of electric-resistance and fuel-burning heaters in a duct system. Metal nosings or sleeves shall be installed over exposed duct liner edges that face opposite the direction of airflow.

604.9 Thermal continuity. Where a duct liner has been interrupted, a duct covering of equal thermal performance shall be installed.

604.10 Service openings. Service openings shall not be concealed by duct coverings unless the exact location of the opening is properly identified.

604.11 Vapor retarders. Where ducts used for cooling are externally insulated, the insulation shall be covered with a vapor retarder having a maximum permeance of 0.05 perm $[(2.87 \text{ ng}/(\text{Pa} \cdot \text{s} \cdot \text{m}^2))]$ or aluminum foil having a minimum thickness of 2 mils (0.051 mm). Insulations having a permeance of 0.05 perm $[(2.87 \text{ ng}/(\text{Pa} \cdot \text{s} \cdot \text{m}^2))]$ or less shall not be required to be covered. All joints and seams shall be sealed to maintain the continuity of the vapor retarder.

604.12 Weatherproof barriers. Insulated exterior ducts shall be protected with an approved weatherproof barrier.

604.13 Internal insulation. Materials used as internal insulation and exposed to the airstream in ducts shall be shown to be durable when tested in accordance with UL 181. Exposed internal insulation that is not impermeable to water shall not be used to line ducts or plenums from the exit of a cooling coil to the downstream end of the drain pan.

SECTION MC 605 AIR FILTERS

605.1 General. Heating and air-conditioning systems of the central type shall be provided with approved air filters. Filters shall be installed in the [return] air system, upstream from any heat exchanger or coil, in an approved convenient location. Liquid adhesive coatings used on filters shall have a flash point not lower than 325°F (163°C).

605.2 Standards. Media-type and electrostatic-type air filters shall be listed and labeled. Media-type air filters shall comply with UL 900. High efficiency particulate air filters shall comply with UL 586. Electrostatic-type air filters shall comply with UL 867. Air filters utilized within dwelling units shall be designed for the intended application and shall not be required to be listed and labeled.

605.2.1 Standards for air-handling units. Air-handling units of mechanical ventilation systems, any portion of which provide outdoor air ventilation, shall be equipped with a particulate matter filtration system in accordance with ASHRAE 62.1 or ASHRAE 62.2 and shall have a minimum efficiency reporting value (MERV) of 11 or greater in accordance with ASHRAE 52.2.

Exceptions:

1. This section shall not apply to the alteration or repair of a mechanical ventilation system that was installed prior to January 1, 2013 unless such alteration or repair includes the replacement or addition of an air-handling unit in such system.

2. This section shall not apply to the replacement of an air handling unit in a mechanical ventilation system installed prior to January 1, 2013 if the department determines that the design of such replacement air-handling unit cannot be made to comply with the allowable fan system power limitations of the *New York City Energy Conservation Code* [or ASHRAE 90.1].
3. This section shall not apply to any air-handling unit with a design capacity of less than 5,000 cfm (2.4 m³/s).
4. This section shall not apply for combustion outside air, ventilation air for mechanical room and inhabitable spaces.

605.3 Airflow over the filter. Ducts shall be constructed to allow an even distribution of air over the entire filter.

605.4 Liquid adhesive tanks. Tanks for liquid adhesives, into which removable filters are dipped, shall be located either outside the building or, if such a location is not available, in a separate fire-resistive room and stored in accordance with NFPA 30. Such tanks shall be metal, equipped with tight-fitting covers and shall be kept tightly covered when not in actual use.

605.5 Filter maintenance. All air filters shall be kept free of excess dust and combustible material. Unit filters shall be renewed or cleaned when the resistance to airflow has increased to two times the original resistance or when the resistance has reached a value of recommended replacement by the manufacturer. A permanently installed draft gauge or differential pressure transmitter shall be provided for [this purpose] all systems equal to or greater than 4000 cfm (1.89 m³/s). Where the filters are of the automatic liquid adhesive type, sludge shall be removed from the liquid adhesive reservoir regularly.

SECTION MC 606 SMOKE DETECTION SYSTEMS CONTROL

606.1 Controls required. Air distribution systems shall be equipped with smoke detectors listed and labeled for installation in air distribution systems, as required by this section. Duct smoke detectors shall comply with UL 268A. Other smoke detectors shall comply with UL 268.

606.2 Where required. Smoke detectors shall be installed where indicated in Sections 606.2.1 through 606.2.4.

Exception: Smoke detectors shall not be required where air distribution systems are incapable of spreading smoke beyond the enclosing walls, floors and ceilings of the room or space in which the smoke is generated.

606.2.1 Return air systems. Smoke detectors shall be installed in return air systems with a design capacity greater than 2,000 cfm (0.9 m³/s), in the return air duct or plenum upstream of any filters, exhaust air connections, outdoor air connections, or decontamination equipment and appliances.

Exception: Smoke detectors are not required in the return air system where all portions of the building served by the air distribution system are protected by area smoke detectors connected to a fire alarm system in accordance with the *New York City Fire Code*. The area smoke detection system shall comply with Section 606.4.

606.2.2 Common supply and return air systems. Where multiple air-handling systems share common supply or return air ducts or plenums with a combined design capacity greater than 2,000 cfm (0.9 m³/s), the return air system shall be provided with smoke detectors in accordance with Section 606.2.1.

Exception: Individual smoke detectors shall not be required for each fan-powered terminal unit, provided that such units do not have an individual design capacity greater than 2,000 cfm (0.9 m³/s) and will be shut down by activation of one of the following:

1. Smoke detectors required by Sections 606.2.1 and 606.2.3.
2. An approved area smoke detector system located in the return air plenum serving such units.
3. An area smoke detector system as prescribed in the exception to Section 606.2.1.

In all cases, the smoke detectors shall comply with Sections 606.4 and 606.4.1.

606.2.3 Return air risers. Where return air risers serve two or more stories and serve any portion of a return air system having a design capacity greater than 15,000 cfm (7.1 m³/s), smoke detectors shall be installed at each story. Such smoke detectors shall be located upstream of the connection between the return air riser and any air ducts or plenums.

606.2.4 Supply air systems. Smoke detectors listed for use in air distribution systems shall be installed downstream of the air filters and ahead of any branch connections in air supply systems having a capacity greater than 2,000 cfm (0.9 m³/s).

606.3 Installation. Smoke detectors required by this section shall be installed in accordance with the *New York City Electrical Code*. The required smoke detectors shall be installed to monitor the entire airflow conveyed by the system [including supply air, return air and exhaust or relief air]. Access shall be provided to smoke detectors for inspection and maintenance.

606.4 Controls operation. Upon activation, the smoke detectors shall [automatically] shut down [their respective air distribution system(s)] all operational capabilities of the air distribution systems serving the affected areas in accordance with the listing and labeling of appliances

used in the system. Air distribution systems that are part of a smoke control system shall switch to the smoke control mode upon activation of a detector.

606.4.1 Supervision. The duct smoke detectors shall be connected to a fire alarm system where a fire alarm system is required by Section 907.2 of the *New York City Building Code*. The actuation of a duct smoke detector shall activate a visible and audible [supervisory] alarm signal at a constantly attended location.

Exceptions:

1. The [supervisory] alarm signal at a constantly attended location is not required where the duct smoke detector activates the building's alarm-indicating appliances.
2. In occupancies not required to be equipped with a fire alarm system, actuation of either area or duct smoke detector shall activate a visible and an audible alarm signal in an approved location. Additionally, duct smoke detector trouble conditions shall activate a visible or audible alarm signal in an approved location and shall be identified as air duct detector trouble.

606.4.2 Fan shutdown. When any building or floor is provided with an air system utilizing recirculated air and is protected by an automatic sprinkler system or an automatic fire alarm system, provisions shall be made to automatically stop the fans serving the affected area when the sprinkler system or fire alarm system are installed in the area, it shall be required to have only one of these systems arranged to stop the fans.

Exceptions:

1. Activation of a manual pull station shall not be required to automatically stop the fans.
2. Systems having a capacity of 2,000 cfm (0.2 m³/s) or less or serving not more than one floor.

606.4.3 Manual restart of fans after automatic fire detecting device or fire alarm system shut down. Fans or fan systems which have been automatically shut down on activation of an automatic fire detecting device or fire alarm system shall be arranged and equipped so that they do not automatically restart when either the automatic fire detecting device or fire alarm system is reset. The manual means of restarting the fans or fan system shall function independently from the manual resetting of either the automatic fire detecting device or fire alarm system.

**SECTION MC 607
DUCTS AND AIR TRANSFER OPENINGS**

607.1 General. The provisions of this section shall govern the protection of duct penetrations and air transfer openings in fire-resistance-rated assemblies required to be protected.

607.1.1 Ducts [and air transfer openings] that penetrate fire-resistance-rated assemblies without dampers. Ducts [and air transfer openings] that penetrate fire-resistance-rated assemblies and are not required by this section to have dampers shall comply with the requirements of [Section 712] Sections 713.2 through 713.3.3 of the *New York City Building Code*. Ducts that penetrate horizontal assemblies not required to be contained within a shaft and not required by this section to have dampers shall comply with the requirements of Sections 713.4 through 713.4.1.4.2 of the *New York City Building Code*.

Exception: Ducts 20 square inches (129 cm²) or less passing through fire-resistance rated assemblies shall not require fire dampers or fire smoke dampers.

607.1.1.1 Ducts that penetrate nonfire-resistance-rated assemblies. The space around a duct penetrating a nonfire-resistance-rated floor assembly shall comply with Section 716.6.3 of the *New York City Building Code*.

607.2 Installation. Fire dampers, smoke dampers, combination fire/smoke dampers and ceiling radiation dampers located within air distribution and smoke control systems shall be installed in accordance with the requirements of this section, and the manufacturer's installation instructions and the damper's listing.

607.2.1 Smoke control system. Where the installation of a fire damper will interfere with the operation of a required smoke control system in accordance with Section [513] 909 of the *New York City Building Code*, approved alternative protection shall be [utilized] used. Where mechanical systems including ducts and dampers used for normal building ventilation serve as part of the smoke control system, the expected performance of these systems in smoke control mode shall be addressed in the rational analysis required by Section 909.4 of the *New York City Building Code*.

607.2.1.1 Remote operation. Combination fire and smoke dampers shall be operable by remote controls where necessary for smoke removal. Such dampers shall have provisions that allow them to reclose automatically upon reaching the damper's maximum degradation test temperature in accordance with UL 555S.

607.2.2 Hazardous exhaust ducts. Fire dampers for hazardous exhaust duct systems shall comply with Section 510.

607.2.3 Supply air systems. Smoke dampers listed for use in air distribution systems shall be installed both upstream and downstream of filters and ahead of any branch connections in supply air-handling apparatus and systems having a capacity equal to or greater than 15,000 cfm (7.1 m³/s).

Exceptions:

1. Where the air-handling unit is located on the floor that it serves and serves only that floor.
2. Where the air-handling unit is located on the roof and serves only the floor immediately below the roof.
- [3. Existing buildings using only UL 90D Class 1 filters shall be exempt from this subdivision provided the control system is arranged to shut down the fresh air intake, return air, and exhaust air dampers, and fan shutdown and smoke detection is provided in accordance with Section 606.]

607.3 Damper testing [and], ratings and actuation. [Dampers shall be listed and bear the label of an approved testing agency indicating compliance with the standards in this section. Fire dampers shall comply with the requirements of UL 555. Only fire dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire. Smoke dampers shall comply with the requirements of UL 555S. Combination fire/smoke dampers shall comply with the requirements of both UL 555 and UL 555S. Ceiling radiation dampers shall comply with the requirements of UL 555C.] Damper testing, ratings and actuation shall be in accordance with Sections 607.3.1 through 607.3.3.

607.3.1 [Fire protection rating. Fire dampers shall have the minimum fire protection rating specified in Table 607.3.1 for the type of penetration.]

[

**TABLE 607.3.1
FIRE DAMPER RATING**

TYPE OF PENETRATION	MINIMUM DAMPER RATING (hour)
Less than 3-hour fire-resistance-rated assemblies	1½
3-hour or greater fire-resistance-rated assemblies	3

]

Damper testing. Dampers shall be listed and bear the label of an approved testing agency indicating compliance with the standards in this section. Fire dampers shall comply with the requirements of UL 555. Only fire dampers labeled for use in dynamic systems shall be installed in heating, ventilation and air-conditioning systems designed to operate with fans on during a fire. Smoke dampers shall comply with the requirements of UL 555S. Combination fire/smoke dampers shall comply with the requirements of both UL 555 and UL 555S. Ceiling radiation dampers shall comply with the requirements of UL 555C-Ceiling Dampers.

[607.3.1.1 Fire damper actuating device. The fire damper actuating device shall meet one of the following requirements:

1. The operating temperature shall be approximately 50°F (27.8°C) above the normal temperature within the duct system, but not less than 160°F (71°C).
2. The operating temperature shall be not more than 286°F (141°C) where located in a smoke control system complying with Section 513.
3. Where a combination fire/smoke damper is located in a smoke control system complying with Section 513, the operating temperature rating shall be approximately 50°F (27.8°C) above the maximum smoke control system designed operating temperature, or a maximum temperature of 350°F (177°C). The temperature shall not exceed the UL 555S degradation test temperature rating for a combination fire/smoke damper.]

607.3.2 [Smoke damper] Damper ratings. [Smoke damper leakage ratings shall not be less than Class II. Elevated temperature ratings shall be not less than 250°F (121°C).] Damper ratings shall be in accordance with Sections 607.3.2.1 through 607.3.2.3.

607.3.2.1 [Smoke damper actuation methods. The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with Section 606 of this code and Sections 907.10 and 907.11 of the *New York City Building Code* and one of the following methods, as applicable:

1. Where a damper is installed within a duct, a smoke detector shall be installed in the duct within 5 feet (1524 mm) of the damper with no air outlets or inlets between the detector and the damper. The detector shall be listed for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.
2. Where a damper is installed above smoke barrier doors in a smoke barrier, a spot-type detector listed for releasing service shall be installed on either side of the smoke barrier door opening.
3. Where a damper is installed within an unducted opening in a wall, a spot-type detector listed for releasing service shall be installed within 5 feet (1524 mm) horizontally of the damper.
4. Where a damper is installed in a corridor wall, the damper shall be permitted to be controlled by a smoke detection system installed in the corridor.
5. Where a total-coverage smoke detector system is provided within areas served by an HVAC system, dampers shall be permitted to be controlled by the smoke detection system.

6. Smoke dampers that are part of an engineered smoke control system shall be capable of being positioned manually from a command station. Such positioning devices shall be provided for supply and return/exhaust dampers grouped by floor and by type. Damper switch positions shall indicate whether the related dampers are commanded to be either open or closed. Smoke damper positioning switches shall be located at the Fire Command Station, or in a Mechanical Control Center in buildings without a Fire Command Station.] **Fire damper ratings.** Fire dampers shall have the minimum fire protection rating specified in Table 607.3.2.1 for the type of penetration.

**TABLE 607.3.2.1
FIRE DAMPER RATING**

TYPE OF PENETRATION	MINIMUM DAMPER RATING (hour)
<u>Less than 3-hour fire-resistance-rated assemblies</u>	<u>1 1/2</u>
<u>3-hour or greater fire-resistance-rated Assemblies</u>	<u>3</u>

607.3.2.2 Smoke damper ratings. Smoke damper leakage ratings shall not be less than Class II. Elevated temperature ratings shall not be less than 250°F (121°C).

607.3.2.3 Combination fire/smoke damper ratings. Combination fire/smoke dampers shall have the minimum fire protection rating specified for fire dampers in Table 607.3.2.1 for the type of penetration and shall also have a minimum Class II leakage rating and a minimum elevated temperature rating of 250°F (121°C).

607.3.3 Damper actuation. Damper actuation shall be in accordance with Sections 607.3.3.1 through 607.3.3.4 as applicable.

607.3.3.1 Fire damper actuation device. The fire damper actuation device shall meet one of the following requirements:

1. The operating temperature shall be approximately 50°F (28°C) above the normal temperature within the duct system, but not less than 160°F (71°C).
2. The operating temperature shall be not more than 350°F (177°C) where located in a smoke control system complying with Section 909 of the *New York City Building Code*.

607.3.3.2 Smoke damper actuation. The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with Section 606 of this code and Section 907.3 of the *New York City Building Code* and one of the following methods, as applicable:

1. Where a smoke damper is installed within a duct, a smoke detector shall be installed in the duct within 5 feet (1524 mm) of the damper with no air outlets or inlets between the detector and the damper. The detector shall be listed for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.

Exceptions:

1. Duct smoke detectors will not be required at each fire smoke damper provided the supply fan shall shut down and all the fire smoke dampers associated with the supply system automatically close upon actuation of any automatic alarm initiating device on the floor(s).
 2. Duct smoke detectors will be required within 5 feet (1.5 m) downstream of any electric duct reheat coil.
 3. Non-ducted return air systems shall have a smoke detector located within 5 feet (1.5 m) upstream of each return air protected opening in a 2 hour fire rated barrier.
 4. Ducted return air systems shall have a duct smoke detector located within 5 feet (1.5 m) of a smoke damper; additional smoke detectors will not be required at fire smoke dampers located downstream where there are no additional return air inlets.
2. Where a smoke damper is installed above smoke barrier doors in a smoke barrier, a spot-type detector listed for releasing service shall be installed on either side of the smoke barrier door opening.
 3. Where a smoke damper is installed within an unducted opening in a wall, a spot-type detector listed for releasing service shall be installed within 5 feet (1524 mm) horizontally of the damper.
 4. Where a smoke damper is installed in a corridor wall, the damper shall be permitted to be controlled by a smoke detection system installed in the corridor.
 5. Where a total-coverage smoke detector system is provided within all areas served by an HVAC system, dampers shall be permitted to be controlled by the smoke detection system.
 6. Smoke dampers that are part of an engineered smoke control system shall be capable of being positioned manually from a command station. Such positioning devices shall be provided for supply and return/exhaust dampers grouped by floor and by type. Damper switch positions shall indicate whether the related dampers are commanded to be either open or closed. Smoke damper

positioning switches shall be located at the Fire Command Station, or in a Mechanical Control Center in buildings without a Fire Command Station.

607.3.3.3 Combination fire/smoke damper actuation. Combination fire/smoke damper actuation shall be in accordance with Sections 607.3.3.1 and 607.3.3.2. Combination fire/smoke dampers installed in smoke control system shaft penetrations shall not be activated by local area smoke detection unless it is secondary to the smoke management system controls.

607.3.3.4 Ceiling radiation damper actuation. The operating temperature of a ceiling radiation damper actuation device shall be 50°F (28°C) above the normal temperature within the duct system, but not less than 160°F (71°C).

607.4 Access and identification. Fire and smoke dampers shall be provided with an approved means of access, large enough to permit inspection and maintenance of the damper and its operating parts. The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance rating of the assembly. Access points shall be permanently identified on the exterior by a label having letters not less than 0.5 inch (12.7 mm) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER, followed by an identification marking that is individual and unique to the damper accessed. Access doors in ducts shall be tight fitting and suitable for the required duct construction.

607.5 Where required. Fire dampers, smoke dampers, and combination fire/smoke dampers [and ceiling radiation dampers] shall be provided at the locations prescribed in this section. Where an assembly is required to have both fire dampers and smoke dampers, combination fire/smoke dampers or a fire damper and a smoke damper shall be required.

Exceptions:

1. Ducts 20 square inches (129 cm²) or less passing through fire-resistance rated assemblies shall not require fire dampers or smoke dampers.

[Smoke dampers shall not be required on air systems other than where necessary for the proper function of that system where the system is designed specifically to:

1.1 Function as an engineered smoke control system, including the provision of continuous air movement with the air handling system; or

1.2 Provide air to other areas of the building during a fire emergency; or

1.3 Provide pressure differentials during a fire emergency.]

2. Smoke dampers shall not be required to be located within a prescribed distance of a fire-rated enclosure within a prescribed distance of a fire-rated enclosure and where isolation smoke dampers are used in air-handling equipment [refer to Section 607.2.3].

[3. Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.]

607.5.1 Fire walls. Ducts and air transfer openings permitted in firewalls in accordance with Section [705.11] 706.11 of the *New York City Building Code* shall be protected with [approved] listed fire dampers and smoke dampers installed in accordance with their listing.

Exception: Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.5.1.1 Horizontal exits. A listed smoke damper designed to resist the passage of smoke shall be provided at each point that a duct or air transfer opening penetrates a fire wall that serves as a horizontal exit.

Exception: Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.5.2 Fire barriers. [Duct penetrations and air transfer openings in] Ducts and air transfer openings that penetrate fire barriers shall be protected with [approved] listed fire dampers installed in accordance with their listing. Ducts and air transfer openings shall not penetrate exit enclosures and exit passageways except as permitted by Sections 1022.4 and 1022.6, respectively, of the *New York City Building Code*. In addition, smoke dampers shall be installed in penetrations of public corridor and horizontal exit walls in accordance with Section 607.5.2.1.

Exceptions: Fire dampers are not required at penetrations of fire barriers where any of the following apply:

1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.
2. [Where permitted under Section 513 and ducts are part of an engineered smoke control system.] Ducts are used as part of an engineered smoke control system in accordance with Section 513 of this Code and Section 909 of the *New York City Building Code* and where the fire damper would interfere with the operation of the smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required fire resistance rating of 1 hour or less, are in areas [of] other than Group H and are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the *New York City Building Code*. For the

purposes of this exception, a ducted HVAC system shall be a duct system for the structure's HVAC system. Such a duct system shall be constructed of sheet metal not less than 26 [-Gage] gage (0.0217 inch) [0.55 mm] thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

607.5.2.1 Horizontal exits. A listed smoke damper designed to resist the passage of smoke shall be provided at each point that a duct or air transfer opening penetrates a fire barrier that serves as a horizontal exit.

Exception:

Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.5.2.2 Public corridors. A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a public corridor wall constructed as a fire barrier.

Exceptions:

1. Smoke dampers are not required where the building is equipped throughout with an approved smoke control system in accordance with Section 909 of the New York City Building Code, and smoke dampers are not necessary for the operation and control of the system.
2. Smoke dampers are not required in corridor penetrations where the duct is constructed of steel not less than 0.019 inch (0.48 mm) in thickness and there are no openings serving the corridor.
3. Smoke dampers are not required in corridor penetrations in Group R-2 buildings [and spaces] and public corridors serving R-2 spaces in mixed use buildings.
4. Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.5.3 Fire partitions. [Duct penetrations in fire partitions] Ducts and air transfer openings that penetrate fire partitions shall be protected with [approved] listed fire dampers installed in accordance with their listing.

Exceptions: In occupancies other than Group H, fire dampers are not required where any of the following apply:

1. The partitions are tenant separation and corridor walls in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the *New York City Building Code* and the duct is protected as a through penetration in accordance with the *New York City Building Code*.
2. The partitions are tenant partitions in covered mall buildings where the walls are not required by provisions elsewhere in the *New York City Building Code* to extend to the underside of the floor or roof sheathing, slab or deck above.
 - [2.] 3. The duct system is constructed of approved materials in accordance with this code and the duct penetrating the wall meets all of the following minimum requirements:
 - [2.1.] 3.1. The duct shall not exceed 100 square inches (0.06 m²).
 - [2.2.] 3.2. The duct shall be constructed of steel a minimum of 0.0217 inch (0.55 mm) in thickness.
 - [2.3.] 3.3. The duct shall not have openings that communicate the corridor with adjacent spaces or rooms.
 - [2.4] 3.4. The duct shall be installed above a ceiling.
 - [2.5] 3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
 - [2.6] 3.6. A minimum 12-inch-long (304.8 mm) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 1½-inch by 1½-inch by 0.060-inch (38 mm by 38 mm by 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The annular space between the steel sleeve and the wall opening shall be filled with rock (mineral) wool batting or approved equivalent on all sides.

607.5.4 Smoke barriers. A listed smoke damper designed to resist the passage of smoke shall be provided at each point where a duct or an air transfer opening penetrates a smoke barrier wall enclosure required to have smoke and draft control doors in accordance with the *New York City Building Code*. Smoke dampers and smoke damper actuation methods shall comply with Section 607.5.4.1.

[Exception:] Exceptions:

1. Smoke dampers are not required in smoke barrier penetrations where the openings in ducts are limited to a single smoke compartment and the ducts are constructed of steel.

2. Smoke dampers are not required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.5.4.1 Smoke damper. The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with the *New York City Building Code* and Section [607.3.2.1] 607.3.3.2.

607.5.5 Shaft enclosures. Ducts and air transfer openings shall not penetrate a shaft serving as an exit enclosure except as permitted by Section [1019.1.2] 1022.4 of the *New York City Building Code*. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

[607.5.5.1 Penetrations of shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.]

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
 - 1.1. Steel exhaust subducts extend at least 22 inches (559 mm) vertically in exhaust shafts provided there is a continuous airflow upward to the outside;
 - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly;
 - 1.3. Ducts are used as part of an [*approved*] engineered smoke control system designed and installed in accordance with Section [513 of this code] 909 of the *New York City Building Code*, and where the fire damper will interfere with the operation of the smoke control system; or
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *New York City Building Code*, smoke dampers are not required at penetrations of shafts where[:]
 - [2.1] kitchen, [Bathroom] bathroom and toilet room exhaust openings with steel exhaust subducts, having a minimum thickness of 0.0187 [0.019]

inch (0.4712 mm) [(0.48 mm)] (No. 26 gage), extend at least 22 inches (559 mm) vertically, and where the exhaust fan at the upper terminus is powered continuously [in accordance with the provisions of Section 909.11 of the *New York City Building Code*,] and maintains airflow upward to the [outside, or] outdoors.

[2.2 Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 of the *New York City Building Code*, and where the smoke damper will interfere with the operation of the smoke control system.]

3. Smoke dampers are not required at penetrations of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an engineered mechanical smoke control system designed in accordance with Section 909 of the *New York City Building Code* and where the smoke damper will interfere with the operation of the smoke control system.

5. Fire dampers and/or smoke dampers [shall] are not [be] required at a shaft where the shaft is acting as an extension of the mechanical equipment room that it serves and the shaft and mechanical equipment room maintain fire and smoke separation required by the greater of the two spaces from the occupied portions of the building and meet the requirements of Section [707.11] 708.11 of the *New York City Building Code*.

[5.] 6. Smoke dampers [shall] are not [be] required to be located within a prescribed distance of a fire-rated enclosure within which the air handling equipment is located and where isolation smoke dampers are used in air-handling equipment. See Section 607.2.3 for additional requirements.

[6.] 7. Smoke dampers [shall] are not [be] required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air [under] during a fire emergency [conditions] condition.

8. Smoke dampers are not required in exhaust ducts or shafts where the exhaust fan is maintained in operation during occupancy, such as in bathrooms and toilet room exhausts.

607.5.5.1 Enclosure at the bottom. Shaft enclosures that do not extend to the bottom of the building or structure shall be protected in accordance with Section 708.11 of the *New York City Building Code*.

607.5.5.2 Limitations. Shafts that constitute air ducts or that enclose air ducts used for the movement of environmental air shall not enclose:

1. Exhaust ducts used for the removal of smoke and grease-laden vapors from cooking equipment;
2. Ducts used for removal of flammable vapors;
3. Ducts used for moving, conveying, or transporting stock, vapor or dust;
4. Ducts used for the removal of nonflammable corrosive fumes and vapors;
5. Refuse and linen chutes; or
6. Piping.

Exception: Shafts that constitute air ducts or that enclose air ducts used for the movement of environmental air may enclose noncombustible piping conveying water or other nonhazardous or nontoxic materials.

607.5.6 Exterior walls. Ducts and air transfer openings in fire-resistance-rated exterior walls required to have protected openings in accordance with Section 705.10 of the *New York City Building Code* shall be protected with listed fire dampers installed in accordance with their listing.

607.5.7 Smoke partitions. A listed smoke damper designed to resist the passage of smoke shall be provided at each point where an air transfer opening penetrates a smoke partition. Smoke dampers and smoke damper actuation methods shall comply with Section 607.3.3.2.

Exceptions:

1. Where the installation of a smoke damper will interfere with the operation of a required smoke control system in accordance with Section 513, approved alternate protection shall be used.
2. Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.6 Horizontal assemblies. Penetrations by air ducts of a floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly shall be protected by a shaft enclosure that complies with the *New York City Building Code* or shall comply with this section.

607.6.1 Through penetrations. In occupancies other than Groups I-2 and I-3, a duct and air transfer opening system constructed of approved materials in accordance with this code

that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection, provided that a listed fire damper is installed at the floor line and the penetration is firestopped or the duct is protected in accordance with Section 713.4 of the *New York City Building Code*. For air transfer openings, see Exception 7, Section 708.2 of the *New York City Building Code*.

Exception: A duct serving a dwelling unit is permitted to penetrate three floors or less without a fire damper at each floor provided [it] such duct meets all of the following requirements.

1. The duct [shall be] is contained and located within the cavity of a wall and [shall be] is constructed of steel [not less than 0.019 inch (0.48 mm) (26 gauge)] having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage).
2. The duct [shall open] opens into only one dwelling or sleeping unit and the duct system [shall be] is continuous from the unit to the exterior of the building.
3. The duct [shall] does not exceed a 5 inch (127 mm) nominal diameter and the total area of such ducts [shall] does not exceed 100 square inches (64 516 mm²) for any 100 square feet (9.3 m²) of the floor area.
4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.
5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly [shall be] is protected with a listed ceiling radiation damper installed in accordance with Section 607.6.2.1.

607.6.2 Membrane penetrations. [Where duct systems constructed of approved materials in accordance with this code penetrate a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly, shaft enclosure protection is not required provided an approved ceiling radiation damper and firestopping is installed at the ceiling line. Where a duct is not attached to a diffuser that penetrates a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly, shaft enclosure protection is not required provided an approved ceiling radiation damper and firestopping is installed at the ceiling line. Ceiling radiation dampers shall be installed in accordance with UL 555C and constructed in accordance with the details listed in a fire-resistance-rated assembly or shall be labeled to function as a heat barrier for air-handling outlet/inlet penetrations in the ceiling of a fire-resistance-rated assembly. Ceiling radiation dampers shall not be required where ASTM E 119 fire tests have shown that ceiling radiation dampers are not necessary in order to maintain the fire-resistance rating of the assembly. Ceiling radiation damper shall not be required where exhaust duct penetrations are protected in accordance with Section 712.4.2

of the *New York City Building Code* and the exhaust ducts are located within the cavity of a wall, and do not pass through another dwelling unit or tenant space.] Ducts and air transfer openings constructed of approved materials, in accordance with Section 603, that penetrate the ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with one of the following:

1. A shaft enclosure in accordance with Section 708 of the *New York City Building Code*.
2. A listed ceiling radiation damper and firestopping installed at the ceiling line where a duct penetrates the ceiling of a fire resistance-rated floor/ceiling or roof/ceiling assembly.
3. A listed ceiling radiation damper and firestopping installed at the ceiling line where a diffuser with no duct attached penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.

607.6.2.1 Ceiling radiation dampers. Ceiling radiation dampers shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTM E 119 or UL 263. Ceiling radiation dampers shall be installed in accordance with the details listed in the fire-resistance-rated assembly and the manufacturer's installation instructions and the listing. Ceiling radiation dampers are not required where either of the following applies:

1. Tests in accordance with ASTM E 119 or UL 263 have shown that ceiling radiation dampers are not necessary to maintain the fire-resistance rating of the assembly.
2. Exhaust duct penetrations are protected in accordance with Section 713.4.1.2 of the *New York City Building Code*, are located within the cavity of a wall and do not pass through another dwelling unit or tenant space.

607.6.3 Nonfire-resistance-rated floor assemblies. Duct systems constructed of approved materials in accordance with [this code] Section 603 that penetrate nonfire-resistance-rated floor assemblies [that connect not more than two stories are permitted without shaft enclosure protection provided that the annular space between the assembly and the penetrating duct is filled with an approved noncombustible material to resist the free passage of flame and the products of combustion. Duct systems constructed of approved materials in accordance with this code that penetrate nonrated floor assemblies that connect not more than three stories are permitted without shaft enclosure protection provided that the annular space between the assembly and the penetrating duct is filled with an approved noncombustible material to resist the free passage of flame and the products of combustion, and a fire damper is installed at each floor line.] shall be protected by any of the following methods:

1. A shaft enclosure in accordance with Section 708 of the *New York City Building Code*.
2. The duct connects not more than two stories, and the annular space around the penetrating duct is protected with an approved noncombustible material that resists the free passage of flame and the products of combustion.
3. The duct connects not more than three stories, and the annular space around the penetrating duct is protected with an approved noncombustible material that resists the free passage of flame and the products of combustion, and a listed fire damper is installed at each floor line.

Exception: Fire dampers are not required in ducts within individual residential dwelling units.

607.7 Flexible ducts and air connectors. Flexible ducts and air connectors shall not pass through any fire-resistance-rated assembly. Flexible air connectors shall not pass through any wall, floor or ceiling.

SECTION MC 608 AIR OUTLETS AND AIR INLETS

608.1 Air outlets. Air outlets shall comply with Sections 608.1.1 through 608.1.3.

608.1.1 General. Air supplied to any space shall not contain flammable vapors, flyings, or dust in quantities and concentrations that would introduce a hazardous condition.

608.1.2 Construction of air outlets. Air outlets shall be constructed of noncombustible material or a material that has a maximum smoke-developed index/rating of 50 and a maximum flame spread index/rating of 25.

608.1.3 Location of air outlets. The location of air outlets shall comply with the following requirements:

1. Air outlets shall be located at least 3 inches (76 mm) above the floor.

Exception: Air outlets may be located less than 3 inches (76 mm) above the floor where provisions have been made to prevent dirt and dust accumulations from entering the system.

2. Where located less than 7 feet (2134 mm) above the floor, outlet openings shall be protected by a grille or screen having openings through which a ½-inch (12.7 mm) sphere cannot pass.
3. Grilles may be located in floors provided they are installed so that they may be removed for cleaning purposes and provided they are constructed as follows:

3.1. Grilles up to 3 square feet (0.2787 m²) in gross area shall be designed to support a concentrated live load of 250 pounds (114 kg) on any 4 square inches (2580 mm²) of surface.

3.2. Grilles over 3 square feet (0.2787 m²) in gross area shall be designed to support the same loads as the floor in the area where used.

3.3. If located where they may be walked upon, the opening in grilles shall reject a 1/2-inch (12.7 mm) sphere.

608.2 Air inlets (return or exhaust or return and exhaust). Air inlets shall be constructed in accordance with Sections 608.2.1 through 608.2.3.

608.2.1 General. Air shall not be recirculated from any space in which flammable vapors, flyings, or dust is present in quantities and concentrations that would introduce a hazardous condition into the return air system.

608.2.2 Construction of air inlets. Air inlets shall be constructed of noncombustible material or a material that has a maximum flame spread index/rating of 25 and a maximum smoke-developed index/rating of 50.

608.2.3 Location of air inlets. The location of air inlets shall comply with the following requirements.

1. Air inlets shall be located at least 3 inches (76 mm) above the floor.

Exception: Air inlets may be located less than 3 inches (76 mm) above the floor where provisions have been made to prevent dirt and dust accumulations from entering the system.

2. Where located less than 7 feet (2134 mm) above the floor, inlet openings shall be protected by a grille or screens having openings through which a 1/2-inch (12.7 mm) sphere cannot pass.
3. Grilles may be located in floors provided they are installed so that they may be removed for cleaning purposes and provided they are constructed as follows:

3.1. Grilles up to 3 square feet (0.2787 m²) in gross area shall be designed to support a concentrated live load of 250 pounds (114 kg) on any 4 square inches (2580 mm²) of surface.

3.2. Grilles over 3 square feet (0.2787 m²) in gross area shall be designed to support the same loads as the floor in the area where used.

3.3. If located where they may be walked upon, the opening in grilles shall reject a ½-inch (12.7 mm) sphere.

SECTION MC 609 SERVICE OPENINGS

609.1 General. Horizontal air ducts and plenums shall be provided with service openings to facilitate the removal of accumulations of dust and combustible materials. Service openings shall be located at approximately 20-foot (6096 mm) intervals along the air duct and at the base of each vertical riser.

Exceptions:

1. Removable air outlet or air inlet devices of adequate size shall be permitted in lieu of service openings.
2. Service openings shall not be required in supply ducts where the supply air has previously passed through an air filter, air cleaner, or water spray. Such air filters and air cleaners shall be properly maintained and replaced when needed.
3. Service openings shall not be required where all of the following conditions exist:
 - 3.1. The occupancy has no process producing combustible material such as dust, lint, or greasy vapors. Such occupancies include banks, office buildings, houses of worship, hotels, and health care facilities (but not kitchens, laundries, and manufacturing portions of such facilities).
 - 3.2. The air inlets are at least 7 feet (2134 mm) above the floor or are protected by corrosion-resistant metal screens of at least 14 mesh (0.07 inches) (1.8 mm) that are installed at the inlets so that they cannot draw papers, refuse, or other combustible solids into the return air duct.
 - 3.3. The minimum design velocity in the return duct for the particular occupancy is 1000 feet/minute (5.080 m/s).

Subpart 7 (Chapter 7 of the New York City Mechanical Code)

§1. Chapter 7 of the New York city mechanical code, as added by local law number 33 for the year 2007, is amended to read as follows:

CHAPTER 7 COMBUSTION, VENTILATION, AND DILUTION AIR

SECTION MC 701 GENERAL

701.1 Scope. The provisions of this chapter shall govern the requirements for combustion, ventilation, and dilution air for fuel-burning appliances other than gas-fired appliances. The requirements for combustion, ventilation, and dilution air for gas-fired appliances shall be in accordance with the *New York City Fuel Gas Code*.

701.2 Combustion, ventilation, and dilution air required. Every room or space containing fuel-burning appliances shall be provided with combustion, ventilation, and dilution air as required by this code. Combustion, ventilation, and dilution air shall be provided in accordance with Section 702, 703, 704, 705, 706 or 707 of this code. Direct-vent appliances or equipment that do not draw combustion air from inside of the building are not required to be considered in the determination of the combustion and dilution air requirements and shall be installed in accordance with the equipment manufacturer's instructions and listing. Combustion air requirements shall be determined based on the simultaneous operation of all fuel-burning appliances drawing combustion, ventilation, and dilution air from the room or space. [The combustion air system shall maintain the room in which the equipment is located at a pressure not less than the outdoor atmosphere pressure.] Combustion, ventilation, and dilution air shall be obtained solely from the outdoors for fuel-burning appliances with an input greater than 350,000 Btu/h (1025 kW).

701.3 Circulation of air. The equipment and appliances within every room containing fuel-burning appliances shall be installed so as to allow free circulation of air. Provisions shall be made to allow for the simultaneous operation of mechanical exhaust systems, fireplaces or other equipment and appliances operating in the same room or space from which combustion, ventilation, and dilution air is being drawn. Such provisions shall prevent the operation of such appliances, equipment and systems from affecting the supply of combustion, ventilation, and dilution air.

701.3.1 Makeup air for fuel burning devices. Where exhaust fans are installed, makeup air shall be provided to replace the exhausted air. Calculations shall be provided on the construction documents to validate the use of the exhaust fan(s) and compliance with this chapter.

701.3.2 Ventilation air for fuel burning devices. Where ventilation air is brought in by mechanical means for heat generation mitigation, provisions must be made for proper air balance to prevent a negative or positive pressure in the boiler room and to discharge the ventilation air directly to the outside.

701.4 Crawl space and attic space. For the purposes of this chapter, an opening to a naturally ventilated crawl space or attic space shall be considered equivalent to an opening to the outdoors.

701.4.1 Crawl space. Where lower combustion air openings connect with crawl spaces, such spaces shall have unobstructed openings to the outdoors at least twice that required for the combustion air openings. The height of the crawl space shall comply with the requirements of the *New York City Building Code* and shall be without obstruction to the free flow of air.

701.4.2 Attic space. Where combustion air is obtained from an attic area, the attic ventilating openings shall not be subject to ice or snow blockage, and the attic shall have not less than 30 inches (762 mm) vertical clear height at its maximum point. Attic ventilation openings shall be sufficient to provide the required volume of combustion air and the attic ventilation required by the *New York City Building Code*. The combustion air openings shall be provided with a sleeve of not less than 0.019 inch (0.48 mm) (No.26 Gage) galvanized steel or other approved material extending from the appliance enclosure to at least 6 inches (152 mm) above the top of the ceiling joists and insulation.

701.5 Prohibited sources. Openings and ducts shall not connect appliance enclosures with a space in which the operation of a fan will adversely affect the flow of the combustion, ventilation, and dilution air. Combustion, ventilation, and dilution air shall not be subject to ice or snow blockage. No combustion, ventilation, and dilution air inlet shall be less than 30 inches (762 mm) above grade. Combustion, ventilation, and dilution air shall not be obtained from a hazardous location, except where the fuel-fired appliances are located within the hazardous location and are installed in accordance with this code. Combustion, ventilation, and dilution air shall not be taken from a refrigeration machinery room, except where a refrigerant vapor detector system is installed to automatically shut off the combustion process in the event of refrigerant leakage. For structures in areas of special flood hazard, air shall be obtained from a location complying with Appendix G of the *New York City Building Code*. [Combustion air shall be obtained solely from the outdoors for a boiler room.]

SECTION MC 702 INSIDE AIR

702.1 All air from indoors. Combustion, ventilation, and dilution air shall be permitted to be obtained entirely from the indoors in buildings that are not of unusually tight construction. In buildings of unusually tight construction, combustion air shall be obtained from the outdoors in accordance with Section 703, 705, 706 or 707.

702.2 Air from the same room or space. The room or space containing fuel-burning appliances shall be an unconfined space as defined in Section 202.

702.3 Air from adjacent spaces. Where the volume of the room in which the fuel-burning appliances are located does not comply with Section 702.2, additional inside combustion, ventilation, and dilution air shall be obtained by opening the room to adjacent spaces so that the combined volume of all communicating spaces meets the volumetric requirement of Section 702.2. Openings connecting the spaces shall comply with Sections 702.3.1, 702.3.2 and Figure A-1 of Appendix A of this code.

702.3.1 Number and location of openings. Two openings shall be provided, one within 1 foot (305 mm) of the ceiling of the room and one within 1 foot (305 mm) of the floor.

702.3.2 Size of openings. The net free area of each opening, calculated in accordance with Section 708, shall be a minimum of 1 square inch per 1,000 Btu/h (2201 mm²/kW) of input

rating of the fuel-burning appliances drawing combustion, ventilation, and dilution air from the communicating spaces and shall be not less than 100 square inches (64 516 mm²).

SECTION MC 703 OUTDOOR AIR

703.1 All air from the outdoors. Where all combustion, ventilation, and dilution air is to be provided by outdoor air, the required combustion, ventilation, and dilution air shall be obtained by direct opening by louver or a duct(s) from the boiler room to the outdoors. Openings connecting the room to the outdoor air shall comply with Sections 703.1.1 through 703.1.4, and Figures A-2, A-3 and A-4 of Appendix A of this code. The size of the openings connecting the room to the outdoor air supply shall also comply with any applicable rules of the New York City Department of Environmental Protection.

703.1.1 [Number and location of openings. Two openings shall be provided, one within 1 foot (305 mm) of the ceiling of the room and one within 1 foot (305 mm) of the floor.] **Two-permanent-openings method.** Two permanent openings, one commencing within 12 inches (305 mm) of the top and one commencing within 12 inches (305 mm) of the bottom of the room, shall be provided. The openings shall communicate directly, or by ducts, with the outdoors or spaces that freely communicate with the outdoors as follows:

1. Where directly communicating with the outdoors, or where communicating with the outdoors through vertical ducts, each opening shall have a minimum free area of 1 square inch per 4,000 Btu/h (550 mm²/kW) of total input rating of all equipment in the room.
2. Where communicating with the outdoors through horizontal ducts, each opening shall have a minimum free area of not less than 1 square inch per 2,000 Btu/h (1100 mm²/kW) of total input rating of all equipment in the room.

703.1.2 [Size of direct openings. The net free area of each direct opening to the outdoors, calculated in accordance with Section 709, shall be a minimum of 1 square inch per 4,000 Btu/h (550 mm²/kW) of combined input rating of the fuel-burning appliances drawing combustion and dilution air from the room.] **One-permanent-opening method.** One permanent opening, commencing within 12 inches (305 mm) of the top of the enclosure, shall be provided. The equipment shall have clearances of at least 1 inch (25 mm) from the sides and back and 6 inches (152 mm) from the front of the appliance. The opening shall directly communicate with the outdoors or through a vertical or horizontal duct to the outdoors or spaces that freely communicate with the outdoors and shall have a minimum free area of 1 square inch per 3,000 Btu/h (734 mm²/kW) of the total input rating of all equipment located in the enclosure, and not less than the sum of the areas of all vent connectors in the space.

[703.1.3 Size of horizontal openings. The net free area of each opening, calculated in accordance with Section 709 and connected to the outdoors through a horizontal duct, shall be a minimum of 1 square inch per 2,000 Btu/h (1100 mm²/kW) of combined input

rating of the fuel-burning appliances drawing combustion and dilution air from the room. The cross-sectional area of the duct shall be equal to or greater than the required size of the opening.

703.1.4 Size of vertical openings. The net free area of each opening, calculated in accordance with Section 709 and connected to the outdoors through a vertical duct, shall be a minimum of 1 square inch per 4,000 Btu/h (550 mm²/kW) of combined input rating of the fuel-burning appliances drawing combustion and dilution air from the room. The cross-sectional area of the duct shall be equal to or greater than the required size of the opening.]

SECTION MC 704 COMBINED USE OF INSIDE AND OUTDOOR AIR (CONDITION 1)

704.1 Combination of air from inside and outdoors. This section shall apply only to appliances located in confined spaces in buildings not of unusually tight construction. Where the volumes of rooms and spaces are combined for the purpose of providing indoor combustion air, such rooms and spaces shall communicate through permanent openings in compliance with Sections 702.3.1 and 702.3.2. The required combustion, ventilation, and dilution air shall be obtained by opening the room to the outdoors using a combination of inside and outdoor air, prorated in accordance with Section 704.1.6. The ratio of interior spaces shall comply with Section 704.1.5. The number, location and ratios of openings connecting the space with the outdoor air shall comply with Sections 704.1.1 through 704.1.4.

704.1.1 Number and location of openings. At least two openings shall be provided, one within 1 foot (305 mm) of the ceiling of the room and one within 1 foot (305 mm) of the floor.

704.1.2 Ratio of direct openings. Where direct openings to the outdoors are provided in accordance with Section 703.1, the ratio of direct openings shall be the sum of the net free areas of both direct openings to the outdoors, divided by the sum of the required areas for both such openings as determined in accordance with Section 703.1.2.

704.1.3 Ratio of horizontal openings. Where openings connected to the outdoors through horizontal ducts are provided in accordance with Section 703.1, the ratio of horizontal openings shall be the sum of the net free areas of both such openings, divided by the sum of the required areas for both such openings as determined in accordance with Section 703.1.3.

704.1.4 Ratio of vertical openings. Where openings connected to the outdoors through vertical ducts are provided in accordance with Section 703.1, the ratio of vertical openings shall be the sum of the net free areas of both such openings, divided by the sum of the required areas for both such openings as determined in accordance with Section 703.1.4.

704.1.5 Ratio of interior spaces. The ratio of interior spaces shall be the available volume of all communicating spaces, divided by the required volume as determined in accordance with Sections 702.2 and 702.3.

704.1.6 Prorating of inside and outdoor air. In spaces that utilize a combination of inside and outdoor air, the sum of the ratios of all direct openings, horizontal openings, vertical openings and interior spaces shall equal or exceed 1.

SECTION MC 705 COMBINED USE OF INSIDE AND OUTDOOR AIR (CONDITION 2)

705.1 General. This section shall apply only to appliances located in unconfined spaces in buildings of unusually tight construction. Combustion air supplied by a combined use of indoor and outdoor air shall be supplied through openings and ducts extending to the appliance room or to the vicinity of the appliance.

705.1.1 Openings and supply ducts. Openings shall be provided, located and sized in accordance with Sections 702.3.1 and 702.3.2; additionally, there shall be one opening to the outdoors having a free area of at least 1 square inch per 5,000 Btu/h (440 mm²/kW) of total input of all appliances in the space.

SECTION MC 706 [FORCED] MECHANICAL COMBUSTION AIR SUPPLY

706.1 Rate of air supplied. Where all combustion air [and dilution air] is provided by a mechanical [forced-] air supply system, the combustion air [and dilution air] shall be supplied from the outdoors at [the] a [minimum] rate of not less than [1 cfm per 2,400 Btu/h [0.00067 m³/(s • kW)]] 0.35 cubic feet per minute per 1,000 Btu/h (0.034 m³/min per kW) of [combined] total input rating [of] for all the fuel-burning appliances [served] located within the space. Combustion air rates shall also comply with any applicable rules of the New York City Department of Environmental Protection. The mechanical air supply shall be sufficient to accommodate combustion air, ventilation air, and dilution air requirements of the installation.

706.1.1 Appliance interlock. Each of the appliances served shall be interlocked with the mechanical air supply system to prevent main burner operation when the mechanical air supply system is not in operation. The air flow and the damper operation shall be proven prior to burner operation.

SECTION MC 707 DIRECT CONNECTION

707.1 General. Fuel-burning appliances that are listed and labeled for direct combustion air connection to the outdoors shall be installed in accordance with the manufacturer's installation instructions.

SECTION MC 708 COMBUSTION AIR DUCTS

708.1 General. Combustion air ducts shall:

1. Be of galvanized steel complying with Chapter 6 or of equivalent corrosion-resistant material approved for this application.

Exception: Within dwelling units, unobstructed stud and joist spaces shall not be prohibited from conveying combustion air, provided that not more than one required fireblock is removed.

2. Have a minimum cross-sectional dimension of 3 inches (76 mm).
3. Terminate in an unobstructed space allowing free movement of combustion air to the appliances.
4. Have the same cross-sectional areas as the free area of the openings to which they connect.
5. Serve a single appliance enclosure.
6. Not serve both upper and lower combustion air openings where both such openings are used. The separation between ducts serving upper and lower combustion air openings shall be maintained to the source of combustion air.
7. Not be screened where terminating in an attic space.
8. Not slope downward toward the source of combustion air, where serving the upper required combustion air opening.
9. Be constructed so that the remaining space surrounding a chimney or chimney liner, installed within a masonry, metal or factory-built chimney cannot be used to supply combustion, ventilation and dilution air, except for direct vent appliances designed and installed in accordance with the equipment manufacturer's instructions and listing.

SECTION MC 709 OPENING OBSTRUCTIONS

709.1 General. The required size of openings for combustion, ventilation, and dilution air shall be based on the net free area of each opening. The net free area of an opening shall be that specified by the manufacturer of the opening covering. In the absence of such information, openings covered with metal louvers shall be deemed to have a net free area of 60 percent of the area of the opening, and openings covered with wood louvers shall be deemed to have a net free

area of 10 percent of the area of the opening. Louvers and grills shall be fixed in the open position.

Exception: Operable [L]louvers shall be interlocked with the appliance so that they are proven to be in the full open position prior to main burner ignition and during main burner operation. Means shall be provided to prevent the main burner from igniting if the louvers fail to open during burner startup and to shut down the main burner if the louvers close during operation.

709.2 Dampered openings. Where the combustion air openings are provided with [volume] automatic, smoke or fire dampers, the dampers shall be electrically interlocked with the [firing cycle of the] appliances served, so as to prevent operation of any appliance when any of the dampers are closed. Manually operated dampers shall not be installed in combustion air openings. The damper opening shall be proven prior to burner operation.

709.3 Caution sign. A sign stating, "Louvers, dampers and/or ventilation openings must not be blocked or disabled." shall be permanently affixed, in clear view, and adjacent to the opening(s) within the room containing the equipment. The letters used on the sign shall be at least 1-inch (25 mm) in height.

SECTION MC 710 OPENING LOCATION AND PROTECTION

710.1 General. Combustion air openings to the outdoors shall comply with the location and protection provisions applicable to outside air intake openings of Sections 401.5 and 401.6 of this code [applicable to outside air intake openings].

Subpart 8 (Chapter 8 of the New York City Mechanical Code)

§1. Chapter 8 of the New York city mechanical code, as added by local law number 33 for the year 2007, sections 801.1.1.1, 804.1, and 804.3.4 as amended by local law number 8 for the year 2008, is amended to read as follows:

CHAPTER 8 CHIMNEYS AND VENTS SECTION MC 801 GENERAL

801.1 Scope. This chapter shall govern the installation, maintenance, design, minimum safety requirements, repair and approval of factory-built chimneys, chimney liners, vents and connectors, and field-built chimneys and connectors for all non-gas-fired appliances. This chapter shall also govern the utilization of masonry chimneys. Gas-fired appliances shall be vented in accordance with the *New York City Fuel Gas Code*.

801.1.1 Adjoining chimneys and vents. Adjoining chimneys and vents shall be in accordance with Sections 801.1.1.1 through 801.1.1.8.

801.1.1.1 Responsibility of owner of taller building. Whenever a building is erected, enlarged, or increased in height so that any portion of such building, except chimneys or vents, extends higher than the top of any previously constructed chimneys or vents within 100 feet (30 480mm), the owner of such new or altered building shall have the responsibility of altering such chimneys or vents to make them conform with the requirements of this chapter. A chimney or vent that is no longer connected with a fireplace or combustion or other equipment for which a chimney or vent was required shall be exempt from this requirement. Such alterations shall be accomplished by one of the following means or a combination thereof:

1. Carry up the previously constructed chimneys or vents to the height required in this chapter.
2. Offset such chimneys or vents to a distance beyond that required in Chapter 5 [of this code] from the new or altered building provided that the new location of the outlet of the offset chimney or vent shall otherwise comply with the requirements of this chapter.

Such requirements shall not dispense with or modify any additional requirements that may be applicable pursuant to rules of the New York City Department of Environmental Protection.

801.1.1.2 Protection of draft. After the alteration of a chimney or vent as required by this section, it shall be the responsibility of the owner of the new or altered building to provide any mechanical equipment or devices necessary to maintain the proper draft in the equipment.

801.1.1.3 Written notification. The owner of the new or altered building shall notify the owner of the building affected in writing at least 45 days before starting the work required and request written consent to do such work. Such notice shall be accompanied by plans indicating the manner in which the proposed alterations are to be made.

801.1.1.4 Approval. The plans and method of alteration shall be subject to the approval of the commissioner.

801.1.1.5 Refusal of consent. If consent is not granted by the owner of the previously constructed building to do the alteration work required by this section, such owner shall signify his or her refusal in writing to the owner of the new or altered building and to the commissioner; and the owner of the new or altered building having submitted plans that conform to the requirements of this section, shall thereupon be released from any responsibility for the proper operation of the equipment due to loss of draft and for any health hazard or nuisance that may occur as a result of the new or altered building. Such responsibilities shall then be assumed by the owner of the previously constructed building.

Similarly, should such owner fail to grant consent within 45 days from the date of written request or fail to signify his or her refusal, he or she shall then assume all responsibilities as prescribed above.

801.1.1.6 Procedure. It shall be the obligation of the owner of the new or altered building to:

1. Schedule this work so as to create a minimum of disturbance to the occupants of the affected building; and
2. Provide such essential services as are normally supplied by the equipment while it is out of service; and
3. Where necessary, support such extended chimneys, vents and equipment from this building or to carry up such chimneys or vents within his or her building; and
4. Provide for the maintenance, repair, and/or replacement of such extensions and added equipment; and
5. Make such alterations of the same material as the original chimney or vent so as to maintain the same quality and appearance, except where the affected owner of the chimney or vent shall give his or her consent to do otherwise. All work shall be done in such fashion as to maintain the architectural aesthetics of the existing building. Where there is practical difficulty in complying strictly with the provisions of this item, the commissioner may permit an equally safe alternative.

801.1.1.7 Existing violations. Any existing violations on the previously constructed equipment shall be corrected by the owner of the equipment before any equipment is added or alterations made at the expense of the owner of the new or altered building.

801.1.1.8 Variance. The commissioner may grant a variance in accordance with the provisions of this code.

801.2 General. Every fuel-burning appliance shall discharge the products of combustion to a vent, factory-built chimney or masonry chimney, except for appliances vented in accordance with Section 804. The chimney or vent shall be designed for the type of appliance being vented.

Exception: Commercial cooking appliances vented by a Type I hood installed in accordance with Section 507.

801.2.1 Design. Chimneys and vents shall be designed and constructed so as to provide the necessary draft and capacity for each appliance connected to completely exhaust the products of combustion to the outside air. The temperature on adjacent combustible surfaces shall not be raised above 160°F (71°C). [Condensation shall not be developed to an extent that can cause deterioration of the chimney or vent.] Chimneys and vents shall

be designed to resist the effects of condensation that would cause deterioration of the chimney or vent.

801.2.2 Outlets. The outlet shall be arranged so that the flue gases are not directed so that they jeopardize people, overheat combustible structures, or enter building openings in the vicinity of the outlet.

801.2.3 Support. Chimneys and vents shall not be supported by the equipment they serve unless such equipment has been specifically designed for such loads.

801.2.4 Oil-fired appliances. Oil-fired appliances shall be vented in accordance with this code and NFPA 31.

801.2.5 Gas-fired appliances. Gas-fired appliances shall be vented in accordance with the *New York City Fuel Gas Code*.

801.3 Masonry chimneys. Masonry chimneys shall be constructed in accordance with the *New York City Building Code*.

801.4 Positive flow. Venting systems shall be designed and constructed so as to develop a positive flow adequate to convey all combustion products to the outside atmosphere.

801.5 Design. Venting systems shall be designed in accordance with this chapter and comply with the requirements of the *New York City Air Pollution Control Code*.

801.6 Minimum size of chimney or vent. Except as otherwise provided for in this chapter, the size of the chimney or vent, serving a single appliance, except engineered systems, shall have a minimum area equal to the area of the appliance connection.

801.7 Solid fuel appliance flues. The cross-sectional area of a flue serving a solid fuel-burning appliance shall be not greater than three times the cross-sectional area of the appliance flue collar or flue outlet.

801.8 Abandoned inlet openings. Abandoned inlet openings in chimneys and vents shall be closed by an approved method, sealed air-tight and permanently labeled as abandoned.

801.9 Positive pressure. Where an appliance equipped with a forced or induced draft system creates a positive pressure in the venting system, the venting system shall be designed and listed for positive pressure applications.

801.10 Connection to fireplace. Connection of appliances to chimney flues serving fireplaces shall be in accordance with Sections 801.10.1 through 801.10.3.

801.10.1 Closure and access. A noncombustible seal shall be provided below the point of connection to prevent entry of room air into the flue. Means shall be provided for access to the flue for inspection and cleaning.

801.10.2 Connection to factory-built fireplace flue. An appliance shall not be connected to a flue serving a factory-built fireplace unless the appliance is specifically listed for such installation. The connection shall be made in accordance with the appliance manufacturer's installation instructions.

801.10.3 Connection to masonry fireplace flue. A connector shall extend from the appliance to the flue serving a masonry fireplace such that the flue gases are exhausted directly into the flue. The connector shall be provided with access or shall be removable for inspection and cleaning of both the connector and the flue. Listed direct connection devices shall be installed in accordance with their listing.

801.11 Multiple solid fuel prohibited. A solid fuel-burning appliance or fireplace shall not connect to a chimney passage-way venting another appliance.

801.12 Chimney entrance. Connectors shall connect to a chimney flue at a point not less than 12 inches (305 mm) above the lowest portion of the interior of the chimney flue.

801.13 Cleanouts. Masonry chimney flues shall be provided with a cleanout opening having a minimum height of 6 inches (152 mm). The upper edge of the opening shall be located not less than 6 inches (152 mm) below the lowest chimney inlet opening. The cleanout shall be provided with a tight-fitting, noncombustible cover of a minimum size of 8 inches by 8 inches (203 mm by 203 mm).

Exception: Cleanouts shall not be required for chimney flues serving masonry fireplaces, if such flues are provided with access through the fireplace opening.

801.14 Connections to exhauster. All appliance connections to a chimney or vent equipped with a power exhauster shall be made on the inlet side of the exhauster. All joints and piping on the positive pressure side of the exhauster shall be listed for positive pressure applications as specified by the manufacturer's installation instructions for the exhauster or in accordance with this code.

801.15 Fuel-fired appliances. Masonry chimneys utilized to vent fuel-fired appliances shall be located, constructed and sized as specified in the manufacturer's installation instructions for the appliances being vented.

801.16 Flue lining. Masonry chimneys shall be lined. The lining material shall be compatible with the type of appliance connected, in accordance with the appliance listing and manufacturer's installation instructions. Listed materials used as flue linings shall be installed in accordance with their listings and the manufacturer's installation instructions.

801.16.1 Residential and low-heat appliances (general). Flue lining systems for use with residential-type and low-heat appliances shall be limited to the following:

1. Clay flue lining complying with the requirements of ASTM C 315 or equivalent. Clay flue lining shall be installed in accordance with the *New York City Building Code*.
2. Listed chimney lining systems complying with UL 1777 (new and existing chimneys) or ULC-S635 (existing chimneys) or ULC-S640 (new chimneys).
3. Other approved materials that will resist, without cracking, softening or corrosion, flue gases and condensate at temperatures up to 1,800°F (982°C).

801.17 Space around lining. The space surrounding a flue lining system or other vent installed within a masonry chimney shall not be used to vent any other appliance. This shall not prevent the installation of a separate flue lining in accordance with the manufacturer's installation instructions and this code.

801.18 Existing chimneys and vents. Where an appliance is permanently disconnected from an existing chimney or vent, or where an appliance is connected to an existing chimney or vent during the process of a new installation, the chimney or vent shall comply with Sections 801.18.1 through 801.18.4.

801.18.1 Size. The chimney or vent shall be resized as necessary to control flue gas condensation in the interior of the chimney or vent and to provide the appliance or appliances served with the required draft. For the venting of oil-fired appliances to masonry chimneys, the resizing shall be in accordance with NFPA 31.

801.18.2 Flue passageways. The flue gas passageway shall be free of obstructions and combustible deposits and shall be cleaned if previously used for venting a solid or liquid fuel-burning appliance or fireplace. The flue liner, chimney inner_wall or vent inner wall shall be continuous and shall be free of cracks, gaps, perforations or other damage or deterioration which would allow the escape of combustion products, including gases, moisture and creosote. Where an oil-fired appliance is connected to an existing masonry chimney, such chimney flue shall be repaired or relined in accordance with NFPA 31.

801.18.3 Cleanout. Masonry chimneys shall be provided with a cleanout opening complying with Section 801.13.

801.18.4 Clearances. Chimneys and vents shall have air-space clearance to combustibles in accordance with the *New York City Building Code* and the chimney or vent manufacturer's installation instructions.

Exception: [Masonry chimneys equipped with a chimney lining system tested and listed for installation in chimneys in contact with combustibles in accordance with UL 1777, and installed in accordance with the manufacturer's instructions, shall not be required to have clearance between combustible materials and exterior surfaces of the masonry chimney. Noncombustible fireblocking shall be provided in accordance with the *New York City Building Code*.] Masonry chimneys without the required airspace clearances shall be permitted to be used if lined or relined with a chimney lining

system listed for use in chimneys with reduced clearances in accordance with UL 1777 or ULC-S635. The chimney clearance shall be not less than permitted by the terms of the chimney liner listing and the manufacturer's instructions.

801.18.4.1 Fireblocking. Noncombustible fireblocking shall be provided in accordance with the *New York City Building Code*.

801.19 Multistory prohibited. Common venting systems for appliances located on more than one floor level shall be prohibited[, except where all of the appliances served by the common vent are located in rooms or spaces that are accessed only from the outdoors. The appliance enclosures shall not communicate with the occupiable areas of the building].

801.20 [Reserved.] Termination requirements. Terminations shall comply with the appliance listing and manufacturer's instructions, and the following:

1. Chimneys serving appliances less than 600°F (316°C) shall extend at least 3 feet (914 mm) above the highest construction, such as a roof ridge, parapet wall or penthouse, but within 10 feet (3048 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. Any chimney located in an area that is more than 10 feet (3048 mm) from such construction but not more than the distance determined by Equation 8-1, shall be at least as high as the highest construction in such area. For purposes of determining the required height of a chimney, such construction shall not include other chimneys, vents or open structural framing.
2. Chimneys serving appliances between 600°F (316°C) and 1000°F (538°C) shall extend at least 10 feet (3048 mm) above the highest construction, such as a roof ridge, or parapet wall or penthouse within 20 feet (6096 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. Any chimney located in an area more than 20 feet (6096 mm) from such construction, but not more than the distance determined from Equation 8-1, shall be at least as high as the highest construction in such area. For purposes of determining the required height of the chimney, such construction does not include other chimneys, vents or open structural framing.
3. Chimneys serving appliances greater than 1000°F (538°C) shall extend at least 20 feet (6096 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or in another building. Any chimney located in an area that is more than 50 feet (15 240 mm) from such construction, but not more than the distance determined from Equation 8-1, shall be at least as high as the highest construction located in such area. For purposes of determining the required height of the chimney, such construction does not include other chimneys, vents, or open structural framing.
4. Reserved.

5. The following formula shall be used in order to determine the distance referred to in Items 1, 2 and 3 of this section:

$$D = F \times \sqrt{A} \quad \text{(Equation 8-1)}$$

where:

D = Distance, in feet, measured from the center of the chimney outlet to the nearest edge of the construction.

F = Value determined from Table 801.20.

A = Free area, in square inches, of chimney flue space.

TABLE 801.20
“F” FACTOR FOR DETERMINING CHIMNEY DISTANCES

<u>TYPE OF FUEL</u>	<u>“F” FACTOR</u>		
	<u>600°F (316°C) and less</u>	<u>600°F (316°C) to 1000°F</u>	<u>Greater than 1000°F</u>
<u>No. 2 Fuel Oil</u>	<u>2.5</u>	<u>2.5</u>	<u>3</u>
<u>No. 4, 6 Fuel Oil, Solid Fuels</u>	<u>3</u>	<u>3</u>	<u>3</u>

801.21 Drains. A drain shall be provided for all chimneys and gas vents to remove rain water and condensation. The drain shall be a minimum of 1 inch (25 mm) in size and shall be equipped with an appropriately-sized p-trap with automatic trap seal primer in accordance with Section 1002 of the *New York City Plumbing Code* or a float drain trap installed in accordance with the manufacturer’s installation requirements. The drain shall be sized by the design engineer and shall be suitable for the chimney area. For listed chimneys and gas vents, the connection tap into the chimney shall be determined by the manufacturer and connected to the drain piping in accordance with the listing and installation instructions. On all outdoor chimneys and gas vents, the connection and drain shall be installed indoors as close as practicable to the chimney base to prevent freezing.

801.22 Thermal safety (spill) switches. Thermal safety (spill) switches shall be installed on barometric dampers, draft hoods, draft diverters, and all other appurtences that allow dilution air into chimneys or gas vents. Thermal safety (spill) switches shall be interlocked with all of the appliances connected to the same chimney or gas vent.

SECTION MC 802 VENTS

802.1 General. All vent systems shall be listed and labeled or field fabricated in accordance with NFPA 211. Type L vents shall be tested in accordance with UL 641.

802.2 Vent application. The application of vents shall be in accordance with Table 802.2.

**TABLE 802.2
VENT APPLICATION**

VENT TYPES	APPLIANCE TYPES
Type L oil vents	Oil-burning appliances listed and labeled for venting with Type L vents; gas appliances listed and labeled for venting with Type B vents.

802.3 Installation. Vent systems shall be sized, installed and terminated in accordance with the vent and appliance manufacturer’s installation instructions.

802.4 Vent termination caps. Vent termination caps shall not be permitted and a [2¹/₂-inch (64 mm) minimum] drain installed to receive condensed or rain water shall be required. A positive means, such as offsets, shall be provided to prevent water from entering the appliance.

802.5 Type L vent terminations. Type L vents shall terminate [not less than 2 feet (610mm) above the highest point of the roof penetration and not less than 2 feet (610 mm) higher than any portion of a building within 10 feet (3048 mm). Chimneys serving appliances less than 600°F (316°C) shall extend at least 3 feet (914 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the chimney outlet, whether the construction is on the same buildings as the chimney or on another building. Any chimney located in an area that is more than 10 feet (3048 mm) from such construction but not more than the distance determined by Equation 8-1 and Table [802.5] 801.20, shall be at least as high as the highest construction in such area. For purposes of determining the required height of the chimney, such construction does not include other chimneys, vents, or open structural framing.

$$D = F \times \sqrt{A} \qquad \text{(Equation 8-1)}$$

where:

D = Distance, in feet, measured from the center of the chimney outlet to the nearest edge of the construction.

F = Value determined from Table 802.5.

A = Free area, in square inches, of chimney flue space.] in accordance with Section 801.20.

**[TABLE 802.5
“F” FACTOR FOR DETERMINING CHIMNEY DISTANCES**

TYPE OF FUEL	“F” FACTOR		
	600°F (316°C) and less	600°F (316°C) to 1000°F (538°C)	Greater than 1000°F (538°C)
No. 2 Fuel Oil	2.5	2.5	3
No. 4, 6 Fuel Oil	3	3	3

]

802.6 Minimum vent heights. Vents shall terminate not less than 5 feet (1524 mm) in vertical height above the highest connected appliance flue collar.

Exceptions:

1. Venting systems of direct vent appliances shall be installed in accordance with the appliance and the vent manufacturer’s instructions.
2. Appliances listed for outdoor installations incorporating integral venting means shall be installed in accordance with their listings and the manufacturer’s installation instructions.

802.7 Support of vents. All portions of vents shall be installed in accordance with the manufacturer’s listing and installation instructions and shall be adequately supported for the design and weight of the materials employed.

802.8 Insulation shield. Where vents pass through insulated assemblies, an insulation shield constructed of not less than No. 26 Gage sheet metal shall be installed to provide clearance between the vent and the insulation material. The clearance shall be not less than the clearance to combustibles specified by the vent manufacturer’s installation instructions. Where vents pass through attic space, the shield shall terminate not less than 2 inches (51 mm) above the insulation materials and shall be secured in place to prevent displacement. Insulation shields provided as part of a listed vent system shall be installed in accordance with the manufacturer’s installation instructions.

**SECTION MC 803
CONNECTORS**

803.1 Connectors required. Connectors shall be used to connect appliances to the vertical chimney or vent, except where the chimney or vent is attached directly to the appliance.

803.2 Location. Connectors shall be located entirely within the room in which the connecting appliance is located, except as provided for in Section 803.10.4. Where passing through an unheated space, a connector shall not be constructed of single-wall pipe.

803.3 Size. The connector shall not be smaller than the size of the flue collar supplied by the manufacturer of the appliance. Where the appliance has more than one flue outlet, and in the absence of the manufacturer’s specific instructions, the connector area shall be not less than the combined area of the flue outlets for which it acts as a common connector.

803.4 Branch connections. All branch connections to the vent connector shall be made in accordance with the vent manufacturer’s instructions.

803.5 Manual dampers. Manual dampers shall not be installed in connectors except in chimney connectors serving solid fuel-burning appliances.

803.6 Automatic dampers. Automatic dampers shall be listed and labeled in accordance with UL 17 for oil-fired heating appliances. The dampers shall be installed in accordance with the manufacturer’s installation instructions. An automatic vent damper device shall not be installed on an existing appliance unless the appliance is listed and labeled and the device is installed in accordance with the terms of its listing. The name of the installer and date of installation shall be marked on a label affixed to the damper device.

803.7 Connectors serving two or more appliances. Where two or more connectors enter a common vent or chimney, the smaller connector shall enter at the highest level consistent with available headroom or clearance to combustible material.

803.8 Vent connector construction. [Vent connectors shall be constructed of metal. The minimum nominal thickness of the connector shall be 0.019 inch (0.5 mm) (No. 28 Gage) for galvanized steel, 0.022 inch (0.6 mm) (No. 26 B & S Gage) for copper, and 0.020 inch (0.5 mm) (No. 24 B & S Gage) for aluminum.] A vent connector for a nonresidential, low-heat appliance shall be a factory-built chimney section or steel pipe having resistance to heat and corrosion equivalent to that for the appropriate galvanized pipe as specified in Table 803.8. Factory-built chimney sections shall be joined together in accordance with the chimney manufacturers’ instructions.

TABLE 803.8
MINIMUM THICKNESS FOR GALVANIZED STEEL VENT
CONNECTORS FOR LOW-HEAT APPLIANCES

<u>DIAMETER OF CONNECTOR</u> <u>(inches)</u>	<u>MINIMUM THICKNESS</u> <u>(inch)</u>
<u>Less than 6</u>	<u>0.019</u>
<u>6 to less than 10</u>	<u>0.023</u>
<u>10 to 12 inclusive</u>	<u>0.029</u>
<u>14 to 16 inclusive</u>	<u>0.034</u>
<u>Over 16</u>	<u>0.056</u>

For SI: 1 inch = 25.4 mm.

803.9 Chimney connector construction. Chimney connectors for low-heat appliances shall be of sheet steel pipe having resistance to corrosion and heat not less than that of galvanized steel specified in Table 803.9(1). Connectors for medium-heat appliances and high-heat appliances shall be of sheet steel not less than the thickness specified in Table 803.9(2).

803.10 Installation. Connectors shall be installed in accordance with Sections 803.10.1 through 803.10.6.

803.10.1 Supports and joints. Connectors shall be supported in an approved manner, and joints shall be fastened with sheet metal screws, rivets or other approved means.

803.10.2 Length. The maximum horizontal length of a single- wall connector shall not affect the capability of the system to produce adequate draft.

**TABLE 803.9(1)
MINIMUM CHIMNEY CONNECTOR THICKNESS FOR
LOW-HEAT APPLIANCES**

DIAMETER OF CONNECTOR (inches)	MINIMUM NOMINAL THICKNESS (galvanized) (inches)
5 and smaller	0.022 (No. 26 Gage)
Larger than 5 and up to 10	0.028 (No. 24 Gage)
Larger than 10 and up to 16	0.034 (No. 22 Gage)
Larger than 16	0.064 (No. 16 Gage)

For SI: 1 inch = 25.4 mm.

**TABLE 803.9(2)
MINIMUM CHIMNEY CONNECTOR THICKNESS FOR
MEDIUM- AND HIGH-HEAT APPLIANCES**

AREA (square inches)	EQUIVALENT ROUND DIAMETER (inches)	MINIMUM NOMINAL THICKNESS (inches)
0-154	0-14	[0.060] <u>0.0575</u> (No. 16 Gage)

155-201	15-16	0.075 (No. 14 Gage)
202-254	17-18	[0.105] <u>0.0994</u> (No. 12 Gage)
Greater than 254	Greater than 18	[0.135] <u>0.1292</u> (No. 10 Gage)

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm²

803.10.3 Connection. The connector shall extend to the inner face of the chimney or vent liner, but not beyond. A connector entering a masonry chimney shall be cemented to masonry in an approved manner. Where thimbles are installed to facilitate removal of the connector from the masonry chimney, the thimble shall be permanently cemented in place with high-temperature cement.

803.10.4 Connector pass-through. Chimney connectors shall not pass through any floor or ceiling, nor through a fire-resistance-rated wall assembly. Chimney connectors for domestic-type appliances shall not pass through walls or partitions constructed of combustible material to reach a masonry chimney unless:

1. The connector is labeled for wall pass-through and is installed in accordance with the manufacturer's instructions; or
2. The connector is put through a device labeled for wall pass-through; or
3. The connector has a diameter not larger than 10 inches (254 mm) and is installed in accordance with one of the methods in Table 803.10.4. Concealed metal parts of the pass-through system in contact with flue gases shall be of stainless steel or equivalent material that resists corrosion, softening or cracking up to 1,800°F (980°C).

TABLE 803.10.4
CHIMNEY CONNECTOR SYSTEMS AND CLEARANCES
TO COMBUSTIBLE WALL MATERIALS FOR
DOMESTIC HEATING APPLIANCES^{a,b,c,d,e}

System A (12-inch clearance)	A 3.5-inch-thick brick wall shall be framed into the combustible wall. A 0.625-inch-thick fire-clay liner (ASTM C 315 or equivalent) shall be firmly cemented in the center of the brick wall maintaining a 12-inch clearance to combustibles. The clay liner shall run from the outer surface of the bricks to the inner surface of the chimney liner.
------------------------------------	---

<p>System B (9-inch clearance)</p>	<p>A labeled solid-insulated factory-built chimney section (1-inch insulation) the same inside diameter as the connector shall be utilized. Sheet [metal] <u>steel</u> supports cut to maintain a 9-inch clearance to combustibles shall be fastened to the wall surface and to the chimney section. Fasteners shall not penetrate the chimney flue liner. The chimney length shall be flush with the masonry chimney liner and sealed to the masonry with water-insoluble refractory cement. Chimney manufacturers' parts shall be utilized to securely fasten the chimney connector to the chimney section.</p>
<p>System C (6-inch clearance)</p>	<p>A sheet metal (minimum number 24 Gage) ventilated thimble having a <u>minimum thickness of 0.0236 inch (No. 24 gage)</u> having two 1-inch air channels shall be installed [with a sheet steel chimney connector (minimum number 24 Gage). Sheet steel]. <u>Steel</u> supports [(minimum number 24 Gage)] shall be cut to maintain a 6-inch clearance <u>with a sheet steel chimney connector</u> between the thimble and combustibles. <u>The chimney connector and steel supports shall have a minimum thickness of 0.0236 inch (No. 24 gage).</u> One side of the support shall be fastened to the wall on all sides. Glass-fiber insulation shall fill the 6-inch space between the thimble and the supports.</p>
<p>System D (2-inch clearance)</p>	<p>A labeled solid-insulated factory-built chimney section (1-inch insulation) with a diameter 2 inches larger than the chimney connector shall be installed with a [sheet] steel chimney connector [(minimum number 24 Gage)] <u>having a minimum thickness of 0.0236 inch (24 gage).</u> Sheet [metal] <u>steel</u> supports shall be positioned to maintain a 2-inch clearance to combustibles and to hold the chimney connector to ensure that a 1-inch airspace surrounds the chimney connector through the chimney section. The steel support shall be fastened to the wall on all sides and the chimney section shall be fastened to the supports. Fasteners shall not penetrate the liner of the chimney section.</p>

For SI: 1 inch = 25.4 mm, $1.0 \text{ Btu} \times \text{in}/\text{ft}^2 \cdot \text{h} \cdot ^\circ\text{F} = 0.144 \text{ W}/\text{m}^2 \cdot \text{K}$.

- a. Insulation material that is part of the wall pass-through system shall be noncombustible and shall have a thermal conductivity of $1.0 \text{ Btu} \times \text{in}/\text{ft}^2 \cdot \text{h} \cdot ^\circ\text{F}$ or less.

- b. All clearances and thicknesses are minimums.
- c. Materials utilized to seal penetrations for the connector shall be non-combustible.
- d. Connectors for all systems except System B shall extend through the wall pass-through system to the inner face of the flue liner.
- e. ASTM C 315.

803.10.5 Pitch. Connectors shall rise vertically to the chimney or vent with a minimum pitch equal to one-fourth unit vertical in 12 units horizontal (2-percent slope).

803.10.6 Clearances. Connectors shall have a minimum clearance to combustibles in accordance with Table 803.10.6. The clearances specified in Table 803.10.6 apply, except where the listing and labeling of an appliance specifies a different clearance, in which case the labeled clearance shall apply. The clearance to combustibles for connectors shall be reduced only in accordance with Section 308 or via the use of a listed chimney or vent connector system.

**TABLE 803.10.6
CONNECTOR CLEARANCES TO COMBUSTIBLES**

TYPE OF APPLIANCE	MINIMUM CLEARANCE (inches)
Domestic-type appliances	
Chimney and vent connectors	
Electric and oil incinerators	18
Oil and solid fuel appliances	18
Oil appliances labeled for venting with Type L vents	<u>9</u>
Commercial, industrial-type appliances	
Low-heat appliances	
Chimney connectors	
Oil and solid fuel boilers, furnaces and water heaters	18
Oil unit heaters	18
Other low-heat industrial appliances	
Medium-heat appliances	
Chimney connectors	36
All oil and solid fuel appliances	

High-heat appliances Masonry or metal connectors All oil and solid fuel appliances	In accordance with NFPA 211

For SI: 1 inch = 25.4 mm.

MC 804
DIRECT-VENT, INTEGRAL VENT AND MECHANICAL
DRAFT SYSTEMS

804.1 Direct-vent terminations. Vent terminals for direct-vent appliances shall be installed in accordance with the manufacturer’s installation instructions. In addition, direct vent terminations shall comply with the following requirements:

1. Where located adjacent to walkways, the termination shall be not less than 7 feet (2134 mm) above the level of the walkway.
2. Vents shall terminate at least 3 feet (914 mm) above any forced air inlet, other than the forced air inlet for the subject direct vent appliance, located within 10 feet (3048 mm).
3. The vent system shall terminate at least 4 feet (1219 mm) below, 4 feet (1219 mm) horizontally from or 1 foot (305 mm) above any door, window or gravity air inlet into the building.
4. The vent termination point shall not be located closer than 3 feet (914 mm) to an interior corner formed by two walls perpendicular to each other.
5. The vent termination shall not be mounted directly above or within 3 feet (914 mm) horizontally from any gas or electric metering, regulating, venting relief equipment or other building opening.
6. The bottom of the vent termination shall be located at least 24 inches (610 mm) above finished grade.
7. The maximum heat input of an appliance served by single horizontal vent termination shall be 350,000 Btu/h (1025 kW), unless otherwise approved by the Commissioner.
8. The maximum heat input of all appliances served by horizontal vent terminations located within a 10 foot (3048 mm) radius shall be 350,000 Btu/h (1025 kW), unless otherwise approved by the Commissioner.
9. The vent termination shall be located a minimum of 4 feet from the lot line or from adjacent buildings. The termination shall be installed in accordance with the vent manufacturer’s listing and installation instructions.

804.2 Appliances with integral vents. Appliances incorporating integral venting means shall be installed in accordance with their listings and the manufacturer's installation instructions. In addition, integral vent terminals shall comply with the following requirements:

1. Where located adjacent to walkways, the vent terminal shall be not less than 7 feet (2134 mm) above the level of the walkway.
2. The vent terminal shall be at least 3 feet (914 mm) above any forced air inlet, other than the forced air inlet for the subject integral vent appliance, located within 10 feet (3048 mm).
3. The vent terminal shall be at least 4 feet (1219 mm) below, 4 feet (1219 mm) horizontally from or 1 foot (305 mm) above any door, window or gravity air inlet into the building.
4. The vent terminal shall not be located closer than 3 feet (914 mm) to an interior corner formed by two walls perpendicular to each other.
5. The vent terminal shall not be mounted directly above or within 3 feet (914 mm) horizontally from any gas or electric metering, regulating, venting relief equipment or other building opening.
6. The bottom of the vent terminal shall be located at least 24 inches (610 mm) above finished grade.
7. The maximum heat input of an appliance served by single horizontal vent terminal shall be 350,000 Btu/h (1025 kW), unless otherwise approved by the Commissioner.
8. The maximum heat input of all appliances served by horizontal vent terminals located within a 10 foot (3048 mm) radius shall be 350,000 Btu/h (1025 kW), unless otherwise approved by the Commissioner.
9. The vent terminal shall be located a minimum of 4 feet from the lot line or from adjacent buildings. The termination shall be installed in accordance with the vent manufacturer's listing and installation instructions.

804.2.1 [Terminal clearances. Appliances designed for natural draft venting and incorporating integral venting means shall be located so that a minimum clearance of 9 inches (229 mm) is maintained between vent terminals and from any openings through which combustion products enter the building. Appliances using forced draft venting shall be located so that a minimum clearance of 12 inches (305 mm) is maintained between vent terminals and from any openings through which combustion products enter the building]
Reserved.

804.3 Mechanical draft systems. Mechanical draft systems of either forced or induced draft design shall comply with Sections 804.3.1 through [804.3.7] 804.3.8.

804.3.1 Forced draft systems. Forced draft systems and all portions of induced draft systems under positive pressure during operation shall be designed and installed so as to be gas tight to prevent leakage of combustion products into a building.

804.3.2 Automatic shutoff. Power exhausters serving automatically-fired appliances shall be electrically connected to each appliance to prevent operation of the appliance when the power exhauster is not in operation.

804.3.3 Termination. The termination of chimneys or vents equipped with power exhausters shall be located a minimum of 10 feet (3048 mm) from the lot line or from adjacent buildings, unless otherwise approved by the Commissioner. The exhaust shall be directed away from the building.

804.3.4 Horizontal terminations. Horizontal terminations and discharges, including any horizontal direct vent terminations subject to Section 804.1 and horizontal integral vent terminals subject to Section 804.2, shall not be permitted, unless otherwise authorized by the commissioner. [only be allowed if approved by the commissioner, if they are in a nonhazardous location, and if the appliance has a sealed combustion chamber (direct vent), and is installed in accordance with the appliance listing and manufacturer's instructions. In addition, horizontal terminations shall comply with the following requirements:

1. Where located adjacent to walkways, the termination of mechanical draft systems shall be not less than 7 feet (2134 mm) above the level of the walkway.
2. Vents shall terminate at least 3 feet (914 mm) above any forced air inlet located within 10 feet (3048 mm).
3. The vent system shall terminate at least 4 feet (1219 mm) below, 4 feet (1219 mm) horizontally from or 1 foot (305 mm) above any door, window or gravity air inlet into the building.
4. The vent termination point shall not be located closer than 3 feet (914 mm) to an interior corner formed by two walls perpendicular to each other.
5. The vent termination shall not be mounted directly above or within 3 feet (914 mm) horizontally from any gas or electric metering, regulating, venting relief equipment or other building opening.
6. The bottom of the vent termination shall be located at least 24 inches (610 mm) above finished grade.]

804.3.5 Vertical terminations. Vertical terminations and discharges shall comply with Section 801.20. [comply with the following requirements and in accordance with the appliance listing and manufacturer's instructions:

1. Chimneys serving appliances less than 600°F (316°C) shall extend at least 3 feet (914 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. Any chimney located in an area that is more than 10 feet (3048 mm) from such construction, but not more than the distance determined by Equation 8-2, shall be at least as high as the highest construction in such area. However, for purposes of determining the required height of a chimney, such construction does not include other chimneys, vents or open structural framing.
2. Chimneys serving appliances between 600°F (316°C) and 1000°F (538°C) shall extend at least 10 feet (3048 mm) above the highest construction, such as a roof ridge, or parapet wall or penthouse within 20 feet (6096 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. Any chimney located in an area more than 20 feet (6096 mm) from such construction, but not more than the distance determined from Equation 8-2, shall be at least as high as the highest construction in such area. However, for purposes of determining the required height of the chimney, such construction does not include other chimneys, vents or open structural framing.
3. Chimneys serving appliances greater than 1000°F (538°C) shall extend at least 20 feet (6096 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or in another building. Any chimney located in an area that is more than 50 feet (15 240 mm) from such construction, but not more than the distance determined from Equation 8-2, shall be at least as high as the highest construction located in such area. However, for purposes of determining the required height of the chimney, such construction does not include other chimneys, vents, or open structural framing.
4. Vent termination caps shall not be permitted and a 3-inch (76 mm) minimum drain installed to receive condensed water shall be required. A positive means shall be provided to prevent water from entering the appliance.
5. The following formula shall be used in order to determine the distance referred to in Items 1, 2 and 3 of this section:

$$D = F \times \sqrt{A} \qquad \text{(Equation 8-2)}$$

where:

D = Distance, in feet, measured from the center of the chimney outlet to the nearest edge of the construction.

F = Value determined from Table 802.5.

A = Free area, in square inches, of chimney flue space.]

804.3.6 Exhauster connections. An appliance vented by natural draft shall not be connected into a vent, chimney or vent connector on the discharge side of a mechanical flue exhauster.

804.3.7 Exhauster sizing. Mechanical flue exhausters and the vent system served shall be sized and installed in accordance with the manufacturer's installation instructions.

804.3.8 Mechanical draft systems for manually fired appliances and fireplaces. A mechanical draft system shall be permitted to be used with manually fired appliances and fireplaces where such system complies with all of the following requirements:

1. The mechanical draft device shall be listed and installed in accordance with the manufacturer's installation instructions.
2. A device shall be installed that produces visible and audible warning upon failure of the mechanical draft device or loss of electrical power, at any time that the mechanical draft device is turned on. This device shall be equipped with a battery backup if it receives power from the building wiring.
3. A smoke detector or alarm, and a carbon monoxide detector or alarm, shall be installed in the room with the appliance or fireplace. This device shall be equipped with a battery backup if it receives power from the building wiring.

SECTION MC 805 FACTORY-BUILT CHIMNEYS

805.1 Listing. Factory-built chimneys shall be listed and labeled and shall be installed and terminated in accordance with this code and the manufacturer's installation instructions.

805.2 Solid fuel appliances. Factory-built chimneys [for use] installed in dwelling units with solid fuel-burning appliances shall comply with the Type HT requirements of UL 103 and shall be marked "Type HT" and "Residential Type and Building Heating Appliance Chimney".

[Exception:] Exceptions:

1. Chimneys for use with [fireplace stoves listed only to UL 737] open combustion chamber fireplaces shall comply with the requirements of UL 103 and shall be marked "Residential Type and Building Heating Appliance Chimney".
2. Chimneys for use with open combustion chamber appliances installed in buildings other than dwelling units shall comply with the requirements of UL 103 and shall be marked "Building Heating Appliance Chimney" or "Residential Type and Building Heating Appliance Chimney."

805.3 Factory-built fireplaces. Chimneys for use with factory-built fireplaces shall comply with the requirements of UL 127.

805.4 Support. Where factory-built chimneys are supported by structural members, such as joists and rafters, such members shall be designed to support the additional load.

805.5 Medium-heat appliances. Factory-built chimneys for medium-heat appliances producing flue gases having a temperature above 1,000°F (538°C), measured at the entrance to the chimney, shall comply with UL 959.

805.6 Decorative shrouds. Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with Section 304.1.

SECTION MC 806 METAL CHIMNEYS

806.1 General. Metal chimneys shall be constructed and installed in accordance with NFPA 211.

806.2 Exterior metal chimneys. Exterior metal chimneys shall be stainless steel or galvanized, painted on the exterior surface with a heat-resisting paint [or constructed of equal corrosion-resistive ~~+~~alloys].

SECTION MC 807 CHANGES IN APPLIANCE FUELS

807.1 Changes in appliance fuels. Conversion of appliances from solid or liquid fuel to, or the addition of, natural gas shall be installed per the *New York City Fuel Gas Code*. Conversion from natural gas to, or the addition of, #2 fuel oil for a heating [appliances] appliance shall be made only if:

1. The chimney design meets the requirements of this chapter for the conversion fuel[; and], and the chimney is test run and smoke tested in accordance with Section 810.
2. The chimney [size is adequate to] is sized to provide adequate draft and vent the combustion products [from] for the new fuel. [Conversion from solid or liquid fuels to natural gas fuels for heating appliances shall be made only if:
 - 2.1. The chimney design meets the requirements of this chapter for the conversion fuel and the *New York City Fuel Gas Code*;
 - 2.2. The chimney is thoroughly cleaned prior to the conversion to remove collected flue deposits, which can spill off when gas is used as a fuel;
 - 2.3. The chimney provides adequate draft for the new fuel;

2.4. Drains are installed to remove condensed water; and

2.5. Gas vents are installed within the chimney for venting purposes if required by the appliance listing.]

3. The chimney is thoroughly cleaned prior to the conversion to remove collected flue deposits.

SECTION MC 808 REDUCTION OF FLUE SIZE

808.1 Reduction of flue size. Conversion from one fuel to another or the use of an existing chimney to service a fireplace or wood-burning appliance may require a flue size change for proper operation. This may be done if the redesigned flue meets the criteria for the fuel and chimney type to be used as set forth in this chapter.

SECTION MC 809 CHIMNEY SUPPORTED FROM EQUIPMENT

809.1 Chimney support. Chimneys shall not be supported by the equipment they serve, unless such equipment has been specifically designed for such loads.

SECTION MC 810 TEST RUN AND SMOKE TEST

810.1 Test run. All new chimneys shall be test run under operating conditions to demonstrate fire safety and the complete exhausting of smoke and the products of combustion to the outer air. The test run shall be conducted by a registered design professional responsible for the test, and the results of such test run shall be certified as correct by such professional and submitted in writing to the department.

810.2 Requirement of a smoke test. A smoke test shall be made as outlined in Section 810.3. Any faults or leaks found shall be corrected. Such smoke test shall be witnessed by a representative of the commissioner. In lieu thereof, the commissioner may accept the test report of a registered design professional responsible for the test which shall be submitted in writing to the department.

810.3 Smoke test. To determine the tightness of chimney construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The equipment, materials, power and labor necessary for such test shall be furnished by, and at the expense of, the owner or holder of the work permit.
2. If the test shows any evidence of leakage or other defects, such defects shall be corrected in

accordance with the requirements of this chapter, and the test shall be repeated until the results are satisfactory.

3. The chimney shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs, or other equivalent method. As the smoke appears at the stack opening on the roof, such opening shall be tightly closed and a pressure equivalent to ½-inch (13 mm) column of water measured at the base of the stack, shall be applied. The test shall be applied for a length of time sufficient to permit the inspection of the chimney.

SECTION MC 811

EXHAUST GASES FROM INTERNAL COMBUSTION ENGINES AND TURBINES

811.1 Exhaust pipe construction. The exhaust pipe from internal combustion engines shall be constructed in accordance with [the requirements for metal chimneys in this chapter,] NFPA 211, [and] NFPA 37, and based on the temperature of the gases entering the exhaust pipe, and in accordance with the following:

1. The exhaust pipe, if factory fabricated, shall be [constructed] installed in accordance with [their] its listing and [manufacturers] manufacturer's instructions.

2. The exhaust pipe, if field fabricated, shall be constructed of at least ³/₁₆-inch (5 mm) steel, or of other equivalent metal of similar strength and resistance to the temperature and corrosive action of the exhaust gases. No lining shall be required.

[3. No lining shall be required.]

[4.] 3. Where the exhaust pipe runs inside a building, it shall be insulated with insulation adequate for the temperature of the pipe, so that the surface temperature shall be not more than 200°F (93°C).

4. Where the exhaust pipe runs inside a building outside of the room containing the equipment, it shall be enclosed in fire-rated construction with a fire rating equal to the fire rating of the construction of the room.

5. All joints shall be constructed so as to be gas tight under all operating conditions and tested in accordance with Section 810.

811.2 [Discharge openings] Emergency and standby generator discharge opening termination requirements. The location of discharge openings for emergency and standby generators shall comply with the requirements of NFPA 37 so that the flue gases are not directed to jeopardize the health or safety of people, overheat combustible structures, nor enter building openings in the vicinity of the outlet, nor shall the location of such openings cause the condensate leaving the outlet to come into contact with people.

811.2.1 Interference. No discharge opening shall be located and constructed so as to interfere with the proper functioning of other openings in the same building or adjoining buildings, to interfere unreasonably with the occupants of the same building or adjoining buildings, or with the general public, or to create a fire or health hazard.

811.2.2 Chimneys. The exhaust pipe may be connected to a chimney used for other equipment, provided that the operation of the engine does not adversely affect the operation of the other equipment so that it is in violation of the *New York City Air Pollution Control Code*.

811.3 [Vertical] All other engine and turbine discharge opening termination requirements.

The location of the discharge outlet from all other engines and turbines shall comply with the [vertical termination requirements of at least a 600°F (316°C) to 1000°F (538°C) chimney or a greater than 1000°F (538°C) chimney] requirements of Section 801.20.2 or Section 801.20.3 based on the temperature of the gases entering the exhaust pipe.

Subpart 9 (Chapter 9 of the New York City Mechanical Code)

§1. Chapter 9 of the New York city mechanical code, as added by local law number 33 for the year 2007, sections 903.5 and 905.4 as amended by local law number 85 for the year 2009 and section 924.1 as amended by local law number 26 for the year 2008, is amended to read as follows:

**CHAPTER 9
SPECIFIC APPLIANCES, FIREPLACES, [AND]
SOLID FUEL-BURNING EQUIPMENT, AND NOISE CONTROL REQUIREMENTS**

**SECTION MC 901
GENERAL**

901.1 Scope. This chapter shall govern the approval, design, installation, construction, maintenance, alteration and repair of the appliances and equipment specifically identified herein and factory-built fireplaces. The approval, design, installation, construction, maintenance, alteration and repair of gas-fired appliances shall be regulated by the *New York City Fuel Gas Code*.

901.2 General. The requirements of this chapter shall apply to the mechanical equipment and appliances regulated by this chapter, in addition to the other requirements of this code, and installed in accordance with the requirements of NFPA 31, NFPA 54 and NFPA 211.

901.3 Hazardous locations. Fireplaces and solid fuel-burning appliances shall not be installed in hazardous locations.

901.4 Fireplace accessories. Listed fireplace accessories shall be installed in accordance with the conditions of the listing and the manufacturer's installation instructions.

901.5 Inspection of solid fuel-burning heating appliances, chimneys and flues. Inspections of solid fuel-burning heating appliances, chimneys and flues shall be in accordance with the *New York City Building Code*.

901.6 Fireplaces. Fireplaces (solid-fuel-type or ANSI Z21.50) shall be installed with tight-fitting noncombustible fireplace doors to control infiltration losses in construction types listed here:

1. Masonry or factory-built fireplaces designed to allow an open burn.
2. Decorative appliances (ANSI Z21.60 gas-log style unit) installed in a vented solid fuel fireplace.
3. Vented decorative gas fireplace appliances (ANSI Z21.50 unit). Fireplaces shall be provided with a source of combustion air as required by the fireplace construction provisions of the *New York City Building Code* and Chapter 7 of this code.

SECTION MC 902 MASONRY FIREPLACES

902.1 General. Masonry fireplaces shall be constructed in accordance with the *New York City Building Code*.

SECTION MC 903 FACTORY-BUILT FIREPLACES

903.1 General. Factory-built fireplaces shall be listed and labeled and shall be installed in accordance with the conditions of the listing. Factory-built fireplaces shall be tested in accordance with UL 127.

903.2 Hearth extensions. Hearth extensions of approved factory-built fireplaces and fireplace stoves shall be installed in accordance with the listing of the fireplace. The hearth extension shall be readily distinguishable from the surrounding floor area.

903.3 Unvented gas log heaters. The installation of unvented gas-fired space heaters, gas stoves, gas logs, gas fireplaces and gas fireplace inserts is prohibited.

903.4 Flues. Separate flues shall be provided for every fireplace and fireplace stove.

903.5 Combustion air supply. All installations of factory-built fireplaces shall comply with the requirements of the *New York City Energy Conservation Code* concerning combustion air supply.

SECTION MC 904 PELLET FUEL-BURNING APPLIANCES

904.1 General. Pellet fuel-burning appliances shall be listed and labeled in accordance with ASTM E 1509 and shall be installed in accordance with the terms of the listing. If permitted, such appliances shall be operated in accordance with the *New York City Air Pollution Control Code*.

SECTION MC 905 FIREPLACE STOVES AND ROOM HEATERS

905.1 General. Fireplace stoves and solid-fuel-type room heaters shall be listed and labeled and shall be installed in accordance with the conditions of the listing. Fireplace stoves shall be tested in accordance with UL 737. Solid-fuel-type room heaters shall be tested in accordance with UL 1482. Fireplace inserts intended for installation in fireplaces shall be listed and *labeled* in accordance with the requirements of UL 1482 and shall be installed in accordance with the manufacturer's installation instructions.

905.2 Connection to fireplace. The connection of solid fuel appliances to chimney flues serving fireplaces shall comply with Sections 801.7 and 801.10.

905.3 Air pollution. All fireplace stoves and room heaters shall comply with the requirements of the *New York City Air Pollution Control Code*.

905.4 Combustion air supply. All fireplace stoves and room heaters shall comply with the requirements of the *New York City Energy Conservation Code* concerning combustion air supply.

905.5 Flues. Separate flues and independent combustion air source shall be provided for every fireplace stove and room heater. Combustion air shall be provided in accordance with the manufacturer's recommendations and Chapter 7.

SECTION MC 906 FACTORY-BUILT BARBECUE APPLIANCES

906.1 General. Factory-built barbecue appliances shall be of an approved type and shall be installed in accordance with the manufacturer's installation instructions, this chapter, [and] Chapters 3, 5, 7, and 8 of this code, and the *New York City Fuel Gas Code*. All provisions for the construction and installation of fireplaces shall be complied with, in the construction and installation of barbecue grills.

SECTION MC 907 INCINERATORS AND CREMATORIES

907.1 General. Incinerators and crematories shall be listed and labeled in accordance with UL 791 and NFPA 82 and shall be installed in accordance with the manufacturer's installation instructions.

907.2 Compliance. All incinerators and crematories shall be installed, altered and maintained in buildings in conformity with the applicable provisions of the *Administrative Code* and the *New York City Air Pollution Control Code*.

**SECTION MC 908
COOLING TOWERS, EVAPORATIVE
CONDENSERS AND FLUID COOLERS**

908.1 General. A cooling tower used in conjunction with an air-conditioning appliance shall be installed in accordance with the manufacturer's installation instructions.

908.2 Access. Cooling towers, evaporative condensers and fluid coolers shall be provided with ready access.

908.3 Location. Cooling towers, evaporative condensers and fluid coolers shall be located to prevent the discharge vapor plumes from entering occupied spaces. Plume discharges shall be not less than 5 feet (1524 mm) above or 20 feet (6096 mm) away from any ventilation inlet to a building. Location on the property shall be as required for buildings in accordance with the *New York City Building Code*.

908.3.1 Indoor. Cooling towers, evaporative condensers and fluid coolers located inside of buildings shall be constructed of noncombustible materials including fill and drift eliminators.

908.3.2 Outside. Cooling towers shall be constructed of noncombustible materials.

[Exception] Exceptions:

1. Fill and drift eliminators of limited combustable materials may be considered non-combustible if the cooling towers are provided with automatic sprinkler protection in compliance with Chapter 9 of the *New York City Building Code*.

2. Fill and drift eliminators may be made of limited [combustibility] combustible materials provided all the following conditions are met:

[1] 2.1. The cooling tower is located on a building [in] of construction [Group 1-A or 1-B] Types IA or IB of the *New York City Building Code*.

[2] 2.2. The cooling tower, fill and drift eliminators are located at least 30 feet (9144mm) away from windows or fresh air intakes which are at an elevation above the roof on which the cooling tower is located, whether in the same building or in an adjoining building.

[3] 2.3. The cooling tower is located not less than 15 feet (4572 mm) from the lot line.

[4] 2.4. The cooling tower is located not less than 10 feet (3048 mm) from any chimney, except that the distance shall not be less than 20 feet (6096 mm) from a chimney venting products of combustion other than from gas- or oil-fired appliances, whether on the same or an adjoining building.

908.4 Support and anchorage. Supports for cooling towers, evaporative condensers and fluid coolers shall be designed in accordance with the *New York City Building Code*. Seismic restraints shall be as required by the *New York City Building Code*. Adequate vibration isolation shall be provided in accordance with the manufacturer's installation guidelines and as required for the supporting structure, and in accordance with [the following:] Sections 928.3.7 and 928.3.8.

[908.4.1 Cooling towers. All moving parts of cooling towers located on a roof or floor other than a floor on grade shall be installed on vibration isolators providing a minimum isolation efficiency of 85 percent at fan rotor rpm with a maximum static deflection of 4 inches (102 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6 mm).

908.4.2 Evaporative condensers. Evaporative and air cooled condensers located on a roof or floor other than a floor on grade shall be mounted on vibration isolators providing a minimum isolation efficiency of 85 percent at fan rotor rpm with a maximum static deflection of 4 inches (102 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6mm).]

908.5 Water supply. Water supplies and protection shall be as required by the *New York City Plumbing Code*.

908.6 Drainage. Drains, overflows and blowdown provisions shall be indirectly connected to an approved disposal location. Discharge of chemical waste shall be approved by the appropriate regulatory authority.

908.7 Refrigerants and hazardous fluids. Heat exchange equipment that contains a refrigerant and that is part of a closed refrigeration system shall comply with Chapter 11. Heat exchange equipment containing heat transfer fluids which are combustible or hazardous shall comply with the *New York City Fire Code*. Flammable heat transfer fluids are prohibited.

SECTION MC 909 VENTED WALL FURNACES

909.1 General. Vented wall furnaces shall be installed in accordance with their listing and the manufacturer's installation instructions. Oil-fired furnaces shall be tested in accordance with UL 730.

909.2 Location. Vented wall furnaces shall be located so as not to cause a fire hazard to walls, floors, combustible furnishings or doors. Vented wall furnaces installed between bathrooms and adjoining rooms shall not circulate air from bathrooms to other parts of the building.

909.3 Door swing. Vented wall furnaces shall be located so that a door cannot swing within 12 inches (305 mm) of an air inlet or air outlet of such furnace measured at right angles to the opening. Doorstops or door closers shall not be installed to obtain this clearance.

909.4 Ducts prohibited. Ducts shall not be attached to wall furnaces. Casing extension boots shall not be installed unless listed as part of the appliance.

909.5 Manual shutoff valve. A manual shutoff valve shall be installed ahead of all controls.

909.6 Access. Vented wall furnaces shall be provided with access for cleaning of heating surfaces, removal of burners, replacement of sections, motors, controls, filters and other working parts, and for adjustments and lubrication of parts requiring such attention. Panels, grilles and access doors that must be removed for normal servicing operations shall not be attached to the building construction.

SECTION MC 910 FLOOR FURNACES

910.1 General. Floor furnaces shall be installed in accordance with their listing and the manufacturer's installation instructions. Oil-fired furnaces shall be tested in accordance with UL 729. Unvented floor furnaces are prohibited.

910.2 Placement. Floor furnaces shall not be installed in any corridor, in the floor of any aisle or passageway of any auditorium, public hall, place of assembly, or in any egress element from any such room or space.

With the exception of wall register models, a floor furnace shall not be placed closer than 6 inches (152 mm) to the nearest wall, and wall register models shall not be placed closer than 6 inches (152 mm) to a corner.

The furnace shall be placed such that a drapery or similar combustible object will not be nearer than 12 inches (305 mm) to any portion of the register of the furnace. Floor furnaces shall not be installed in concrete floor construction built on grade. The controlling thermostat for a floor furnace shall be located within the same room or space as the floor furnace or shall be located in an adjacent room or space that is permanently open to the room or space containing the floor furnace. Floor furnaces shall be located so as to be accessible. Floor furnaces shall be installed only in floors of noncombustible construction having at least a 2-hour fire rating, except as where required for one- and two-family dwellings.

910.3 Bracing. The floor around the furnace shall be braced and headed with a support framework design in accordance with the *New York City Building Code*.

910.4 Clearance. The lowest portion of the floor furnace shall have not less than a 6-inch (152 mm) clearance from the grade level; except where the lower 6-inch (152 mm) portion of the floor furnace is sealed by the manufacturer to prevent entrance of water, the minimum clearance shall be reduced to not less than 2 inches (51 mm). Where these clearances are not present, the ground below and to the sides shall be excavated to form a pit under the furnace so that the required clearance is provided beneath the lowest portion of the furnace. A 12-inch (305 mm) minimum clearance shall be provided on all sides except the control side, which shall have an 18-inch (457 mm) minimum clearance.

910.5 Enclosures. Enclosures of floor furnaces shall be constructed entirely of noncombustible materials with a fire-resistance rating of at least 1 hour and shall be provided with adequate outdoor air to ensure proper combustion. The enclosure shall be provided with adequate means of access for servicing the furnace.

910.6 Duct temperature. The outlet duct temperature of warm air heating furnaces shall not be greater than 250°F (121°C).

910.7 One- and two- family dwellings. Floor furnace enclosures shall be constructed of noncombustible materials with a fire-resistance rating of at least 1 hour. Means shall be provided for supporting the furnace when the grille is removed. Clearances shall be provided as per NFPA 54.

SECTION MC 911 DUCT FURNACES

911.1 General. Duct furnaces shall be installed in accordance with the manufacturer's installation instructions. Electric furnaces shall be tested in accordance with UL 1995. Unvented furnaces are prohibited.

911.2 Access panels. Ducts connected to duct furnaces shall have removable access panels on both the upstream and downstream sides of the furnace.

911.3 Location of draft hood and controls. The controls, combustion air inlets and draft hoods for duct furnaces shall be located outside of the ducts. The draft hood shall be located in the same enclosure from which combustion air is taken.

911.4 Circulating air. Where a duct furnace is installed so that supply ducts convey air to areas outside the space containing the furnace, the return air shall also be conveyed by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace. The duct furnace shall be installed on the positive pressure side of the circulating air blower.

911.5 Duct temperature. The outlet duct temperature of duct furnaces shall not be greater than 250°F (121°C).

SECTION MC 912 INFRARED RADIANT HEATERS

912.1 Support. Infrared radiant heaters shall be [safely and adequately] fixed in [an approved] a position independent of fuel and electric supply lines. Hangers and brackets shall be noncombustible material.

912.2 Clearances. Heaters shall be installed with clearances from combustible material in accordance with the manufacturer's installation instructions.

SECTION MC 913 CLOTHES DRYERS

913.1 General. Clothes dryers shall be installed in accordance with the manufacturer's installation instructions. Electric commercial clothes dryers shall be tested in accordance with UL 1240. Electric residential and coin-operated clothes dryers shall be tested in accordance with UL 2158.

913.2 Exhaust required. Clothes dryers shall be exhausted in accordance with Section 504.

Exception: Electric clothes dryers provided with a condensate drain.

913.3 Clearances. Clothes dryers shall be installed with clearance to combustibles in accordance with the manufacturer's instructions.

SECTION MC 914 SAUNA HEATERS

914.1 Location and protection. Sauna heaters shall be located so as to minimize the possibility of accidental contact by a person in the room.

914.1.1 Guards. Sauna heaters shall be protected from accidental contact by an approved guard or barrier of material having a low coefficient of thermal conductivity. The guard shall not substantially affect the transfer of heat from the heater to the room.

914.2 Installation. Sauna heaters shall be listed and labeled in accordance with UL 875 and shall be installed in accordance with their listing and the manufacturer's installation instructions.

914.3 Access. Panels, grilles and access doors that are required to be removed for normal servicing operations shall not be attached to the building.

914.4 Heat and time controls. Sauna heaters shall be equipped with a thermostat that will limit room temperature to 194°F (90°C). If the thermostat is not an integral part of the sauna

heater, the heat-sensing element shall be located within 6 inches (152 mm) of the ceiling. If the heat-sensing element is a capillary tube and bulb, the assembly shall be attached to the wall or other support, and shall be protected against physical damage.

914.4.1 Timers. A timer, if provided to control main burner operation, shall have a maximum operating time of 1 hour. The control for the timer shall be located outside the sauna room.

914.5 Sauna room. A ventilation opening into the sauna room shall be provided. The opening shall be not less than 4 inches by 8 inches (102 mm by 203 mm) located near the top of the door into the sauna room.

914.5.1 Warning notice. The following permanent notice, constructed of approved material, shall be mechanically attached to the sauna room on the outside:

WARNING: DO NOT EXCEED 30 MINUTES IN SAUNA. EXCESSIVE EXPOSURE CAN BE HARMFUL TO HEALTH. ANY PERSON WITH POOR HEALTH SHOULD CONSULT A PHYSICIAN BEFORE USING SAUNA.

The words shall contrast with the background and the wording shall be in letters not less than 0.25-inch (6.4 mm) high.

Exception: This section shall not apply to one- and two-family dwellings.

SECTION MC 915 ENGINE AND GAS TURBINE-POWERED EQUIPMENT AND APPLIANCES

915.1 General. The installation of liquid-fueled stationary internal combustion engines and gas turbines, including combustion air, exhaust, fuel storage and piping, shall meet the requirements of NFPA 37 and [Chapter] Chapters 7, 8, and 13 of this code. Stationary engine generator assemblies shall meet the requirements of UL 2200.

915.2 Powered equipment and appliances. Permanently installed equipment and appliances powered by internal combustion engines and turbines shall be installed in accordance with the manufacturer's installation instructions and NFPA 37.

SECTION MC 916 POOL AND SPA HEATERS

916.1 General. Pool and spa heaters shall be installed in accordance with the manufacturer's installation instructions. Oil-fired pool and spa heaters shall be tested in accordance with UL 726. Electric pool and spa heaters shall be tested in accordance with UL 1261.

SECTION MC 917 COOKING APPLIANCES

917.1 Cooking appliances. Cooking appliances that are designed for permanent installation, including ranges, ovens, stoves, broilers, grills, fryers, griddles and barbecues, shall be listed, labeled and installed in accordance with the manufacturer's installation instructions. Oil-fired cooking appliances are prohibited. Commercial electric cooking appliances shall be listed and labeled in accordance with UL 197. Household electric ranges shall be listed and labeled in accordance with UL 858. Microwave cooking appliances shall be listed and labeled in accordance with UL 923. Oil-burning stoves shall be listed and labeled in accordance with UL 896. Solid-fuel-fired ovens shall be [tested] listed and labeled in accordance with UL 2162.

917.2 Prohibited location. Cooking appliances designed, tested, listed and labeled for use in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

917.3 Domestic appliances. Cooking appliances installed within dwelling units and within areas where domestic cooking operations occur shall be listed and labeled as household-type appliances for domestic use.

917.4 Domestic range installation. Domestic ranges installed on combustible floors shall be set on their own bases or legs and shall be installed with clearances of not less than that shown on the label.

917.5 Open-top broiler unit hoods. A ventilating hood shall be provided above a domestic open-top broiler unit, unless otherwise listed for forced down draft ventilation.

917.5.1 Clearances. A minimum clearance of 24 inches (610 mm) shall be maintained between the cooking top and combustible material above the hood. The hood shall be at least as wide as the open-top broiler unit and be centered over the unit.

917.6 Commercial cooking appliance venting. Commercial cooking appliances, other than those exempted by Section 501.8 of the *New York City Fuel Gas Code*, shall be vented by connecting the appliance to a vent or chimney in accordance with this code and the appliance manufacturer's instructions or the appliance shall be vented in accordance with Section 505.1.1 of the *New York City Fuel Gas Code*.

917.7 Domestic ventilation. When a hood is required for proper ventilation of a domestic cooking appliance, the exhaust and make-up air systems shall be properly engineered and designed in accordance with Chapter 5.

SECTION MC 918 FORCED-AIR WARM-AIR FURNACES

918.1 Forced-air furnaces. Oil-fired furnaces shall be tested in accordance with UL 727. Electric furnaces shall be tested in accordance with UL 1995. Solid fuel furnaces shall be tested in accordance with UL 391. Forced-air furnaces shall be installed in accordance with the listings and the manufacturer's installation instructions. Forced-air warm-air furnaces shall be

installed in accordance with the requirements of NFPA 31 and the *New York City Fuel Gas Code*. Unvented furnaces are prohibited.

918.2 Minimum duct sizes. The minimum unobstructed total area of the outside and return air ducts or openings to a forced-air warm-air furnace shall be not less than 2 square inches per 1,000 Btu/h (4402 mm²/kW) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions. The minimum unobstructed total area of supply ducts from a forced-air warm-air furnace shall not be less than 2 square inches for each 1,000 Btu/h (4402mm²/kW) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions.

Exception: The total area of the supply air ducts and outside and return air ducts shall not be required to be larger than the minimum size required by the furnace manufacturer's installation instructions and in accordance with NFPA 54.

918.3 Heat pumps. The minimum unobstructed total area of the outside and return air ducts or openings to a heat pump shall be not less than 6 square inches per 1,000 Btu/h (13 208 mm²/kW) output rating or as indicated by the conditions of listing of the heat pump. Electric heat pumps shall be tested in accordance with UL 1995.

918.4 Dampers. Volume dampers shall not be placed in the air inlet to a furnace in a manner that will reduce the required air to the furnace.

918.5 Circulating air ducts for forced-air warm-air furnaces. Circulating air for fuel-burning, forced-air-type, warm-air furnaces shall be conducted into the blower housing from outside the furnace enclosure by continuous air-tight ducts.

918.6 Prohibited sources. [Outside] Outdoor or return air for a forced-air heating system shall not be taken from the following locations:

1. [Closer] Less than 10 feet (3048 mm) from an appliance vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the [outside] outdoor air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or unsanitary location or a refrigeration machinery room as defined in this code.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Sections 918.2 and 918.3, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A closet, bathroom, toilet room, kitchen, garage, mechanical room, boiler room [or], furnace room or unconditioned attic.

Exception: Where return air intakes are located not less than 10 feet (3048mm) from cooking appliances, and serve the kitchen area only, taking return air from a kitchen shall not be prohibited.

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.

[6] 7. A room or space containing a fuel-burning appliance where such room or space serves as the sole source of return air.

Exceptions:

1. This shall not apply where the fuel-burning appliance is a direct-vent appliance.
2. This shall not apply where the room or space complies with the following requirements:
 - 2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning appliances therein.
 - 2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
 - 2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of any appliance firebox or draft hood in the same room or space.
3. This shall not apply to rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.

918.7 Outside opening protection. Outdoor air intake openings shall be protected in accordance with Section [401.6] 401.5.

918.8 Return-air limitation. Return air from one dwelling unit shall not be discharged into another dwelling unit.

**SECTION MC 919
CONVERSION BURNERS**

919.1 Conversion burners. The installation of conversion burners shall conform to ANSI Z21.8.

**SECTION MC 920
UNIT HEATERS**

920.1 General. Unit heaters shall be installed in accordance with the listing and the manufacturer's installation instructions. Oil-fired unit heaters shall be tested in accordance with UL 731.

920.2 Support. Suspended-type unit heaters shall be supported by elements that are designed and constructed to accommodate the weight and dynamic loads. Hangers and brackets shall be of noncombustible material. Suspended-type oil-fired unit heaters shall be installed in accordance with NFPA 31.

920.3 Ductwork. A unit heater shall not be attached to a warm-air duct system unless listed for such installation.

**SECTION MC 921
VENTED ROOM HEATERS**

921.1 General. Vented room heaters shall be listed and labeled and shall be installed in accordance with the conditions of the listing and the manufacturer's instructions.

**SECTION MC 922
KEROSENE AND OIL-FIRED STOVES**

922.1 General. The installation of kerosene and oil-fired stoves is prohibited.

**SECTION MC 923
SMALL CERAMIC KILNS**

923.1 General. The provisions of this section shall apply to kilns that are used for ceramics, have a maximum interior volume of 20 cubic feet (0.566 m³) and are used for hobby and noncommercial purposes.

923.1.1 Installation. Kilns shall be installed in accordance with the manufacturer's installation instructions and the provisions of this code.

**SECTION MC 924
STATIONARY FUEL CELL POWER PLANTS**

924.1 General. Stationary fuel cell power plants having a power output not exceeding 1,000 kW, shall be tested in accordance with ANSI Z21.83 and shall be installed in accordance with manufacturer's installation instructions and NFPA 853. Such fuel cell plants shall be powered by hydrogen derived on-site from piped natural gas, except where the storage, handling and use of hydrogen or other flammable gas is authorized by the *New York City Fire Code* for such purposes and approved by the fire commissioner.

SECTION 925 MASONRY HEATERS

925.1 General. Masonry heaters shall be constructed in accordance with the *New York City Building Code*.

SECTION 926 GASEOUS HYDROGEN SYSTEMS

926.1 Installation. The installation of gaseous hydrogen systems shall be in accordance with the applicable requirements of this code, the *New York City Fire Code*, the *New York City Fuel Gas Code* and the *New York City Building Code*.

SECTION 927 HEAT RECOVERY VENTILATORS

927.1 Ducted heat recovery ventilators. Ducted heat recovery ventilators shall be listed and labeled in accordance with UL 1812.

927.2 Nonducted heat recovery ventilators. Nonducted heat recovery ventilators shall be listed and labeled in accordance with UL 1815.

SECTION MC [926] 928 NOISE CONTROL REQUIREMENTS

[926.1 Minimum air-borne noise insulation requirements.] 928.1 General. Interior and exterior mechanical equipment and systems shall comply with the provisions of this section.

[926.1.1 Exterior] 928.2 Noise from exterior mechanical equipment. Mechanical equipment [in a building in any occupancy group, when] located outside of the building in a yard or court or on a roof, or [where the equipment] located inside a building but [opens] open to the exterior of the building, shall [be subject to the noise output limitations given in Table 926.1 where one or more windows of a dwelling unit in any building in Occupancy Groups R-1, R-2, and R-3, are located within a sphere of 100-foot radius (30 480 mm) whose center is any part of the equipment or its housing, unless it can be shown that the sound pressure levels, in octave bands, of the exterior mechanical equipment as measured within the dwelling unit do not exceed the levels given in Table 926.1(2)] comply with the requirements of Sections 928.2.1 and 928.2.2.

928.2.1 Design and installation. The applicant shall select and design any such exterior mechanical equipment in order to achieve compliance with the applicable requirements of Sections 24-218, 24-227, 24-228 and 24-232 of the *Administrative Code*, also known as the *New York City Noise Control Code*, in accordance with generally acceptable engineering practices.

928.2.2 Operation. The operation of such exterior mechanical equipment shall comply with any applicable requirements of Sections 24-218, 24-227, 24-228 and 24-232 of the *New York City Noise Control Code*, as enforced by the Department of Environmental Protection.

**[TABLE 926.1 (1)
MAXIMUM SOUND POWER LEVELS PERMITTED FOR EXTERIOR
MECHANICAL EQUIPMENT ADJOINING BUILDINGS**

MINIMUM DISTANCE FROM EQUIPMENT TO EXTERIOR WINDOW (ft.) ^a	MAXIMUM SOUND POWER LEVELS IN OCTAVE BANDS – db re 10 ⁻¹³							
	Octave Bands c.p.s. Mid Frequency							
	63	125	250	500	1000	2000	4000	8000
12	97	90	83	78	75	73	72	71

50	110	102	95	90	87	85	84	83
100	116	108	101	96	93	91	90	89
	Octave Bands- db re 10 ⁻¹² Watts							
12	87	80	73	68	65	63	62	61
25	94	86	79	74	71	69	68	67
50	100	92	85	80	77	75	74	73
100	106	98	91	86	83	81	80	79

For SI: 1 foot = 304.8 mm.

- a. The minimum distance shall be measured in a straight line regardless of obstructions. Interpolated levels may be used for distances between those given in this table. See note (a) at end of Table 1207.2.1 in the *New York City Building Code*.

Notes:

1. In the event sound power level data for the exterior mechanical equipment is not available, the sound pressure levels, in octave bands, of the exterior mechanical equipment shall be measured.
2. The measurements shall be obtained with the microphone of the measuring equipment located at the interior of the dwelling unit affected in a line with the window nearest the

exterior mechanical equipment. The window shall be fully open and the microphone shall be located 3 feet away from the open portion of the window.

3. Measurements shall be obtained during times when the ambient sound pressure levels, in octave bands, are at least 6db lower at all octave bands than the sound pressure levels measured with the exterior equipment operating. By ambient sound pressure levels is meant the measured sound pressure levels, at the above described measuring location, with the exterior equipment not in operation.]

a. Measurements shall be obtained with a sound level meter and octave band analyzer, calibrated both electronically and acoustically before and after the measurements are made.]

[926.1.2 Noise Control Code. Sound sources shall also comply with any applicable requirements of Section 24-232 of the *Administrative Code*, also known as the *New York City Noise Control Code*.]

[926.2] 928.3 Minimum structure-borne noise and vibration isolation requirements. All isolators shall comply with the requirements of Sections [926.2.1] 928.3.1 through Section [926.2.9] 928.3.10.

[926.2.1] 928.3.1 Boiler rooms.

[926.2.1.1] 928.3.1.1 Boilers. All boilers supported on floors directly above a story having dwelling units shall be supported on resilient isolators having a minimum static deflection of 1 inch (25 mm). The isolators shall be installed directly under the structural frame of the boiler.

[926.2.1.2] **928.3.1.2 Boiler breeching and piping.** When boilers are equipped with mechanical draft fans, the boiler breeching and piping that are supported from or on slabs, floors or walls that are contiguous to the dwelling unit shall be supported for a distance of 50 pipe diameters on or from resilient isolators. Each isolator shall have a minimum static deflection of 1 inch (25 mm).

[926.2.2] **928.3.2 [Incinerator] Refuse charging chutes.**

[926.2.2.1] **928.3.2.1 Metal chutes.** Metal chutes, metal chute supports, and/or metal chute bracing shall be free of direct contact with the shaft enclosure and the openings provided in the floor construction. Metal chutes shall be resiliently supported at each structural support location. Isolators shall provide a minimum static deflection of 0.30 inches (7.62 mm). All chutes shall be plumb.

[926.2.2.2] **928.3.2.2 Masonry chutes.** The interior chute wall shall be plumb and without obstructions for the full height of the shaft and shall have a smooth interior finish.

[926.2.3] **928.3.3 Piping.** Equipment piping shall be installed as follows:

1. Metal piping connected to power driven equipment shall be resiliently supported from or on the building structure for a distance of 50 pipe diameters from the power driven equipment. The resilient isolators shall have a minimum static deflection of 1 inch (25 mm) for all piping with a 4 inch (25 mm) or larger in actual outside diameter and ½ inch (12.7 mm) for piping with less than 4 inches (25 mm) in actual outside diameter. Piping connected to fluid pressure-reducing valves shall be resiliently isolated for a distance of 50 pipe diameters from pressure-reducing valves and isolators shall provide a minimum static deflection of ½ inch (12.7 mm).
2. Equipment such as heat exchangers, absorption refrigeration machines, or similar equipment, that is located on any floor or roof other than a floor on grade, and that is not power driven but is connected by metal piping to power driven equipment, shall be resiliently supported from or on the building structure, for a distance of 50 pipe diameters from the power driven equipment. The resilient supports shall be vibration isolators having a minimum static deflection of 1 inch (25 mm) and shall incorporate approved resilient pads having a minimum thickness of ¼ inch (6.4 mm).

[926.2.4] **928.3.4 Fans.** All fan equipment with motors in excess of ½ horsepower (0.37 kW), located on any roof or floor other than a floor on grade shall be mounted on or from vibration isolators. Fan equipment with motor drives separated from the fan equipment shall be supported on an isolated integral rigid structural base supporting both the fan and motor. Fan equipment with motor drives supported from the fan equipment shall be mounted directly on vibration isolators. Each isolator shall have provision for leveling. Isolators shall incorporate resilient pads having a minimum thickness of ¼ inch (6.4 mm). The vibration isolators shall provide a minimum isolation efficiency of 90 percent at fan rotor rpm with a maximum deflection of 2 inches (51 mm). Fans and compressors [of

3 horsepower (2.25 kW) or less] assembled in unitary containers may meet this requirement with isolators internal to the container providing the isolators meet the above minimum isolator efficiencies.

[926.2.5] 928.3.5 Pumps. All pumps of 3 horsepower (2.25 kW) or more located on any floor other than a floor on grade shall be supported on vibration isolators having a minimum isolation efficiency of [85] 90 percent at the lowest disturbing frequency. Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm).

[926.2.6] 928.3.6 Compressors. Compressors and drives located on a floor other than a floor on grade shall be mounted on vibration isolators having a minimum isolation efficiency of [85] 90 percent at the lowest disturbing frequency. Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm).

[926.2.7] 928.3.7 Cooling towers and fluid coolers. All moving parts of cooling towers and fluid coolers located on a roof or floor other than a floor on grade shall be installed on vibration isolators providing a minimum isolation efficiency of [85] 90 percent at fan rotor rpm with a maximum static deflection of 4 inches (102 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm). Vibration cutoff switches shall be provided.

[926.2.8] 928.3.8 Evaporative condensers. Evaporative and air cooled condensers located on a roof or floor other than a floor on grade shall be mounted on vibration isolators providing a minimum isolation efficiency of [85] 90 percent at fan rotor rpm with a maximum static deflection of 4 inches (102 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm). Vibration cutoff switches shall be provided on evaporative condensers.

[926.2.9] 928.3.9 Duct connections to [fan] fans [equipment]. Flexible connections shall be installed between fan equipment and connecting ductwork.

928.3.10 Ceiling suspended packaged HVAC units with compressors. Equipment such as heat pumps, AC units, or similar equipment, that is suspended from a structure shall be resiliently supported from or on the building structure. Vibration isolators shall have a minimum isolation efficiency of 90 percent at the lowest disturbing frequency.

Subpart 10 (Chapter 10 of the New York City Mechanical Code)

§1. Chapter 10 of the New York city mechanical code, as added by local law number 33 for the year 2007, is amended to read as follows:

CHAPTER 10

BOILERS, WATER HEATERS AND PRESSURE VESSELS

SECTION MC 1001 GENERAL

1001.1 Scope. This chapter shall establish the minimum safety requirements for and shall govern the installation, alteration and repair of boilers, water heaters and pressure vessels.

Exceptions:

1. Pressure vessels used for unheated water supply.
2. Portable unfired pressure vessels and Interstate Commerce Commission containers.
3. Containers for bulk oxygen and medical gas.
4. Unfired pressure vessels having a volume of 5 cubic feet (0.14 m³) or less operating at pressures not exceeding 250 pounds per square inch (psi) (1724 kPa) and located within occupancies of Groups B, F, H, M, R, S and U.
5. Pressure vessels used in refrigeration systems that are regulated by Chapter 11 of this code.
6. Pressure tanks used in conjunction with coaxial cables, telephone cables, power cables and other similar humidity control systems.
7. Any boiler or pressure vessel subject to inspection by federal inspectors.

1001.2 Thermal safety (spill) switches. Thermal safety (spill) switches shall be installed on barometric dampers, draft hoods, draft diverters, and all other appurtenances that allow dilution air into a chimney or gas vent. Thermal safety (spill) switches shall be interlocked with all of the appliances connected to the same chimney or gas vent.

SECTION MC 1002 WATER HEATERS

1002.1 General. Potable water heaters and hot water storage tanks shall be listed and labeled and installed in accordance with the manufacturer's installation instructions, the *New York City Plumbing Code* and this code. All water heaters shall be capable of being removed without first removing a permanent portion of the building structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the *New York City Plumbing Code*. Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall

comply with UL 732. Approval for oil-fired water heaters 350,000 Btu/h input (1025 kW) and above shall be obtained from the New York City Department of Environmental Protection.

1002.2 Water heaters utilized for space heating. Water heaters utilized both to supply potable hot water and provide hot water for space-heating applications shall be listed and labeled for such applications by the manufacturer, and shall be built in accordance with Section IV of the *ASME Boiler and Pressure Vessel Code* with an “H” code stamp. They shall be installed in accordance with the manufacturer’s installation instructions, the [ASME Code] *ASME Boiler and Pressure Vessel Code* and the *New York City Plumbing Code*.

1002.2.1 Sizing. Water heaters utilized for both potable water heating and space-heating applications shall be sized to prevent the space-heating load from diminishing the required potable water-heating capacity.

1002.2.2 [Scald protection.] Temperature limitation. Where a combination potable water-heating and space-heating system requires water for space heating at temperatures higher than 140°F (60°C), a [tempering] temperature actuated mixing valve that conforms to ANSI/ASSE 1017 shall be provided to temper the water supplied to the potable hot water distribution system to a temperature of 140°F (60°C) or less.

1002.3 Supplemental water-heating devices. Potable water-heating devices that utilize refrigerant-to-water heat exchangers shall be approved and installed in accordance with the *New York City Plumbing Code* and the manufacturer’s installation instructions.

SECTION MC 1003 PRESSURE VESSELS

1003.1 General. All pressure vessels shall be constructed in accordance with the *ASME Boiler and Pressure Vessel Code* and shall bear the label of an approved agency. [and] Pressure vessels shall be installed in accordance with the manufacturer’s installation instructions. [The requirements for unfired pressure vessels shall be the same as required for boilers designed for the same operating temperatures.]

1003.2 Piping. All piping materials, fittings, joints, connections and devices associated with systems utilized in conjunction with pressure vessels shall be designed for the specific application and shall [be approved] comply with the *ASME Boiler and Pressure Vessel Code* and this code.

1003.3 Welding. Welding on pressure vessels shall be performed by [approved certified] welders certified in compliance with nationally recognized standards, *ASME Boiler and Pressure Vessel Code*, [Sections VIII and] Section IX, 12 NYCRR 4-6.2, and 12 NYCRR 14-3.3 through 14-3.18.

SECTION MC 1004 BOILERS

1004.1 Standards. Oil-fired boilers and their control systems shall be listed and labeled in accordance with UL 726. Electric boilers and their control systems shall be listed and labeled in accordance with UL 834. Boilers shall be designed and constructed in accordance with the requirements of ASME CSD-1 and as applicable: the *ASME Boiler and Pressure Vessel Code* [Sections I, II, IV, V, VI, VIII and IX,]; 12 NYCRR Parts 4 and 14; and NFPA 85[01; NFPA 8502; and NFPA 8504]. Approval for oil-fired boilers 350,000 Btu/h input (1025 kW) and above shall be obtained from the New York City Department of Environmental Protection.

1004.1.1 Field erected boilers requirements.

1. The vessel erector shall hold the appropriate ASME stamp for vessel construction.
2. The licensed installer is responsible for the installation of all controls and burners which shall be designed and constructed in accordance with the requirements of ASME CSD-1 and, as applicable, the ASME Boiler and Pressure Vessel Code, 12 NYCRR Parts 4 and 14, and NFPA 85.
3. The New York City Department of Environmental Protection shall approve the installation of the boiler and burner for compatibility, controls and safety devices.
4. Boiler vessels shall comply with one of the following listings:
 - 4.1. UL 726 or UL 795 as applicable;
 - 4.2. UL 2106; or

Exception: Unlisted equipment shall obtain Department approval.

5. Controls and safety devices shall be tested and inspected in accordance with ASME CSD-1 and, as applicable, the ASME Boiler and Pressure Vessel Code, 12 NYCRR Parts 4 and 14, and NFPA 85. Testing and inspection shall be performed by the burner manufacturer's authorized representative in the presence of the licensed installer.
6. Inspection of the installed boiler assembly shall be performed by the department.

1004.2 Installation. In addition to the requirements of this code, the installation of boilers shall conform to the manufacturer's instructions. Operating instructions of a permanent type shall be [attached to the boiler] located in the boiler room and readily accessible. Boilers shall have all controls set, adjusted and tested by the installer. The manufacturer's rating data and the nameplate shall be attached to the boiler.

1004.3 Working clearance. Clearances shall be maintained around boilers, generators, heaters, tanks and related equipment and appliances so as to permit inspection, servicing, repair, replacement and visibility of all gauges. When boilers are installed or replaced, clearance shall be provided to allow access for [inspection,] maintenance and repair per the boiler's listing and manufacturer's installation instructions. Passageways for inspection around all sides of boilers shall have an unobstructed width of not less than 18 inches (457mm) [, unless otherwise approved, by the commissioner] unless the boiler's listing or department approval or manufacturer's installation instructions state otherwise.

1004.3.1 Top clearance. High-pressure steam boilers having a steam-generating capacity in excess of 5,000 pounds per hour (2268 kg/h) or having a heating surface in excess of 1,000 square feet (93 m²) or input in excess of 5,000,000 Btu/h (1465 kW) shall have a minimum clearance of 7 feet (2134 mm) from the top of the boiler to the ceiling. Steam-heating boilers and hot-water-heating boilers that exceed one of the following limits: 5,000,000 Btu/h input (1465 kW); 5,000 pounds of steam per hour (2268 kg/h) capacity or a 1,000-square-foot (93 m²) heating surface; and high-pressure steam boilers that do not exceed one of the following limits: 5,000,000 Btu/h input (1465 kW); 5,000 pounds of steam per hour (2268 kg/h) capacity or a 1,000-square-foot (93 m²) heating surface; and all boilers with manholes on top of the boiler, shall have a minimum clearance of 3 feet (914mm) from the top of the boiler to the ceiling. Package boilers, steam-heating boilers and hot-water-heating boilers without manholes on top of the shell and not exceeding one of the limits of this section shall have a minimum clearance of 2 feet (610 mm) from the ceiling.

1004.4 Mounting. Equipment and appliances shall be set or mounted on a level base capable of supporting and distributing the weight contained thereon. Boilers, tanks and equipment shall be securely anchored to the structure. Equipment and appliances requiring vibration isolation shall be installed as designed by a registered design professional in accordance with the manufacturer's installation instructions.

1004.5 Floors. Boilers shall be mounted on floors of noncombustible construction, unless listed for mounting on combustible flooring.

1004.6 Boiler rooms and enclosures. Boiler rooms and enclosures and access thereto shall comply with the *New York City Building Code* and Chapter 3 of this code. Boiler rooms shall be equipped with a floor drain or other approved means for disposing of liquid waste in accordance with the *New York City Plumbing Code*.

1004.7 Operating adjustments and instructions. Hot water and steam boilers shall have all operating and safety controls set and operationally tested by the installing contractor. A complete control diagram and boiler operating instructions shall be furnished by the installer for each installation. A complete control diagram of a permanent type shall be located in the boiler room and shall be readily accessible.

1004.8 Burner controls. Gas and oil modulating burners shall be provided with burner controls (oil and gas equivalent ratings) in accordance with Table 1004.8.

**SECTION MC 1005
BOILER CONNECTIONS**

1005.1 Valves. Every boiler or modular boiler shall have a shutoff valve in the supply and return piping. For multiple boiler or multiple modular boiler installations, each boiler or modular boiler shall have individual shutoff valves in the supply and return piping.

Exception: Shutoff valves are not required in a system having a single low-pressure steam boiler of 350,000 Btu/h (103 kW) output or less.

1005.2 Potable water supply. The water supply to all boilers shall be connected in accordance with the *New York City Plumbing Code*.

**SECTION MC 1006
SAFETY AND PRESSURE RELIEF
VALVES AND CONTROLS**

1006.1 Safety valves for steam boilers. All steam boilers shall be protected with a safety valve.

1006.2 Safety relief valves for hot water boilers. Hot water boilers shall be protected with a safety relief valve.

1006.3 Pressure relief for pressure vessels. All pressure vessels shall be protected with a pressure relief valve or pressure-limiting device as required by the manufacturer's installation instructions for the pressure vessel.

1006.4 Standards of safety and safety relief valves. Safety and safety relief valves shall be listed and labeled, and shall have a minimum rated capacity for the equipment or appliances served. Safety and safety relief valves shall be set at a maximum of the nameplate pressure rating of the boiler or pressure vessel.

1006.5 Installation. Safety or relief valves shall be installed directly into the safety or relief valve opening on the boiler or pressure vessel. Valves shall not be located on either side of a safety or relief valve connection. The safety or relief valve shall discharge [by gravity] without obstruction to a nonhazardous point of discharge. The discharge piping shall drain by gravity without traps.

**TABLE 1004.8
MINIMUM CONTROL REQUIREMENTS**

TYPE OF CONTROL	GROSS OUTPUT FIRING RATE OF THE BOILER OR THE BURNER OIL DELIVERY RATE (gph), WHICHEVER IS GREATER
-----------------	--

Combustion Controls	#6 Oil	#4 Oil	#2 Oil
On-Off	—	—	<10
Low-High-Off with low fire start	20 to <30	10 to <30	10 to <30
Low-High-Low-Off with proven low fire start	30 to <50	30 to <50	30 to <50
Full Modulation with proven low fire start	≥50	≥ 50	≥ 50
Full Modulation with proven low fire start as well as cross-limited oxygen trim (dry cell electrochemical type)	≥ 350	≥ 350	≥ 350

1006.6 Safety and relief valve discharge. Safety and relief valve discharge pipes shall be of rigid pipe that is approved for the temperature of the system. The discharge pipe shall, at a minimum, be the same diameter as the safety or relief valve outlet. Safety and relief valves shall not discharge so as to be a hazard, a potential cause of damage or otherwise a nuisance. High-pressure-steam safety valves shall be vented to the outside of the structure. Where a low-pressure safety valve or a relief valve discharges to the drainage system, the installation shall conform to the *New York City Plumbing Code*.

1006.7 Boiler safety devices. Boilers shall be equipped with controls and limit devices as required by the manufacturer’s installation instructions and the conditions of the listing.

1006.8 Electrical requirements. The power supply to the electrical control system shall be from a two-wire branch circuit that has a grounded conductor, or from an isolation transformer with a two-wire secondary. Where an isolation transformer is provided, one conductor of the secondary winding shall be grounded. Control voltage shall not exceed 150 volts nominal, line to line. Control and limit devices shall interrupt the ungrounded side of the circuit. A means of manually disconnecting the control circuit shall be provided and controls shall be arranged so that when deenergized, the burner shall be inoperative. Such disconnecting means shall be capable of being locked in the off position and shall be provided with ready access.

1006.8.1 Remote control (shutdown). A remote control shall be provided to stop the flow of oil and/or gas and combustion air to any burner or fuel-burning internal combustion equipment. Such control shall be located outside all means of egress to the room in which the burner or equipment is located and as close to such entrances as practicable, except that when an outside location is impracticable, such control may be located immediately inside the room in which the burner or equipment is located, provided such location is accessible at all times. All such controls shall be labeled: “REMOTE CONTROL FOR BURNER.”

SECTION MC 1007 BOILER LOW-WATER CUTOFF

1007.1 General. All steam and hot water boilers shall be protected with dual low-water cutoff control.

Exception: Hot water boilers located within a dwelling unit supplying only that unit and having a total heat input of less than 350,000 Btu/h (1025 kW) may be protected by only one low water cutoff control.

[**1007.1.1 High-Pressure boiler.** If the low-water cut off devices are mounted externally to the boiler, the main and auxiliary low-water cut offs shall be connected to the boiler using isolated steam side and water side connection. No other control devices, gauges or valves except for the water column drain shall be connected to the tappings on the boiler used for low-water cut offs.]

1007.2 Operation. The low-water cutoff shall automatically stop the combustion operation of the appliance when the water level drops below the lowest safe water level as established by the manufacturer and in accordance with ASME CSD- 1.

SECTION MC 1008 BOILER BLOWOFF/BLOWDOWN VALVES

1008.1 General. Every boiler shall be equipped with blowoff/blowdown valve(s). The valve(s) shall be installed in the openings provided on the boiler. The minimum quantity and size of each valve shall be the quantity and size specified by the boiler manufacturer or the quantity and size of the boiler blowoff/blowdown valve opening.

1008.2 Discharge. Blowoff/blowdown valves shall discharge to a safe place of disposal. Where discharging to the drainage system, the installation shall conform to the *New York City Plumbing Code*.

SECTION MC 1009 HOT WATER BOILER EXPANSION TANK

1009.1 Where required. An expansion tank shall be installed in every hot water system. For multiple boiler installations, a minimum of one expansion tank is required. Expansion tanks shall be of the closed or open type. Tanks shall be rated for the pressure of the hot water system. Lockable shutoff valves shall be installed at connections to all expansion tanks. Valves shall remain locked in the open position.

1009.2 Closed-type expansion tanks. Closed-type expansion tanks shall be installed in accordance with the manufacturer's instructions. The size of the tank shall be based on the capacity of the hot-water-heating system. The minimum size of the tank shall be determined in accordance with the following equation:

where:

$$V_t = \frac{(0.00041T - 0.0466)V_s}{\left(\frac{P_a}{P_f}\right) - \left(\frac{P_a}{P_o}\right)}$$

For SI:

$$V_t = \frac{(0.000738T - 0.03348)V_s}{\left(\frac{P_a}{P_f}\right) - \left(\frac{P_a}{P_o}\right)}$$

V_t = Minimum volume of tanks (gallons) (L).

V_s = Volume of system, not including expansion tanks (gallons) (L).

T = Average operating temperature (°F) (°C).

P_a = Atmospheric pressure (psi) (kPa).

P_f = Fill pressure (psi) (kPa).

P_o = Maximum operating pressure (psi) (kPa).

1009.3 Open-type expansion tanks. Open-type expansion tanks shall be located a minimum of 4 feet (1219 mm) above the highest heating element. The tank shall be adequately sized for the hot water system. An overflow with a minimum diameter of 1 inch (25 mm) shall be installed at the top of the tank. The overflow shall discharge to the drainage system in accordance with the *New York City Plumbing Code*.

SECTION MC 1010 GAUGES

1010.1 Hot water boiler gauges. Every hot water boiler shall have a pressure gauge and a temperature gauge, or a combination pressure and temperature gauge. The gauges shall indicate the temperature and pressure within the normal range of the system's operation.

1010.2 Steam boiler gauges. Every steam boiler shall have a water-gauge glass and a pressure gauge. The pressure gauge installed with a siphon shall indicate the pressure within the normal range of the system's operation.

1010.2.1 Water-gauge glass. The gauge glass shall be installed so that the midpoint is at the normal boiler water level.

SECTION MC 1011 TESTS

1011.1 Tests. Upon completion of the assembly and installation of boilers and pressure vessels, acceptance tests shall be conducted in accordance with the requirements of the *ASME Boiler*

and Pressure Vessel Code. Boilers shall not be placed in operation upon completion of construction until they have been inspected and tested and a certificate of compliance has been issued by the commissioner. All final inspections and tests for boilers shall be made by a qualified boiler inspector in the employ of the department or a duly authorized insurance company as provided in Section 204 of the *Labor Law of the State of New York*. Equipment having [a Btu] an input of not more than 350,000 Btu/h (103 kW) shall be exempt from this requirement. Where field assembly of pressure vessels or boilers is required, a copy of the completed H-2, P-2 or U-1 Manufacturer's Data Report and the completed Appendix C of ASME CSD-1 required by the *ASME Boiler and Pressure Vessel Code* shall be submitted to the department.

1011.2 Test gauges. An indicating test gauge shall be connected directly to the boiler or pressure vessel where it is visible to the operator throughout the duration of the test. The pressure gauge scale shall be graduated over a range of not less than one and one-half times and not greater than four times the maximum test pressure. All gauges utilized for testing shall be calibrated and certified annually in accordance with ASME B40.100 by the test operator.

1011.3 Periodic boiler inspections. Periodic boiler inspections shall be performed in accordance with Section 28-303 of the *Administrative Code*.

SECTION MC 1012 **MAXIMUM TEMPERATURE**

1012.1 Maximum temperature. Maximum indoor temperature in spaces surrounding boilers, water heaters, and pressure vessels shall not exceed the operational temperature of the installed equipment or 104° F (40°C).

Subpart 11 (Chapter 11 of the New York City Mechanical Code)

§1. Chapter 11 of the New York city mechanical code, as added by local law number 33 for the year 2007, is amended to read as follows:

CHAPTER 11 **REFRIGERATION**

SECTION MC 1101 **GENERAL**

1101.1 Scope. This chapter shall govern the design, installation, construction, alteration and repair of refrigeration systems that vaporize and liquefy a fluid during the refrigerating cycle. Refrigerant piping design and installation, including pressure vessels and pressure relief devices, shall conform to this code. Permanently installed refrigerant storage systems and other components shall be considered as part of the refrigeration system to which they are attached. This chapter shall also govern the change of refrigerants in existing refrigerating systems having a different safety group classification.

1101.2 Factory-built equipment and appliances. Listed and labeled self-contained, factory-built equipment and appliances shall be tested in accordance with UL 207, 412, 471 or 1995. Such equipment and appliances are deemed to meet the design, manufacture and factory test requirements of this code if installed in accordance with their listing and the manufacturer's installation instructions.

1101.3 Protection. Any portion of a refrigeration system that is subject to physical damage shall be protected in an approved manner.

1101.4 Water connection. Water supply and discharge connections associated with refrigeration systems shall be made in accordance with this code and the *New York City Plumbing Code*.

1101.5 Fuel-oil and fuel-gas connection. Refrigeration system devices, equipment and appliances utilizing fuel oil or fuel gas for combustion shall be installed in accordance with the applicable provisions of the *New York City Fuel Gas Code* and this code.

1101.6 General. Refrigeration systems shall comply with the requirements of this code and, except as modified by this code, ASHRAE 15. Ammonia-refrigerating systems shall comply with this code and, except as modified by this code, ASHRAE 15 and IIAR 2.

1101.7 Maintenance. Mechanical refrigeration systems shall be maintained in proper operating condition, free from accumulations of oil, dirt, waste, excessive corrosion, other debris and leaks.

1101.8 Change in refrigerant type. The type of refrigerant in refrigeration systems having a refrigerant circuit containing more than 220 pounds ([100] 99.8 kg) of Group A1 or 30 pounds (13.6 kg) of any other group refrigerant shall not be changed without prior notification to the commissioner and compliance with the applicable code provisions for the new refrigerant type. The refrigerant being considered shall be evaluated for suitability by an engineer. Whenever change in the type of refrigerant is to be done, consideration shall be given to the following:

1. The effects of the substitute refrigerant on materials in the system;
2. The possibility of overloading the liquid receiver, which shall not be more than 80 percent full of liquid;
3. The possibility of exceeding motor rating, design working pressure, or other requirements that would violate any of the provisions of this code;
4. The proper size of refrigerant controls;
5. The effect of the operation and setting of safety devices;

6. The possible hazards created by mixture of the original and the substituted refrigerant; and
7. The effect of the classification of the refrigerant as provided.

1101.9 Refrigerant discharge. Notification of refrigerant discharge shall be provided in accordance with the *New York City Fire Code*.

1101.10 Gas- and oil-fired absorption systems. Refrigeration systems utilizing fuel oil or fuel gas for combustion shall be installed in accordance with the applicable provisions of the *New York City Fuel Gas Code* and this code.

1101.11 Signs, nameplates, and operation and emergency shut-down instructions. Signs, nameplates, and operation and emergency shut-down instructions for refrigeration systems shall comply with the following:

1. Sections 9.15, 11.2.1, 11.2.2, 11.2.4, and 11.7 of ASHRAE 15.
2. Each refrigeration unit or system shall be provided with a nameplate indicating the horsepower of the prime mover or compressor and the equivalent of such horsepower in kilowatts.
3. Section [1105.10] 1105.11 of this code.

1101.12 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps requiring a special tool or key to open.

SECTION MC 1102 SYSTEM REQUIREMENTS

1102.1 General. The system classification, allowable refrigerants, maximum quantity, enclosure requirements, location limitations, and field pressure test requirements shall be determined as follows:

1. Determine the refrigeration systems classification, in accordance with Section 1103.3.
2. Determine the refrigerant classification in accordance with Section 1103.1.
3. Determine the maximum allowable quantity of refrigerant in accordance with Section 1104, based on type of refrigerant, system classification[,] and occupancy.
4. Determine the system enclosure requirements in accordance with Section 1104.
5. Refrigeration equipment and appliance location and installation shall be subject to the limitations of Chapter 3.

6. Nonfactory-tested, field-erected equipment and appliances shall be pressure tested in accordance with Section 1108.

1102.2 Refrigerants. The refrigerant shall be that which the equipment or appliance was designed to utilize or converted to utilize. Refrigerants not identified in Table 1103.1 shall be approved by the department before use. Refrigerants not identified in Table 1103.1, other than those having a Safety Group Classification of A-1, shall also be approved by the Fire Department before use.

1102.2.1 Mixing. Refrigerants, including refrigerant blends, with different designations in ASHRAE 34 shall not be mixed in a system.

Exception: Addition of a second refrigerant is allowed where permitted by the equipment or appliance manufacturer to improve oil return at low temperatures. The refrigerant and amount added shall be in accordance with the manufacturer's instructions.

1102.2.2 Purity. Refrigerants used in refrigeration systems shall be new, recovered or reclaimed refrigerants in accordance with Section 1102.2.2.1, 1102.2.2.2 or 1102.2.2.3. Where required by the equipment or appliance owner, the installer shall furnish a signed declaration that the refrigerant used meets the requirements of Section 1102.2.2.1, 1102.2.2.2 or 1102.2.2.3.

Exception: The refrigerant used shall meet the purity specifications set by the manufacturer of the equipment or appliance in which such refrigerant is used where such specifications are different from that specified in Sections 1102.2.2.1, 1102.2.2.2 and 1102.2.2.3.

1102.2.2.1 New refrigerants. Refrigerants shall be of a purity level specified by the equipment or appliance manufacturer.

1102.2.2.2 Recovered refrigerants. Refrigerants that are recovered from refrigeration and air-conditioning systems shall not be reused in other than the system from which they were recovered and in other systems of the same owner. Recovered refrigerants shall be filtered and dried before reuse. Recovered refrigerants that show clear signs of contamination shall not be reused unless reclaimed in accordance with Section 1102.2.2.3.

1102.2.2.3 Reclaimed refrigerants. Used refrigerants shall not be reused in a different owner's equipment or appliances unless tested and found to meet the purity requirements of ARI 700. Contaminated refrigerants shall not be used unless reclaimed and found to meet the purity requirements of ARI 700.

SECTION MC 1103 REFRIGERATION SYSTEM CLASSIFICATION

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1.

[

[F] TABLE 1103.1
REFRIGERANT CLASSIFICATION, AMOUNT AND OEL

CHEMICAL REFRIGERANT	FORMULA	CHEMICAL NAME OF BLEND	REFRIGERANT CLASSIFICATION	DEGREES OF HAZARD ^a	[M] AMOUNT OF REFRIGERANT PER OCCUPIED SPACE			OEL ^b
					Pounds per 1,000 cubic feet	ppm	g/m ³

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m³.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.

b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.

c. For installations that are entirely outdoors, use 3-1-0.

d. Class I ozone depleting substance; prohibited for new installations.

e. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the AHA WEL or consistent value on a time-weighted average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

<u>510A</u>	<u>R-E170/600a (88.0/12.0)</u>	<u>(±0.5/±0.5)</u>	<u>1000</u>	<u>A3</u>	<u>7,300</u>	<u>14</u>	<u>.87</u>
<u>511A</u>	<u>R-290/E170 (95.0,5.0)</u>	<u>(±1.0/±1.0)</u>	<u>1000</u>	<u>A3</u>	<u>5,300</u>	<u>9.5</u>	<u>.59</u>

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m³.

- a. Data based on ASHRAE 34 including Addenda a through o. For more complete data see ASHRAE 34 and Addenda. Use of Addenda issued after Addendum o is subject to approval as set forth in Section 1102.2.
- b. Class I ozone depleting refrigerant. Not permitted for new installations.
- c. Refrigerants in Safety Group “A2L” shall comply with all applicable requirements for “A2” refrigerants. Refrigerants in Safety Group “B2L” shall comply with all applicable requirements for “B2” refrigerants.
- d. **OCCUPATIONAL EXPOSURE LIMIT (OEL).** The time-weighted average (TWA) concentration for a normal eight-hour workday and a 40-hour workweek to which nearly all workers can be repeatedly exposed without adverse effect, based on the OSHA PEL, ACGIH TLV-TWA, AIHA WEEL, or consistent value.

1103.2 Occupancy classification. Locations of refrigerating systems are described by occupancy classifications that consider the ability of people to respond to potential exposure to refrigerants. Where equipment or appliances, other than piping, are located outside a building and within 20 feet (6096 mm) of any building opening, such equipment or appliances shall be governed by the occupancy classification of the building. Occupancy classifications of buildings shall be [defined as follows] in accordance with the building classifications in the *New York City Building Code*.

1. Institutional occupancy [is that portion of premises from which, because they are disabled, debilitated or confined, occupants cannot readily leave without the assistance of others. Institutional occupancies include, among others, hospitals, nursing homes, asylums and spaces containing locked cells] shall include Occupancy Groups I-1, I-2, I-3 and I-4.
2. Public assembly occupancy [is that portion of premises where large numbers of people congregate and from which occupants cannot quickly vacate the space. Public assembly occupancies include, among others, auditoriums, ballrooms, classrooms, passenger depots, restaurants and theaters] shall include Occupancy Groups A-1, A-2, A-3, A-4, A-5 and E.
3. Residential occupancy [is that portion of premises that provides the occupants with complete independent living facilities, including permanent provisions for living, sleeping, eating, cooking and sanitation. Residential occupancies include, among others, dormitories, hotels, multiunit apartments and private residences] shall include Occupancy Groups R-1, R-2 and R-3.
4. Commercial occupancy [is that portion of premises where people transact business, receive personal service or purchase food and other goods. Commercial occupancies include, among others, office and professional buildings, markets (but not large mercantile occupancies) and work or storage areas that do not qualify as industrial occupancies]

shall include Occupancy Groups M and B, except Occupancy Group M with retail stores having an occupant load of more than 100 persons on any floor other than street level.

5. Large mercantile occupancy [is that portion of premises where more than 100 persons congregate on levels above or below street level to purchase personal merchandise] shall include Occupancy Group M with retail stores having an occupant load of more than 100 persons on any floor other than street level.
6. Industrial occupancy [is that portion of premises that is not open to the public, where access by authorized persons is controlled, and that is used to manufacture, process or store goods such as chemicals, food, ice, meat or petroleum] shall include Occupancy Groups F-1, F-2, H-1, H-2, H-3, H-4, H-5, S-1 and S-2.
7. Mixed occupancy occurs when two or more occupancies are located within the same building. When each occupancy is isolated from the rest of the building by tight walls, floors and ceilings and by self-closing doors, the requirements for each occupancy shall apply to its portion of the building. When the various occupancies are not so isolated, the occupancy having the most stringent requirements shall be the governing occupancy.

1103.3 System classification. Refrigeration systems shall be classified according to the degree of probability that refrigerant leaked from a failed connection, seal[,] or component could enter an occupied area. The distinction is based on the basic design or location of the components.

1103.3.1 Low-probability systems. Double-indirect open-spray systems, indirect closed systems and indirect-vented closed systems shall be classified as low-probability systems, provided that all refrigerant-containing piping and fittings are isolated when the quantities in Table 1103.1 are exceeded.

1103.3.2 High-probability systems. Direct systems and indirect open-spray systems shall be classified as high-probability systems.

Exception: An indirect open-spray system shall not be required to be classified as a high-probability system if the pressure of the secondary coolant is at all times (operating and standby) greater than the pressure of the refrigerant.

SECTION MC 1104 SYSTEM APPLICATION REQUIREMENTS

1104.1 General. The refrigerant, occupancy and system classification cited in this section shall be determined in accordance with Sections 1103.1, 1103.2 and 1103.3, respectively. For refrigerant blends assigned dual classifications, as formulated and for the worst case of fractionation, the classifications for the worst case of fractionation shall be used. For blends assigned only a single safety group classification in Table 1103.1 or ASHRAE 34, that

classification shall be used. Use of a Group A3 or Group B3 refrigerant is prohibited. In an industrial occupancy, a Group A3 or Group B3 refrigerant may be used in high- or low-probability systems only when approved by the commissioner and the Commissioner of the Fire Department. Such use will be approved only if the applicant can demonstrate to the satisfaction of the commissioner and the Commissioner of the Fire Department that the use of the refrigerant is a necessity and does not represent a substantial risk to life, limb, health or property.

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components containing the refrigerant shall be located either outdoors or in a machinery room where the quantity of refrigerant in an independent circuit of a system exceeds the amounts shown in Table 1103.1. For refrigerant [blends] names not listed in Table 1103.1, the same requirement shall apply when the amount for any [blend] named component exceeds that indicated in Table 1103.1 for that component. This requirement shall also apply when the combined amount of the [blend] named components exceeds a limit of 69,100 parts per million (ppm) by volume. Machinery rooms required by this section shall be constructed and maintained in accordance with Section 1105 for Group A1 and B1 refrigerants and in accordance with Sections 1105 and 1106 for Group A2, B2, A3 and B3 refrigerants. Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

Exceptions:

1. Machinery rooms are not required for listed equipment and appliances containing not more than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant's safety classification, where installed in accordance with the equipment's or appliance's listing and the equipment or appliance manufacturer's installation instructions.
2. Piping in conformance with Section 1107 of this chapter and Section 8.10 of ASHRAE 15 is allowed in other locations to connect components installed in a machinery room with those installed outdoors.

1104.2.1 Institutional occupancies. The amounts shown in Table 1103.1 shall be reduced by 50 percent for all areas of institutional occupancies except kitchens, laboratories[,] and mortuaries. The total of all Group A2, B2, A3 and B3 refrigerants shall not exceed 550 pounds (250 kg) in occupied areas or machinery rooms. Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to industrial occupancies and refrigerated rooms for manufacturing, food and beverage preparation, meat cutting, other processes and storage. Machinery rooms are not required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. The floor area per occupant is not less than 100 square feet (9.3 m²). Where provided with egress directly to the outdoors or into building exits meeting the requirements of the *New York City Building Code*, the minimum floor area shall not apply.
4. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.
5. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section [1104.3.4] 1104.3.3). Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.
6. All electrical equipment and appliances conform to Class 1, Division 2, hazardous location classification requirements of [NFPA 70] the New York City Electrical Code where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space based on the volume determined by Section 1104.4. Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.
7. All refrigerant-containing parts in systems exceeding 100 hp (74.6 kW) drive power, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; and connecting piping, shall be located either outdoors or in a machinery room.

1104.3 Refrigerant restrictions. Refrigerant applications, maximum quantities and use shall be restricted in accordance with Sections 1104.3.1 through [1104.3.4] 1104.3.3.

1104.3.1 Air-conditioning for human comfort. [In other than industrial occupancies where the quantity in a single independent circuit does not exceed the amount in Table 1103.1, Group B 1, B2 and B3 refrigerants shall not be used in high-probability systems for air-conditioning for human comfort.] Group A2, A3, B1, B2 and B3 refrigerants shall not be used in high-probability air conditioning systems for human comfort.

Exceptions:

1. Sealed absorption and unit air conditioning systems having refrigerant quantities not exceeding those set forth in Table 1104.3.1.

2. Industrial occupancies.

Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

TABLE 1104.3.1
Special Quantity Limits for Sealed Ammonia/Water Absorption and Self-Contained Systems

<u>Type of Refrigeration System</u>	<u>Maximum lb for Various Occupancies</u>			
	<u>Institutional</u>	<u>Public Assembly/ Large Mercantile</u>	<u>Residential</u>	<u>Commercial</u>
<u>Sealed Ammonia/Water Absorption System</u>				
<u>In exit access or lobbies</u>	<u>0</u>	<u>0</u>	<u>3.3</u>	<u>3.3</u>
<u>In adjacent outdoor locations</u>	<u>0</u>	<u>0</u>	<u>22</u>	<u>22</u>
<u>In other than exit access or lobbies</u>	<u>0</u>	<u>6.6</u>	<u>6.6</u>	<u>22</u>
<u>Unit Systems</u>				
<u>In other than exit access or lobbies</u>	<u>0</u>	<u>0</u>	<u>6.6</u>	<u>22</u>

For SI: 1 pound = 0.454 kg.

[1104.3.2 Nonindustrial occupancies. Group A2 and B2 refrigerants shall not be used in high-probability systems where the quantity of refrigerant in any independent refrigerant circuit exceeds the amount shown in Table 1104.3.2.]

**[TABLE 1104.3.2
MAXIMUM PERMISSIBLE QUANTITIES OF REFRIGERANTS**

TYPE OF REFRIGERATION	MAXIMUM POUNDS FOR VARIOUS OCCUPANCIES			
	Institutional	Assembly	Residential	All other
Sealed absorption system				
In exit access	0	0	3.3	3.3
In adjacent outdoor locations	0	0	22	22
In other than exit access	0	6.6	6.6	6.6
Unit systems				
In other than exit access	0	0	6.6	6.6

For SI: 1 pound = 0.454 kg.]

[1104.3.3] 1104.3.2 All occupancies. The total of all Group A2, B2, A3 and B3 refrigerants other than R-717, ammonia, shall not exceed 1,100 pounds (499 kg) except where approved. Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

[1104.3.4] 1104.3.3 Protection from refrigerant decomposition. Where any device having an open flame or surface temperature greater than 800°F (427°C) is used in a room containing more than 6.6 pounds (3 kg) of refrigerant in a single independent circuit, a hood and exhaust system shall be provided in accordance with Section 510. Such exhaust system shall exhaust combustion products to the outdoors.

Exception: A hood and exhaust system shall not be required:

1. Where the refrigerant is R-717, R-718[,] or R-744;
2. Where the combustion air is ducted from the outdoors in a manner that prevents leaked refrigerant from being combusted; or
3. Where a refrigerant detector is used to stop the combustion in the event of a refrigerant leak (see Sections 1105.3 and 1105.5).

1104.4 Volume calculations. Volume calculations shall be in accordance with Sections 1104.4.1 through 1104.4.3.

1104.4.1 Noncommunicating spaces. Where the refrigerant-containing parts of a system are located in one or more spaces that do not communicate through permanent openings or HVAC ducts, the volume of the smallest, enclosed occupied space shall be used to determine the permissible quantity of refrigerant in the system.

1104.4.2 Communicating spaces. Where an evaporator or condenser is located in an air duct system, the volume of the smallest, enclosed occupied space served by the duct system shall be used to determine the maximum allowable quantity of refrigerant in the system.

Exception: If airflow to any enclosed space cannot be reduced below one-quarter of its maximum, the entire space served by the air duct system shall be used to determine the maximum allowable quantity of refrigerant in the system.

1104.4.3 Plenums. Where the space above a suspended ceiling is continuous and part of the supply or return air plenum system, this space shall be included in calculating the volume of the enclosed space.

SECTION MC 1105 MACHINERY ROOM, GENERAL REQUIREMENTS

1105.1 Design and construction. Machinery rooms shall be designed and constructed in accordance with the *New York City Building Code* and this section.

1105.2 Openings. Ducts and air handlers in the machinery room that operate at a lower pressure than the room shall be sealed to prevent any refrigerant leakage from entering the airstream.

1105.3 Refrigerant detector. Refrigerant detectors in machinery rooms shall be provided as required by ASHRAE 15.

1105.4 Tests. Periodic tests of the mechanical ventilating system shall be performed in accordance with manufacturer's specifications and as required by the Commissioner of the Fire Department.

1105.5 Fuel-burning appliances. Open flames that use combustion air from the machinery room shall not be installed in a machinery room.

Exceptions:

[1. Matches, lighters, halide leak detectors and similar devices.]

[2] 1. Where the refrigerant is carbon dioxide or water.

[3] 2. Fuel-burning appliances shall not be prohibited in the same machinery room with refrigerant-containing equipment or appliances where combustion air is ducted from outside the machinery room and sealed in such a manner as to prevent any refrigerant leakage from entering the combustion chamber, or where a refrigerant vapor detector is employed to automatically shut off the combustion process in the event of refrigerant leakage.

1105.6 Ventilation. Machinery rooms shall be mechanically ventilated to the outdoors. Mechanical ventilation shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions. Multiple fans or multispeed fans shall be allowed in order to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation. Location of the mechanical ventilation openings shall be based on the relative density of the refrigerant to air. When compressors or self-contained unit system are housed in a machinery space, other than in a machinery room or plenum, the space shall be ventilated in accordance with the requirements of Section 1105.6.3.

Exception: Where a refrigerating system is located outdoors more than 20 feet (6096 mm) from any building opening and is enclosed by a penthouse, lean-to or other open structure, natural [ventilation may be provided in lieu of] or mechanical ventilation shall be provided. Location of the [natural ventilation] openings shall be based on the relative density of the refrigerant to air. The free-aperture cross section for the ventilation of the machinery room shall be not less than:

$$F = \sqrt{G} \quad \text{(Equation 11-1)}$$

For SI: $F = 0.138\sqrt{G}$

where:

F = The free opening area in square feet (m^2).

G = The mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the machinery room.

1105.6.1 Discharge location. The discharge of the air shall be to the outdoors in accordance with Chapter 5. Exhaust from mechanical ventilation systems shall be discharged not less than 20 feet (6096 mm) from outdoor air intake or openings into buildings and 10 feet (3048 mm) from a fire escape or exterior stair.

1105.6.2 Make[-]up air. Provisions shall be made for make[-]up air to replace that being exhausted. Openings for make[-]up air shall be located to avoid intake of exhaust air. Supply and exhaust ducts to the machinery room shall serve no other area, shall be constructed in accordance with Chapter 5 and shall be covered with corrosion-resistant screen of not less than ¼-inch (6.4 mm) mesh.

Exception: The requirement for supply and exhaust ducts to the machinery room to serve no other area shall not apply to a change in the type of refrigerant in a lawfully installed existing refrigerating system being maintained and operated in accordance with these approved installation requirements:

1. Where the replacement refrigerant has a safety classification of Group A1; or
2. Where the replacement refrigerant is R123 and the engineer or architect demonstrates to the satisfaction of the commissioner that providing such air supply and exhaust ducts represents a hardship and that the proposed alternative provides an equivalent level of safety.

1105.6.3 Quantity-normal ventilation. During occupied conditions, the mechanical ventilation system shall exhaust the larger of the following:

1. Not less than 0.5 cfm per square foot ($0.0025\text{m}^3/\text{sm}^2$) of machinery room area or 20 cfm ($0.009\text{m}^3/\text{s}$) per person; or
2. A volume required to limit the room temperature rise to 18°F (10°C) taking into account the ambient heating effect of all machinery in the room but not above a maximum temperature of 122°F (50°C).

1105.6.4 Quantity-emergency conditions. Upon actuation of the refrigerant detector required in Section 1105.3, the mechanical ventilation system shall exhaust air from the machinery room in the following quantity:

$$Q = 100 \times \sqrt{G}$$

(Equation 11-2)

For SI: $Q = 0.007 \times \sqrt{G}$

where:

Q = The airflow in cubic feet per minute (m^3/s).

G = The design mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the machinery room.

1105.7 Termination of relief devices. In addition to the requirements of Section 9.7.8 of ASHRAE 15, pressure relief devices, fusible plugs and purge systems located within the machinery room shall terminate outside of the structure at a location not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or exit.

1105.7.1 Discharge of Group A2, B2, A3 and B3 refrigerants. Discharge of systems containing Group A2 or B2 refrigerants shall be acceptable to the commissioner. Discharge of systems containing Group A3 or B3 refrigerants shall be subject to the approval of the commissioner and the Commissioner of the Fire Department. Nothing in this section shall be construed to approve the use of Group A3 and B3 refrigerants if otherwise prohibited.

1105.7.2 Certificate of Qualification. Discharge of pressure relief devices, fusible plugs and purge systems for refrigerating systems containing flammable, toxic and highly toxic refrigerants and ammonia shall comply with Section 606 of the *New York City Fire Code*.

1105.8 Ammonia discharge. Pressure relief valves for ammonia systems shall discharge in accordance with ASHRAE 15.

1105.9 Emergency pressure control system. Refrigeration systems containing more than 6.6 pounds (3 kg) of a refrigerant other than a Group A1 refrigerant shall be provided with an emergency pressure control system in accordance with Sections 1105.9.1 and 1105.9.2.

1105.9.1 Automatic crossover valves. Each high- and intermediate-pressure zone in a refrigerating system shall be provided with a single automatic valve providing a crossover connection to a lower pressure zone. Such automatic crossover valves shall comply with Sections 1105.9.1.1 through 1105.9.1.3.

1105.9.1.1 Overpressure limit setpoint. Automatic crossover valves shall be arranged to automatically relieve excess system pressure to a lower pressure zone if the pressure in a high- or intermediate-pressure zone rises to within 15 psi (108.4 kPa) of the set point for pressure-relief devices.

1105.9.1.2 Manual operation. Automatic crossover valves shall be capable of manual operation for refrigerating systems containing more than 200 pounds (90.8 kg) of refrigerant.

1105.9.1.3 System design pressure. Refrigerating system zones that are connected to a higher pressure zone by an automatic crossover valve shall be designed to safely contain the maximum pressure that can be achieved by interconnection of the two zones.

1105.9.2 Automatic emergency stop. An automatic emergency stop feature shall be provided in accordance with Sections 1105.9.2.1 and 1105.9.2.2.

1105.9.2.1 Automatic crossover valves. A refrigerating system equipped with an automatic crossover valve shall be designed, when such valve is activated, to cause all compressors on the affected system to immediately cease operating. Dedicated pressure-sensing devices located immediately adjacent to crossover valves may be used as a means for activating such crossover valve. To ensure that the automatic crossover valve system provides a redundant means of ceasing operation of the compressors in an overpressure condition, high-pressure cutout sensors associated with compressors shall not be used for purposes of activating such crossover valve.

1105.9.2.2 Overpressure in low-pressure zone. The lowest pressure zone in a refrigerating system shall be provided with a dedicated means of determining a rise in system pressure to within 15 psi (103.4 kPa) of the zone pressure relief device setpoint. Activation of such overpressure sensing device shall cause all compressors on the effected system to immediately cease operation.

[1105.9] **1105.10 Remote control.** A clearly identified switch of the break-glass type shall provide off-only control of the compressors in the machinery room. A second clearly identified switch of the break-glass type shall provide on-only control of the machinery room ventilation fans. Such switches shall be located outside each entrance to the machinery room and as close to the entrance as practicable, except that when an outside location is impracticable, such switches may be located immediately inside the machinery room provided such location is accessible at all times.

[1105.10] **1105.11 Emergency signs.** Signs shall comply with the following:

1. Sections 8.11.8 and 11.2.4 of ASHRAE 15.
2. Refrigeration units or systems having a refrigerant circuit containing more than 220 pounds (100kg) of Group A1 or 30 pounds (14 kg) of any other group refrigerant shall be provided with approved emergency signs, charts, and labels in accordance with NFPA 704.

1105.12 Storing refrigerant. The total amount of refrigerant stored in a machinery room shall be the lesser of: (i) not more than twenty percent of the normal charge in the system; or (ii) not more than 330 pounds (150 kg) in addition to the charge in the system and the refrigerant contained in a permanently attached receiver. Refrigerant shall be stored in containers meeting the requirements of the *New York City Fire Code*.

Exception: Recovery service containers used for storing refrigerant during periods of system maintenance or replacement may exceed 330 pounds (150 kg) provided such containers are securely fixed in position and have pressure relief valves piped to the outside in conformance with this code.

SECTION MC 1106 MACHINERY ROOM, SPECIAL REQUIREMENTS

1106.1 General. Where required by Section 1104.2, the machinery room shall meet the requirements of this section in addition to the requirements of Section 1105.

1106.2 Elevated temperature. There shall not be an open flame-producing device or continuously operating hot surface over 800°F (427°C) permanently installed in the room.

1106.3 Ammonia room ventilation. Ventilation systems in ammonia machinery rooms shall be operated continuously at the emergency ventilation rate determined in accordance with Section 1105.6.4.

Exceptions:

1. Machinery rooms equipped with a vapor detector that will automatically start the ventilation system at the emergency rate determined in accordance with Section 1105.6.4, and that will actuate an alarm at a detection level not to exceed 1,000 ppm; or
2. Machinery rooms conforming to the Class 1, Division 2, hazardous location classification requirements of the *New York City Electrical Code*.

1106.4 Flammable refrigerants. Where refrigerants of Groups A2, A3, B2 and B3 are used, the machinery room shall conform to the Class 1, Division 2, hazardous location classification requirements of the *New York City Electrical Code*.

Exception: Ammonia machinery rooms. Nothing in this section shall be construed to approve the use of Group A3 and B3 refrigerants if otherwise prohibited.

1106.5 Remote controls. Remote control of the mechanical equipment and appliances located in the machinery room shall be provided at an accessible location immediately outside the machinery room and adjacent to its principal entrance.

1106.5.1 Refrigeration system. A clearly identified switch of the break-glass type shall provide off-only control of all electrically energized equipment and appliances in the machinery room, other than refrigerant leak detectors and machinery room ventilation.

1106.6 Reserved

**SECTION MC 1107
REFRIGERANT PIPING**

1107.1 General. All refrigerant piping shall be installed, tested and placed in operation in accordance with this chapter.

1107.1.1 Protection of refrigerant piping located inside buildings. All refrigerant piping and fittings installed at a height less than 7 feet 3 inches (2210 mm) above the floor shall be concealed or otherwise protected from mechanical damage except at the point of connection to terminal equipment.

1107.2 Piping location. Refrigerant piping that crosses an open space that affords passageway in any building shall be not less than 7 feet 3 inches (2210 mm) above the floor

unless the piping is located against the ceiling of such space. Refrigerant piping shall not be placed in any elevator, dumbwaiter or other shaft containing a moving object or in any shaft that has openings to living quarters or to means of egress. Refrigerant piping shall not be installed in an enclosed public stairway, stair landing or an exit.

1107.2.1 Piping in public corridors. Refrigerant piping shall not be installed in public corridors.

Exception: Refrigerant piping in public corridors that complies with all of the following conditions:

1. The refrigeration system to which the piping is associated utilizes a Group A-1 refrigerant and contains not more than 10 pounds (4.54 kg) of refrigerant per system, and there is not more than one system's refrigerant piping per tenant per public corridor; and
2. A complete discharge of any one refrigerant system's charge into the volume of the public corridor would be insufficient to achieve 50% of the allowable refrigerant densities set forth in Table 1103.1; and
3. Refrigerant piping and fittings within a public corridor are installed with brazed joints or the refrigerant equipment manufacturer provided pre-charged tubing systems installed in accordance with the refrigerant equipment manufacturers instructions. Refrigerant piping and fittings shall be concealed or otherwise protected from mechanical damage.

1107.2.2 Piping in concrete floors. Refrigerant piping installed in concrete floors shall be encased in pipe ducts. The piping shall be isolated and supported to prevent damaging vibration, stress and corrosion.

1107.2.3 Refrigerant piping penetrations. Refrigerant piping shall not penetrate floors, ceilings or roofs.

Exceptions:

1. Penetrations connecting the basement and the first floor.
2. Penetrations connecting the top floor and a machinery penthouse or roof installation.
3. Penetrations connecting adjacent floors served by the refrigeration system.
4. Penetrations by piping in a direct system where the refrigerant quantity does not exceed Table 1103.1 for the smallest occupied space through which the piping

passes.

5. In other than industrial occupancies and where the refrigerant quantity exceeds Table 1103.1 for the smallest space, penetrations for piping that connects separate pieces of equipment that are either:

- 5.1. Enclosed by an approved gas-tight, fire- resistive duct or shaft with openings to those floors served by the refrigeration system or

- 5.2. Located on the exterior of the building where vented to the outdoors or to the space served by the system and not used as an air shaft, closed court or similar space.

[1107.2] 1107.3 Pipe enclosures. Rigid or flexible metal enclosures or pipe ducts shall be provided for soft, annealed copper tubing used for refrigerant piping erected on the premises and containing other than Group A1 refrigerant. Enclosures shall not be required for connections between condensing units and the nearest riser box(es), provided such connections do not exceed 6 feet (1829 mm) in length.

[1107.3] 1107.4 Condensation. All refrigerating piping and fittings, brine piping and fittings that, during normal operation, will reach a surface temperature below the dew point of the surrounding air, and are located in spaces or areas where condensation will cause a safety hazard to the building occupants, structure, electrical equipment or any other equipment or appliances, shall be protected in an approved manner to prevent such damage.

[1107.4] 1107.5 Materials for refrigerant pipe and tubing. Piping materials shall be as set forth in Sections [1107.4.1] 1107.5.1 through [1107.4.6] 1107.5.7.

[1107.4.1] 1107.5.1 Steel pipe. Carbon steel pipe with a wall thickness not less than Schedule 80 shall be used for Group A2, A3, B2 or B3 refrigerant liquid lines for sizes 1.5 inches (38 mm) and smaller. Carbon steel pipe with a wall thickness not less than Schedule 40 shall be used for Group A1 or B 1 refrigerant liquid lines 6 inches (152 mm) and smaller, Group A2, A3, B2 or B3 refrigerant liquid lines sizes 2 inches (51 mm) through 6 inches (152mm) and all refrigerant suction and discharge lines 6 inches (152 mm) and smaller. Type F steel pipe shall not be used for refrigerant lines having an operating temperature less than -20°F (-29°C).

[1107.4.2] 1107.5.2 Copper and brass pipe. Standard iron-pipe size, copper and red brass (not less than 80-percent copper) pipe shall conform to ASTM B 42 and ASTM B 43.

[1107.4.3] 1107.5.3 Copper tube. Copper tube used for refrigerant piping erected on the premises shall be seamless copper tube of Type ACR (hard or annealed) complying with ASTM B 280. Where approved, copper tube for refrigerant piping erected on the premises shall be seamless copper tube of Type K or L (drawn or

annealed) in accordance with ASTM B 88. Annealed temper copper tube shall not be used in sizes larger than a 2-inch (51 mm) nominal size. Mechanical joints shall not be used on annealed temper copper tube in sizes larger than $\frac{7}{8}$ -inch (22.2 mm) OD size.

[1107.4.4] 1107.5.4 Copper tubing joints. Copper tubing joints used in refrigerating systems containing Group A2, A3, B1, B2 or B3 refrigerants shall be brazed. Soldered joints shall not be used in such refrigerating systems. Brazed joints shall be made in accordance with ASME Boiler and Pressure Vessel Code, Section IX Welding and Brazing Qualifications or in accordance with American Welding Society AWS B2.2 Standard for Brazing Procedure and Performance Qualification.

1107.5.5 Soldered joints. Soldered joints shall be made as follows: soldered joint surfaces shall be cleaned, a flux conforming to ASTM B 813 shall be applied, and the joint shall be soldered with a solder conforming to ASTM B32.

[1107.4.5] 1107.5.6 Aluminum tube. Type 3003-0 aluminum tubing with high-pressure fittings shall not be used with methyl chloride and other refrigerants known to [attack] deteriorate aluminum.

[1107.4.6] 1107.5.7 Insulation. Pipe and [chiller] other refrigerant-containing components' insulation shall meet the requirements of Section 1204.1 of this code.

[1107.5] 1107.6 Joints and refrigerant-containing parts in air ducts. Joints and all refrigerant-containing parts of a refrigerating system located in an air duct of an air-conditioning system carrying conditioned air to and from human-occupied space shall be constructed to withstand, without leakage, a pressure of 150 percent of the higher of the design pressure or pressure relief device setting.

[1107.6] 1107.7 Exposure of refrigerant pipe joints. Refrigerant pipe joints erected on the premises shall be exposed for visual inspection prior to being covered or enclosed.

[1107.7] 1107.8 Stop valves. All systems containing more than 6.6 pounds (3 kg) of a refrigerant in systems using positive-displacement compressors shall have stop valves installed as follows:

1. At the inlet of each compressor, compressor unit or condensing unit.
2. At the discharge outlet of each compressor, compressor unit or condensing unit and of each liquid receiver.

Exceptions:

1. Systems that have a refrigerant pumpout function capable of storing the entire refrigerant charge in a receiver or heat exchanger.

2. Systems that are equipped with provisions for pumpout of the refrigerant using either portable or permanently installed recovery equipment.
3. Self-contained systems.

[1107.7.1] 1107.8.1 Liquid receivers. All systems containing 100 pounds (45 kg) or more of a refrigerant, other than systems utilizing nonpositive displacement compressors, shall have stop valves, in addition to those required by Section 1107.[7]8, on each inlet of each liquid receiver. Stop valves shall not be required on the inlet of a receiver in a condensing unit, nor on the inlet of a receiver which is an integral part of the condenser.

[1107.7.2] 1107.8.2 Copper tubing. Stop valves used with soft annealed copper tubing or hard-drawn copper tubing ⁷/₈-inch (22.2 mm) OD standard size or smaller shall be securely mounted, independent of tubing fastenings or supports.

[1107.7.3] 1107.8.3 Identification. Stop valves shall be identified where their intended purpose is not obvious. Numbers shall not be used to label the valves, unless a key to the numbers is located near the valves.

SECTION MC 1108 FIELD TEST

1108.1 General. Every refrigerant-containing part of every system that is erected on the premises, except compressors, condensers, vessels, evaporators, safety devices, pressure gauges and control mechanisms that are listed and factory tested, shall be tested and proved tight after complete installation, and before operation. Tests shall include both the high- and low-pressure sides of each system at not less than the lower of the design pressures or the setting of the pressure relief device(s). The design pressures for testing shall be those listed on the condensing unit, compressor or compressor unit name-plate, as required by ASHRAE 15.

Exceptions:

1. Gas bulk storage tanks that are not permanently connected to a refrigeration system.
2. Systems using an A1 refrigerant erected on the premises with copper tubing not exceeding ⁵/₈-inch (15.8 mm) OD, with wall thickness as required by ASHRAE 15, shall be tested in accordance with Section 1108.1, or by means of refrigerant charged into the system at the saturated vapor pressure of the refrigerant at 70°F (21°C) or higher.
3. Limited-charge systems equipped with a pressure relief device, erected on the premises, shall be tested at a pressure not less than one and one-half times the pressure

setting of the relief device. If the equipment or appliance has been tested by the manufacturer at one and one-half times the design pressure, the test after erection on the premises shall be conducted at the design pressure.

1108.1.1 Booster compressor. Where a compressor is used as a booster to obtain an intermediate pressure and discharges into the suction side of another compressor, the booster compressor shall be considered a part of the low side, provided that it is protected by a pressure relief device.

1108.1.2 Centrifugal/nonpositive displacement compressors. In field-testing systems using centrifugal or other nonpositive displacement compressors, the entire system shall be considered as the low-side pressure for field test purposes.

1108.2 Test gases. Tests shall be performed with an inert[-]dried gas including, but not limited to, nitrogen and carbon dioxide. Oxygen, air, flammable gases and mixtures containing such gases shall not be used.

Exceptions:

1. The use of air is allowed to test R-7 17, ammonia, systems provided that they are subsequently evacuated before charging with refrigerant.
2. Mixtures of dry nitrogen, inert gases, or a combination of them with nonflammable refrigerants in concentrations of a refrigerant weight fraction (mass fraction) not exceeding five are allowed for tests.

1108.3 Test apparatus. The means used to build up the test pressure shall have either a pressure-limiting device or a pressure-reducing device and a gauge on the outlet side.

1108.4 Declaration. A certificate of test shall be provided for all systems containing 55 pounds (25 kg) or more of refrigerant. The certificate shall give the name of the refrigerant and the field test pressure applied to the high[-]side and the low side of the system. The certification of test shall be signed by the installer and shall be made part of the public record.

**SECTION MC 1109
PERIODIC TESTING**

1109.1 Testing required. The following emergency devices and systems shall be periodically tested and the results logged in accordance with the manufacturer's instructions and as required by the Commissioner of the Fire Department:

1. Treatment and flaring systems.

2. Valves and appurtenances necessary to the operation of emergency refrigeration control boxes.
3. Fans and associated equipment intended to operate emergency purge ventilation systems.
4. Detection and alarm systems.

1109.2 Operation. Operating permits and qualification of operators for refrigeration systems shall comply with the requirements of the *New York City Fire Code* [and the rules of the Fire Department].

Subpart 12 (Chapter 12 of the New York City Mechanical Code)

§1. Chapter 12 of the New York city mechanical code, as added by local law number 33 for the year 2007, is amended to read as follows:

CHAPTER 12 HYDRONIC PIPING

SECTION MC 1201 GENERAL

1201.1 Scope. The provisions of this chapter shall govern the construction, installation, alteration and repair of hydronic piping systems. This chapter shall apply to hydronic piping systems that are part of heating, ventilation and air-conditioning systems. Such piping systems shall include steam, hot water, chilled water, condenser water, cooling coil condensate drain, steam condensate and ground source heat pump loop systems. Potable cold and hot water distribution systems shall be installed in accordance with the *New York City Plumbing Code*.

1201.2 [Pipe sizing] Sizing. Piping and piping system components for hydronic systems shall be sized for the [demand] design requirements of the system.

1201.3 Standards. As an alternative to the provisions of Sections 1202 and 1203, piping shall be designed, installed, inspected and tested in accordance with ASME B31.1 and ASME B31.9, as applicable.

SECTION MC 1202 MATERIAL

1202.1 Piping. Piping material [shall conform to the standards cited in this section] , other than those contained within this section and conforming with the ASTM standards listed within this chapter, shall be of an approved type.

Exception: Embedded piping regulated by Section 1209.

1202.2 Used existing materials. Reused pipe, fittings, valves or other materials shall be clean and free of foreign materials.

1202.3 Material rating. Materials shall be rated for the operating temperature and pressure of the hydronic system. Materials shall be suitable for the type of fluid in the hydronic system.

1202.4 Piping materials standards. Hydronic pipe shall conform to the standards listed in Table 1202.4. The exterior of the pipe shall be protected from corrosion and degradation.

**Table 1202.4
HYDRONIC PIPE**

MATERIAL	STANDARD (see Chapter 15)
Acrylonitrile butadiene styrene (ABS) plastic pipe	ASTM D 1527; ASTM D 2282
Brass pipe	ASTM B 43
Brass tubing	ASTM B 135
Copper or copper-alloy pipe	ASTM B 42; ASTM B 302
Copper or copper-alloy tube (Type K, L or M)	ASTM B 75; ASTM B 88; ASTM B 251
Chlorinated polyvinyl chloride (CPVC) plastic pipe	ASTM D 2846; ASTM F 441; ASTM F 442
Cross-linked polyethylene/ aluminum/ cross-linked polyethylene (PEX-AL-PEX) pressure pipe	ASTM F 1281; CSA CAN/CSA-B-137.10
Cross-linked polyethylene (PEX) tubing	ASTM F 876; ASTM F 877
<u>Ductile iron pipe</u>	<u>AWWA C151/A21.51;</u> <u>AWWA C115/A21.15</u>
<u>Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe</u>	<u>ASTM F 1282; CSA B137.9</u>
Polyethylene (PE) pipe, tubing and	ASTM D 2513; ASTM D

fittings (for ground source heat pump loop systems)	3035; ASTM D 2447; ASTM D 2683; ASTM F 1055; ASTM D 2837; ASTM D 3350; ASTM D 1693
<u>Polypropylene (PP) plastic pipe</u>	<u>ASTM F 2389</u>
Polyvinyl chloride (PVC) plastic pipe	ASTM D 1785; ASTM D 2241
<u>Raised temperature polyethylene (PE-RT)</u>	<u>ASTM F 2623</u>
Steel pipe	ASTM A 53; ASTM A 106
Steel tubing	ASTM A 254

1202.5 Pipe fittings. Hydronic pipe fittings [shall be approved for installation with the piping materials to be installed, and] shall conform to the respective pipe standards or to the standards listed in Table 1202.5.

**Table 1202.5
HYDRONIC PIPE FITTINGS**

MATERIAL	STANDARD (see Chapter 15)
<u>Brass</u>	<u>ASTM F 1974</u>
Bronze	ASME B16.24
Copper and copper alloys	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29
Ductile iron and gray iron	ANSI/AWWA C110/A21.10
Ductile iron	ANSI/AWWA C153/A21.53
Gray iron	ASTM A 126
Malleable iron	ASME B16.3
Plastic	ASTM D 2466; ASTM D 2467; ASMT D 2468; ASTM F 438; ASTM F 439; ASTM F 877
Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A 420
[Brass	ASTM F 1974]

1202.6 Valves. Valves shall be constructed of materials that are compatible with the type of piping material and fluids in the system. Valves shall be rated for the temperatures and pressures of the systems in which the valves are installed.

1202.7 Flexible connectors, expansion and vibration compensators. Flexible connectors, expansion and vibration control devices and fittings, when used, shall [be of an approved type] protect the components of the hydronic system from damage caused by expansion, contraction, transverse movement, angular deflection and vibration, shall be rated for the temperatures and pressures of the systems in which the devices are installed, and shall be compatible with the fluid and all materials provided.

SECTION 1203 JOINTS AND CONNECTIONS

1203.1 Approval. Joints and connections, other than those contained in Section 1203 and conforming to the ASTM standards listed in Section 1203, shall be of an approved type. Joints and connections shall be tight for the pressure of the hydronic system.

1203.1.1 Joints between different piping materials. Joints between different piping materials shall be [made with approved adapter fittings] rated for the temperatures and pressures of the systems in which the devices are installed and shall be compatible with the fluid and all materials provided.

1203.1.2 Joints between dissimilar metallic piping materials. Joints between [different] dissimilar metallic piping materials shall be provided to protect against galvanic corrosion. Such joints shall be made with [approved] dielectric fittings [or brass converter fittings] conforming to ANSI B16.39 or ASTM F-492, as applicable, shall be rated for the temperatures and pressures of the systems in which the devices are installed and shall be compatible with the fluid and all materials provided.

1203.2 Preparation of pipe ends. Pipe shall be cut square, reamed and chamfered, and shall be free of burrs and obstructions. Pipe ends shall have full-bore openings and shall not be undercut.

1203.3 Joint preparation and installation. When required by Sections 1203.4 through 1203.14, the preparation and installation of brazed, mechanical, soldered, solvent-cemented, threaded and welded joints shall comply with Sections 1203.3.1 through 1203.3.7.

1203.3.1 Brazed joints. [Joint surfaces shall be cleaned. An approved flux shall be applied where required.] [The] All joints shall be brazed [with a filler metal conforming to AWS A 5.8] with a brazing procedure developed and qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX (Welding and Brazing Qualifications) or in accordance with AWS B2.2 standard for Brazing Procedure and Performance Qualification.

1203.3.2 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer's instructions.

1203.3.3 Soldered joints. Joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32.

1203.3.4 Solvent-cemented joints. [CPVC joints shall be made in accordance with ASTM D 2846.] Joint surfaces shall be clean and free of moisture. [An approved] A primer, compatible with both the piping material and the cement shall be applied to [CPVC and PVC] pipe-joint surfaces, in accordance with the manufacturer's requirements. Joints shall be made while the cement is wet. Solvent cement conforming to the following standards shall be applied to all joint surfaces:

1. ASTM D 2235 for ABS joints.
2. ASTM F 493 for CPVC joints.
3. ASTM D 2564 for PVC joints.

1203.3.5 Threaded joints. Threads shall conform to ASME B 1.20.1. Schedule 80 or heavier plastic pipe shall be threaded with dies specifically designed for plastic pipe. Thread lubricant, pipe-joint compound or tape shall be applied on the male threads only and shall be [approved] compatible for application on the piping material and fluid.

1203.3.6 Welded joints. [Joint surfaces shall be cleaned by an approved procedure. Joints shall be welded with an approved filler metal.] All joints shall be welded with a welding procedure developed and qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX (Welding and Brazing Qualifications) or in accordance with AWS B2.1 Specifications for Welding Procedure and Performance Qualification.

1203.3.7 Grooved and shouldered mechanical joints. Grooved and shouldered mechanical joints shall [be approved] conform to the requirements of ASTM F 1476 and shall be installed in accordance with the manufacturer's installation instructions.

1203.3.8 Mechanically formed tee fittings. Mechanically extracted outlets shall have a height not less than three times the thickness of the branch tube wall.

1203.3.8.1 Full flow assurance. Branch tubes shall not restrict the flow in the run tube. A dimple/depth stop shall be formed in the branch tube to ensure that penetration into the outlet is of the correct depth. For inspection purposes, a second dimple shall be placed 0.25 inch (6.4 mm) above the first dimple. Dimples shall be aligned with the tube run.

1203.3.8.2 Brazed joints. Mechanically formed tee fittings shall be brazed in accordance with Section 1203.3.1.

1203.4 ABS plastic pipe. Joints between ABS plastic pipe or fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1203.5 Brass pipe. Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints conforming to Section 1203.3.

1203.6 Brass tubing. Joints between brass tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3.

1203.7 Copper or copper-alloy pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, soldered, threaded or welded joints conforming to Section 1203.3.

1203.8 Copper or copper-alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3 [or], flared joints conforming to Section 1203.8.1 or push-fit joints conforming to Section 1203.8.2.

1203.8.1 Flared joints. Flared joints shall be made by a tool designed for that operation.

1203.8.2 Push-fit joints. Push-fit joints shall be installed in accordance with the manufacturer's instructions.

1203.9 CPVC plastic pipe. Joints between CPVC plastic pipe or fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1203.10 Reserved

1203.11 Cross-linked polyethylene (PEX) plastic tubing. Joints between cross-linked polyethylene plastic tubing and fittings shall conform to Sections 1203.11.1 and 1203.11.2. Mechanical joints shall conform to Section 1203.3.

1203.11.1 Compression-type fittings. When compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1203.11.2 Plastic-to-metal connections. Soldering on the metal portion of the system shall be performed at least 18 inches (457mm) from a plastic-to-metal adapter in the same water line.

1203.12 PVC plastic pipe. Joints between PVC plastic pipe and fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1203.13 Steel pipe. Joints between steel pipe or fittings shall be mechanical, [joints that are made with an approved elastomeric seal, or shall be] threaded or welded joints conforming to Section 1203.3.

1203.14 Steel tubing. Joints between steel tubing or fittings shall be mechanical or welded joints conforming to Section 1203.3.

1203.15 Polyethylene plastic pipe and tubing for ground source heat pump loop systems. Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat fusion joints conforming to Section 1203.15.1, electrofusion joints conforming to Section 1203.15.2, or stab-type insertion joints conforming to Section 1203.15.3.

1203.15.1 Heat-fusion joints. Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, [fabricated] joined in accordance with [the piping manufacturer's instructions] ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.

1203.15.2 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.

1203.15.3 Stab-type insert fittings. Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM [D 2513] F 1924.

1203.16 Polypropylene (PP) plastic. Joints between PP plastic pipe and fittings shall comply with Sections 1203.16.1 and 1203.16.2.

1203.16.1 Heat-fusion joints. Heat-fusion joints for polypropylene (PP) pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings, electrofusion polypropylene fittings or by butt fusion. Joint surfaces shall be clean and free from moisture. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM F 2389.

1203.16.2 Mechanical and compression sleeve joints. Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer's instructions.

1203.17 Raised temperature polyethylene (PE-RT) plastic tubing. Joints between raised temperature polyethylene tubing and fittings shall conform to Sections 1203.17.1 and 1203.17.2. Mechanical joints shall conform to Section 1203.3.

1203.17.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1203.17.2 PE-RT-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PE-RT pipe.

1203.18 Polyethylene/aluminum/polyethylene (PE-AL-PE) pressure pipe. Joints between polyethylene/aluminum/polyethylene pressure pipe and fittings shall conform to Sections 1203.18.1 and 1203.18.2. Mechanical joints shall comply with Section 1203.3.

1203.18.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1203.18.2 PE-AL-PE-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457mm) of a transition from such metal pipe to PE-AL-PE pipe.

1203.19 Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PEX) pressure pipe. Joints between cross-linked polyethylene/aluminum/cross-linked polyethylene pressure pipe and fittings shall conform to Sections 1203.19.1 and 1203.19.2. Mechanical joints shall comply with Section 1203.3.

1203.19.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1203.19.2 PEX-AL-PEX-to-metal connections. Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PEX-AL-PEX pipe.

SECTION MC 1204 PIPE INSULATION

1204.1 Insulation characteristics. Pipe insulation installed in buildings shall conform to the requirements of the *New York City Energy Conservation Code*, shall be tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231; and shall have a maximum flame spread index of 25 and a smoke-developed index not exceeding 450. Insulation installed in an air plenum shall comply with Section 602.2.1.

1204.2 Required thickness. Hydronic piping shall be insulated to the thickness required by the *New York City Energy Conservation Code*.

SECTION MC 1205 VALVES

1205.1 Where required. Shutoff valves shall be installed in hydronic piping systems in the locations indicated in Sections 1205.1.1 through 1205.1.[5]6.

1205.1.1 Heat exchangers. Shutoff valves shall be installed on the supply and return side of a heat exchanger.

Exception: Shutoff valves shall not be required when heat exchangers are integral with a boiler; or are a component of a manufacturer's boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section 1005.1.

1205.1.2 Central systems. Shutoff valves shall be installed on the building supply and return of central utility systems, and district heating and cooling systems.

1205.1.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

1205.1.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

1205.1.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical equipment and appliances. This requirement does not apply to components of a hydronic system such as pumps, air separators, metering devices and similar equipment.

1205.1.6 Expansion tanks. Lockable shutoff valves shall be installed at connections to all expansion tanks. Valves shall be locked in the open position.

1205.2 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section 1006.

SECTION MC 1206 PIPING INSTALLATION

1206.1 General. Piping, valves, fittings and connections shall be installed in accordance with the conditions of approval.

[1206.1.1 Prohibited tee applications. Fluid in the supply side of a hydronic system shall not enter a tee fitting through the branch opening.]

1206.2 System drain down. Hydronic piping systems shall be designed and installed to permit the system to be drained. Where the system drains to the plumbing drainage system, the installation shall conform to the requirements of the *New York City Plumbing Code*.

Exception: The buried portions of systems embedded underground.

1206.3 Protection of potable water. The potable water system shall be protected from backflow in accordance with the *New York City Plumbing Code*.

1206.4 Pipe penetrations. Openings for pipe penetrations in walls, floors or ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with the *New York City Building Code*.

1206.5 Clearance to combustibles. A pipe in a hydronic piping system in which the exterior temperature exceeds 250°F (121°C) shall have a minimum clearance of 1 inch (25 mm) to combustible materials.

1206.6 Contact with building material. A hydronic piping system shall not be in direct contact with building materials that cause the piping material to degrade or corrode, or that interfere with the operation of the system.

1206.7 Water hammer. The flow velocity of the hydronic piping system shall be controlled to reduce the possibility of water hammer. Where a quick-closing valve creates water hammer, an [approved] engineered water-hammer arrestor shall be installed. The arrestor shall be located within a range as specified by the manufacturer of the quick-closing valve.

1206.8 Steam piping pitch. Steam piping shall be installed to drain to the boiler or the steam trap. Steam systems shall not have drip pockets that reduce the capacity of the steam piping.

1206.9 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

1206.9.1 Flood hazard. Piping located in areas of special flood hazard shall comply with Appendix G of the *New York City Building Code*.

1206.10 Pipe support. Pipe shall be supported in accordance with Section 305. Seismic supports shall be provided where required by the *New York City Building Code*.

1206.11 Condensation. Provisions shall be made to prevent the formation of condensation on the exterior of piping.

SECTION MC 1207 TRANSFER FLUID

1207.1 Flash point. The flash point of transfer fluid in a hydronic piping system shall be a minimum of 50°F (28°C) above the maximum system operating temperature.

1207.2 Makeup water. The transfer fluid shall be compatible with the makeup water supplied to the system.

SECTION MC 1208 TESTS

1208.1 General. Hydronic piping systems other than ground-source heat pump loop systems shall be tested hydrostatically at one and one half times the system design operating pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 2 hours. Ground-source heat pump loop systems shall be tested in accordance with Section 1208. 1.1.

1208.1.1 Ground source heat pump loop systems. Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa) for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the problem shall be identified and corrected.

SECTION MC 1209 EMBEDDED PIPING

1209.1 Materials. Piping for heating panels shall be standard-weight steel pipe, Type L copper tubing, or [approved] plastic pipe or tubing, in accordance with Section 1202, rated at 100 psi (689 kPa) at 180°F (82°C).

1209.2 Pressurizing during installation. Piping to be embedded in concrete shall be pressure tested prior to pouring concrete. During pouring, the pipe shall be maintained at the proposed operating pressure.

1209.3 Embedded joints. Joints of pipe or tubing that are embedded in a portion of the building, such as concrete or plaster, shall be in accordance with the requirements of Sections 1209.3.1 and 1209.2.

1209.3.1 Steel pipe joints. Steel pipe shall be welded by electrical arc or oxygen/acetylene method.

1209.3.2 Copper tubing joints. Copper tubing joints shall be [joined by brazing with filler metals having a melting point of not less than 1,000°F (538°C)] brazed in accordance with Section 1203.3.

1209.4 [Reserved.] Not embedded related piping. Joints of other piping in cavities or running exposed shall be joined in accordance with manufacturer's installation instructions and related sections of this code.

1209.5 Thermal barrier required. Radiant floor heating systems shall be provided with a thermal barrier in accordance with Sections 1209.5.1 through 1209.5.4.

Exception: Insulation shall not be required in engineered systems where it can be demonstrated that the insulation will decrease the efficiency or have a negative effect on the installation.

1209.5.1 Slab-on-grade installation. Radiant piping utilized in slab-on-grade applications shall be provided with insulating materials installed beneath the piping having a minimum *R*-value of 5.

1209.5.2 Suspended floor installation. In suspended floor applications, insulation shall be installed in the joist bay cavity serving the heating space above and shall consist of materials having a minimum *R*-value of 11.

1209.5.3 Thermal break required. A thermal break shall be provided consisting of asphalt expansion joint materials or similar insulating materials at a point where a heated slab meets a foundation wall or other conductive slab.

1209.5.4 Thermal barrier material marking. Insulating materials utilized in thermal barriers shall be installed such that the manufacturer's *R*-value mark is readily observable upon inspection.

SECTION MC 1210

HIGH-PRESSURE STEAM AND HIGH TEMPERATURE HOT WATER PIPING SYSTEMS

1210.1 Scope. The provisions of this section shall apply to high-pressure steam piping system, which is defined as a system operating at a steam pressure of more than 15 psi (103 kPa), and high temperature water intended for operation at pressures in excess of 160 psi (827 kPa) and temperatures in excess of 250°F (101°C). For purposes of this section, loops, bends or offsets of the piping shall not be considered expansion joints.

1210.2 New systems. For purposes of this section, the replacement of existing steam piping systems, the installation of a new system in existing buildings, as well as installations in buildings hereafter constructed, shall be considered to be new high-pressure steam piping systems. The following requirements are applicable:

1210.2.1 Design. The design of new steam piping systems shall be conducted as follows:

1. The system shall be designed by an engineer. An application and plans shall be filed and the approval of the department obtained. The plans and application shall contain, but not be limited to, the following information:
 - 1.1. Size and location of all steam piping.
 - 1.2. The operating pressures and temperatures.
 - 1.3. The location, type, specifications and details of all expansion joints.
 - 1.4. The design, size, material and location of all anchors, guides and auxiliary steel, and the stresses thereon.
2. Systems using utility street steam shall be designed for a pressure of 200 psig (1379 kPa) and 413°F (212°C) up to and including the steam pressure reducing valve or valves which reduce the pressure of 90 psig (621 kPa) or below. For steam pressures between 90 psig (621 kPa) and 16 psig (110 kPa), the system shall be designed for 125 psig (108 kPa).
3. Steam distribution systems utilizing pressure reducing valves.
 - 3.1. Safety Shutoff Valves (“SSO”) to protect downstream piping from overpressure shall be allowed in lieu of a safety relief valve vented to the outdoors as required by Section 1006.6.
 - 3.2. SSO shall be designed to automatically close at or below the design pressure of the downstream piping system that is being protected, to provide positive shut-off against full upstream pressure. Manual reset shall be required to reopen the SSO.
 - 3.3. SSO shall be designed in accordance with the Steam Distribution Utility System requirements of the utility company having jurisdiction and ASME B31.1.
4. Bellows expansion joints shall not be utilized on high pressure steam piping.

Exception: Bellows expansion joints shall be permitted for final connection to equipment where readily accessible for inspection and service and within Mechanical Equipment Rooms.

1210.2.2 Installation. The installation of new steam piping systems shall be conducted as follows:

1. Installations, including any welding, shall be [by] subject to special inspection [by the engineer responsible for the design, or by an engineer acceptable to him or her].
2. Welders shall be qualified for all required pipe sizes, wall thicknesses and positions in accordance with the *ASME Boiler and Pressure Vessel Code*, Section IX. Requalification is required every [3] five years or sooner if the commissioner has a specific reason to doubt a welder's ability to make [sound] acceptable welds.
3. Welder qualification testing shall be performed by an approved agency listed with the department, and the inspector witnessing the test shall be an authorized AWS Certified Welding Inspector. [i]If the testing is by radiography, the [inspection shall have a] test specimen shall be evaluated by personnel having a minimum radiography qualification of Level II in accordance with the ASNT, Document No. SNT-TC-1A, Supplement A. A successful radiographic test of a production weld made within the 6 months prior to requalification may be considered as an acceptable requalification test.
4. Copies of the certified welder qualification reports shall be maintained by the responsible welding agency and the company performing the welding, and shall be made available upon request to the department.
5. No reports from any welding inspection agency shall be accepted unless such agency has first requested and obtained approval from the department in accordance with rules of the department.
6. Pipe welding shall conform to the following:
 - 6.1. All piping over 2 inches (51 mm) shall be butt-welded. Piping 2 inches (76 mm) and under may be socket-welded or threaded, providing Schedule 80 piping is utilized.
 - 6.2. Threaded piping may continue to be used for existing construction in sizes of 6 inches (152 mm) and under.
 - 6.3. Where welding is not feasible, the commissioner may allow an acceptable alternative.

7. Radiographic examination, when required, shall be performed on butt-welds in accordance with ASME B31.1 based on the piping system design pressure and shall be as follows:

Piping System Design Pressure	Percentage
90 psig (621 kPa) or below	Not Required
91 psig (627 kPa) to 150 psig (1034 kPa)	10 at Random
Over 150 psig (1034 kPa)	100

However, if, in the opinion of the engineer responsible for special inspection, radiographic examination is not required for piping at pressure between 90 psig (621 kPa) and 150 psig (1034 kPa), the engineer shall so specify in writing, and the final report on the installation may omit the foregoing, and be predicated on all of the other requirements noted in this section, and a hydrostatic test.

1210.2.3 Testing. Hydrostatic testing shall be conducted on the completed installation at 150 percent of the design pressure for all piping pressure. Where the changes in an existing steam system involve less than 30 percent of the piping in the system, the testing may be in accordance with ASME B31.1.

1210.2.4 Relocation. The commissioner, where deemed necessary, shall require the replacement or relocation of any expansion joints, guides or anchors. The commissioner shall cause the expansion joints in potentially hazardous locations, such as those that are located adjacent to tenant occupied spaces, to be relocated, unless means exist or are provided for eliminating the hazard.

1210.3 Existing systems. Existing steam piping systems shall be in accordance with Sections 1210.3.1 through 1210.3.3. Upon the completion of a new high-pressure steam piping system and department approval of same, the rules relating to maintenance requirements and the keeping of records for existing high-pressure steam piping systems shall apply.

1210.3.1 Maintenance inspections. Expansion joints, anchorage and guides shall be inspected as follows:

1. Expansion joints shall be visually inspected [weekly] monthly.
2. The anchorage and guides shall be visually inspected annually. Exposure of the structural attachments to the buildings of the anchorages or guides shall not be required.
3. A record of such inspections shall be kept by the person in charge of the mechanical equipment of the building, or other qualified person designated by the owner and acceptable to the commissioner. The records shall be available at the premises and

subject to inspection by the commissioner.

1210.3.2 Work approval. No joint, anchorage or guides shall be repaired, replaced or relocated without a work permit issued by the department. The application for the permit shall contain all pertinent information and shall be filed by an engineer knowledgeable as to high-pressure steam piping systems. The engineer shall be responsible for the special inspection of the proposed work in accordance with the approved application. This provision shall not apply to the repacking of a slip or ball joint; however, records of such repacking shall be kept in the inspection records as provided in Section 1210.3.1, Item 3. When, in the opinion of the engineer, the requirement for prior department approval would create an imminent health or safety hazard, the engineer may permit the work to proceed without prior approval. In such cases, the engineer shall, prior to the repair, replacement or relocation, notify by telephone the borough commissioner of the borough in which the building is located; and, if the emergency occurs at other than normal working hours, he or she shall notify the department in a manner prescribed by the commissioner. This shall be followed by the filing of the application for department approval as specified in Section 28-105.4.1 of the *Administrative Code*.

Subpart 13 (Chapter 13 of the New York City Mechanical Code)

§1. Chapter 13 of the New York city mechanical code, as added by local law number 33 for the year 2007, and as amended by local law number 99 for the year 2013, is amended to read as follows:

**CHAPTER 13
FUEL OIL PIPING AND STORAGE
SECTION MC 1301
GENERAL**

1301.1 Scope. This chapter shall govern the design, installation, construction and repair of fuel-oil storage and piping systems. The storage of flammable and combustible liquids not addressed in this chapter shall be in accordance with the *New York City Fire Code*.

1301.2 Storage and piping systems. Fuel-oil storage and piping systems shall comply with the requirements of Chapter 13 and, to the extent not otherwise provided for in this code, shall comply with the requirements of NFPA 31. All above-ground and underground storage facilities with a combined storage capacity of over 1,100 gallons (4160 L) shall also comply with the requirements of the *New York State Department of Environmental Conservation's Petroleum Bulk Storage Code* [; 6 NYCRR Parts 612, 613 and 614].

1301.3 Fuel type. An appliance shall be designed for use with the type of fuel to which it will be connected. Such appliance shall not be converted from the fuel specified on the rating plate

for use with a different fuel without conforming with its listing and manufacturers specifications and securing re-approval from the commissioner.

1301.4 Fuel tanks, piping and valves. The tank, piping and valves for appliances burning oil shall be installed in accordance with the requirements of this chapter. When oil burning equipment is served by a tank located such that any part of the tank is above the level of the burner inlet connection and where the fuel supply line is taken from the top of the tank, an approved anti-siphon valve or other siphon-breaking device shall be installed. The anti-siphon valve or siphon-breaking device shall be located at the highest point in the supply line.

Exceptions: An anti-siphon valve or other siphon-breaking device shall not be required where either:

1. An approved foot valve is used in the tank, or
2. No. 6 fuel oil is used.

1301.5 Tanks abandoned or removed. All exterior above-grade fill piping shall be removed when tanks are abandoned or removed. Tank abandonment and removal shall be in accordance with Section 3404 of the *New York City Fire Code*.

1301.[5]6 Out of service system. Fuel-oil storage systems that are temporarily or permanently taken out of service shall comply with the requirements of the *New York City Fire Code and of the New York State Department of Environmental Conservation's Petroleum Bulk Storage Code*.

1301.[6]7 Fuel-oil spill and overflow prevention equipment. Fuel-oil spill and overflow prevention equipment shall comply with EPA 40 CFR Parts 280, and Section 1305.6.6.

1301.[7]8 Portable fire extinguishers. Portable fire extinguishers [with a minimum weight of 30 pounds (13.64 kg)] shall be provided as required by the *New York City Fire Code* and NFPA 10.

1301.[8]9 Absorbent materials. The building owner shall maintain a sufficient quantity of absorbent materials near fuel-oil storage tanks, pumps, and related equipment to control leaks and slipping hazards.

1301.[9]10 Certificate of fitness. Where fuel-oil piping systems utilize pumps to transfer fuel oil to equipment at levels above the lowest floor or to storage tanks at levels above the lowest floor in buildings, a qualified employee or contracted general company holding a certificate of fitness from the Fire Department shall maintain the fuel-oil system.

SECTION MC 1302 MATERIAL

1302.1 General. Piping materials shall conform to the ASTM standards cited in this section.

1302.2 Rated for system. All materials shall be rated for the operating temperatures and pressures of the system, and shall be compatible with the type of liquid being handled by the system.

1302.3 Pipe standards. Fuel-oil pipe shall comply with the standards listed in Table 1302.3.

Exception: Piping for fuel-oil systems utilizing a transfer pump to equipment at levels above the lowest floor or to storage tanks at levels above the lowest floor in buildings shall comply with the requirements of Section 1305.9.5.

1302.4 Nonmetallic pipe. All nonmetallic pipe shall be listed and labeled as being acceptable for the intended application for flammable and combustible liquids. Nonmetallic pipe shall be installed only outside, underground.

1302.5 Fittings and valves. Fittings and valves [shall be approved] for the piping systems [, and] shall be compatible with, or shall be of the same material as, the pipe or tubing, and shall conform with Table 1202.5.

1302.6 Bending of pipe. Pipe shall be [approved] suitable for bending and shall conform with Table 1302.3. Pipe bends shall be made with approved equipment. The bend shall not exceed the structural limitations of the pipe.

**TABLE 1302.3^a
FUEL OIL PIPING**

MATERIAL	STANDARD (see
Brass pipe	ASTM B 43
Copper or copper-alloy pipe	ASTM B 42; ASTM B 302
Copper or copper-alloy tubing (Type K, or L(<u>PVC coated</u>))	ASTM B 75; ASTM B 88; ASTM B 280
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D 2996
Steel pipe	ASTM A 53 <u>M</u> ; ASTM A 106

<u>Steel tubing^b</u>	<u>ASTM A 254; ASTM A 539</u>
---------------------------------	-----------------------------------

a. Brass tubing, [steel tubing] and copper tubing type [L or] M are not permitted.

b. Steel tubing shall only be permitted when installed by the equipment manufacturer in accordance with UL 2200 and UL labeled.

1302.7 Pumps. Pumps that are not part of an appliance shall be of a positive-displacement type. The pump shall automatically shut off the supply when not in operation. Pumps shall be listed and labeled in accordance with UL 343.

1302.8 Flexible connectors and hoses. Flexible metal connectors and hoses used where rigid connections are impractical or to reduce the effect of jarring and vibration shall be listed and labeled in accordance with UL 536 and shall be installed in compliance with its label and the manufacturer's installation instructions and shall not exceed 18 inches (457 mm). Connectors made from combustible materials shall not be used inside buildings or above ground outside of buildings.

SECTION MC 1303 JOINTS AND CONNECTIONS

1303.1 [Approval] General. Joints and connections shall conform to the ASTM Standards listed in Section 1203, shall be [shall be approved and] of a type approved for fuel-oil piping systems, shall be rated for the temperatures and pressures of the systems in which the devices are installed, and shall be compatible with the fluid and all materials used. All threaded joints and connections shall be made tight with suitable lubricant or pipe compound. Unions [requiring gaskets or packings] and flanges, right or left couplings, and sweat fittings [employing brazing material having a melting point of less than 1,000°F (538°C) shall not be used in oil lines.] shall be brazed in accordance with ASME Boiler and Pressure Vessel Code, Section IX (Welding and Brazing Qualifications) or in accordance with AWS B2.2 Standard for Brazing Procedure and Performance Qualification. Cast-iron fittings shall not be used. Joints and connections shall be tight for the pressure required by test. Flanged joints requiring gaskets or packing shall be equipped with gaskets rated for a minimum of 750°F (399°C).

1303.1.1 Joints between different piping materials. Joints between different piping materials shall be made with [approved] adapter fittings. Joints between different metallic piping materials shall be made with [approved] dielectric fittings [or brass converter fittings]. All such fittings shall conform with the requirements of Section 1203.

1303.2 Reserved.

1303.3 Joint preparation and installation. Where required by Sections 1303.4 through 1303.10, the preparation and installation of brazed, mechanical, threaded and welded joints shall comply with Sections 1303.3.1 through 1303.3.4.

1303.3.1 Brazed joints. [All joint surfaces shall be cleaned. An approved flux shall be applied where required. The joints shall be brazed with a filler metal conforming to AWS A5.8.] All joints shall be brazed in accordance with ASME Boiler and Pressure Vessel Code, Section IX Welding and Brazing Qualifications or in accordance with American Welding Society AWS B2.2 Standard for Brazing Procedure and Performance Qualification.

1303.3.2 Mechanical joints. Mechanical joints utilizing an elastomeric and/or compression seal are not permitted.

1303.3.3 Threaded joints. Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only and shall be compatible for application on the piping material and fluid.

1303.3.4 Welded joints. [All joint surfaces shall be cleaned by approved procedure. The joint shall be welded with an approved filler metal.] All joints shall be welded in accordance with ASME Boiler and Pressure Vessel Code, Section IX Welding and Brazing Qualifications or in accordance with AWS B2.1 Specifications for Welding Procedure and Performance Qualification.

1303.4 Brass pipe. Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints complying with Section 1303.3.

1303.5 Reserved.

1303.6 Copper or copper-alloy pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, threaded or welded joints complying with Section 1303.3.

1303.7 Copper or copper-alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed or mechanical joints complying with Section 1303.3 or flared joints. Flared joints shall be made by a tool designed for that operation.

1303.8 Nonmetallic pipe. Joints between nonmetallic pipe or fittings shall be installed in accordance with the manufacturer's instructions for the labeled pipe and fittings.

1303.9 Steel pipe. Joints between steel pipe or fittings shall be threaded or welded joints complying with Section 1303.3.

1303.10 Reserved.

1303.11 Piping protection. Proper allowance shall be made for expansion, contraction, jarring and vibration. Piping other than tubing, connected to underground tanks, except straight fill lines and test wells, shall be [provided with flexible connectors, or otherwise] arranged to permit the tanks to settle without impairing the tightness of the piping connections. Piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Sections 1305.9.6 and 1305.9.7.

SECTION MC 1304 PIPING SUPPORT

1304.1 General. Pipe supports shall be in accordance with Section 305. Piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Sections 1305.9.6 and 1305.9.7.

SECTION MC 1305 FUEL-OIL SYSTEM INSTALLATION

1305.1 General. Fuel-oil piping systems shall be installed in accordance with this section.

1305.2 Protection of pipe, equipment and appliances. All fuel-oil pipe, equipment and appliances shall be protected from physical damage. Piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

1305.2.1 Flood hazard. All fuel-oil pipe, tanks, equipment and appliances located in areas of special flood hazard shall comply with Appendix G of the *New York City Building Code*.

1305.3 Supply piping. Supply piping shall comply with the requirements of Sections 1305.3.1 through 1305.3.7.

1305.3.1 Size. The fuel-oil system shall be sized for the maximum capacity of fuel oil required. The minimum size of a supply line shall be $\frac{3}{8}$ -inch (9.5 mm) inside diameter nominal pipe or $\frac{3}{8}$ -inch (9.5 mm) OD tubing.

1305.3.2 Connections to tank. Supply piping shall connect to the top of the fuel-oil tank.

Exception: Storage tanks in buildings that comply with all of the following conditions:

1. The tank is located above ground on the lowest floor;
2. The tank does not exceed 330 gallons (1250 L); and

3. The tank is provided with a ¾-inch (19.1 mm) opening for gravity discharge and a 1-inch (25 mm) opening in the bottom for cleaning and protection against corrosion.

1305.3.3 Pumps. Fuel oil shall be supplied by a transfer pump or automatic pump or by other approved means.

1305.3.4 Smoke detectors. Appropriate safeties shall be provided so that detection of smoke or heat within the generator or equipment room shall prevent additional fuel oil from being pumped into the piping system within such room, including a fusible link operated [lever gate] valve in the supply pipe at the wall of the generator or equipment room.

1305.3.5 Horizontal runouts. Horizontal runouts from risers to the generator or equipment room shall follow as direct a route as practicable.

1305.3.6 Direct feed. Systems where day tanks are absent (such as generator installations where fuel oil is taken directly from a fuel-oil pipe or header into the engine) shall comply with Section 1305.9. 12.

1305.3.7 Piping from transfer pump to equipment or storage tanks above the lowest floor. Supply piping from a transfer pump to equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

1305.4 Return piping. Return piping shall connect to the top of the fuel-oil tank. The minimum size of a return line shall be [¼-inch (6.4 mm) inside diameter nominal pipe or 5/16-inch (7.9 mm) outside diameter tubing] no less than the size of the supply piping specified in Section 1305.3.1. Valves shall not be installed on return piping unless a means of relieving overpressure is provided. Return piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

1305.5 System pressure. The system shall be designed for the maximum pressure required by the fuel-oil-burning appliance. Air or other gases shall not be used to pressurize tanks. Pressure in a storage tank for the purpose of discharging oil shall be prohibited.

1305.6 Fill piping. Fill piping shall comply with the requirements of Sections 1305.6.1 through 1305.6.6.

1305.6.1 Size. Fill piping shall be a minimum of 2 inches (51 mm) in diameter or 3 inches (76mm) for No.6 fuel oil.

1305.6.2 Termination location. A fill pipe shall terminate outside of a building at or above grade at a point at least 2 feet (610 mm) from any building opening and 5 feet (1524 mm) away from any subway grating at the same or lower level. A fill pipe shall terminate in a manner designed to minimize spilling when the filling hose is disconnected. Where No. 6 fuel oil is used, the fill pipe terminal shall be within 3 feet (914 mm) of the curb unless otherwise required by the Department of Transportation or the Transit Authority. If facilities exist for an oil delivery truck to drive onto the premises, the fuel-oil terminal may be located elsewhere other than the curb.

1305.6.3 Separate fill piping. Each storage tank shall be provided with a separate fill pipe, except that where a battery of tanks containing the same grade of oil is installed, a common fill and header pipe may be installed.

1305.6.4 Check valve. Where the top of the storage tank is above the fill pipe terminal, the fill pipe shall be connected to the top of the tank and provided with a shutoff valve and swing check valve, both of which shall be located at the fill pipe terminal. The shutoff valve and swing check valve may be installed in an accessible location inside the building at or below the level of the fill pipe terminal.

1305.6.5 Terminal opening. The fill opening shall be equipped with a tight metal cover designed to discourage tampering. All fill pipe terminals shall be of an approved type and shall be provided with lugs for embedding in concrete. In lieu of lugs, a set screw or threads to fasten the terminal to the fill pipe may be used. The outer flange of the fill pipe terminal or the seal cap shall be permanently marked: FUEL OIL. The fill pipe terminal shall be [threaded] right-handed thread or provided with other equivalent means to receive the seal cap. The seal cap shall be suitably slotted for receiving an opening wrench, and an oilproof gasket inserted in a groove in the fill pipe terminal shall be provided so as to make the seal cap leakproof. A strainer shall not be required but if used, shall be of at least 1/8-inch (3.2 mm) mesh. Where a storage system for volatile flammable oil and a storage system for fuel oil are to be used in the same premises, the terminal of the [fuel-oil pipe] volatile oil pipe shall be provided with a left-handed thread and the fill pipe fitting shall be of a different size than that required for the fill pipes to the tanks containing the volatile flammable oil.

1305.6.6 Spill containment. For fill [pipes] terminal openings serving tanks greater than 660 gallons (2500 L), an approved overflow/spill containment device shall be provided.

1305.7 Normal vent piping. Normal vent piping shall comply with the requirements of Sections 1305.7.1 through 1305.7.9.

1305.7.1 Size. Normal vent sizes shall comply with the sizes listed in Tables 1305.7(1) and 1305.7(2); provided, however, for tanks other than those complying with the alternate tank design and construction standards contained in Section 1305.14, the normal vent shall not be smaller in size than the supply pipe.

**TABLE 1305.7(1)
VENT PIPING FOR UNDERGROUND TANKS**

TANK SIZE	MINIMUM VENT
660 gallons (2500 L) or less	1¼ inch (32 mm)
661 gallons (2505 L) to 3,000 gallons (11 355 L)	1½ inch (38 mm)
3,001 gallons (11 360 L) to 10,000 gallons (37 850 L)	2 inch (51 mm)
10,001 gallons (37 855 L) to 20,000 gallons (75 700 L)	2½ inch (64 mm)
Larger than 20,000 gallons (75 700 L)	3 inch (76 mm)

**TABLE 1305.7(2)
VENT PIPING FOR TANKS INSTALLED INSIDE BUILDINGS**

TANK SIZE	MINIMUM VENT
660 gallons (2500 L) or less	1¼ inch (32 mm) ^a
Larger than 660 gallons (2500 L)	Sized to prevent abnormal pressure in the tank during

a. For tanks constructed to UL 80 specifications, the minimum vent diameter shall be 2 inches (51 mm) [or as required by Section 1305.8, Item .3, whichever is greater]. For tanks constructed to UL 142 specifications, the minimum vent diameter shall not be less than as required by Section 1305.8.4.

1305.7.2 Termination location. The location of the normal vent pipe terminations shall comply with the following:

1. Liquid fuel normal vent pipes shall terminate outside of buildings in a nonhazardous location at a point not less than 2 feet (610 mm) measured vertically or horizontally

from any building opening and not less than 2 feet (610 mm) nor more than 12 feet (3658 mm) above the fill pipe terminal.

2. If the normal vent pipe terminal is not visible from the fill pipe terminal location, a 1-inch (25 mm) tell-tale line shall be connected to the tank and shall parallel the fill pipe and terminate at the fill pipe terminal with an unthreaded end. Such tell-tale lines shall be provided with a check valve set to prevent flow of surface water to the storage tank.
3. Normal vent pipes shall terminate sufficiently above the ground to avoid being obstructed with snow or ice.
4. Normal vent pipes from tanks containing heaters shall be extended to a location where oil vapors discharging from the normal vent will be readily diffused.

1305.7.3 Termination caps. Outer ends of normal vent pipes shall terminate in a weatherproof vent cap or fitting or be provided with a weatherproof hood. All normal vent caps shall have a minimum free open area equal to the cross-sectional area of the normal vent pipe and shall not employ screens finer than No. 4 mesh.

1305.7.4 Tank pressure. The tank shall be designed for the maximum static head that will be imposed with the normal vent piping filled with oil.

1305.7.5 Multiple tanks. A normal vent pipe shall be provided for each storage tank. Normal vent piping from multiple tanks of the same grade oil with not more than 660 gallons (2500 L) aggregate capacity may be combined. Where a battery of storage tanks complying with the alternate tank design and construction standards contained in Section 1305.14 designed to hold the same grade of oil with not more than 660 gallons (2500 L) aggregate capacity is installed, normal vent pipes may be run into a main header.

1305.7.6 Pitch. Normal vent pipes shall drain toward the tank. The normal vent pipes shall have no sags or traps where liquid can collect.

1305.7.7 Protection. Normal vent pipes shall be located so that they are not subjected to physical damage.

1305.7.8 Cross-connection. Liquid fuel normal vent pipes shall not be cross-connected with fill pipes, lines from burners or overflow lines from auxiliary tanks.

1305.7.9 Tanks above the lowest floor. For tanks installed above the lowest floor, the normal vent shall be piped, in an approved manner, into the vent or top of tank of the lowest floor storage tank that supplies the fuel to such tank.

1305.8 Emergency relief vent piping. Each primary tank, the interstitial space of a secondary containment tank and each compartment of a compartment tank complying with UL 142 shall be provided with emergency relief venting. A tank's emergency relief vent piping and normal vent piping shall be combined. The design and installation of the combined normal and emergency relief vent shall be in accordance with Section 1305.7 and Sections 1305.8.1 through 1305.8.4. Tanks designed in accordance with Section 1305.14 shall not require emergency relief vent piping.

1305.8.1 Piping. The combination normal and emergency relief venting shall be provided through an open vent pipe connected directly, as applicable, to the primary tank, interstitial space or compartment. The use of a self-closing man- way cover, a manway cover provided with long bolts that permit the cover to lift under internal pressure, or other type emergency relief vent device, shall be prohibited.

1305.8.2 Termination. Combination normal and emergency relief vent piping shall terminate outdoors.

1305.8.3 Tanks above the lowest floor. For tanks installed inside of buildings above the lowest floor, the combination normal and emergency vent piping shall be piped, in an approved manner, into the vent or top of tank of the lowest floor storage tank that supplies the fuel to such tank. Normal and emergency vents are to be sized in accordance with NFPA 30.

1305.8.4 Capacity. The total relief venting capacity of the combination normal and emergency relief venting shall be in accordance with Section 4.2.5.2 of NFPA 30. Construction documents shall include calculations demonstrating that the extension of the normal and emergency vent piping is adequately sized to provide the required emergency vent flow while limiting the backpressure to less than the maximum pressure permitted by the design of the tank. Additionally, consistent with Section 4.2.5.2.5 of NFPA 30, where the design provides for a reduction in the required emergency relief venting capacity based upon the properties of the fuel oil to be stored in the tank, the construction documents shall include supporting calculations.

1305.9 Supplemental requirements for piping from transfer pumps to equipment or storage tanks above lowest floor. Fuel-oil piping systems utilizing pumps to transfer fuel oil to equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall comply with the requirements of Sections 1305.9.1 through 1305.9.12.

1305.9.1 Shaft enclosure. The piping from a transfer pump to equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings, the return piping, and vent piping shall be enclosed in a shaft constructed of 4-inch (102 mm) concrete or masonry having a 4-inch (102 mm) clearance from all pipe or pipe covering, except that no such enclosures shall be required within the room containing the pump,

tank, or equipment where such room is itself enclosed with construction and materials having at least a 2-hour fire-resistance rating. Multiple fuel oil risers serving multiple systems are permitted within a common shaft enclosure. All shaft penetrations must be fire stopped.

1305.9.2 Ducts or other piping in shafts. Pipe shafts containing fuel-oil piping shall not be penetrated by or contain other piping or ducts.

1305.9.3 Horizontal offsets. Where it is necessary to make horizontal offsets in the supply and overflow/return piping and pipe shafts, including the lowest level, such piping shall be enclosed in a sleeve of other piping of at least No. 10 standard Gage steel, two sizes larger than the supply piping and arranged to drain into the shaft. Horizontal piping offsets shall be further enclosed in construction having a 2-hour fire-resistance rating except that no such enclosure or pipe sleeve shall be required for the pipes serving the equipment within the room containing the pump, tank, or equipment where such room is itself enclosed with construction and materials having at least a 2-hour fire-resistance rating. Horizontal piping shall include all piping at or above the roof level. No 2-hour fire-resistance rated enclosure is required for horizontal piping offsets located outside the building.

1305.9.4 Drain at base of shafts; leak detection. A drain pipe shall be installed at the base of shafts enclosing the supply and overflow/return piping. The pipe shall lead to a dedicated sump or minimum 55-gallon (208 L) container with a leak detection alarm, arranged so as to sound an alarm and stop the transfer pump. The alarm shall be connected to a local audible alarm and to a remote alarm located at a supervising station. The wiring shall comply with the *New York City Electrical Code*.

1305.9.5 Piping materials. Oil lines for equipment or tanks shall be steel pipe ASTM A 53 or ASTM A 106, grade B seamless Schedule 40 with welded connections up to the oil tank or equipment, except that fittings at the tank or equipment, shutoff valves and other fuel-oil flow and control devices may be screwed or flanged.

1305.9.6 Expansion. Provision shall be made for expansion in piping without the use of expansion joints.

1305.9.7 Movement and vibration. The piping shall be located and secured from movement so as to prevent undue stress on the piping and to isolate the piping from vibrations from any equipment.

1305.9.8 Connections to header. Pipe connections to the main header (supply or return) shall be made from the top of the header, except for systems with equipment above the lowest floor where such equipment is designed to operate utilizing fuel pumped as needed from the lowest floor and without utilizing fuel oil stored above the lowest floor.

1305.9.9 Air vents and breakers. Required air vents and vacuum breakers shall be designed for their required use.

1305.9.10 Curb or pan. All air vents and vacuum breakers shall be hard-piped to a curb or pan.

1305.9.11 Pipe size; fuel storage above the lowest floor. In systems with equipment above the lowest floor where such equipment is designed to operate utilizing fuel stored above the lowest floor, piping diameters shall not exceed 4 inches (102 mm). However, where an applicant demonstrates by the inclusion of calculations in the construction documents that a greater diameter is necessary to ensure the proper flow for the functioning of the system, such greater diameter may be permitted. Piping shall not be used for fuel storage purposes.

1305.9.12 Pipe size; without fuel storage above the lowest floor. In systems with equipment above the lowest floor, where such equipment is designed to operate utilizing fuel pumped as needed from the lowest floor and without utilizing fuel oil stored above the lowest floor, piping diameters throughout such systems shall not exceed the design flow (three times the maximum firing rate as calculated by the engineer or architect). However, piping diameters within rooms containing such equipment may exceed the calculated design flow pipe size to provide limited reservoir storage to prime equipment, provided such reservoir storage is counted toward the maximum permitted oil storage per story, as provided for in Section 1305.11.1.3.

1305.10 Devices to control flow to oil-burning equipment including generators.

The following requirements shall apply:

1. The pressure in oil lines to oil-burning equipment located above the lowest floor of a building shall not be more than is required to circulate oil to and from the burners, and all parts of the oil system shall be capable of withstanding the maximum working pressure in that part of the system.
2. A remote control shall be provided to stop the flow of oil to any burner wherever located, and to any oil-burning equipment located on levels above the lowest floor in buildings. Such control shall be located outside the entrance to the room in which the burner is located and as close to such entrance as practicable, except that when an outside location is impracticable, such control may be located immediately inside the room in which the burner is located, provided such location is accessible at all times. All such controls shall be permanently labeled: "REMOTE CONTROL FOR [OIL] BURNER," ["REMOTE CONTROL FOR GENERATOR,"] or as appropriate to the oil-burning equipment. On storage tanks of 60 gallons (227 L) or less capacity used with manually operated equipment, such remote control may be installed in the supply lines between tank and burner.

3. In systems where either steam or air is used for atomizing the oil, the oil and the atomizing supply shall be interlocked so that where the supply of either is interrupted, the supply of the other will be immediately cut off.

1305.11 Limitations on quantities of fuel-oil storage. Quantities of fuel-oil storage shall be limited in accordance with the provisions of this section. For the purposes of this section, fuel oil stored on roofs shall be deemed inside of buildings and located on the floor to which they are adjacent.

1305.11.1 Inside of buildings. A total of not more than 100,000 gallons (378 000 L) shall be stored inside of any building. Oil storage inside of buildings shall also comply with applicable requirements of Sections 1305.11.1.1 through 1305.11.1.3.

1305.11.1.1 Inside of buildings; below ground. The maximum size of each below-ground oil-storage tank inside of a building shall be 35,000 gallons (132 475 L).

1305.11.1.2 Inside of buildings; above ground on the lowest floor. Fuel-oil storage tanks installed above ground on the lowest floor of a building shall be mounted on and anchored by adequate noncombustible supports. The maximum size of each individual tank shall be 660 gallons (2500 L), and a total of not more than 1375 gallons (5200 L) shall be stored within the same 2-hour fire area.

Exceptions. Fuel-oil storage tanks shall be permitted to exceed 660 gallons (2500 L), and the total quantity within a fire area shall be permitted to exceed 1375 gallons (5200 L) in accordance with any one of the following options:

1. **Buildings of Type I,II, IIIA, IV or VA construction with a total limit of 15,000 gallons.** The maximum size of each individual tank shall be 15,000 gallons (56 775 L) provided that all such tanks are located in a room or enclosure dedicated to oil storage that is separated from the rest of the building by fire-resistance-rated construction of at least 3 hours. Notwithstanding Section 1305.11.1, in such cases, the maximum total quantity in the building shall be limited to 15,000 gallons (56 775 L).
2. **Buildings of Type IIIB or VB construction with a total limit of 10,000 gallons.** The maximum size of each individual tank shall be 10,000 gallons (37 850 L) provided that all such tanks are located in a room or enclosure dedicated to oil storage that is separated from the rest of the building by fire-resistance-rated construction of at least 3 hours. Notwithstanding Section 1305.11.1, in such cases, the maximum total quantity in the building shall be limited to 10,000 gallons (37 850 L).
3. **Buildings of any type construction with a total limit of 100,000 gallons.**

The maximum size of each individual tank shall be 25,000 gallons (94 625 L) provided that all such tanks are enclosed in a vault (i) with walls, floor, and top having a fire-resistance rating of not less than 3 hours, (ii) with such walls bonded to the floor, and (iii) with such top and walls of the vault independent of the building structure. An exterior building wall having a fire-resistance rating of not less than 3 hours shall be permitted to serve as a wall of the vault. The vault shall be located in a dedicated room or area of the building that is cut off vertically and horizontally from other areas and floors of the building by assemblies having a fire-resistance rating of not less than 2 hours. Where the aggregate fuel-oil storage on the lowest level of the building exceeds 50,000 gallons (189 250 L), such storage shall be protected with an alternate extinguishing system complying with Section 904 of the *New York City Building Code*.

1305.11.1.3 Inside of buildings; above the lowest floor. Fuel oil above the lowest floor inside of a building shall be limited to 330 gallons (1249 L) per story. The maximum quantity shall include oversized piping as described in Section 1305.9.12. Piping installations shall comply with the requirements of Section 1305.9.

Exception: Fuel-oil storage capacity in areas of special flood hazard and shaded X-Zones, as defined in Section G201.2 of Appendix G of the *New York City Building Code*, shall comply with Section G307.4 of Appendix G of the *New York City Building Code*.

1305.11.2 Outside of buildings. Oil storage outside of buildings shall comply with applicable requirements of Sections 1305.11.2.1 and 1305.11.2.2.

1305.11.2.1 Outside of buildings; below ground. The maximum size of each below-ground oil-storage tank outside of a building shall be 35,000 gallons (132 475 L).

1305.11.2.2 Outside of buildings; above ground. The maximum size of each above-ground oil-storage tank outside of a building shall be 100,000 gallons (378 000 L).

1305.12 Standards for tank design. Tanks shall be designed and constructed in compliance with Sections 1305.12.1 and 1305.12.2.

1305.12.1 Below ground. Tanks located below ground, inside or outside of buildings, shall comply with any one of the following design standards, as appropriate for the specific installation as determined by the engineer:

1. UL 58; such tanks shall be listed and labeled;
2. UL 1316; such tanks shall be listed and labeled; or

3. Alternate tank design and construction standards contained in Section 1305.14.

1305.12.2 Above ground. Tanks located above ground, inside or outside of buildings, shall comply with any one of the following design standards, as appropriate for the specific installation as determined by the engineer:

1. UL 80; such tanks shall be listed and labeled;
2. UL 142; such tanks shall be listed and labeled;
3. *ASME Boiler and Pressure Vessel Code*, Section VIII, Division 1 or 2; such tanks shall be [listed and] labeled; or
4. Alternate tank design and construction standards contained in Section 1305.14.

1305.13 Installation of tanks. Tanks shall be installed in accordance with the provisions of Sections 1305.13.1 through 1305.13.4. For the purposes of this section, fuel oil stored on roofs shall be deemed inside of buildings.

1305.13.1 Below ground. Tanks located below ground, inside or outside of buildings, shall comply with the following requirements:

1. **Containment.** Fuel-oil tanks having a capacity of more than 660 gallons (2500 L) shall be provided with secondary containment intended to prevent any leakage of fuel oil from the tank from entering the environment. The capacity of the containment shall equal or exceed the capacity of the tank served.
2. **Burial.** Regardless of capacity, fuel-oil tanks shall be buried with the top of the tank at least 2 feet (610 mm) below ground. Tanks shall be placed in firm soil and shall be surrounded by clean sand or well-tamped earth, free from ashes or other corrosive substance, and free from stones that will not pass a 1-inch (25 mm) mesh.
3. **Anchorage.** When necessary to prevent floating, fuel-oil tanks, regardless of capacity, shall be securely anchored.
4. **Distance to foundations.** Regardless of capacity, no fuel-oil tank shall be buried within 3 feet (914 mm) of any foundation wall or footing.
5. **Special limitations near subways.** Regardless of capacity, no fuel-oil tank shall be placed within 20 feet (6096 mm) of the outside line of a subway wall. For the purpose of the foregoing requirement, a subway shall be deemed to include any subsurface railroad or rapid transit roadbed.

1305.13.2 Above ground; on the lowest floor inside a building. Tanks located above ground, on the lowest floor inside of buildings, shall comply with the following requirements:

1. **Enclosure of room.** Installation of tank(s) and enclosure of room shall comply with Section 1305.11.1.2.

2. **Fire-extinguishing system.** Fire extinguishing systems shall comply with Section 1305.11.1.2.

[1.] 3. **Ventilation.** Rooms containing fuel-oil tanks which exceed 1375 gallons (5200 L) shall be ventilated to limit the concentration of vapors within the room at or below 25 percent of the Lower Flammable Limit (LFL) of the fuel oil being used.

[2.] 4. **Containment.** Fuel-oil tanks having a capacity of more than 660 gallons (2500 L) storage shall be provided with secondary containment intended to capture any leakage of fuel oil from the tank. The capacity of the containment shall equal or exceed the capacity of the tank served. For fuel storage, the capacity shall include the portion of the tank up to the height of the containment.

[3.] 5. **Special limitations near subways.** Regardless of capacity, fuel-oil tanks located within the outer lines of the subway, or within 20 feet (6096mm) of the outside line of a subway shall be placed within a welded steel oil-tight pan of not less than No. 18 Gage metal suitably reinforced and of capacity to contain the contents of the tank. For the purpose of the foregoing requirement, a subway shall be deemed to include any subsurface railroad or rapid transit roadbed.

1305.13.3 Above ground; above the lowest floor inside a building. Regardless of capacity, fuel-oil tanks and fuel-oil-burning equipment located above ground, above the lowest floor inside of buildings, shall comply with the following requirements:

1. **Enclosure of room.** Fuel-oil tanks and fuel-oil-burning equipment shall be located in a dedicated room or enclosure, having a fire-resistance rating of at least 2 hours. Rooftop tanks need not be enclosed provided that all exterior walls and roof surfaces within 10 feet (3048 mm) horizontally and 20 feet (6096 mm) vertically have a fire-resistance rating of at least 2 hours.

2. **Fire-extinguishing system.** Rooms containing fuel-oil tanks and fuel-oil-burning equipment shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1 of the *New York City Building Code*. To prevent overfilling of the containment barriers, sprinkler shut-offs shall be located on the outside of tank and generator rooms and prominently placarded for immediate control by the Fire Department.

3. **Smoke detection.** Rooms containing fuel-oil tanks and fuel-oil-burning equipment shall be equipped with automatic smoke detection in accordance with Section 907 of the *New York City Building Code*, except that heat detectors may be utilized where, during normal operation, products of combustion are present in sufficient quantity to actuate a smoke detector.
4. **Ventilation.** Rooms containing fuel-oil tanks shall be ventilated to limit the concentration of vapors within the room at or below 25 percent of the Lower Flammable Limit (LFL) of the fuel oil being used.
5. **Containment.** Fuel-oil tanks, fuel-oil-burning equipment, and related equipment shall be provided with secondary containment area intended to capture any leakage of fuel oil. Floor drains shall be prohibited in containment areas. For tanks, the capacity of the containment area shall equal or exceed 2 times the capacity of the tank served. For fuel storage, the capacity shall include the portion of the tank up to the height of the containment. For fuel-oil-burning equipment, and related equipment the capacity of the containment area shall equal or exceed 1.5 times the [storage] fuel capacity of the equipment.
6. **Transfer pumps.** Fuel-oil tanks shall be filled by means of a transfer pump supplied from a primary storage tank located on the lowest floor. A separate transfer pump and piping circuit shall be provided for each storage tank installed above the lowest floor. No intermediate pumping stations shall be provided between the storage tank and the transfer pump. Appropriate devices shall be provided for the automatic and manual starting and stopping of the transfer pumps so as to prevent the overflow of oil from these storage tanks.
7. **Indicators and alarms.** Indicators and alarms shall be provided for fuel-oil tanks and rooms containing fuel-oil-burning equipment, including a level sensor for height and capacity of fuel oil, high and low levels, and leak detection. The float switch shall be provided within the containment areas and shall be arranged so as to sound an alarm and stop the transfer pump in case of failure of the tank or the control in the tank. These indicators shall be connected to a local audible alarm in the tank room and to a remote alarm located at a supervising station. The wiring shall comply with the *New York City Electrical Code*.
8. **Weekly testing.** The operation of the float switch shall be tested at least once each week by the holder of the certificate of fitness as provided for in Sections 1301.[9]10 and 1308.3.

1305.13.4 Above ground; outside a building. Tanks located above ground, outside of buildings, shall comply with the following requirements:

1. **Containment.** Regardless of capacity, each fuel-oil storage tank shall be protected by an embankment or dike. Such protection shall have a capacity at least 1½ times the capacity of the tank so surrounded (including the portion of the tank up to the height of the containment) and shall be at least 4 feet (1219 mm) high, but in no case shall the protection be higher than one-quarter the height of the tank when the height of the tank exceeds 16 feet (4877 mm). Embankments or dikes shall be made of earthwork with clay core, of masonry, of reinforced concrete or of steel. Earth work embankments shall be firmly and compactly built of good earth free from stones, vegetable matter, or other similar material, and shall have a flat section of at least 3 feet (914 mm) at the top and a slope of at least 1½ (457 mm) rise to 2 feet (610 mm) of run on all sides. Concrete, masonry or steel dikes shall be designed so as to contain safely all of the oil in the tank so surrounded. Embankments or dikes shall be continuous and unpierced, and the outside toe shall be located at least 5 feet (1524 mm) inside of the property line, and no less than 5 feet (1524 mm) from a driveway or parking area.

2. **Distances to buildings, lot lines and other tanks.** Storage tanks of a capacity greater than 330 gallons (1250 L) shall be not less than 1¼ tank diameters and in no case less than 10 feet (3048 mm) from the tax lot line, the nearest building or adjacent tank. However, in no case shall the clearance between individual tanks and the tax lot line be less than the distance fixed by the following formula:

$$M.C. = 10 + 4 \left[\left[\frac{(G - 275)}{5000} \right] \right] \quad \textbf{(Equation 13-1)}$$

where:

M. C. = Minimum clearance from nearest surface of tank to tax lot line, in feet.

G = Capacity of tank, in gallons.

3. **Means of egress.** Tanks shall be located so as not to obstruct or interfere with any means of egress.

1305.14 Alternate tank design and construction standards. Oil-storage tanks, other than those conforming to *ASME Boiler and Pressure Vessel Code*, Section VIII, Division 1 or 2, UL 58, UL 80, UL 142, or UL 1316 shall be designed, constructed and installed in accordance with the requirements of Sections 1305. 14.1 through 1305. 14.5.

1305.14.1 General construction standards. All tanks shall comply with the requirements of Sections 1305.14.1.1 through 1305.14.1.9.

1305.14.1.1 Materials and workmanship. All fuel-oil storage tanks shall be built of steel plates or sheets, made by the open hearth or basic oxygen process. Such steel shall be free from physical imperfections, and shall be new, in good condition and free from rust.

1305.14.1.2 Assembly. Tanks, flanges or other pipe connections shall be welded. Filler of any kind between plates shall be prohibited.

1305.14.1.3 Corrosion resistance. Tanks to be buried shall be cleaned and then coated on the outside with two coats of corrosion protective material. They shall be further protected by a coating of hot tar, asphalt, or equivalent rust-resistive material, applied at the work site. Tanks installed inside buildings above ground shall be coated with one coat of corrosion protective material.

1305.14.1.4 External loads on underground tanks. All buried storage tanks shall be constructed of at least ¼-inch-thick (6.4 mm) metal and shall be designed to withstand any external loads to which the tank may be subjected.

1305.14.1.5 Identification. At the time of installation all storage tanks shall bear a permanently fixed plate, spot welded or equivalent, bearing the name of the tank manufacturer, the gage of the material, and capacity of the tank. Shop-fabricated storage tanks shall be installed without structural alteration.

1305.14.1.6 Openings. All openings shall be through the top of the storage tank, except that storage tanks of 275 gallon (1041 L) capacity or less, located above ground but below the lowest story, may be provided with a ¾-inch (19.1 mm) opening for gravity discharge and a 1-inch (25 mm) opening in the bottom for cleaning and protection against corrosion.

1305.14.1.7 Manholes. Tanks for No. 1, No.2, No.3 and No. 4 commercial-grade oils need not have manholes. However, if manholes are used for tanks containing such oils, the manhole covers shall be bolted and made gas tight. Tanks for No. 5 and No. 6 commercial-grade oils shall have manhole covers bolted or otherwise secured to the tanks and kept hydrostatically tight at all times. Tanks 275 gallon (1041 L) capacity or less, and all other tanks without manholes, shall be provided with a 2 screwed connection on the top of the tank to permit measuring the level of the oil within.

1305.14.1.8 Electrical grounding. Tanks outside of buildings shall be electrically grounded in accordance with the requirements for equipment grounding of the *New York City Electrical Code*.

1305.14.1.9 Protection from heat and flame. Tanks shall be located at least 7 feet (2134 mm), measured in the most direct manner, from any source of exposed flame unless protected as provided in Section 1305.11.1.2, Exception 3, and at least 2 feet (610 mm) from any surface where the temperature exceeds 165°F (74°C).

1305.14.2 Additional construction standards for cylindrical tanks exceeding 275 gallons (1041 L). Cylindrical tanks, including oval, elongated oval, or round tanks,

exceeding 275 gallons (1041 L) shall comply with the requirements of Sections 1305.14.2.1 through 1305.14.2.3.

Exception: Such above-ground vertical tanks that are outside of buildings shall comply with Sections 1305.14.1 and 1305.14.5.

1305.14.2.1 Thickness. The minimum thickness shall be as follows:

1. Tanks 36 inches (914mm) in diameter or less shall have at least a ¼-inch (6.4 mm) shell and ¼-inch (6.4 mm) heads.
2. Tanks 37 inches (940mm) to 72 inches (1829mm) in diameter shall have at least a ¼-inch (6.4 mm) shell and ⁵/₁₆-inch (7.9 mm) heads.
3. Tanks 73 inches (1854 mm) to 120 inches (3048 mm) in diameter shall have at least a ⁵/₁₆-inch (7.9 mm) shell and ³/₈-inch (9.5 mm) heads.
4. Tanks over 120 inches (3048 mm) in diameter shall be of at least ³/₈-inch (9.5 mm) steel and shall be stiffened by angle rings or equivalent members so as to retain their cylindrical form.

1305.14.2.2 Dished heads. Dished heads for such tanks shall have a curvature the radius of which is not greater than the diameter of the tank. Dished heads shall be formed with an adequate cylindrical extension rim to provide a welding surface.

1305.14.2.3 Flat heads. If flat heads are used, they shall be braced in the same manner as described for the bracing of flat sides of rectangular tanks as provided for in Section 1305.14.3.

1305.14.3 Additional construction standards for rectangular tanks exceeding 275 gallon (1041 L). Rectangular tanks exceeding 275-gallon (1241 L) capacity shall comply with the requirements of Sections 1305.14.3.1 through 1305.14.3.6.

1305.14.3.1 Thickness. Plates for rectangular tanks of more than 275 gallon (1040 L) capacity shall be at least ⁵/₁₆ inch (7.9 mm) thick.

1305.14.3.2 Corners. Corners may be made up by bending the plates or by using angles.

1305.14.3.3 Seams. All tanks shall have full penetration ⁵/₁₆ welds at all seams.

1305.14.3.4 Bracing. All flat surfaces of rectangular tanks shall be braced by structural members or rods.

1305.14.3.5 Structural work. All structural members shall be designed in accordance with the requirements of the *New York City Building Code*.

1305.14.3.6 Connections. Connections between bracing members and the sides of the tank shall be designed so that the connection will not fail before the member will fail.

1305.14.4 Additional construction standards for tanks 275 gallons (1041 L) or less. Storage tanks with a capacity of less than or equal to 275 gallons (1041 L) shall have a minimum thickness of shell and head plates of No. 10 manufacturer's standard Gage steel plate. Storage tanks of 60 gallon (227 L) capacity or less shall be similarly constructed but need not be thicker than No.14 manufacturer's standard Gage.

Exceptions:

1. Such vertical above-ground cylindrical tanks outside of buildings shall comply with Sections 1305.14.1 and 1305.14.5.
2. Such underground tanks need comply only with Section 1305.14.1.
3. Storage containers of 6 gallons (23 L) or less used with burners or oil-burning heaters need only be designed so as to withstand a hydrostatic pressure test of at least 5 psi (34 kPa) without permanent deformation, rupture, or leakage, and shall be approved. Such containers shall be installed with rigid metal fasteners for wall, floor, or stand-type installations, and shall be protected against mechanical damage. Portable storage containers of 6 gallons (23 L) or less may be filled by a pump mounted on a storage tank, provided that the pump is approved.

1305.14.5 Additional construction standards for vertical above-ground cylindrical tanks outside of buildings exceeding 6 gallons (23 L). Vertical above-ground cylindrical storage tanks exceeding 6 gallons (23 L) that are located outside of buildings shall comply with the requirements of Sections 1305.14.5.1 through 1305.14.5.3.

1305.14.5.1 Plates. Such tanks shall be built of steel plates of the quality required for cylindrical tanks in accordance with Section 1305.14.2.

1305.14.5.2 Thickness. The minimum thickness of shell or bottom plates shall be ¼ inch (6.4 mm), and the minimum thickness of roof plates ⅛ inch (3.2 mm). The thickness of shell plates shall be determined in accordance with the following formula:

$$t = \frac{P \times R \times F}{T \times E} \quad \text{(Equation 13-2)}$$

where:

t = Thickness of shell plate in inches.

P = Head pressure at bottom of ring under consideration in psi.

R = Radius of shell, in inches.

F = Factor of safety (taken as 5).

T = Tensile strength of plate, in psi, as verified by mill test certificate.

E = Efficiency of vertical joint in ring under consideration. E shall in no case be taken greater than 1.00.

1305.14.5.3 Seams. Roof plates shall have welded water-tight seams, and the roof shall be built to shed water. Bottom plates shall have welded seams. Shell plate seams shall be designed to develop the full strength of the plate.

SECTION MC 1306 OIL GAUGING

1306.1 Level indication. All tanks located inside buildings shall be equipped with a method of determining the oil level.

1306.2 Test wells. Test wells shall not be installed inside buildings. Unused tank openings shall be permanently sealed. For outside service, test wells shall be equipped with a tight metal cover designed to discourage tampering.

1306.3 Inside tanks. The gauging of inside tanks by means of measuring sticks shall not be permitted. An inside tank provided with fill and vent pipes shall be provided with a device to indicate either visually or audibly at the fill point when the oil in the tank has reached a predetermined safe level.

1306.4 Gauging devices. Gauging devices such as liquid level indicators or signals shall be designed and installed so that oil vapor will not be discharged into a building from the liquid fuel supply system.

1306.5 Gauge glass. A tank used in connection with any oil burner shall not be equipped with a glass gauge or any gauge which, when broken, will permit the escape of oil from the tank.

1306.6 Storage above lowest floors. Fuel oil stored above the lowest floor shall also comply with the indicator requirements of Section 1305.13.3, Item 7.

SECTION MC 1307 FUEL-OIL VALVES

1307.1 Building shutoff. [A] For outside or below ground tanks, a shutoff valve shall be installed on the fuel-oil supply line at the entrance to the building. Inside or above-ground tanks [are permitted to] shall have valves installed at the tank. The valve shall be capable of stopping

the flow of fuel oil to the building or to the appliance served where the valve is installed at a tank inside the building.

1307.2 Appliance shutoff. A shutoff valve shall be installed at the supply connection to each appliance [where more than one fuel-oil-burning appliance is installed.] and a check valve installed at the return connection.

1307.3 Pump relief valve. A relief valve shall be installed on the pump discharge line where a valve is located downstream of the pump.

1307.4 Fuel-oil heater relief valve. A relief valve shall be installed on the discharge line of fuel-oil-heating appliances.

1307.5 Relief valve operation. Relief valves shall be set to discharge at not more than 1½ times the maximum working pressure of the system. The discharge from relief valves shall be returned to the storage tank or to the supply line. Shutoff valves are not permitted in the line of relief.

SECTION MC 1308 TESTING

1308.1 Testing required. Fuel-oil storage tanks, other than tanks complying with the alternate tank design and construction standards contained in Section 1305.14, shall be tested in accordance with NFPA 31.

1308.2 Hydrostatic test. All liquid-fuel piping, and all tanks complying with the alternate tank design and construction standards contained in Section 1305.14, shall be hydrostatically tested for tightness by the contractor who made the installation before the work is closed in and before the system is operated. The piping shall be tested at 1½ times the maximum working pressure applicable to that part of the piping system but at a pressure not less than the test pressure required for the storage tank. The minimum pressure for testing tanks shall be 1½ times the maximum working pressure applicable to the tank but in no case less than 25 psig (172 kPag), except as provided for containers 6 gallons (23 L) or less in capacity as provided for in Section 1305.14.4, Exception 3. The hydrostatic pressure shall be maintained until all joints and connections have been visually inspected for leaks, but in no case for less than ½ hour. The tank shall not show any permanent deformation as a result of the test. A record shall be kept of the pressure tests showing the name of the contractor and the pressures at which the piping and the tank were tested.

1308.3. Weekly testing. For fuel-oil tanks and fuel-oil-burning equipment located above ground, above the lowest floor inside of buildings, the operation of the float switch shall be tested at least once each week by the holder of the certificate of fitness as provided for in Sections 1301.10 and 1305.13.3, Item 8.

Subpart 14 (Chapter 14 of the New York City Mechanical Code)

§1. Section 1402.1 of the New York city mechanical code, as added by local law number 33 for the year 2007, is amended to read as follows:

1402.1 Access. Access shall be provided to solar energy equipment and appliances for maintenance. Solar systems and appurtenances shall be installed in accordance with the requirements of Chapter 5 of the *New York City Fire Code* regarding rooftop access and obstructions, and shall not obstruct or interfere with fire-fighting operations or the operation of any doors, windows, fire escapes, or other means of egress or other building components requiring operation or access.

Subpart 15 (Chapter 15 of the New York City Mechanical Code)

§1. Section 1502 of the New York city mechanical code, as added by local law number 33 for the year 2007, is REPEALED, and a new Section 1502 is added to read as follows:

Subpart 16 (Appendix A of the New York City Mechanical Code)

§1. Appendix A to the New York city mechanical code, as added by local law number 33 for the year 2007, is amended by adding a new Figure A-4.1 to read as follows:

For SI: 1 foot = 304.8 mm, 1 square inch = 645 mm², 1 British thermal unit per hour = 0.293
1 W.

NOTE: The air duct or direct opening shall have a free area of not less than 1 square inch per
3,000 Btu/h (734mm²/kW) of the total input rating of all appliances in the enclosure.

FIGURE A-4.1
ALL AIR FROM OUTDOORS THROUGH A SINGLE DUCT OR DIRECT OPENING

Part E (Chapter 9 of Title 28 - New York City Fuel Gas Code)

§1. The first unnumbered paragraph of section 28-901.2 of chapter 9 of title 28 of the administrative code of the city of New York, as added by local law number 33 for the year 2007, is amended to read as follows

The New York city fuel gas code based on the 2003 edition of the International Fuel Gas Code published by the International Code Council, with changes that reflect the unique

character of the city and amendments that bring it up to date with the 2009 edition of such International Fuel Gas Code, is hereby adopted to read as follows:

Subpart 1 (Chapter 1 of the New York City Fuel Gas Code)

§1. Chapter 1 of the New York city fuel gas code, as added by local law number 33 for the year 2007, section 101.4 as amended by local law number 49 for the year 2010, section 102.2.1, items 2 and 4 of section 106.4, and sections 106.6 and 106.7 as amended by, and sections 105.5 and 107.1.3 as added by, local law number 8 for the year 2008, and section 106.8 as amended by local law number 85 for the year 2009, is amended to read as follows:

**CHAPTER 1
ADMINISTRATION**

**SECTION FGC 101
GENERAL**

101.1 Title. This code shall be known and may be cited as the “*New York City Fuel Gas Code*,” “NYCFG” or “FGC.” All section numbers in this code shall be deemed to be preceded by the designation “FGC.”

101.2 Scope. This code shall apply to the installation of fuel-gas piping systems, fuel-gas [utilization equipment] appliances and related accessories in accordance with Sections 101.2.2 through 101.2.5.

101.2.1 Reserved.

101.2.2 Piping systems. These regulations cover piping systems for natural gas [with an operating pressure of 125 pounds per square inch gauge (psig) (862 kPa gauge) or less]. High pressure natural gas installations at pressures of 15 psig (103 kPa gauge) or above shall also comply with the requirements of Appendix G of this code. Coverage shall extend to the outlet of the [equipment] appliance shutoff valves. Piping [systems] system requirements shall include design, materials, components, fabrication, assembly, installation, testing, inspection, operation and maintenance.

101.2.3 Gas utilization [equipment] appliances. Requirements for gas [utilization equipment] appliances and related accessories shall include installation, combustion and ventilation air and venting and connections to piping systems.

101.2.4 Systems and equipment outside the scope. This code shall not apply to the following:

1. Portable LP-gas appliances and equipment of all types that [is] are not connected to a fixed fuel piping system.
2. Oxygen-fuel gas cutting and welding systems.
3. Industrial gas applications using gases such as acetylene and acetylenic compounds, hydrogen, ammonia, carbon monoxide, oxygen and nitrogen.
4. Petroleum refineries, pipeline compressor or pumping stations, loading terminals, compounding plants, refinery tank farms and natural gas processing plants.
5. Integrated chemical plants or portions of such plants where flammable or combustible liquids or gases are produced by, or used in, chemical reactions.
6. LP-gas installations at utility gas plants.
7. Liquefied natural gas (LNG) installations.
8. Fuel gas piping in public utility power plants and atomic energy plants.
9. Components within proprietary items of equipment, apparatus or instruments such as gas-generating sets, compressors and calorimeters.
10. LP-gas equipment for vaporization, gas mixing and gas manufacturing.
11. Temporary LP-gas piping for buildings under construction or renovation that is not to become part of the permanent piping system.
12. Installation of LP-gas systems for railroad switch heating.
13. Installation of hydrogen gas, LP-gas and compressed natural gas (CNG) systems on vehicles.
14. Except as provided in Section 401.1.1 and Appendices E and [F] G, gas piping, meters, gas pressure regulators and other appurtenances used by the serving gas supplier in the distribution of gas, other than undiluted LP-gas.
15. Building design and construction, except as specified herein.
16. Piping systems for mixtures of gas and air within the flammable range with an operating pressure greater than 10 psig (69 kPa gauge).
17. Portable fuel cell appliances that are neither connected to a fixed piping system nor interconnected to a power grid.

101.2.5 Other fuels. The requirements for the design, installation, maintenance, alteration and inspection of mechanical systems operating with fuels other than fuel gas shall be regulated by the *New York City Mechanical Code*.

101.3 Reserved.

101.4 Intent. The purpose of this code is to provide minimum standards to safeguard life or limb, health, property, public welfare and the environment by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of fuel gas systems.

101.5 Severability. If a section, subsection, sentence, clause or phrase of this code is, for any reason, held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this code.

SECTION FGC 102 APPLICABILITY

102.1 General. [The provisions of this code shall apply to all matters affecting or relating to structures and premises, as set forth in Section 101.] Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern. Where, in a specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive shall govern.

102.2 Existing installations. Except as otherwise provided for in this chapter or elsewhere in this code, a provision in this code shall not require the removal, alteration or abandonment of, nor prevent the continued utilization and maintenance of, existing installations lawfully in existence on the effective date of this code.

102.2.1 Existing buildings. Additions, alterations, renovations or repairs related to building or structural issues shall be governed by Chapter 1 of Title 28 of the *Administrative Code*, the *New York City Building Code* and the *1968 Building Code*, as applicable.

102.3 Maintenance. Installations, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe condition. Devices or safeguards that are required by this code shall be maintained in compliance with the applicable provisions under which they were installed.

102.3.1 Owner responsibility. The owner or the owner's designated agent shall be responsible for maintenance of installations. To determine compliance with this provision, the commissioner shall have the authority to require an existing installation to be inspected.

102.4 Additions, alterations or repairs. Additions, alterations, renovations or repairs to installations shall conform to that required for new installations without requiring the existing installation to comply with all of the requirements of this code. Additions, alterations or repairs shall not cause an existing installation to become unsafe, hazardous or overloaded.

102.4.1 Minor additions, alterations, renovations and repairs. Minor additions, alterations, renovations and repairs to existing installations shall meet the provisions for new construction, unless such work is done in the same manner and arrangement as was in the existing system, is not hazardous and is approved.

102.4.2 Special provisions for prior code buildings. In addition to the requirements of Sections 102.4 and 102.4.1, the provisions of Sections 102.4.1.1 through 102.4.1.4 shall apply to prior code buildings.

102.4.2.1 Fuel gas piping in fire-resistance-rated assemblies. For prior code buildings, the replacement of existing fuel gas piping in the same locations shall not be subject to Section 404.1, item 5, when approved by the commissioner.

102.4.2.2 Guards and access to roofs and elevated structures. The provisions of Section 306.6 relating to guards and Section 306.5 relating to permanent means of access shall not apply where the equipment or appliances replace existing equipment or appliances in the same location.

102.4.2.3 Seismic supports. For prior code buildings, the determination as to whether seismic requirements apply to an alteration shall be made in accordance with the *1968 Building Code* and interpretations by the department relating to such determinations. Any applicable seismic loads and requirements shall be permitted to be determined in accordance with Chapter 16 of the *New York City Building Code* or the *1968 Building Code* and Reference Standard RS 9-6 of such code.

102.4.2.4 Wind resistance. For prior code buildings, equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with Chapter 16 of the *New York City Building Code*.

102.5 Change in occupancy. Refer to Chapter 1 of Title 28 of the *Administrative Code*.

102.6 Reserved.

102.7 Reserved.

102.8 Referenced standards. The standards referenced in this code shall be those that are listed in Chapter 8 and in the rules of the department and such standards shall be considered part of

the requirements of this code to the prescribed extent of each such reference. Where differences occur between provisions of this code and the referenced standards, the provisions of this code shall apply. Refer to Article 103 of Chapter 1 of Title 28 of the *Administrative Code* for additional provisions relating to referenced standards.

102.8.1 Editions of referenced standards. References to standards in this code shall be to the editions of those standards provided for in Chapter 8 of this code, or as otherwise provided by rule.

102.9 Requirements not covered by code. Requirements necessary for the strength, stability or proper operation of an existing or proposed installation, or for the public safety, health and general welfare, not specifically covered by this code, shall be determined by the commissioner.

102.10 Application of references. Reference to chapter section numbers, or to provisions not specifically identified by number, shall be construed to refer to such chapter, section or provision of this code.

SECTION FGC 103 DEPARTMENT OF BUILDINGS

103.1 Enforcement agency. Refer to the New York City Charter and Chapter 1 of Title 28 of the *Administrative Code*.

103.2 Reserved.

103.3 Reserved.

103.4 Reserved.

SECTION FGC 104 DUTIES AND POWERS OF THE COMMISSIONER OF BUILDINGS

104.1 General. The commissioner shall have the authority to render interpretations of this code and to adopt rules, [establishing] policies, and procedures in order to clarify and implement [the] its provisions [of this code]. Such interpretations, policies, procedures, and rules shall be in compliance with the intent and purpose of this code. See the New York City Charter and Chapter 1 of Title 28 of the *Administrative Code* for additional provisions relating to the authority of the Commissioner of Buildings.

SECTION FGC 105 PERMITS

105.1 General. Permits shall comply with this section, with Article 105 of Chapter 1 of Title 28 of the *Administrative Code*, and with requirements found elsewhere in this code.

105.2 Required. Any owner or authorized agent who intends to construct, add to, alter, repair, move, demolish, or change the occupancy of a building or structure, or to erect, install, add to, alter, repair, remove, convert or replace any gas, mechanical or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application for construction document approval in accordance with Chapter 1 of Title 28 of the *Administrative Code* and this chapter and obtain the required permit.

105.3 Work exempt from permit. Exemptions from permit requirements of this code as authorized in Chapter 1 of Title 28 of the *Administrative Code* and the rules of the department shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or rules.

105.4 Validity of permit. The issuance or granting of a permit shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of any other law. Permits presuming to give authority to violate or cancel the provisions of this code or other law shall not be valid. The issuance of a permit based on construction documents and other data shall not prevent the commissioner from requiring the correction of errors in the construction documents and other data. The commissioner is also authorized to prevent occupancy or use of a structure where in violation of this code or of any other law.

105.5 Other permits. In addition to any permits required by the provisions of this code, permits for sidewalk and street openings shall be obtained from the Department of Transportation.

SECTION FGC 106 CONSTRUCTION DOCUMENTS

106.1 General. Construction documents shall comply with Article 104 of Chapter 1 of Title 28 of the *Administrative Code* and other applicable provisions of this code and its referenced standards. Such construction documents shall be coordinated with architectural, structural and means of egress plans.

106.2 Required documents. The applicant shall submit all of the documents specified in Sections 106.3 through 106.8 as appropriate to the nature and extent of the work proposed. Construction documents shall indicate the heating, [ventilating] ventilation, refrigeration, and other mechanical work to be performed, so drawn as to conform to the architectural and structural aspects of the building and to show in detail compliance with this code.

106.2.1 Composite plans. Composite plans showing compliance of architectural, structural, and mechanical parts of a building may be submitted provided that a clear understanding of each part is not impaired.

106.3 Lot diagram. The lot diagram shall be provided where applicable to the work proposed, including but not limited to the installation of exterior or rooftop equipment.

106.4 Building classification statement. Where applicable to the proposed work, the statement shall identify:

1. The occupancy group or groups that apply to parts of the building code in accordance with Section 302 of the *New York City Building Code*;
2. The occupancy group of the main use or dominant occupancy of the building;
3. The construction class of the building in accordance with Section 602 of the *New York City Building Code*;
4. The structural occupancy/risk category in accordance with Table 1604.5 of the *New York City Building Code*;
5. The height of the building as defined in Section 502.1 of the *New York City Building Code*;
6. The applicable measurements to the highest and lowest level of fire department access; and
7. Whether the building is inside or outside of the fire districts.

106.5 Fuel-gas-burning [equipment] appliance and fuel-gas piping plans. Construction documents for fuel-gas-burning [equipment] appliances and fuel-gas piping shall contain plans that include the following data and information:

1. Riser diagrams showing the story heights, the gas risers, and related [equipment] appliances.
2. Diagrammatic floor plans showing the size, location, material for all gas distribution piping and related [equipment] appliances.
3. Floor plans or partial floor plans showing the location, layout, size, and listing information for all fuel-gas burning [equipment] appliances, gas vents, and chimneys, with the riser numbers coordinated with other plans and diagrams. The floor plans shall indicate locations of meters, shutoff valves, including the outside gas cut-off required by Appendix E, Section E6. The plans shall also indicate the method or means of providing air to the [equipment] appliance space, including duct and opening sizes.

4. Plans indicating the location and type of any relevant smoke and heat detectors, alarm and fire-extinguishing systems.
5. Seismic protection and restraint details for piping and [equipment] appliances as required by Chapter 16 of the *New York City Building Code*.
6. Details [indicating] indicating the location, size and materials for all breechings; the thickness and type of insulation materials; and the clearances from combustible walls, partitions and ceiling; and the fire-resistive ratings of rooms and spaces containing the [equipment] appliances.
7. Details describing the type, material, listing information, height, and termination distances to adjacent properties and structures for chimneys and gas vents.
8. Details showing structural supports for fuel-gas-burning equipment where required.
9. In areas of special flood hazards, construction documents shall comply with Appendix G of the *New York City Building Code*.

106.6 Heating systems. Construction documents for heating systems shall include the temperature to be maintained in every room and the output capacity in BTU per hour (W) of the central heating source.

106.7 Boilers. Construction documents for boiler installations shall indicate the output capacity in BTU per hour (W), the operating weight of each boiler, the pressure setting of the relief valves, and such other data and information as required by this code.

106.8 Energy efficiency. Construction documents shall include compliance documentation as required by the *New York City Energy Conservation Code*.

SECTION FGC 107 [(IFGC)] INSPECTIONS AND TESTING

107.1 General. Except as otherwise [specifically provided] specified, inspections required by this code or by the department during the progress of work may be performed on behalf of the owner by approved agencies or, if applicable, by special inspectors. However, in the interest of public safety, the commissioner may direct that any of such inspections be performed by the department. All inspections shall be performed at the sole cost and expense of the owner. Refer to Article 116 of Chapter 1 of Title 28 of the *Administrative Code* for additional provisions relating to inspections.

107.2 Required inspections and testing. In addition to any inspections otherwise required by this code or applicable rules, the following inspections shall be required:

1. Progress inspections:

1.1 Underground inspection shall be made after trenches or ditches are excavated and bedded, piping is installed and before backfill is put in place. When excavated soil contains rocks, broken concrete, frozen chunks and other rubble that would damage or break the piping or cause corrosive action, clean backfill shall be on the job site.

1.2 Rough-in inspection shall be made after the roof, framing, fireblocking and bracing are in place and components to be concealed are complete, and prior to the installation of wall or ceiling membranes.

1.3 Inspections required by the *New York City Energy Conservation Code* shall be made in accordance with rules of the department, as applicable.

2. Special inspections. Special inspections shall be performed in accordance with this code and Chapter 17 of the *New York City Building Code*.

3. Final inspection. Refer to Article 116 of Chapter 1 of Title 28 of the *Administrative Code*.

4. Issuance of [Certificate] certificate of [Compliance] compliance. Upon satisfactory inspection of service equipment and [the project satisfied all the requirements for sign-off] the satisfaction of all the requirements for sign-off, the department shall issue a [Certificate] certificate of [Compliance] compliance as applicable for the following service equipment:

4.1. Fuel-gas-burning equipment,

4.2. Heating systems, and

4.3. Boilers.

[107.1.1] 107.2.1 Approved inspection agencies. Refer to Articles 114 and 115 of Chapter 1 of Title 28 of the *Administrative Code*.

[107.1.2] 107.2.2 Inspection of prefabricated construction assemblies. Prior to the approval of a prefabricated construction assembly having concealed work and the issuance of a permit, the department shall require the submittal of an evaluation report by an approved agency on each prefabricated construction assembly, indicating the complete details of the installation, including a description of the system and its components, the basis upon which the system is being evaluated, test results and similar information and other data as necessary for the commissioner to determine conformance to this code.

[107.1.2.1] 107.2.2.1 Test and inspection records. Required test and inspection records shall be available to the commissioner at all times during the fabrication of the installation and the erection of the building; or such records as the commissioner designates shall be filed.

[107.1.3] 107.2.3 Exposure of work. It shall be the duty of the permit holder to cause the work to remain accessible and exposed for inspection purposes. Neither the commissioner nor the city shall be liable for expense entailed in the removal or replacement of any material required to allow inspection.

[107.2] 107.3 Testing. Installations shall be tested as required in this code and in accordance with Sections [107.2.1] 107.3.1 through [107.2.3] 107.3.3. Tests shall be made by the permit holder and witnessed by the department or an approved agency.

[107.2.1] 107.3.1 New, altered, extended or repaired installations. New installations and parts of existing installations that have been altered, extended, renovated or repaired, shall be tested as prescribed herein to disclose leaks and defects.

[107.2.2] 107.3.2 Apparatus, instruments, material and labor for tests. Apparatus, instruments, material and labor required for testing an installation or part thereof shall be furnished by the permit holder.

[107.2.3] 107.3.3 Reinspection and testing. Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made so as to achieve compliance with this code. The work or installation shall then be resubmitted to the department for inspection and testing.

[107.3] 107.4 Sign-off of completed work. Refer to Article 116 of Chapter 1 of Title 28 of the *Administrative Code*.

[107.4] 107.5 Temporary connection. The commissioner shall have the authority to allow the temporary connection of an installation to the sources of energy for the purpose of testing the installation or for use under a temporary certificate of occupancy.

SECTION FGC 108 VIOLATIONS

108.1 General. Refer to Chapters 2 and 3 of Title 28 of the *Administrative Code*.

108.2 Authority to disconnect service utilities. The commissioner shall have the authority to require disconnection of utility service to the building, structure or system regulated by the technical codes in case of emergency where necessary to eliminate an immediate hazard to life or property. The commissioner shall notify the serving utility, and wherever possible, the owner and occupant of the building, structure or service system of the decision to disconnect prior to

taking such action. If not notified prior to disconnection, the owner or occupant of the building, structure or service system shall be notified in writing, as soon as practicable thereafter.

108.3 Connection after order to disconnect. A person shall not make energy source connections to installations regulated by this code that have been disconnected or ordered to be disconnected by the commissioner, or the use of which has been ordered to be discontinued by the commissioner until the commissioner authorizes the reconnection and use of such installations. When an installation is maintained in violation of this code, and in violation of a notice issued pursuant to the provisions of this section, the commissioner shall institute appropriate action to prevent, restrain, correct or abate the violation.

Subpart 2 (Chapter 2 of the New York City Fuel Gas Code)

§1. Section 202 of the New York city fuel gas code, as added by local law number 33 for the year 2007, the definitions of BTU and Demand as amended by local law number 8 for the year 2008, is amended to read as follows:

**SECTION FGC 202
GENERAL DEFINITIONS**

1968 OR PRIOR CODE BUILDINGS OR STRUCTURES (PRIOR CODE BUILDINGS).
See Section 28-101.5 of the *Administrative Code*.

ACCESS (TO). That which enables a device, appliance or equipment to be reached by ready access or by a means that first requires the removal or movement of a panel, door or similar obstruction (see also “Ready access”).

ADMINISTRATIVE CODE. *The Administrative Code of the City of New York.*

AIR CONDITIONER, GAS-FIRED. A gas-burning, automatically operated appliance for supplying cooled and/or dehumidified air or chilled liquid.

AIR CONDITIONING. The treatment of air so as to control simultaneously the temperature, humidity, cleanness and distribution of the air to meet the requirements of a conditioned space.

AIR, EXHAUST. Air being removed from any space or piece of equipment or appliance and conveyed directly to the atmosphere by means of openings or ducts.

AIR-HANDLING UNIT. A blower or fan used for the purpose of distributing supply air to a room, space or area.

AIR, MAKEUP. Air that is provided to replace air being exhausted.

ALTERATION. Any construction, addition, change of use or occupancy, or renovation to a building or structure in existence. See Section 28-101.5 of the *Administrative Code*.

ANODELESS RISER. A transition assembly in which plastic piping is installed and terminated above ground outside of a building.

APPLIANCE [(EQUIPMENT)]. Any apparatus or [equipment] device that utilizes gas as a fuel or raw material to produce light, heat, power, refrigeration or air conditioning.

[**APPLIANCE, FAN-ASSISTED COMBUSTION.** An appliance equipped with an integral mechanical means to either draw or force products of combustion through the combustion chamber or heat exchanger.]

APPLIANCE, AUTOMATICALLY CONTROLLED. Appliances equipped with an automatic burner ignition and safety shutoff device and other automatic devices which accomplish complete turn-on and shutoff of the gas to the main burner or burners, and graduate the gas supply to the burner or burners, but do not affect complete shutoff of the gas.

APPLIANCE, FAN-ASSISTED COMBUSTION. An appliance equipped with an integral mechanical means to either draw or force products of combustion through the combustion chamber or heat exchanger.

APPLIANCE TYPE.

Low-heat appliance (residential appliance). Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of 1,000°F (538°C) or less.

Medium-heat appliance. Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of more than 1,000°F (538°C), but not greater than 2,000°F (1093°C).

APPLIANCE, UNVENTED. An appliance designed or installed in such a manner that the products of combustion are not conveyed by a vent or chimney directly to the [outside] outdoor atmosphere.

APPLIANCE, VENTED. An appliance designed and installed in such a manner that all of the products of combustion are conveyed directly from the appliance to the [outside] outdoor atmosphere through an approved chimney or vent system.

APPROVED. [Acceptable to the commissioner.] In reference to construction documents, the determination by the department after full examination that submitted construction documents comply with this code and other applicable laws and rules. In reference to materials, the

determination by the commissioner that material is acceptable for its intended use. See Section 28-101.5 of the *Administrative Code*.

APPROVED AGENCY. An established and recognized agency, or other qualified person, [regularly]engaged in conducting tests or furnishing inspection services, when approved pursuant to department rules as qualified to perform or witness identified testing or inspection services. See Chapter 1 of Title 28 of the *Administrative Code*.

APPROVED INSPECTION AGENCY. An approved agency that is approved by the department as qualified to perform one or more of the inspections required by this code. See Chapter 1 of Title 28 of the *Administrative Code*.

APPROVED TESTING AGENCY. An approved agency that is approved by the department as qualified to test and evaluate the performance of one or more of the materials regulated in their use by this code. Such term shall include, when approved pursuant to department rules, a third-party testing or certification agency, evaluation agency, testing laboratory, testing service, licensed concrete testing laboratory or other entity concerned with product evaluation. See Chapter 1 of Title 28 of the *Administrative Code*.

ARCHITECT. A person licensed and registered to practice the profession of architecture under the *Education Law of the State of New York*.

ATMOSPHERIC PRESSURE. The pressure of the weight of air and water vapor on the surface of the earth, approximately 14.7 pounds per square inch (psi) (101 kPa absolute) at sea level.

AUTOMATIC IGNITION. Ignition of gas at the burner(s) when the gas controlling device is turned on, including reignition if the flames on the burner(s) have been extinguished by means other than by the closing of the gas controlling device.

BAFFLE. An object placed in an appliance to change the direction of or retard the flow of air, air-gas mixtures or flue gases.

BAROMETRIC DRAFT REGULATOR. A balanced damper device attached to a chimney, vent connector, breeching or flue gas manifold to protect combustion [equipment] appliances by controlling chimney draft. A double-acting barometric draft regulator is one in which the balancing damper is free to move in either direction to protect combustion [equipment] appliances from both excessive draft and backdraft.

BOILER, HIGH-PRESSURE. An appliance [(equipment)] for supplying steam or hot water that, for a steam boiler, operates at a pressure of more than 15 psig (103 kPa gauge), and for a hot water boiler, operates at a pressure exceeding 1[5]60 psig (1034 kPa gauge) or at a temperature exceeding 250°F (121°C).

BOILER, LOW-PRESSURE. A self-contained appliance for supplying steam or hot water as follows:

Hot water heating boiler. A boiler in which no steam is generated, from which hot water is circulated for heating purposes and then returned to the boiler, and that operates at water pressures not exceeding 160 pounds per square inch gauge (psig) ([1100]1103 kPa gauge) and at water temperatures not exceeding 250°F (121°C) at or near the boiler outlet.

Hot water supply boiler. A boiler, completely filled with water, which furnishes hot water to be used externally to itself, and that operates at water pressures not exceeding 160 psig ([1100] 1103 kPa gauge) and at water temperatures not exceeding 250°F (121°C) at or near the boiler outlet.

Steam heating boiler. A boiler in which steam is generated and that operates at a steam pressure not exceeding 15 psig (103 kPa gauge).

BRAZING. A metal-joining process wherein coalescence is produced by the use of a nonferrous filler metal having a melting point above 1,000°F (538°C), but lower than that of the base metal being joined. The filler material is distributed between the closely fitted surfaces of the joint by capillary action.

BROILER. A general term including salamanders, barbecues and other appliances cooking primarily by radiated heat, excepting toasters.

BTU. Abbreviation for British Thermal Unit, which is the quantity of heat required to raise the temperature of 1 pound (454 g) of water 1°F (0.56°C) (1 Btu = 1055 J).

BURNER. A device for the final conveyance of the gas, or a mixture of gas and air, to the combustion zone.

Induced-draft. A burner that depends on draft induced by a fan that is an integral part of the appliance and is located downstream from the burner.

Power. A burner in which gas, air or both are supplied at pressures exceeding, for gas, the line pressure, and for air, atmospheric pressure, with this added pressure being applied at the burner.

CHIMNEY. A primarily vertical structure containing one or more flues, for the purpose of carrying gaseous products of combustion and air from a fuel-burning appliance to the outside atmosphere.

Factory-built chimney. A listed and labeled chimney composed of factory-made components, assembled in the field in accordance with manufacturer's instructions and the conditions of the listing.

Masonry chimney. A field-constructed chimney composed of solid masonry units, bricks, stones or concrete.

Metal chimney. A field-constructed chimney of metal.

CHIMNEY CONNECTOR. A pipe that connects a fuel-burning appliance to a chimney.

CLEARANCE. The minimum distance through air measured between the heat-producing surface of the mechanical appliance, device or equipment and the surface of the combustible material or assembly.

CLOTHES DRYER. An appliance used to dry wet laundry by means of heated air. Dryer classifications are as follows:

Type 1. Factory-built package, multiple production. Primarily used in family living environment. Usually the smallest unit physically and in function output.

Type 2. Factory-built package, multiple production. Used in business with direct intercourse of the function with the public. Not designed for use in individual family living environment.

COMBUSTION. In the context of this code, refers to the rapid oxidation of fuel accompanied by the production of heat or heat and light.

COMBUSTION AIR. Air necessary for complete combustion of a fuel, including theoretical air and excess air.

COMBUSTION CHAMBER. The portion of an appliance within which combustion occurs.

COMBUSTION PRODUCTS. Constituents resulting from the combustion of a fuel with the oxygen of the air, including inert gases, but excluding excess air.

COMMISSIONER. The Commissioner of [Buildings] buildings of the City of New York or his or her duly authorized representative. See Section 28-101.5 of the *Administrative Code*.

CONCEALED LOCATION. A location that cannot be accessed without damaging permanent parts of the building structure or finished surface. Spaces above, below or behind readily removable panels or doors shall not be considered as concealed.

CONCEALED PIPING. Piping that is located in a concealed location (see “Concealed Location”).

CONDENSATE. The liquid that condenses from a gas (including flue gas) caused by a reduction in temperature or increase in pressure.

[**CONNECTOR.** The pipe that connects an approved appliance to a chimney, flue or vent.]

CONNECTOR, APPLIANCE (Fuel). Rigid metallic pipe and fittings or a listed and labeled device that connects an appliance to the gas piping system.

CONNECTOR, CHIMNEY OR VENT. The pipe that connects an appliance to a chimney or vent.]

CONSTRUCTION DOCUMENTS. Plans and specifications and other written, graphic and pictorial documents, prepared or assembled for describing the design, location, [and] physical characteristics[, of the] and other elements of the project necessary for obtaining a building permit. See Section 28-101.5 of the *Administrative Code*. [.]

CONTROL. A manual or automatic device designed to regulate the gas, air, water or electrical supply to, or operation of, a mechanical system.

CONVERSION BURNER. A unit consisting of a burner and its controls for installation in an appliance originally utilizing another fuel.

COUNTER APPLIANCES. Appliances such as coffee brewers and coffee urns and any appurtenant water-heating [equipment] appliance, food and dish warmers, hot plates, griddles, waffle bakers and other appliances designed for installation on or in a counter.

CUBIC FOOT. The amount of gas that occupies 1 cubic foot (0.02832 m³) when at a temperature of 60°F (16°C), saturated with water vapor and under a pressure equivalent to that of 30 inches of mercury (101 kPa).

DAMPER. A manually or automatically controlled device to regulate draft or the rate of flow of air or combustion gases.

DECORATIVE APPLIANCE, VENTED. A vented appliance wherein the primary function lies in the aesthetic effect of the flames.

DECORATIVE APPLIANCES FOR INSTALLATION IN VENTED FIREPLACES. A vented appliance designed for installation within the fire chamber of a vented fireplace, wherein the primary function lies in the aesthetic effect of the flames.

DECORATIVE SHROUD. A partial non-combustible enclosure for aesthetic purposes that is installed at the termination of a venting system that surrounds or conceals the chimney or vent cap.

DEMAND. The maximum amount of gas input required per unit of time, usually expressed in cubic feet per hour ($1 \text{ ft}^3 = 0.0283 \text{ m}^3$), or Btu/h ($1 \text{ Btu/h} = 0.293 \text{ W}$).

DILUTION AIR. Air that is introduced into a draft hood and is mixed with the flue gases.

DIRECT-VENT APPLIANCES. Appliances that are constructed and installed so that all air for combustion is derived directly from the outside atmosphere and all flue gases are discharged directly to the outside atmosphere.

DRAFT. The pressure difference existing between the [equipment] appliance or any component part and the atmosphere, that causes a continuous flow of air and products of combustion through the gas passages of the appliance to the atmosphere.

Mechanical or induced draft. The pressure difference created by the action of a fan, blower or ejector, that is located between the appliance and the chimney or vent termination.

Natural draft. The pressure difference created by a vent or chimney because of its height, and the temperature difference between the flue gases and the atmosphere.

DRAFT HOOD. A nonadjustable device built into an appliance, or made as part of the vent connector from an appliance, that is designed to (1) provide for ready escape of the flue gases from the appliance in the event of no draft, backdraft or stoppage beyond the draft hood, (2) prevent a backdraft from entering the appliance, and (3) neutralize the effect of stack action of the chimney or gas vent upon operation of the appliance.

DRAFT REGULATOR. A device that functions to maintain a desired draft in the appliance by automatically reducing the draft to the desired value.

DRIP. A nipple and cap placed at a lowpoint in a system of piping to collect condensate and from which the condensate is removable.

DRY GAS. A gas having a moisture and hydrocarbon dew point below any normal temperature to which the gas piping is exposed.

DUCT FURNACE. A warm-air furnace normally installed in an air distribution duct to supply warm air for heating. This definition shall apply only to a warm-air heating appliance that depends for air circulation on a blower not furnished as part of the furnace.

DUCT SYSTEM. A continuous passageway for the transmission air that, in addition to ducts, includes duct fittings, dampers, plenums, fans and accessory air-handling equipment and appliances.

DWELLING. A building or structure which is occupied in whole or in part as the home, residence or sleeping place of one or more families.

DWELLING UNIT. A single unit consisting of one or more habitable rooms and occupied or arranged to be occupied as a unit separate from all other units within a dwelling.

ENGINEER. A person licensed and registered to practice the profession of engineering under the *Education Law of the State of New York*.

EQUIPMENT. [See “Appliance.”] Any apparatus or device that delivers gas as a fuel or raw material to an appliance or vents combustion products from an appliance, including but not limited to control devices, pressure regulators, valves, appliance appurtenances, gas connectors, or power exhausters used in connections to appliances.

EXTERIOR MASONRY CHIMNEYS. Masonry chimneys exposed to the outdoors on one or more sides below the roof line.

FIREPLACE. A fire chamber and hearth constructed of noncombustible material for use with solid fuels and provided with a chimney.

[Masonry fireplace. A hearth and fire chamber of solid masonry units such as bricks, stones, listed masonry units or reinforced concrete, provided with a suitable chimney.]

Factory-built fireplace. A fireplace composed of listed factory-built components assembled in accordance with the terms of listing to form the completed fireplace.

Masonry fireplace. A hearth and fire chamber of solid masonry units such as bricks, stones, listed masonry units or reinforced concrete, provided with a suitable chimney.

FIRING VALVE. A valve of the plug and barrel type designed for use with gas, and equipped with a lever handle for manual operation and a dial to indicate the percentage of opening.

FLAME SAFEGUARD. A device that will automatically shut off the fuel supply to a main burner or group of burners when the means of ignition of such burners becomes inoperative, and when flame failure occurs on the burner or group of burners.

FLOOR FURNACE. A completely self-contained furnace suspended from the floor of the space being heated, taking air for combustion from outside such space and with means for observing flames and lighting the appliance from such space.

[**Gravity type.** A floor furnace depending primarily upon circulation of air by gravity. This classification shall also include floor furnaces equipped with booster-type fans which do not materially restrict free circulation of air by gravity flow when such fans are not in operation.]

Fan type. A floor furnace equipped with a fan which provides the primary means for circulating air.

Gravity type. A floor furnace depending primarily upon circulation of air by gravity. This classification shall also include floor furnaces equipped with booster-type fans which do not materially restrict free circulation of air by gravity flow when such fans are not in operation.

FLUE. A passageway within a chimney or vent through which gaseous combustion products pass.

FLUE, APPLIANCE. The passage(s) within an appliance through which combustion products pass from the combustion chamber of the appliance to the draft hood inlet opening on an appliance equipped with a draft hood or to the outlet of the appliance on an appliance not equipped with a draft hood.

FLUE COLLAR. That portion of an appliance designed for the attachment of a draft hood, vent connector or venting system.

FLUE GASES. Products of combustion plus excess air in appliance flues or heat exchangers.

FLUE LINER (LINING). A system or material used to form the inside surface of a flue in a chimney or vent, for the purpose of protecting the surrounding structure from the effects of combustion products and for conveying combustion products without leakage into the atmosphere.

FUEL GAS. [Fuel gases include: a)A natural gas, manufactured gas, liquefied petroleum gas[, hydrogen gas and] or mixtures of these gases.

FUEL GAS UTILIZATION EQUIPMENT. See “Appliance.”

FURNACE. A completely self-contained heating unit that is designed to supply heated air to spaces remote from or adjacent to the appliance location.

FURNACE, CENTRAL. A self-contained appliance for heating air by transfer of heat of combustion through metal to the air, and designed to supply heated air through ducts to spaces remote from or adjacent to the appliance location.

Downflow furnace. A furnace designed with airflow discharge vertically downward at or near the bottom of the furnace.

Forced-air furnace with cooling unit. A single-package unit, consisting of a gas-fired forced-air furnace of one of the types listed below combined with an electrically or fuel gas-powered summer air-conditioning system, contained in a common casing.

Forced-air type. A central furnace equipped with a fan or blower which provides the primary means for circulation of air.

Gravity furnace with booster fan. A furnace equipped with a booster fan that does not materially restrict free circulation of air by gravity flow when the fan is not in operation.

Gravity type. A central furnace depending primarily on circulation of air by gravity.

Horizontal forced-air type. A furnace with airflow through the appliance essentially in a horizontal path.

Multiple-position furnace. A furnace designed so that it can be installed with the airflow discharge in the upflow, horizontal or downflow direction.

Upflow furnace. A furnace designed with airflow discharge vertically upward at or near the top of the furnace. This classification includes “highboy” furnaces with the blower mounted below the heating element and “lowboy” furnaces with the blower mounted beside the heating element.

FURNACE, ENCLOSED. A specific heating, or heating and ventilating, furnace incorporating an integral total enclosure and using only outside air for combustion.

FURNACE PLENUM. An air compartment or chamber to which one or more ducts are connected and which forms part of an air distribution system.

GAS CONVENIENCE OUTLET. A permanently mounted, manually operated device that provides the means for connecting an appliance to, and disconnecting an appliance from, the supply piping. The device includes an integral, manually operated valve with a nondisplaceable valve member and is designed so that disconnection of an appliance only occurs when the manually operated valve is in the closed position.

GAS PIPING. An installation of pipe, valves or fittings installed on a premises or in a building and utilized to convey fuel gas.

GAS UTILIZATION EQUIPMENT. An appliance that utilizes gas as a fuel or raw material or both.

HAZARDOUS LOCATION. Any location considered to be a fire hazard for flammable vapors, dust, combustible fibers or other highly combustible substances. The location is not necessarily categorized in the *New York City Building Code* as a high-hazard group classification.

HOUSE PIPING. See “Piping system.”

IGNITION PILOT. A pilot that operates during the lighting cycle and discontinues during main burner operation.

IGNITION SOURCE. A flame, spark or hot surface capable of igniting flammable vapors or fumes. Such sources include appliance burners, burner ignitors, and electrical switching devices.

INCINERATOR. An appliance used to reduce combustible refuse material to ashes and which is manufactured, sold and installed as a complete unit.

INDUSTRIAL AIR HEATERS, DIRECT-FIRED NONRECIRCULATING. A heater in which all the products of combustion generated by the burners are released into the air stream being heated. The purpose of the heater is to offset building heat loss by heating only outdoor air.

INDUSTRIAL AIR HEATERS, DIRECT-FIRED RECIRCULATING. A heater in which all the products of combustion generated by the burners are released into the air stream being heated. The purpose of the heater is to offset building heat loss by heating outdoor air, and, if applicable, indoor air.

INFRARED RADIANT HEATER. A heater that directs a substantial amount of its energy output in the form of infrared radiant energy into the area to be heated. Such heaters are of either the vented or unvented type.

INTEGRAL VENT APPLIANCES. Appliances designed for outdoor installation that have built-in natural or mechanical venting means and are constructed and installed so that all air for combustion is derived from the outdoor atmosphere and all flue gases are discharged to the outdoor atmosphere through an integral vent termination.

INTERLOCK. A device actuated by another device with which it is directly associated, to govern succeeding operations of the same or allied devices. A circuit in which a given action cannot occur until after one or more other actions have taken place.

JOINT, FLANGED. A joint made by bolting together a pair of flanged ends.

JOINT, FLARED. A metal-to-metal compression joint in which a conical spread is made on the end of a tube that is compressed by a flare nut against a mating flare.

JOINT, MECHANICAL. A general form of gas-tight joints obtained by the joining of metal parts through a positive-holding mechanical construction, such as flanged joint, threaded joint, flared joint or compression joint.

JOINT, PLASTIC ADHESIVE. A joint made in thermoset plastic piping by the use of an adhesive substance which forms a continuous bond between the mating surfaces without dissolving either one of them.

JOINT, PLASTIC HEAT FUSION. A joint made in thermoplastic piping by heating the parts sufficiently to permit fusion of the materials when the parts are pressed together.

JOINT, WELDED. A gas-tight joint obtained by the joining of metal parts in molten state.

LABEL. Identification applied to material by the manufacturer or an approved agency that contains the name of the manufacturer, the function and performance characteristics of the material, and the name and identification of the approved agency that conducted the evaluation of a representative sample of such material.

LABELED. [Material] Equipment, appliances, material or products to which has been attached a label, symbol or other identifying mark of the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the [product or material] equipment, appliances, material or products, and the name and identification of an approved agency and that indicates that a representative sample of the equipment, appliances, material, or products has been tested and evaluated by an approved agency for compliance with nationally recognized standards or tests to determine suitable usage in a specified manner. See Section 28-101.5 of the *Administrative Code*.

LEAK CHECK. An operation performed on a gas piping system to verify that the system does not leak. Leakage checks are intended to discover open outlets, defective appliance connections and defects that have developed since the initial installation, normally performed after pressure testing.

LIMIT CONTROL. A device responsive to changes in pressure, temperature or level for turning on, shutting off or throttling the gas supply to an appliance.

LIQUEFIED PETROLEUM GAS or LPG (LP-GAS). Liquefied petroleum gas composed predominately of propane, propylene, butanes or butylenes, or mixtures thereof that is gaseous under normal atmospheric conditions, but is capable of being liquefied under moderate pressure at normal temperatures.

LISTED. Material identified in a list published by an approved agency that maintains periodic inspection of production of listed material or periodic evaluation of services and whose listing states either that the material meets identified nationally recognized standards or has been tested and found suitable for a specified purpose when installed in accordance with the manufacturer's installation instructions. See Section 28-101.5 of the *Administrative Code*.

LIVING SPACE. Space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes.

LOG LIGHTER. A manually operated solid fuel ignition appliance for installation in a vented solid fuel-burning fireplace.

LUBRICATED PLUG-TYPE VALVE. A valve of the plug and barrel type provided with means for maintaining a lubricant between the bearing surfaces.

MAIN BURNER. A device or group of devices essentially forming an integral unit for the final conveyance of gas or a mixture of gas and air to the combustion zone, and in which combustion takes place to accomplish the function for which the appliance is designed.

[MECHANICAL EXHAUST SYSTEM. Equipment installed in and made a part of the vent, which will provide a positive induced draft.]

METER. The instrument installed to measure the volume of gas delivered through it.

MODULATING. Modulating or throttling is the action of a control from its maximum to minimum position in either predetermined steps or increments of movement as caused by its actuating medium.

[MP REGULATOR. A medium-pressure gas regulator, the capacity of which shall be determined by the manufacturer.]

NPS. An abbreviation for “Nominal pipe size.”

OCCUPANCY. The purpose or activity for which a building or space is used or is designed, arranged or intended to be used.

OFFSET (VENT). A combination of approved bends that makes two changes in direction bringing one section of the vent out of line but into a line parallel with the other section.

ORIFICE. The opening in a cap, spud or other device whereby the flow of gas is limited and through which the gas is discharged to the burner.

OUTLET. [A threaded connection or bolted flange in a pipe system to which a gas-burning appliance is attached.] The point at which a gas-fired appliance connects to the gas piping system.

OXYGEN DEPLETION SAFETY SHUTOFF SYSTEM (ODS). A system designed to act to shut off the gas supply to the main and pilot burners if the oxygen in the surrounding atmosphere is reduced below a predetermined level.

PILOT. A small flame that is utilized to ignite the gas at the main burner or burners.

PIPING. Where used in this code, “piping” refers to either pipe or tubing, or both.

Pipe. A rigid conduit of iron, steel, copper, brass or plastic.

Tubing. Semirigid conduit of copper, aluminum, plastic or steel.

PIPING SYSTEM. All fuel piping, valves and fittings from the outlet of the point of delivery to the outlets of the [equipment] appliance shutoff valves.

PLASTIC, THERMOPLASTIC. A plastic that is capable of being repeatedly softened by increase of temperature and hardened by decrease of temperature.

POINT OF DELIVERY. For natural gas systems, the point of delivery is the outlet of the service meter assembly[, or the outlet of the service regulator or service shutoff valve where a meter is not provided. Where a valve is provided at the outlet of the service meter assembly, such valve shall be considered to be downstream of the point of delivery. For undiluted liquefied petroleum gas systems, the point of delivery shall be considered the outlet of the first-stage pressure regulator that provides utilization pressure, exclusive of line gas regulators].

PORTABLE FUEL CELL APPLIANCE. A fuel cell generator of electricity, which is not fixed in place. A portable fuel cell appliance utilizes a cord and plug connection to a grid-isolated load and has an integral fuel supply.

PRESSURE DROP. The loss in pressure due to friction or obstruction in pipes, valves, fittings, regulators and burners.

PRESSURE TEST. An operation performed to verify the gas-tight integrity of gas piping following its installation or modification.

PURGE. To free a gas conduit of air or gas, or a mixture of gas and air.

QUICK-DISCONNECT DEVICE. A hand-operated device that provides a means for connecting and disconnecting an appliance or an appliance connector to a gas supply and that is equipped with an automatic means to shut off the gas supply when the device is disconnected.

READY ACCESS (TO). That which enables a device, appliance or equipment to be directly reached, without requiring the removal or movement of any panel, door or similar obstruction (see “Access”).

REGISTERED DESIGN PROFESSIONAL. An architect or engineer.

REGISTERED DESIGN PROFESSIONAL OF RECORD. The registered design professional who prepared or supervised the preparation of applicable construction documents filed with the department.

REGULATOR. A device for controlling and maintaining a uniform supply pressure, either pounds-to-inches water column (MP regulator) or inches-to-inches water column (appliance regulator).

REGULATOR, GAS APPLIANCE. A pressure regulator for controlling pressure to the manifold of [equipment]the appliance. Types of appliance regulators are as follows:

Adjustable.

- 1. Spring type, limited adjustment.** A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is adjustable over a range of not more than 15 percent of the outlet pressure at the midpoint of the adjustment range.
- 2. Spring type, standard adjustment.** A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is adjustable. The adjustment means shall be concealed.

Multistage. A regulator for use with a single gas whose adjustment means is capable of being positioned manually or automatically to two or more predetermined outlet pressure settings. Each of these settings shall be adjustable or nonadjustable. The regulator may modulate outlet pressures automatically between its maximum and minimum predetermined outlet pressure settings.

Nonadjustable.

- 1. Spring type, nonadjustable.** A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is not field adjustable.
- 2. Weight type.** A regulator in which the regulating force acting upon the diaphragm is derived from a weight or combination of weights.

REGULATOR, LINE GAS PRESSURE. A device placed in a gas line between the service pressure regulator and the [equipment]appliance for controlling, maintaining or reducing the pressure in that portion of the piping system downstream of the device.

[REGULATOR, MEDIUM-PRESSURE. A medium-pressure (MP) regulator reduces the gas piping pressure to the appliance regulator or to the appliance utilization pressure.]

REGULATOR, MEDIUM-PRESSURE (MP Regulator). A line pressure regulator that reduces gas pressure from the range of greater than 0.5 psig (3.4 kPa) and less than or equal to 5 psig (34.5 kPa) to a lower pressure.

REGULATOR, PRESSURE. A device placed in a gas line for reducing, controlling and maintaining the pressure in that portion of the piping system downstream of the device.

REGULATOR, SERVICE PRESSURE. A device installed by the serving gas supplier to reduce and limit the service line pressure to delivery pressure.

RELIEF OPENING. The opening provided in a draft hood to permit the ready escape to the atmosphere of the flue products from the draft hood in the event of no draft, back draft, or stoppage beyond the draft hood, and to permit air into the draft hood in the event of a strong chimney updraft.

RELIEF VALVE (DEVICE). A safety valve designed to forestall the development of a dangerous condition by relieving either pressure, temperature or vacuum in the hot water supply system.

RELIEF VALVE, PRESSURE. An automatic valve that opens and closes a relief vent, depending on whether the pressure is above or below a predetermined value.

RELIEF VALVE, TEMPERATURE.

Manual reset type. A valve that automatically opens a relief vent at a predetermined temperature and that must be manually returned to the closed position.

Reseating or self-closing type. An automatic valve that opens and closes a relief vent, depending on whether the temperature is above or below a predetermined value.

[**Manual reset type.** A valve that automatically opens a relief vent at a predetermined temperature and that must be manually returned to the closed position.]

RELIEF VALVE, VACUUM. A valve that automatically opens and closes a vent for relieving a vacuum within the hot water supply system, depending on whether the vacuum is above or below a predetermined value.

RISER, GAS. A vertical pipe supplying fuel gas.

ROOM HEATER, UNVENTED. See “Unvented room heater.”

ROOM HEATER, VENTED. See “Vented room heater.”

ROOM LARGE IN COMPARISON WITH SIZE OF [EQUIPMENT]THE APPLIANCE. Rooms having a volume equal to at least 12 times the total volume of a furnace, water heater or air-conditioning appliance and at least 16 times the total volume of a boiler. Total volume of the appliance is determined from exterior dimensions and is to include

fan compartments and burner vestibules, when used. When the actual ceiling height of a room is greater than 8 feet (2438 mm), the volume of the room is figured on the basis of a ceiling height of 8 feet (2438 mm).

SAFETY SHUTOFF DEVICE. See “Flame safeguard.”

SERVICE PIPING. All fuel-gas piping, valves and fittings upstream of the point of delivery.

SHAFT. An enclosed space extending through one or more stories of a building, connecting vertical openings in successive floors, or floors and the roof.

SLEEPING UNIT. A dwelling unit, which may contain either toilet or kitchen facilities but not both. Any sleeping unit housing more than one family shall also be classified as a congregate living unit. The creation of or conversion to sleeping units shall be limited by Section 27-2077 of the New York City Housing Maintenance Code.

SPECIFIC GRAVITY. As applied to gas, specific gravity is the ratio of the weight of a given volume to that of the same volume of air, both measured under the same condition.

STATIONARY FUEL CELL POWER PLANT. A self-contained package or factory-matched packages which constitute an automatically operated assembly of integrated systems for generating electrical energy and recoverable thermal energy that is permanently connected and fixed in place.

THERMOSTAT

Electric switch type. A device that senses changes in temperature and controls electrically, by means of separate components, the flow of gas to the burner(s) to maintain selected temperatures.

Integral gas valve type. An automatic device, actuated by temperature changes, designed to control the gas supply to the burner(s) in order to maintain temperatures between pre-determined limits, and in which the thermal actuating element is an integral part of the device.

- 1. Graduating thermostat.** A thermostat in which the motion of the valve is approximately in direct proportion to the effective motion of the thermal element induced by temperature change.
- 2. Snap-acting thermostat.** A thermostat in which the thermostatic valve travels instantly from the closed to the open position, and vice versa.

TRANSITION FITTINGS, PLASTIC TO STEEL. An adapter for joining plastic pipe to steel pipe. The purpose of this fitting is to provide a permanent, pressure-tight connection between two materials which cannot be joined directly one to another.

UNIT HEATER

High-static pressure type. A self-contained, automatically controlled, vented appliance having integral means for circulation of air against 0.2 inch (15 mm H₂O) or greater static pressure. Such appliance is equipped with provisions for attaching an outlet air duct and, where the appliance is for indoor installation remote from the space to be heated, is also equipped with provisions for attaching an inlet air duct.

Low-static pressure type. A self-contained, automatically controlled, vented appliance, intended for installation in the space to be heated without the use of ducts, having integral means for circulation of air. Such units are allowed to be equipped with louvers or face extensions made in accordance with the manufacturer's specifications.

UNLISTED BOILER. A boiler not listed by a nationally recognized testing agency.

UNVENTED ROOM HEATER. An unvented heating appliance designed for stationary installation and utilized to provide comfort heating. Such appliance provides radiant heat or convection heat by gravity or fan circulation directly from the heater and does not utilize ducts.

VALVE. A device used in piping to control the gas supply to any section of a system of piping or to an appliance.

Appliance shutoff. A valve located in the piping system, used to isolate individual appliances for purposes such as service or replacement.

Automatic. An automatic or semiautomatic device consisting essentially of a valve and operator that control the gas supply to the burner(s) during operation of an appliance. The operator shall be actuated by application of gas pressure on a flexible diaphragm, by electrical means, by mechanical means, or by other approved means.

Automatic gas shutoff. A valve used in conjunction with an automatic gas shutoff device to shut off the gas supply to a water-heating system. It shall be constructed integrally with the gas shutoff device or shall be a separate assembly.

[**Equipment shutoff.** A valve located in the piping system, used to isolate individual equipment for purposes such as service or replacement.]

Individual main burner. A valve that controls the gas supply to an individual main burner.

Main burner control. A valve that controls the gas supply to the main burner manifold.

Manual main gas-control. A manually operated valve in the gas line for the purpose of completely turning on or shutting off the gas supply to the appliance, except to pilot or pilots that are provided with independent shutoff.

Manual reset. An automatic shutoff valve installed in the gas supply piping and set to shut off when unsafe conditions occur. The device remains closed until manually reopened.

Service shutoff. A valve, installed by the serving gas supplier between the service meter or source of supply and the customer piping system, to shut off the entire piping system.

VENT. A pipe or other conduit composed of factory-made components, containing a passageway for conveying combustion products and air to the atmosphere, listed and labeled for use with a specific type or class of appliance.

Special gas vent. A vent listed and labeled for use with listed Category II, III and IV appliances.

Type B vent. A vent listed and labeled for use with appliances with draft hoods and other Category I appliances that are listed for use with Type B vents.

Type BW vent. A vent listed and labeled for use with wall furnaces.

Type L vent. A vent listed and labeled for use with appliances that are listed for use with Type L or Type B vents.

VENT CONNECTOR. See “Connector.”

VENT GASES. Products of combustion from appliances plus excess air plus dilution air in the vent connector, gas vent or chimney above the draft hood or draft regulator.

VENT PIPING.

Breather. Piping run from a pressure-regulating device to the outdoors, designed to provide a reference to atmospheric pressure. If the device incorporates an integral pressure relief mechanism, a breather vent can also serve as a relief vent.

Relief. Piping run from a pressure-regulating or pressure-limiting device to the outdoors, designed to provide for the safe venting of gas in the event of excessive pressure in the gas piping system.

VENTED APPLIANCE CATEGORIES. Appliances that are categorized for the purpose of vent selection are classified into the following four categories:

Category I. An appliance that operates with a nonpositive vent static pressure and with a vent gas temperature that avoids excessive condensate production in the vent.

Category II. An appliance that operates with a nonpositive vent static pressure and with a vent gas temperature that is capable of causing excessive condensate production in the vent.

Category III. An appliance that operates with a positive vent static pressure and with a vent gas temperature that avoids excessive condensate production in the vent.

Category IV. An appliance that operates with a positive vent static pressure and with a vent gas temperature that is capable of causing excessive condensate production in the vent.

VENTED ROOM HEATER. A vented self-contained, free-standing, nonrecessed appliance for furnishing warm air to the space in which it is installed, directly from the heater without duct connections.

VENTED WALL FURNACE. A self-contained vented appliance complete with grilles or equivalent, designed for incorporation in or permanent attachment to the structure of a building, mobile home or travel trailer, and furnishing heated air circulated by gravity or by a fan directly into the space to be heated through openings in the casing. This definition shall exclude floor furnaces, unit heaters and central furnaces as herein defined.

VENTING SYSTEM. A continuous open passageway from the flue collar or draft hood of an appliance to the outside atmosphere for the purpose of removing flue or vent gases. A venting system is usually composed of a vent or a chimney and vent connector, if used, assembled to form the open passageway.

[**Mechanical draft venting system.** A venting system designed to remove flue or vent gases by mechanical means, that consists of an induced draft portion under nonpositive static pressure or a forced draft portion under positive static pressure.]

Forced-draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under positive static vent pressure.

Induced draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under nonpositive static vent pressure.

Mechanical draft venting system. A venting system designed to remove flue or vent gases by mechanical means, that consists of an induced draft portion under nonpositive static pressure or a forced draft portion under positive static pressure.

Natural draft venting system. A venting system designed to remove flue or vent gases under nonpositive static vent pressure entirely by natural draft.

WALL HEATER, UNVENTED-TYPE. A room heater of the type designed for insertion in or attachment to a wall or partition. Such heater does not incorporate concealed venting arrangements in its construction and discharges all products of combustion through the front into the room being heated.

WATER HEATER. Any heating appliance or equipment that heats potable water and supplies such water to the potable hot water distribution system.

Subpart 3 (Chapter 3 of the New York City Fuel Gas Code)

§1. Chapter 3 of the New York city fuel gas code, as added by local law number 33 for the year 2007, section 301.2 as amended by local law number 85 for the year 2009, section 304.10 as amended by local law number 8 for the year 2008, is amended to read as follows:

CHAPTER 3 GENERAL REGULATIONS

SECTION FGC 301 GENERAL

301.1 Scope. This chapter shall govern the approval and installation of all equipment and appliances that comprise parts of the installations regulated by this code in accordance with Section 101.2.

301.1.1 Other fuels. The requirements for combustion and dilution air for gas-fired appliances shall be governed by Section 304. The requirements for combustion and dilution air for appliances operating with fuels other than fuel gas shall be regulated by the *New York City Mechanical Code*.

301.2 Energy utilization. Heating, ventilating and air-conditioning systems of all structures shall be designed and installed for efficient utilization of energy in accordance with the *New York City Energy Conservation Code*.

301.3 Listed and labeled. Appliances regulated by this code shall be listed and labeled.

301.4 Labeling. Refer to Section 28-113.4 of the *Administrative Code* and Article 114 of Chapter 1 of Title 28 of the *Administrative Code*.

301.5 Label information. A permanent factory-applied nameplate(s) shall be affixed to appliances on which shall appear, in legible lettering, the manufacturer's name or trademark, the model number, serial number and, for listed appliances, the seal or mark of the testing agency. A label shall also include the hourly rating in British thermal units per hour (Btu/h) (W), the type of fuel approved for use with the appliance; and the minimum clearance requirements.

301.6 Plumbing connections. Potable water supply and building drainage system connections to appliances regulated by this code shall be in accordance with the *New York City Plumbing Code*.

[**301.7 Fuel types.** Appliances shall be designed for use with the type of fuel gas to which they will be connected and the altitude at which they are installed. Appliances that comprise parts of the installation shall not be converted for the usage of a different fuel, except where approved and converted in accordance with the manufacturer's instructions. The fuel gas input rate shall not be increased or decreased beyond the limit rating for the altitude at which the appliance is installed.]

301.7 Fuel types. Appliances shall be designed for use with the type of fuel gas that will be supplied to them.

301.7.1 Appliance fuel conversion. Appliances shall not be converted to utilize a different fuel gas except where complete instructions for such conversion are provided in the installation instructions by the serving gas supplier or by the appliance manufacturer.

[**301.7.1**] **301.7.2 Liquid petroleum gas.** Storage or use of LPG for a stationary LPG installation shall comply with the *New York City Fire Code*.

301.8 Vibration isolation. Where means for isolation of vibration of an appliance is installed, means for support and restraint of that appliance shall be provided as designed by a registered design professional.

301.9 Repair. Defective material or parts shall be replaced or repaired in such a manner so as to preserve the original approval or listing.

301.10 Wind resistance. Appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with the *New York City Building Code*.

301.11 Flood hazard. For structures located in areas of special flood hazard, the appliance, equipment and system installations regulated by this code shall comply with Appendix G of the *New York City Building Code*.

301.12 Seismic resistance. When earthquake loads are applicable in accordance with the *New York City Building Code*, the supports shall be designed and installed for the seismic forces in accordance with that code.

301.13 Ducts. All ducts required for the installation of systems regulated by this code shall be designed and installed in accordance with the *New York City Mechanical Code*.

301.14 Rodentproofing. Buildings or structures and the walls enclosing habitable or occupiable rooms and spaces in which persons live, sleep or work, or in which feed, food or foodstuffs are stored, prepared, processed, served or sold, shall be constructed to protect against rodents in accordance with the *New York City Building Code*.

301.15 Prohibited location. The appliances, equipment and systems regulated by this code shall not be located in an elevator shaft.

301.16 Mechanical systems. Hydronic piping, ventilation and other mechanical systems not covered by this code shall be in accordance with the *New York City Mechanical Code*.

301.17 Electrical systems. Electrical wiring, controls and connections to equipment and appliances regulated by this code shall be in accordance with the *New York City Electrical Code*.

301.18 Noise control requirements. Appliances and equipment regulated by this code must comply with Section 928 of the *New York City Mechanical Code*.

SECTION FGC 302 STRUCTURAL SAFETY

302.1 Structural safety. The building shall not be weakened by the installation of any gas piping. In the process of installing or repairing any gas piping, the finished floors, walls, ceilings, tile work or any other part of the building or premises which is required to be changed or replaced shall be left in a safe structural condition in accordance with the requirements of the *New York City Building Code*.

302.2 Penetrations of floor/ceiling assemblies and fire-resistance-rated assemblies. Penetrations of floor/ceiling assemblies and assemblies required to have a fire-resistance rating shall be protected in accordance with the *New York City Building Code*.

302.3 Cutting, notching and boring in wood members. The cutting, notching and boring of wood members shall comply with Sections 302.3.1 through 302.3.4.

302.3.1 Engineered wood products. Cuts, notches and holes bored in trusses, [laminated veneer] structural composite lumber, structural glued-laminated members and I-joists are prohibited except where permitted by the manufacturer's recommendations or where the effects of such alterations are specifically considered in the design of the member by a registered design professional.

302.3.2 Joist notching and boring. Notching at the ends of joists shall not exceed one-fourth the joist depth. Holes bored in joists shall not be within 2 inches (51 mm) of the top and bottom of the joist and their diameter shall not exceed one-third the depth of the member. Notches in the top or bottom of the joist shall not exceed one-sixth the depth and shall not be located in the middle one-third of the span.

302.3.3 Stud cutting and notching. In exterior walls and bearing partitions, any wood stud is permitted to be cut or notched to a depth not exceeding 25 percent of its width. Cutting or notching of studs to a depth not greater than 40 percent of the width of the stud is permitted in nonload-bearing partitions supporting no loads other than the weight of the partition.

302.3.4 Bored holes. A hole not greater in diameter than 40 percent of the stud depth is permitted to be bored in any wood stud. Bored holes not greater than 60 percent of the depth of the stud are permitted in nonload-bearing partitions or in any wall where each bored stud is doubled, provided not more than two such successive doubled studs are so bored. In no case shall the edge of the bored hole be nearer than $\frac{5}{8}$ inch (15.9 mm) to the edge of the stud. Bored holes shall not be located at the same section of stud as a cut or notch.

302.4 Alterations to trusses. Truss members and components shall not be cut, drilled, notched, spliced or otherwise altered in any way without the written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, water heaters) shall not be permitted without verification that the truss is capable of supporting such additional loading.

302.5 Cutting, notching and boring holes in structural steel framing. The cutting, notching and boring of holes in structural steel framing members shall be as prescribed by the registered design professional.

302.6 Cutting, notching and boring holes in cold-formed steel framing. Flanges and lips of load-bearing, cold-formed steel framing members shall not be cut or notched. Holes in webs of load-bearing, cold-formed steel framing members shall be permitted along the centerline of the web of the framing member and shall not exceed the dimensional limitations, penetration spacing or minimum hole edge distance as prescribed by a registered design professional.

Cutting, notching and boring holes of steel floor/roof decking shall be as prescribed by a registered design professional.

302.7 Cutting, notching and boring holes in nonstructural cold-formed steel wall framing. Flanges and lips of nonstructural cold-formed steel wall studs shall be permitted along the centerline of the web of the framing member, shall not exceed 1½ inches (38 mm) in width or 4 inches (102 mm) in length, and the holes shall not be spaced less than 24 inches (610 mm) center to center from another hole or less than 10 inches (254 mm) from the bearing end.

SECTION FGC 303 APPLIANCE LOCATION

303.1 General. Appliances shall be located as required by this section, specific requirements elsewhere in this code and the conditions of the equipment and appliance listing.

303.2 Hazardous locations. Appliances shall not be located in a hazardous location unless listed and approved for the specific installation.

303.3 Prohibited locations. [Appliances shall not be located in, or obtain combustion air from, any of the following rooms or spaces:] Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces.

[1. Sleeping rooms.]

[2. Bathrooms.]

[3. Toilet rooms.]

[4. Storage closets.]

[5. Surgical rooms.]

Exceptions:

1. In rooms other than those used for sleeping purposes, direct-vent appliances that obtain all combustion air directly from the outdoors and installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. In rooms other than those used for sleeping purposes, [vented room heaters, wall furnaces, vented decorative appliances and decorative appliances for installation in vented solid fuel-burning fireplaces, provided that the room meets the required volume criteria of Section 304.5.] vented room heaters, wall furnaces, vented

decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces that are installed in rooms that meet the required volume criteria of Section 304.5.

3. In rooms other than those used for sleeping purposes, appliances installed in an enclosure in which all combustion air is taken from the outdoors, in accordance with Section 304.6. Access to such enclosure shall be through a solid weather-stripped door, equipped with an approved self-closing device.

303.3.1 Gas-fired direct vent appliances. Gas-fired direct vent space-heating appliances used for providing heat in rooms for sleeping purposes shall be deemed to be located outside of the sleeping room provided that such a unit is factory assembled and manufactured with an integral factory assembled carbon monoxide detector interlock with automatic main gas shut-off valve. Such unit shall be of direct vent type, such that all air for combustion is derived from the outdoors and that all flue gases are discharged directly to the outdoors. All gas piping shall be hard-piped with no flexible connectors. Such unit shall be installed through a sleeve located in an exterior wall. Pursuant to 27-2034 (f) of the *New York City Housing Maintenance Code*, each heater shall be equipped with an effective device which will automatically shut off the gas supply to the heater if its pilot light or other constantly burning flame is extinguished, or in the event of an interruption of the gas supply to the heater, and will not permit the heater to be relighted unless such shut-off device is first reset manually. Installation requirements shall be in accordance with the manufacturer's instructions and the applicable listing.

303.4 Protection from physical damage. Appliances shall not be installed in a location where subject to physical damage, including vehicular impact, unless protected by approved barriers meeting the requirements of the *New York City Fire Code*.

303.5 Indoor locations. Furnaces and boilers installed in closets and alcoves shall be listed for such installation.

303.5.1 Gas Fired Appliances. Gas fired appliances, regardless of btu per hour input, shall be located in an enclosure in accordance with Section 509 of the *New York City Building Code*.

Exception: [1.] Gas fired direct vented appliances with a 350,000 btu per hour input or less may be installed in a non-fire rated enclosure.

303.5.2 Maximum temperature. Maximum indoor temperature in spaces surrounding appliances shall not exceed the operational temperature of the installed equipment and/or 104° F (40°C).

303.6 Outdoor locations. [Equipment]Appliances installed in outdoor locations shall be either listed for outdoor installation or provided with protection from outdoor environmental factors that influence the operability, durability and safety of the [equipment]appliances.

303.7 Pit locations. Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil. The sides of the pit or excavation shall be held back a minimum of 12 inches (305 mm) from the appliance. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry, such concrete or masonry shall extend a minimum of 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. The appliance shall be protected from flooding in a manner approved by the commissioner.

SECTION FGC 304 COMBUSTION, VENTILATION AND DILUTION AIR

304.1 General. Air for combustion, ventilation and dilution of flue gases for [gas utilization equipment] appliances installed in buildings shall be provided by application of one of the methods prescribed in Sections 304.5 through 304.9. Where the requirements of Section 304.5 are not met, outdoor air shall be introduced in accordance with one of the methods prescribed in Sections 304.6 through 304.9. Direct-vent appliances, gas appliances of other than natural draft design and vented gas appliances other than Category I shall be provided with combustion, ventilation and dilution air in accordance with the [equipment] appliance manufacturer's instructions. Combustion, ventilation, and dilution air shall be obtained solely from the outdoors for fuel-burning appliances with an input greater than 350,000 Btu/h.

Exception: Type 1 clothes dryers that are provided with makeup air in accordance with Section 614.5.

304.1.1 Crawl space and attic space. For the purposes of this chapter, an opening to a naturally ventilated crawl space or attic space shall be considered equivalent to an opening to the outdoors.

304.1.2 Crawl space. Where lower combustion air openings connect with crawl spaces, such spaces shall have unobstructed openings to the outdoors at least twice that required for the combustion air openings. The height of the crawl space shall comply with the requirements of the *New York City Building Code* and shall be without obstruction to the free flow of air.

304.1.3 Attic space. Where combustion air is obtained from an attic area, the attic ventilating openings shall not be subject to ice or snow blockage, and the attic shall have not less than 30 inches (762 mm) vertical clear height at its maximum point. Attic ventilation openings shall be sufficient to provide the required volume of combustion air and the attic ventilation required by the *New York City Building Code*. The combustion air openings shall be provided with a sleeve of not less than 0.019 inch (0.48 mm) (No.26 Gage) galva-

nized steel or other approved material extending from the appliance enclosure to at least 6 inches (152 mm) above the top of the ceiling joists and insulation.

304.2 [Appliance/equipment]Appliance location. [Equipment]Appliances shall be located so as not to interfere with proper circulation of combustion, ventilation and dilution air.

304.3 Draft hood/regulator location. Where used, a draft hood or a barometric draft regulator shall be installed in the same room or enclosure as the equipment served so as to prevent any difference in pressure between the hood or regulator and the combustion air supply. A barometric damper may be installed in an adjacent room provided that a louver is installed in the adjacent room to the outside air. The net free area of the louver shall be equal to or greater than the area of the barometric damper.

[**304.4 Makeup air provisions.** Makeup air requirements for the operation of exhaust fans, kitchen ventilation systems, clothes dryers and fireplaces shall be considered in determining the adequacy of a space to provide combustion air requirements.]

304.4 Circulation of air. The equipment and appliances within every room containing fuel-burning appliances shall be installed so as to allow free circulation of air. Provisions shall be made to allow for the simultaneous operation of mechanical exhaust systems, fireplaces or other equipment and appliances operating in the same room or space from which combustion, ventilation, and dilution air is being drawn. Such provisions shall prevent the operation of such appliances, equipment and systems from affecting the supply of combustion, ventilation, and dilution air.

304.4.1 Makeup air for fuel burning devices. Where exhaust fans are installed, makeup air shall be provided to replace the exhausted air. Calculations shall be provided on the construction documents to validate the use of the exhaust fan(s) and compliance with this Chapter.

304.4.2 Ventilation air for fuel burning devices. Where ventilation air is brought in by mechanical means for heat generation mitigation, provisions must be made for proper air balance to prevent a negative or positive pressure in the boiler room and to discharge the ventilation directly to the outside.

304.4.3 Prohibited sources. Openings and ducts shall not connect appliance enclosures with a space in which the operation of a fan will adversely affect the flow of the combustion, ventilation, and dilution air. Combustion, ventilation, and dilution air shall not be subject to ice or snow blockage. No combustion, ventilation, and dilution air inlet shall be less than 30 inches above grade. Combustion, ventilation, and dilution air shall not be obtained from a hazardous location, except where the fuel-fired appliances are located within the hazardous location and are installed in accordance with this code. Combustion, ventilation, and dilution air shall not be taken from a refrigeration machinery room, except where a refrigerant vapor detector system is installed to automatically shut off the

combustion process in the event of refrigerant leakage. For structures in areas of special flood hazard, air shall be obtained from a location complying with Appendix G of the *New York City Building Code*.

304.5 Indoor combustion air. The required volume of indoor air shall be determined in accordance with Section 304.5.1 or 304.5.2, except that where the air infiltration rate is known to be less than 0.40 air changes per hour (ACH), Section 304.5.2 shall be used. The total required volume shall be the sum of the required volume calculated for all appliances located within the space. Rooms communicating directly with the space in which the appliances are installed through openings not furnished with doors, and through combustion air openings sized and located in accordance with Section 304.5.3, are considered to be part of the required volume.

Exception: Combustion, ventilation, and dilution air shall be obtained solely from the outdoors for fuel-burning appliances with an input greater than 350,000 Btu/h.

304.5.1 Standard method. The minimum required volume shall be 50 cubic feet per 1,000 Btu/h (4.8m³/kW) of the appliance input rating.

304.5.2 Known air-infiltration-rate method. Where the air infiltration rate of a structure is known, the minimum required volume shall be determined as follows:

For appliances other than fan-assisted, calculate volume using Equation 3-1.

$$\text{Required Volume}_{\text{other}} \geq \frac{21 \text{ ft}^3}{ACH} \left(\frac{I_{\text{other}}}{1,000 \text{ Btu / hr}} \right)$$

(Equation 3-1)

For fan-assisted appliances, calculate volume using Equation 3-2.

$$\text{Required Volume}_{\text{fan}} \geq \frac{15 \text{ ft}^3}{ACH} \left(\frac{I_{\text{fan}}}{1,000 \text{ Btu / hr}} \right)$$

(Equation 3-2)

where:

I_{other} = All appliances other than fan assisted (input in Btu/h).

I_{fan} = Fan-assisted appliance (input in Btu/h).

ACH = Air change per hour (percent of volume of space exchanged per hour, expressed as a decimal).

For purposes of this calculation, an infiltration rate greater than 0.60 ACH shall not be used in Equations 3-1 and 3-2.

304.5.3 Indoor opening size and location. Openings used to connect indoor spaces shall be sized and located in accordance with Sections 304.5.3.1 and 304.5.3.2 (see Figure 304.5.3).

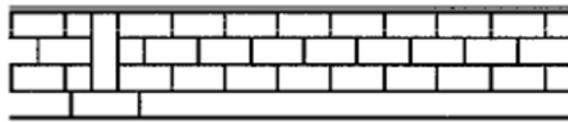

FIGURE 304.5.3
ALL AIR FROM INSIDE THE BUILDING
(See Section 304.5.3)

304.5.3.1 Combining spaces on the same story. Each opening shall have a minimum free area of 1 square inch per 1,000 Btu/h (2200 mm²/kW) of the total input rating of all [gas utilization equipment] appliances in the space, but not less than 100 square inches (0.06 m²). One opening shall commence within 12 inches (305 mm) of the top and one opening shall commence within 12 inches (305 mm) of the bottom of the enclosure. The minimum dimension of air openings shall be not less than 3 inches (76 mm).

304.5.3.2 Combining spaces in different stories. The volumes of spaces in different stories shall be considered as communicating spaces where such spaces are connected by one or more openings in doors or floors having a total minimum free area of 2 square inches per 1,000 Btu/h (4402 mm²/kW) of total input rating of all [gas utilization equipment] appliances.

304.6 Outdoor combustion air. Outdoor combustion air shall be provided through opening(s) to the outdoors in accordance with Section 304.6.1 or 304.6.2. The minimum dimension of air openings shall be not less than 3 inches (76mm). The size of the openings connecting the room to the outdoor air supply shall also comply with any applicable rules of the New York City Department of Environmental Protection.

304.6.1 Two-permanent-openings method. Two permanent openings, one commencing within 12 inches (305mm) of the top and one commencing within 12 inches (305 mm) of the bottom of the enclosure, shall be provided. The openings shall communicate directly, or by ducts, with the outdoors or spaces that freely communicate with the outdoors. Where directly communicating with the outdoors, or where communicating with the outdoors through vertical ducts, each opening shall have a minimum free area of 1 square inch per 4,000 Btu/h (550 mm²/kW) of total input rating of all [equipment] appliances in the enclosure [[(see Figures 304.6.1(1) and 304.6.1(2))]].

Where communicating with the outdoors through horizontal ducts, each opening shall have a minimum free area of not less than 1 square inch per 2,000 Btu/h (1100mm²/kW) of total input rating of all [equipment] appliances in the enclosure. [[(see Figure 304.6.1(3))]].

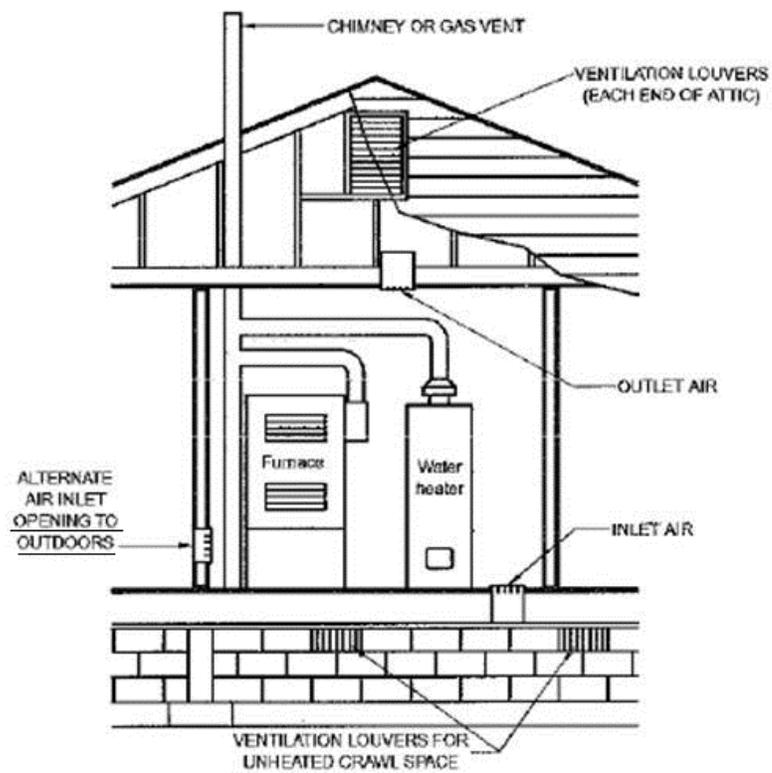

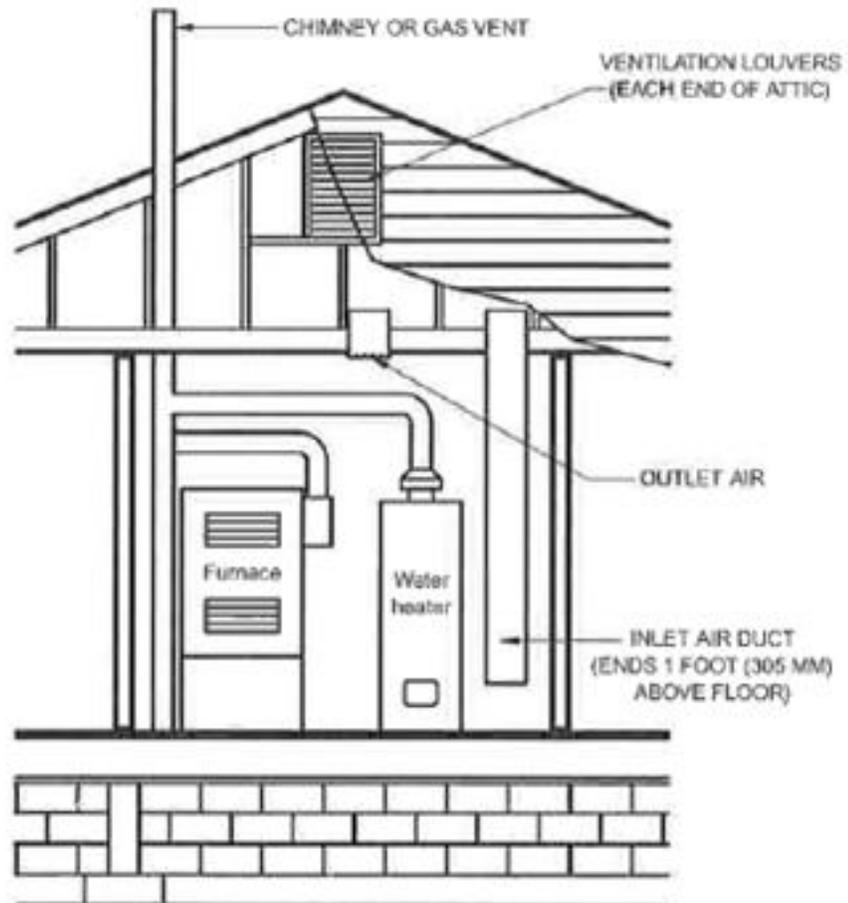

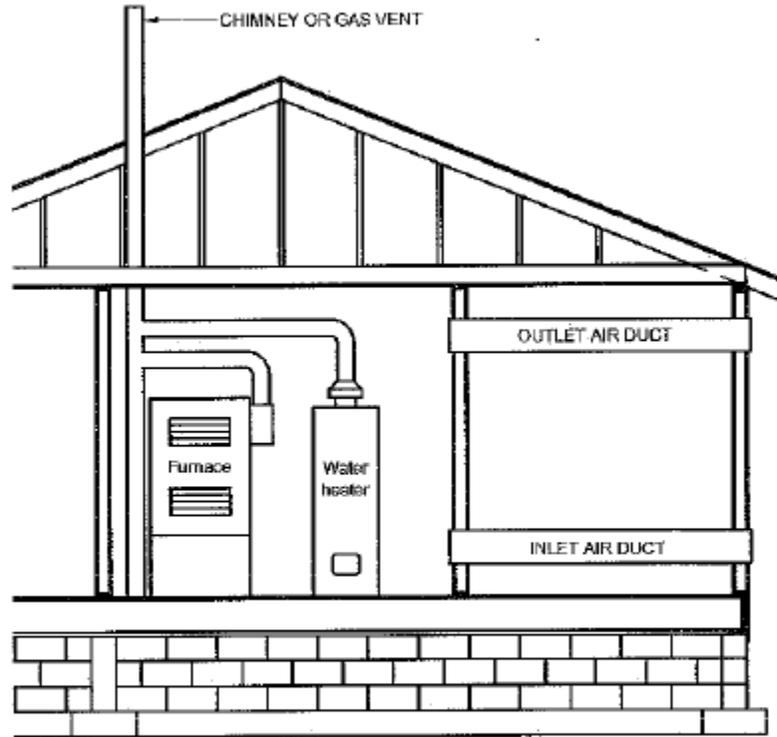

FIGURE 304.6.1(1)
ALL AIR FROM OUTDOOR—INLET AIR FROM VENTILATED
CRAWL SPACE AND OUTLET AIR TO VENTILATED ATTIC
(see Section 304.6.1)

For SI: 1 foot = 304.8 mm.

FIGURE 304.6.1(2)
ALL AIR FROM OUTDOORS THROUGH VENTILATED ATTIC
 (see Section 304.6.1)

For SI: 1 foot = 304.8 mm.

FIGURE 304.6.1(3)
ALL AIR FROM OUTDOORS
 (see Section 304.6.1)

304.6.2 One-permanent-opening method. One permanent opening, commencing within 12 inches (305 mm) of the top of the enclosure, shall be provided. The [equipment]appliance shall have clearances of at least 1 inch (25 mm) from the sides and back and 6 inches (152 mm) from the front of the appliance. The opening shall directly communicate with the outdoors or through a vertical or horizontal duct to the outdoors or spaces that freely communicate with the outdoors (see Figure 304.6.2) and shall have a minimum free area of 1 square inch per 3,000 Btu/h (734 mm²/kW) of the total input rating of all [equipment]appliances located in the enclosure, and not less than the sum of the areas of all vent connectors in the space.

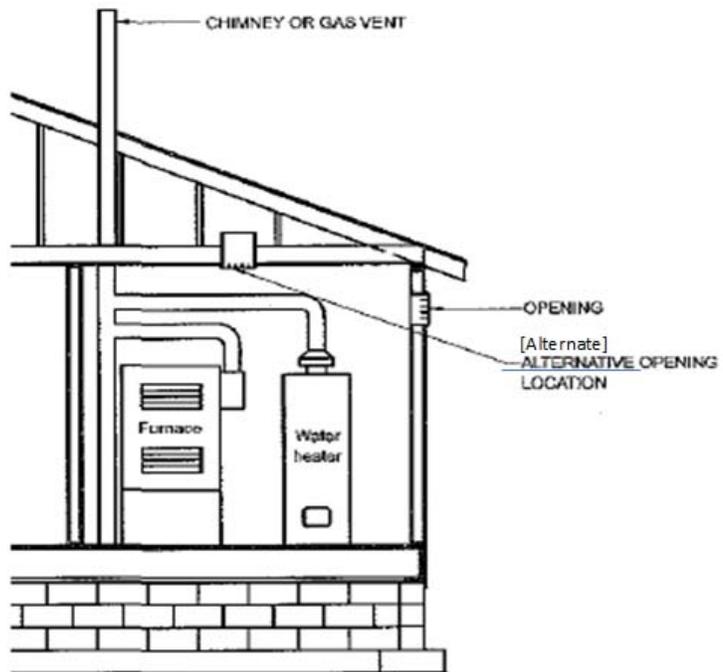

FIGURE 304.6.2
SINGLE COMBUSTION AIR OPENING,
ALL AIR FROM THE OUTDOORS
(see Section 304.6.2)

304.7 Combination indoor and outdoor combustion air. The use of a combination of indoor and outdoor combustion air shall be in accordance with Sections 304.7.1 through 304.7.3.

304.7.1 Indoor openings. Where used, openings connecting the interior spaces shall comply with Section 304.5.3.

304.7.2 Outdoor opening location. Outdoor opening(s) shall be located in accordance with Section 304.6.

304.7.3 Outdoor opening(s) size. The outdoor opening(s) size shall be calculated in accordance with the following:

1. The ratio of interior spaces shall be the available volume of all communicating spaces divided by the required volume.
2. The outdoor size reduction factor shall be one minus the ratio of interior spaces.
3. The minimum size of outdoor opening(s) shall be the full size of outdoor opening(s) calculated in accordance with Section 304.6, multiplied by the reduction factor. The minimum dimension of air openings shall be not less than 3 inches (76 mm).

304.8 Reserved.

304.9 Mechanical combustion air supply. Where all combustion air is provided by a mechanical air supply system, the combustion air shall be supplied from the outdoors at a rate not less than 0.35 cubic feet per minute per 1,000 Btu/h (0.034 m³/min per kW) of total input rating of all appliances located within the space. Combustion air rates shall also comply with any applicable rules of the New York City Department of Environmental Protection. The mechanical air supply shall be sufficient to accommodate combustion air, ventilation air, and dilution air requirements of the installation.

304.9.1 Makeup air. Where exhaust fans are installed, makeup air shall be provided to replace the exhausted air.

304.9.2 Appliance interlock. Each of the appliances served shall be interlocked with the mechanical air supply system to prevent main burner operation when the mechanical air supply system is not in operation. The air flow and the damper operation shall be proven prior to burner operation.

304.9.3 [Combined combustion air and ventilation air system. Where combustion air is provided by the building's mechanical ventilation system, the system shall provide the specified combustion air rate in addition to the required ventilation air.]**Reserved.**

[304.10 Louvers and grilles. The required size of openings for combustion, ventilation and dilution air shall be based on the net free area of each opening. Where the free area through a design of louver, grille or screen is known, it shall be used in calculating the size opening required to provide the free area specified. Where the design and free area of louvers and grilles are not known, it shall be assumed that wood louvers will have 10-percent free area and metal louvers and grilles will have 60-percent free area. Screens shall have a mesh size not smaller than ¼ inch (6.4 mm). Nonmotorized louvers and grilles shall be fixed in the open position. Motorized louvers shall be interlocked with the equipment so that they are proven to be in the full open position prior to main burner ignition and during main burner operation. Means shall be provided to prevent the main burner from igniting if the louvers fail to open during burner start-up and to shut down the main burner if the louvers close during operation.]

304.10 Opening obstructions locations, and protection. The required size of openings for combustion, ventilation, and dilution air shall be based on the net free area of each opening. The net free area of an opening shall be that specified by the manufacturer of the opening covering. In the absence of such information, openings covered with metal louvers shall be deemed to have a net free area of 60 percent of the area of the opening, and openings covered with wood louvers shall be deemed to have a net free area of 10 percent of the area of the opening. Louvers and grilles shall be fixed in the open position.

Exception: Operable louvers shall be interlocked with the appliance so that they are proven to be in the full open position prior to main burner ignition and during main burner operation. Means shall be provided to prevent the main burner from igniting if the louvers fail to open during burner startup and to shut down the main burner if the louvers close during operation.

304.10.1 Dampered openings. Where the combustion air openings are provided with automatic, smoke or fire dampers, the dampers shall be electrically interlocked with the appliances served, so as to prevent operation of any appliance when any of the dampers are closed. Manually operated dampers shall not be installed in combustion air openings. The damper opening shall be proven prior to burner operation.

304.10.2 Caution sign. A sign stating, “Louvers, dampers and/or ventilation openings must not be blocked or disabled.” shall be permanently affixed, in clear view, adjacent to the opening(s) within the room containing the equipment. The letters used on the sign shall be at least 1-inch (25 mm) in height.

304.10.3 Opening location and protection. Combustion air openings to the outdoors shall comply with the location and protection provisions applicable to outside air intake openings of Sections 401.5 and 401.6 of the *New York City Mechanical Code*.

304.11 Combustion air ducts. Combustion air ducts shall comply with all of the following:
[

1. Ducts shall be of galvanized steel complying with Chapter 6 of the *New York City Mechanical Code* or of equivalent corrosion-resistant material listed and labeled for this application.
2. Ducts shall terminate in an unobstructed space allowing free movement of combustion air to the appliances.
3. Ducts shall serve a single enclosure.
4. Ducts shall not serve both upper and lower combustion air openings where both such openings are used. The separation between ducts serving upper and lower combustion air openings shall be maintained to the source of combustion air.
5. Ducts shall not be screened where terminating in an attic space.
6. Horizontal upper combustion air ducts shall not slope downward toward the source of combustion air.
7. The remaining space surrounding a chimney liner, gas vent, special gas vent or plastic piping installed within a masonry, metal or factory-built chimney shall not be used to supply combustion air.

Exception: Direct-vent gas-fired appliances designed for installation in a solid fuel-burning fireplace where installed in accordance with the listing and the manufacturer's instructions.

8. Combustion air intake openings located on the exterior of a building shall have the lowest side of such openings located not less than 12 inches (305 mm) vertically from the adjoining grade level.]
1. Be of galvanized steel complying with Chapter 6 of the *New York City Mechanical Code* or of equivalent corrosion-resistant material approved for this application.

Exception: Within dwelling units, unobstructed stud and joist spaces shall not be prohibited from conveying combustion air, provided that not more than one required fireblock is removed.

2. Have a minimum cross-sectional dimension of 3 inches (76 mm).
3. Terminate in an unobstructed space allowing free movement of combustion air to the appliances.
4. Have the same cross-sectional areas as the free area of the openings to which they connect.

5. Serve a single appliance enclosure.
6. Not serve both upper and lower combustion air openings where both such openings are used. The separation between ducts serving upper and lower combustion air openings shall be maintained to the source of combustion air.
7. Not be screened where terminating in an attic space.
8. Not slope downward toward the source of combustion air, where serving the upper required combustion air opening.
9. Be constructed so that the remaining space surrounding a chimney or chimney liner, installed within a masonry, metal or factory-built chimney cannot be used to supply combustion, ventilation and dilution air, except for direct vent appliances designed and installed in accordance with the equipment manufacturer's instructions and listing."

304.12 Protection from fumes and gases. Where corrosive or flammable process fumes or gases, other than products of combustion, are present, means for the disposal of such fumes or gases shall be provided. Such fumes or gases include carbon monoxide, hydrogen sulfide, ammonia, chlorine and halogenated hydrocarbons. In barbershops, beauty shops and other facilities where chemicals that generate corrosive or flammable products, such as aerosol sprays, are routinely used, nondirect-vent-type appliances shall be located in [an] a [equipment]mechanical room separated or partitioned off from other areas with provisions for combustion air and dilution air from the outdoors. Direct-vent appliances shall be installed in accordance with the appliance manufacturer's installation instructions.

SECTION FGC 305 INSTALLATION

305.1 General. Equipment and appliances shall be installed as required by the terms of their approval, in accordance with the conditions of listing, the manufacturer's instructions and this code. Manufacturers' installation instructions shall be available on the job site at the time of inspection. Where a code provision is less restrictive than the conditions of the listing of the equipment or appliance or the manufacturer's installation instructions, the conditions of the listing and the manufacturer's installation instructions shall apply.

305.2 Hazardous area. Equipment and appliances having an ignition source shall not be installed in Group H occupancies or control areas where open use, handling or dispensing of combustible, flammable or explosive materials occurs.

305.3 Elevation of ignition source. Equipment and appliances having an ignition source shall be elevated such that the source of ignition is not less than 18 inches (457 mm) above the floor in hazardous locations and public garages, private garages, repair garages, motor fuel-dispensing facilities and parking garages. For the purpose of this section, rooms or spaces that are not part of the living space of a dwelling unit and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

Exception: Elevation of the ignition source is not required for appliances that are listed as flammable vapor ignition resistant and for installation without elevation].

305.3.1 Installation in residential garages. In residential garages where appliances are installed in a separate, enclosed space having access only from outside of the garage, such appliances shall be permitted to be installed at floor level, provided that the required combustion air is taken from the exterior of the garage.

305.3.2 Parking garages. Connection of a parking garage with any room in which there is a fuel-fired appliance shall be by means of a vestibule providing a two-doorway separation, except that a single door is permitted where the sources of ignition in the appliance are elevated in accordance with Section 305.3.

Exception: This section shall not apply to appliance installations complying with Section 305.4.

305.4 Public garages, motor fuel-dispensing facilities and repair garages. Appliances located in public garages, motor fuel-dispensing facilities, repair garages or other areas frequented by motor vehicles shall be installed a minimum of 8 feet (2438 mm) above the floor. [Where motor vehicles exceed 6 feet (1829 mm) in height and are capable of passing under an appliance, appliances shall be installed a minimum of 2 feet (610 mm) higher above the floor than the height of the tallest vehicle.] Where motor vehicles are capable of passing under an appliance, the appliance shall be installed at the clearances required by the appliance manufacturer and not less than 1 foot (305 mm) higher than the tallest vehicle garage door opening.

Exceptions:

1. The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 305.3 of this code and NFPA [88B]30A.
2. Appliances installed in repair garages shall be separated from repair areas by walls or partitions, floors, or floor ceiling assemblies that are constructed so as to prohibit the transmission of vapors and having a fire-resistance rating of not less than 1 hour, and that have no openings in the wall separating the repair area within 8 feet (2438mm) of the floor. Wall penetration shall be firestopped. Air for combustion purposes shall be obtained from the outdoors. The heating room shall not be used for the

storage of combustible materials.

3. Heating appliances for vehicle repair areas where there is no dispensing or transferring of Class I or Class II flammable or combustible liquids or liquefied petroleum gas shall be installed in accordance with NFPA 30A.

305.5 Private garages. Appliances located in private garages shall be installed with a minimum clearance of 6 feet (1829 mm) above the floor.

Exception: The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 305.3.

305.6 Construction and protection. Boiler rooms and furnace rooms shall be protected as required by the *New York City Building Code*.

305.7 Clearances from grade. [Equipment and appliances] Appliances installed at grade level shall be supported on a level concrete slab or other approved material extending not less than 3-inches (76 mm) above adjoining grade or shall be suspended [a minimum of]not less than 6 inches (152 mm) above adjoining grade. Such supports shall be installed in accordance with the manufacturer's installation instructions.

305.8 Clearances to combustible construction. Heat-producing equipment and appliances shall be installed to maintain the required clearances to combustible construction as specified in the listing and manufacturer's instructions. Such clearances shall be reduced only in accordance with Section 308. Clearances to combustibles shall include such considerations as door swing, drawer pull, overhead projections or shelving and window swing. Devices, such as door stops or limits and closers, shall not be used to provide the required clearances.

305.9 Parking structures. Appliances installed in enclosed, basement and underground parking structures shall be installed in accordance with NFPA 88A.

305.10 Repair garages. Appliances installed in repair garages shall be installed in a detached building or room, separated from repair areas by walls or partitions, floors or floor-ceiling assemblies that are constructed so as to prohibit the transmission of vapors and having a fire-resistance rating of not less than 1 hour, and that have no openings in the wall separating the repair area within 8 feet (2438 mm) of the floor. Wall penetrations shall be firestopped. Air for combustion purposes shall be obtained from the outdoors. The appliance room shall not be used for the storage of combustible materials.

Exceptions:

1. Overhead heaters where installed not less than 8 feet (2438 mm) above the floor shall be permitted.

2. Heating appliances for vehicle repair areas where there is no dispensing or transferring of Class I or II flammable or combustible liquids or liquefied petroleum gas shall be installed in accordance with NFPA 30A.

305.11 Installation in aircraft hangars. Heaters in aircraft hangars shall be installed in accordance with NFPA 409.

305.12 Avoid strain on gas piping. Appliances shall be supported and connected to the piping so as not to exert undue strain on the connections.

SECTION FGC 306 ACCESS AND SERVICE SPACE

306.1 Clearances for maintenance and replacement. [Clearances around appliances to elements of permanent construction, including other installed appliances, shall be sufficient to allow inspection, service, repair or replacement without removing such elements of permanent construction or disabling the function of a required fire-resistance-rated assembly.] Appliances shall be accessible for inspection, service, repair and replacement without disabling the function of a fire-resistance-rated assembly or removing permanent construction, other appliances, or any other piping or ducts not connected to the appliance being inspected, serviced, repaired or replaced. A level working space at least 30 inches deep and 30 inches wide (762 mm by 762 mm) shall be provided in front of the control side to service an appliance.

306.2 Appliances in rooms. Rooms containing appliances [requiring access]shall be provided with a door and an unobstructed passageway measuring not less than 36 inches (914 mm) wide and 80 inches (2032 mm) high.

Exception: Within a dwelling unit, appliances installed in a compartment, alcove, basement or similar space shall be provided with access by an opening or door and an unobstructed passageway measuring not less than 24 inches (610 mm) wide and large enough to allow removal of the largest appliance in the space, provided that a level service space of not less than 30 inches (762 mm) deep and the height of the appliance, but not less than 30 inches (762mm), is present at the front or service side of the appliance with the door open.

306.3 Appliances in attics. Attics containing appliances [requiring access]shall be provided with an opening and unobstructed passageway large enough to allow removal of the largest [component of the] appliance. The passageway shall not be less than 30 inches (762 mm) high and 22 inches (559 mm) wide and not more than 20 feet (6096 mm) in length when measured along the centerline of the passageway from the opening to the [equipment]appliance. The passageway shall have continuous solid flooring not less than 24 inches (610 mm) wide. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the [equipment]appliance. The clear access opening

dimensions shall be a minimum of 20 inches by 30 inches (508 mm by 762 mm), [where such dimensions are] and large enough to allow removal of the largest component of the appliance.

Exceptions:

1. The passageway and level service space are not required where the appliance is capable of being serviced and removed through the required opening.
2. Where the passageway is not less than 6 feet (1829 mm) high for its entire length, the passageway shall be not greater than 50 feet (15 250 mm) in length.

306.3.1 Electrical requirements. A [lighting fixture] luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the [equipment]appliance location in accordance with the *New York City Electrical Code*.

306.4 Appliances under floors. Under-floor spaces containing appliances [requiring access]shall be provided with an access opening and unobstructed passageway large enough to remove the largest component of the appliance. The passageway shall not be less than 30 inches (762 mm) high and 22 inches (559 mm) wide, nor more than 20 feet (6096 mm) in length when measured along the centerline of the passageway from the opening to the [equipment] appliance. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the appliance. If the depth of the passageway or the service space exceeds 12 inches (305 mm) below the adjoining grade, the walls of the passageway shall be lined with concrete or masonry extending 4 inches (102 mm) above the adjoining grade and having sufficient lateral-bearing capacity to resist collapse. The clear access opening dimensions shall be a minimum of 22 inches by 30 inches (559 mm by 762 mm), [where such dimensions are] and large enough to allow removal of the largest [component of the]appliance.

Exceptions:

1. The passageway is not required where the level service space is present when the access is open and the appliance is capable of being serviced and removed through the required opening.
2. Where the passageway is unobstructed and not less than 6 feet (1829 mm) high [(1829 mm)] and 22 inches (559 mm) wide for its entire length, the passageway shall not be limited in length.

306.4.1 Electrical requirements. A [lighting fixture]luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the [equipment] appliance location in accordance with the *New York City Electrical Code*.

306.5 [Appliances] Equipment and appliances on roofs or elevated structures. Where [appliances] equipment and appliances requiring access are installed on roofs or elevated structures at a height exceeding 16 feet (4877mm), such access shall be provided by a permanent approved means of access [designed by a registered design professional], the extent of which shall be from grade or floor level to the [appliance's] equipment and appliances' level service space. Such access shall not require climbing over obstructions greater than 30 inches [high](762 mm) high or walking on roofs having a slope greater than [four]4 units vertical in 12 units horizontal (33-percent slope). Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.

Permanent ladders installed to provide the required access shall comply with the following minimum design criteria.

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).
2. Ladders shall have [a] rung spacing not to exceed [14] 12 inches [(356 mm)] (305 mm) on center.
3. Ladders shall have a toe spacing not less than [6] 7 inches [(152 mm)] (178 mm) deep.
4. There shall be a minimum of 18 inches (457 mm) between rails.
5. Rungs shall have a minimum diameter of 0.75-inch (19 mm) and shall be capable of withstanding a 300-pound (136.1 kg) load.
6. Where a cage, well or ladder safety device is provided, [Ladders] ladders over [30] 20 feet [(9144 mm)] (6096 mm) in height shall be provided with landing [offset sections and landings] platforms for each 30 feet (9144 mm) of height. Where a cage, well or ladder safety device is not provided, ladders over 20 feet (6096 mm) in height shall be provided with landing platforms for each 20 feet (6096 mm) in height. Landings shall be capable of withstanding a load of 100 pounds per square foot (488.2 kg/m²). Landing dimensions shall be not less than 30 inches (762 mm) and not less than 24 inches (610 mm) in width. A guardrail and toeboard shall be provided on all open sides of the landing.
7. Where ladder extensions are installed the side rails of through or side-step ladder extensions shall extend 3 ½ feet above the parapets and landings. For through ladder extensions, the rungs shall be omitted from the extensions and shall have not less 18 nor more than 24 inches of clearance between rails. For side-step or offset fixed ladder sections, at landings, the side rails and rungs shall be carried to the next regular rung beyond or above the 3 ½ feet minimum.

8. Ladders shall be protected against corrosion by approved means. [designed by a registered design professional.]

9. Catwalks installed to provide the required access shall be not less than 24 inches wide (610 mm) and shall have railings as required for service platforms.

Exception: This section shall not apply to Group R-3 occupancies.

306.5.1 Sloped roofs. Where appliances, equipment, fans or other components that require service are installed on a roof having a slope of [three] 3 units vertical in 12 units horizontal (25-percent slope) or greater and having an edge more than 30 inches (762 mm) above grade at such edge, a level platform shall be provided on each side of the appliance or equipment to which access is required [by the manufacturer's installation instructions] for service, repair or maintenance. The platform shall be not [be] less than 30 inches (762 mm) in any dimension and shall be provided with guards [in accordance with Section 306.6]. The guards shall extend not less than 42 inches (1067 mm) above the platform, shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the *New York City Building Code*. Access shall not require walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Where access involves obstructions greater than 30 inches (762 mm) in height, such obstructions shall be provided with ladders installed in accordance with Section 306.5 or stairs installed in accordance with the requirements specified in the *New York City Building Code* in the path of travel to and from appliances, fans or equipment requiring service.

306.5.2 Electrical requirements. A receptacle outlet shall be provided at or near the [equipment] appliance location in accordance with the *New York City Electrical Code*.

306.6 Guards. Guards shall be provided where appliances, [fans] equipment or other components that require service and roof hatch openings are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of such appliances, fans or other components and roof hatch openings and the top of the guard shall be located not less than 42 inches (1067 mm) above the elevated surface adjacent to the guard. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere and shall comply with the loading requirements for guards specified in the *New York City Building Code*.

[304.7] **306.7. Rooftop access and obstructions.** Equipment and appliances installed on rooftops of buildings shall be installed in accordance with the requirements of the *New York City Fire Code* regarding rooftop access and obstructions, and shall not obstruct or interfere with firefighting operations or the operation of any doors, windows, fire escapes, or other means of egress or other building components requiring operation or access.

SECTION FGC 307 CONDENSATE DISPOSAL

307.1 Evaporators and cooling coils. Condensate drainage systems shall be provided for equipment and appliances containing evaporators and cooling coils in accordance with the *New York City Mechanical Code*.

307.2 Fuel-burning appliances. Liquid combustion by-products of condensing appliances shall be collected and discharged to [a dedicated] an approved plumbing fixture, or [to a] disposal area in accordance with the manufacturer's installation instructions. Condensate piping shall be of approved corrosion-resistant material and shall not be smaller than the drain connection on the appliance. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than one-eighth unit vertical in 12 units horizontal (1-percent slope).

307.2.1 Condensate disposal. Condensate from all fuel-burning appliances and associated flues shall be neutralized to a pH of at least 6 and no more than 8 prior to disposal to a sanitary system.

[307.2] **307.3 Drain pipe materials and sizes.** Components of the condensate disposal system shall be cast iron, galvanized steel, copper, cross-linked polyethylene, polybutylene, polyethylene, ABS, CPVC or PVC pipe or tubing. All components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the *New York City Plumbing Code* relative to the material type. Condensate waste and drain line size shall be not less than $\frac{3}{4}$ -inch (19 mm) internal diameter [(19 mm)]and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized by a registered design professional.[All horizontal sections of drain piping shall be installed in uniform alignment at a uniform slope.]

[307.3] **307.4. Traps.** Condensate drains shall be trapped as required by the equipment or appliance manufacturer.

[307.4 **Evaporators and cooling coils.** Drainage of condensate from evaporators and cooling coils shall be performed in accordance with the *New York City Mechanical Code*.]

[307.5 **Exceptions.** Section 307.5 applies to permanently installed equipment. Window units and through-the-wall air-conditioning units are exempt.]

307.5 Auxiliary drain pan. Category IV condensing appliances shall be provided with an auxiliary drain pan where damage to any building component will occur as a result of stoppage in the condensate drainage system. Such pan shall be installed in accordance with the applicable provisions of Section 307 of the *New York City Mechanical Code*.

Exception: An auxiliary drain pan shall not be required for appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

SECTION FGC 308 CLEARANCE REDUCTION

308.1 Scope. This section shall govern the reduction in required clearances to combustible materials and combustible assemblies for chimneys, vents, appliances, devices and equipment. Clearance requirements for air-conditioning equipment and central heating boilers and furnaces shall comply with Sections 308.3 and 308.4.

308.2 Reduction table. The allowable clearance reduction shall be based on one of the methods specified in Table 308.2 or shall utilize an assembly listed for such application. Where required clearances are not listed in Table 308.2, the reduced clearances shall be determined by linear interpolation between the distances listed in the table. Reduced clearances shall not be derived by extrapolation below the range of the table. The reduction of the required clearances to combustibles for listed and labeled appliances and equipment shall be in accordance with the requirements of this section except that such clearances shall not be reduced where reduction is specifically prohibited by the terms of the appliance or equipment listing [see Figures 308.2(1) through 308.2(3)].

308.3 Clearances for indoor air-conditioning [equipment]appliances. Clearance requirements for indoor air-conditioning equipment shall comply with Sections 308.3.1 through 308.3.5.

308.3.1 [Equipment]Appliances installed in rooms that are large in comparison with the size of the [equipment]appliance. Air-conditioning [equipment]appliances installed in rooms that are large in comparison with the size of the [equipment]appliance shall be installed with clearances in accordance with the terms of their listing and the manufacturer's instructions.

308.3.2 [Equipment]Appliances installed in rooms that are not large in comparison with the size of the [equipment]appliance. Air-conditioning [equipment]appliances installed in rooms that are not large in comparison with the size of the [equipment]appliance, such as alcoves and closets, shall be listed for such installations and installed in accordance with the manufacturer's instructions. Listed clearances shall not be reduced by the protection methods described in Table 308.2, regardless of whether the enclosure is of combustible or noncombustible material.

308.3.3 Clearance reduction. Air-conditioning [equipment]appliances installed in rooms that are large in comparison with the size of the [equipment]appliance shall be permitted to be installed with reduced clearances to combustible material provided the combustible material or [equipment]appliance is protected as described in Table 308.2.

308.3.4 Plenum clearances. Where the furnace plenum is adjacent to plaster on metal lath or noncombustible material attached to combustible material, the clearance shall be measured to the surface of the plaster or other noncombustible finish where the clearance specified is 2 inches (51 mm) or less.

308.3.5 Clearance from supply ducts. Air-conditioning [equipment]appliance shall have the clearance from supply ducts within 3 feet (914 mm) of the furnace plenum be not less than that specified from the furnace plenum. [No clearance] Clearance is not necessary beyond this distance.

308.4 Central-heating boilers and furnaces. Clearance requirements for central-heating boilers and furnaces shall comply with Sections 308.4.1 through 308.4.6. The clearance to [this equipment] these appliances shall not interfere with combustion air; draft hood clearance and relief; and accessibility for servicing.

308.4.1 [Equipment]Appliances installed in rooms that are large in comparison with the size of the [equipment]appliance. Central-heating furnaces and low-pressure boilers installed in rooms large in comparison with the size of the [equipment]appliance shall be installed with clearances in accordance with the manufacturer's instructions.

308.4.2 [Equipment]Appliances installed in rooms that are not large in comparison with the size of the [equipment]appliance. Central-heating furnaces and low-pressure boilers installed in rooms that are not large in comparison with the size of the [equipment]appliance, such as alcoves and closets, shall be listed for such installations. Listed clearances shall not be reduced by the protection methods described in Table 308.2 and illustrated in Figures 308.2(1) through 308.2(3), regardless of whether the enclosure is of combustible or noncombustible material.

308.4.3 Clearance reduction. Central-heating furnaces and low-pressure boilers installed in rooms that are large in comparison with the size of the [equipment]appliance shall be permitted to be installed with reduced clearances to combustible material provided the combustible material or [equipment]appliance is protected as described in Table 308.2.

308.4.4 Clearance for servicing [equipment]appliances. Front clearance shall be sufficient for servicing the burner and the furnace or boiler.

308.4.5 Plenum clearances. Where the furnace plenum is adjacent to plaster on metal lath or noncombustible material attached to combustible material, the clearance shall be measured to the surface of the plaster or other noncombustible finish where the clearance specified is 2 inches (51 mm) or less.

308.4.6 Clearance from supply ducts. Central-heating furnaces shall have the clearance from supply ducts within 3 feet (914 mm) of the furnace plenum be not less than that specified from the furnace plenum. No clearance is necessary beyond this distance.

TABLE 308.2 ^{a[-j] through k}

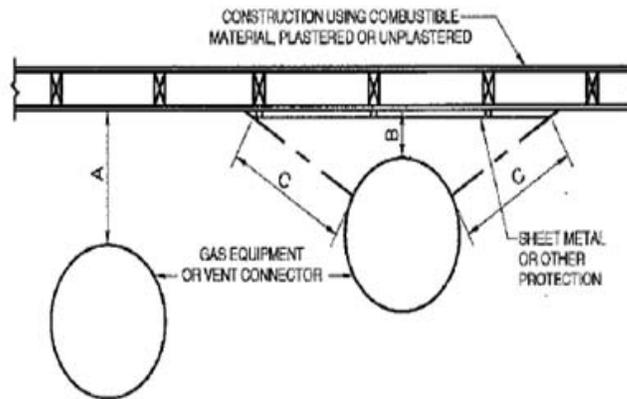

REDUCTION OF CLEARANCES WITH SPECIFIED FORMS OF PROTECTION

TYPE OF PROTECTION APPLIED TO AND COVERING ALL SURFACES OF COMBUSTIBLE MATERIAL WITHIN THE DISTANCE SPECIFIED AS THE REQUIRED CLEARANCE WITH NO PROTECTION [see Figures 308.2(1), 308.2(2), and 308.2(3)]	WHERE THE REQUIRED CLEARANCE WITH NO PROTECTION FROM APPLIANCE, VENT CONNECTOR, OR SINGLE-WALL METAL PIPE IS: (inches)									
	36		18		12		9		6	
	Allowable clearances with specified protection (inches)									
	Use Column 1 for clearances above appliance or horizontal connector. Use Column 2 for clearances from appliance, vertical connector, and single-wall metal pipe.

6. [0.024 sheet metal with ventilated airspace over 0.024 sheet metal] 1/2-inch thick insulation board with ventilated airspace	18	12	9	6	6	4	5	3	3	3
7. [1-inch glass fiber or mineral wool batts sandwiched between two sheets 0.024 sheet metal with ventilated airspace] 0.024-inch (nominal 24 gage) sheet metal with ventilated airspace over 0.024-inch (nominal 24 gage) sheet metal with ventilated airspace	18	12	9	6	6	4	5	3	3	3
8. 1-inch glass fiber or mineral wool batts sandwiched between two sheets 0.024-inch (nominal 24 gage) sheet metal with ventilated airspace	18	12	9	6	6	4	5	3	3	3

For SI: 1 inch = 25.4 mm, °C = [(°F - 32)/1.8], 1 pound per cubic foot = 16.02 kg/m³, 1 Btu per inch per square foot per hour per °F = 0.144 W/m² · K.

- Reduction of clearances from combustible materials shall not interfere with combustion air, draft hood clearance and relief, and accessibility of servicing.
- All clearances shall be measured from the outer surface of the combustible material to the nearest point on the surface of the appliance, disregarding any intervening protection applied to the combustible material.
- Spacers and ties shall be of noncombustible material. No spacer or tie shall be used directly opposite an appliance or connector.
- For all clearance reduction systems using a ventilated airspace, adequate provision for air circulation shall be provided as described [see Figures 308.2(2) and 308.2(3)].
- There shall be at least 1 inch between clearance reduction systems and combustible walls and ceilings for reduction systems using ventilated airspace.
- Where a wall protector is mounted on a single flat wall away from corners, it shall have a minimum 1-inch air gap. To provide air circulation, the bottom and top edges, or only the side and top edges, or all edges shall be left open.
- Mineral wool batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of 1500°F.

- h. Insulation material used as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu per inch per square foot per hour per °F or less.
- i. There shall be at least 1 inch between the appliance and the protector. In no case shall the clearance between the appliance and the combustible surface be reduced below that allowed in this table.
- j. All clearances and thicknesses are minimum; larger clearances and thicknesses are acceptable.
- k. Listed single-wall connectors shall be installed in accordance with the terms of their listing and the manufacturer's installation instructions.

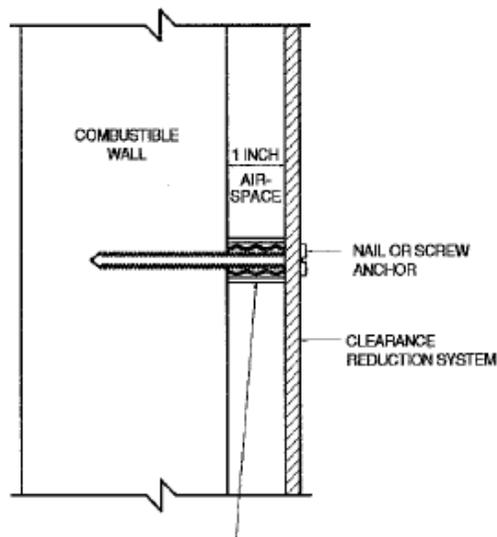

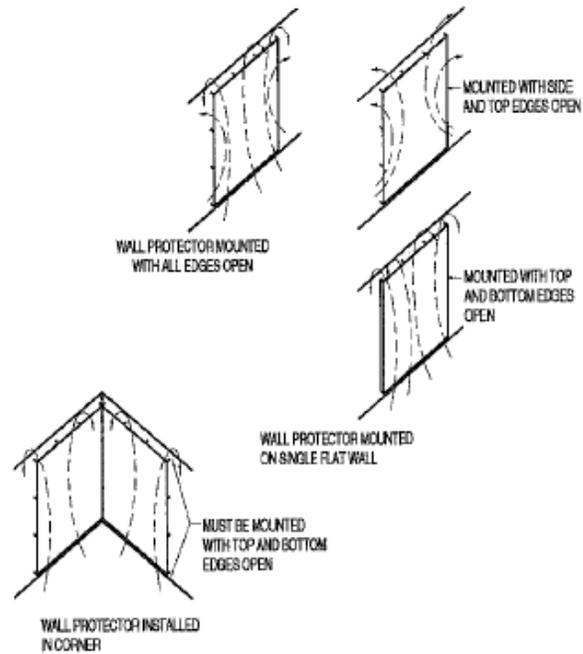

Notes:

"A" equals the reduced clearance with no protection.

"B" equals the reduced clearance permitted in accordance with Table 308.2. The protection applied to the construction using combustible material shall extend far enough in each direction to make "C" equal to "A."

FIGURE 308.2(1)
EXTENT OF PROTECTION NECESSARY TO REDUCE CLEARANCES FROM GAS EQUIPMENT OR VENT CONNECTIONS

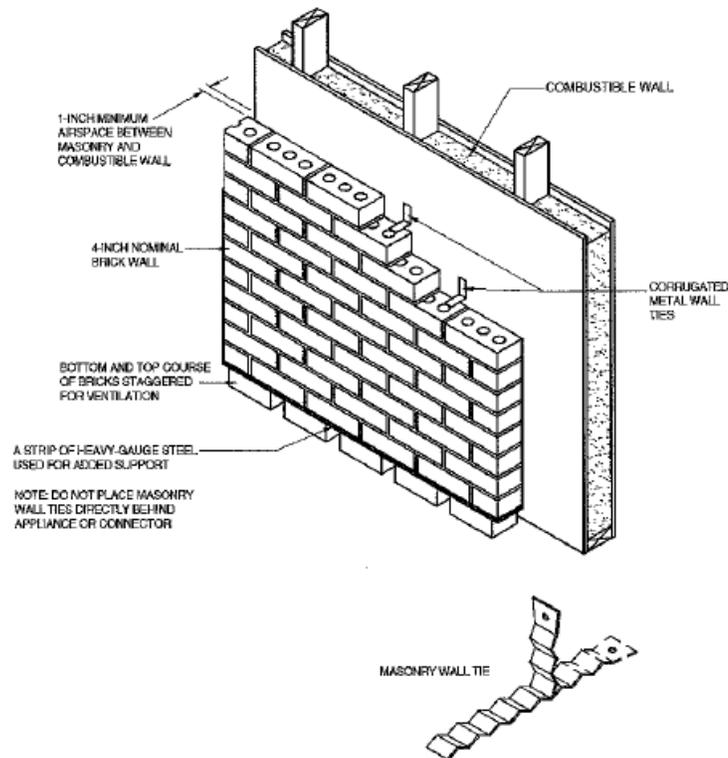

1-INCH NONCOMBUSTIBLE SPACER SUCH AS STACKED WASHERS, SMALL-DIAMETER PIPE, TUBING OR ELECTRICAL CONDUIT.

MASONRY WALLS CAN BE ATTACHED TO COMBUSTIBLE WALLS USING WALL TIES.

DO NOT USE SPACERS DIRECTLY BEHIND APPLIANCE OR CONNECTOR.

For SI: 1 inch = 25.4 mm.

FIGURE 308.2(2)
WALL PROTECTOR CLEARANCE REDUCTION SYSTEM

For SI: 1 inch = 25.4 mm.

FIGURE 308.2(3)
MASONRY CLEARANCE REDUCTION SYSTEM

SECTION FGC 309 ELECTRICAL

309.1 Grounding. Gas piping shall not be used as a grounding electrode.

309.2 Connections. Electrical connections between [equipment] appliances and the building wiring, including the grounding of the [equipment] appliance, shall conform to the *New York City Electrical Code*.

SECTION FGC 310 ELECTRICAL BONDING

310.1 [Gas pipe bonding] Pipe and tubing. Each above-ground portion of a gas piping system that is likely to become energized shall be [electrically continuous] continuously [and] bonded electrically to an effective ground-fault current path. Gas piping shall be considered to be bonded where it is connected to [gas utilization equipment] appliances that [is] are connected to the equipment grounding conductor of the circuit supplying that [equipment] appliance.

Subpart 4 (Chapter 4 of the New York City Fuel Gas Code)

§1. Chapter 4 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

**CHAPTER 4
GAS PIPING INSTALLATIONS**

**SECTION FGC 401
GENERAL**

401.1 Scope. This chapter shall govern the design, installation, modification and maintenance of fuel-gas piping systems. The scope covered by this chapter includes piping systems from the point of delivery to the connections with the [equipment] appliances and includes the design, materials, components, fabrication, assembly, installation, testing, inspection, operation and maintenance of such piping systems.

401.1.1 Meters and service piping. Service piping includes the fuel-gas piping up to the point of delivery. Meters and service piping shall comply with the requirements of Appendix E [and Appendix F] of this code. In addition, service piping located within buildings shall be designed and installed in accordance with the structural integrity, firestopping, and fire protection provisions of the *New York City Building Code*.

401.1.2 [Plastic piping. Underground plastic piping installed outside of buildings shall be in compliance with Appendix E and Appendix F of this code.] **Reserved.**

401.2 Reserved.

401.3 Modifications to existing systems. In modifying or adding to existing piping systems, sizes shall be maintained in accordance with this chapter.

401.4 Additional appliances. Where an additional appliance is to be served, the existing piping shall be checked to determine if it has adequate capacity for all appliances served. If inadequate, the existing system shall be enlarged as required or separate piping of adequate capacity shall be provided.

401.5 Identification. [For other than black steel pipe, exposed] All piping installed in new construction and all new piping installed in existing buildings, whether or not the piping is intended to be enclosed when construction is completed, shall be identified by a yellow label marked "Gas" in black letters. Where the installation requires a gas test such labeling shall be completed prior to such test. Labels shall be provided in accordance with ASME A13.1 and the [The] marking shall be spaced at intervals not exceeding 5 feet (1524 mm). The

marking shall not be required on pipe located in the same room as the [equipment] appliance served.

401.6 Interconnections. Where two or more meters are installed on the same premises but supply separate consumers, the piping systems shall not be interconnected on the outlet side of the meters.

401.7 Piping meter identification. Piping from multiple meter installations shall be marked with an approved permanent identification by the installer so that the piping system supplied by each meter is readily identifiable.

401.8 Minimum sizes. All pipe utilized for the installation, extension and alteration of any piping system shall be sized to supply the full number of outlets for the intended purpose and shall be sized in accordance with Section 402.

SECTION FGC 402 PIPE SIZING

402.1 General considerations. [Piping systems shall be of such size and so installed as to provide a supply of gas sufficient to meet the maximum demand without undue loss of pressure between the point of delivery and the gas utilization equipment.] Piping systems shall be of such size and so installed as to provide a supply of gas sufficient to meet the maximum demand and supply gas to each appliance inlet at not less than the minimum supply pressure required by the appliance.

402.2 Maximum gas demand. The volume of gas to be provided, in cubic feet per hour, shall be determined directly from the manufacturer's input ratings of the [gas utilization equipment] appliance served. Where an input rating is not indicated, the gas supplier, [equipment] appliance manufacturer or a qualified agency shall be contacted, or the rating from Table 402.2 shall be used for estimating the volume of gas to be supplied. The total connected hourly load shall be used as the basis for pipe sizing, assuming that all [equipment] appliances could be operating at full capacity simultaneously. Where a diversity of load can be established, pipe sizing shall be permitted to be based on such loads.

**TABLE 402.2
APPROXIMATE GAS INPUT FOR TYPICAL APPLIANCES**

APPLIANCE	INPUT BTU/H (Approx.)
Space Heating Units	
Hydronic boiler	
Single family	100,000

Multifamily, per unit Warm-air furnace	60,000
Single family Multifamily, per unit	100,000 60,000
Space and Water Heating Units	
Hydronic boiler	
Single family Multifamily, per unit	120,000 75,000
Water Heating Appliances	
Water heater, automatic	
Capacity at 2 gal./minute	142,800
Capacity at 4 gal./minute	285,000
Capacity at 6 gal./minute	428,400
Water heater, automatic storage, 30- to 40-gal. tank	35,000
Water heater, automatic storage, 50-gal. tank	50,000
Water heater, domestic, circulating or side-arm	35,000
Cooking Appliances	
Built-in oven or broiler unit,	25,000
Built-in top unit, domestic	40,000
Range, free-standing, domestic	65,000
Other Appliances	
Barbecue	40,000
Clothes dryer, Type 1 (domestic)	35,000
Gas fireplace, direct-vent	40,000
Gas light	2,500
Gas log	80,000
Refrigerator	3,000

For SI: 1 British thermal unit per hour = 0.293 W, 1 gallon = 3.785 L,
1 gallon per minute = 3.785 L/m.

402.3 Sizing. Gas piping shall be sized in accordance with one of the following:

1. Pipe sizing tables or sizing equations in accordance with Section 402.4.
2. The sizing tables included in a listed piping system's manufacturer's installation instructions.
3. Other approved engineering methods.
4. Individual outlets to gas ranges shall not be less than [0.75] $\frac{3}{4}$ inches (19 mm) NPS.

402.4 Sizing tables and equations. Where Tables 402.4(1) through 402.4([6]5) are used to size piping or tubing, the pipe length shall be determined in accordance with Section 402.4.1, 402.4.2 or 402.4.3.

Where Equations 4-1 and 4-2 are used to size piping or tubing, the pipe or tubing shall have smooth inside walls and the pipe length shall be determined in accordance with Section 402.4.1, 402.4.2 or 402.4.3.

1. Low-pressure gas equation [Less than [1.5] $1\frac{1}{2}$ pounds per square inch (psi) (10.3 kPa)]:

$$D = Q^{0.381} / 19.17 (\Delta H / C_r \times L)^{0.206} \quad \text{(Equation 4-1)}$$

2. High-pressure gas equation [[1.5] $1\frac{1}{2}$ psi (10.3 kPa) and above]:

$$D = Q^{0.381} / 18.93 [(P_1^2 - P_2^2) \times Y / C_r \times L]^{0.206} \quad \text{(Equation 4-2)}$$

where:

D = Inside diameter of pipe, inches (mm).

Q = Input rate appliance(s), cubic feet per hour at 60°F (16 °C) and 30-inch mercury column

P_1 = Upstream pressure, psia ($P_1 + 14.7$)

P_2 = Downstream pressure, psia ($P_2 + 14.7$)

L = Equivalent length of pipe, feet

ΔH = Pressure drop, inch water column (27.7 inch water column = 1 psi)

TABLE 402.4
 C_r AND Y VALUES FOR NATURAL GAS
AT STANDARD CONDITIONS

GAS	EQUATION FACTORS	
	C_r	Y
Natural gas	0.6094	0.9992

For SI: 1 cubic foot = 0.028 m³, 1 foot = 305 mm, 1-inch water column = [0.249] 0.2488 kPa, 1 pound per square inch = 6.895 kPa, 1 British thermal unit per hour = 0.293 W.

402.4.1 Longest length method. The pipe size of each section of gas piping shall be determined using the longest length of piping from the point of delivery to the most remote outlet and the load of the section.

402.4.2 Branch length method. Pipe shall be sized as follows:

1. Pipe size of each section of the longest pipe run from the point of delivery to the most remote outlet shall be determined using the longest run of piping and the load of the section.
2. The pipe size of each section of branch piping not previously sized shall be determined using the length of piping from the point of delivery to the most remote outlet in each branch and the load of the section.

402.4.3 Hybrid pressure. The pipe size for each section of higher pressure gas piping shall be determined using the longest length of piping from the point of delivery to the most remote line pressure regulator. The pipe size from the line pressure regulator to each outlet shall be determined using the length of piping from the regulator to the most remote outlet served by the regulator.

402.5 Allowable pressure drop. The design pressure loss in any piping system under maximum probable flow conditions, from the point of delivery to the inlet connection of the [equipment] appliance, shall be such that the supply pressure at the [equipment] appliance is greater than or equal to the minimum pressure required [for proper equipment operation] by appliance.

402.6 Gas distribution pressures. No gas distribution piping containing gas at a pressure in excess of ½ psig (3.5 kPa gauge) shall be run within a building[,], [except that]

Exceptions:

1. [p] Pressure not exceeding [3] 5 psig ([20] 34.5 kPa gauge) is permitted for [the following uses]: (a) commercial and [(b)] industrial occupancies where [(c) other

large volume use in which] fuel requirements for [boiler room equipment] appliances exceed 4,000 cubic feet per hour (113.2 m³/h) and such large volume use is supplied through separate gas distribution piping [to the boiler room].

2. Gas pressure not exceeding 15 psig (100 kPa gauge) is permitted for [boiler room equipment] appliances in excess of 100,000 cubic feet per hour (2830 m³/h) provided the gas distribution piping is installed as provided for in Section 404. The use of pressure in excess of 15 psig (100 kPa gauge) shall be permitted for distribution piping provided all of the requirements of Section 406 and Appendix G are met.

SECTION FGC 403 PIPING MATERIALS

403.1 General. Materials used for piping systems shall be new and comply with the requirements of this chapter or shall be approved.

403.1.1 Pipe size and pressure limitations.

1. All requirements for installation of gas distribution piping with operating pressures at $\frac{1}{2}$ psig (3.5 kPa gauge) or less and above $\frac{1}{2}$ psig (3.5 kPa gauge) shall be in accordance with Chapter 4 of this code.
2. Gas distribution piping operating at a pressure of over $\frac{1}{2}$ psig (3.5 kPa gauge) to [3] 5 psig ([20] 34.5 kPa gauge) and size 4 inches (102 mm) or larger shall be welded.

Exception: Manufactured and listed gas trains provided with the appliance may be threaded.

3. All gas distribution piping operating at a pressure above [3] 5 psig ([20] 34.5 kPa gauge) shall be welded.
4. All welding of gas distribution piping shall be subject to special inspection as set forth in Section 406.
5. All piping 4 inches (102 mm) and greater operating at pressure exceeding [3] 5 psig ([20] 34.5 kPa gauge) must be butt welded, subject to special inspection and radiographed.
6. Threaded piping may be used up to 4 inches (102 mm) at pressure no greater than $\frac{1}{2}$ psig (3.5 kPa gauge).

403.2 Used materials. Used pipe, fittings, valves and other materials shall not be reused.

403.3 Other materials. Material not covered by the standards specifications listed herein shall be investigated and tested to determine that it is safe and suitable for the proposed service, and, in addition, shall be recommended for that service by the manufacturer subject to approval by the commissioner.

403.4 Metallic pipe. Metallic pipe shall comply with Sections 403.4.1 through 403.4.4.

403.4.1 Cast iron. Cast-iron pipe shall not be used.

403.4.2 Steel. Carbon steel and wrought-iron pipe shall be at least of standard weight and shall comply with one of the following standards:

1. ASME B 36.10, 10M
2. ASTM A 53/A53M; or
3. ASTM A 106.

403.4.3 Copper and brass. Copper and brass pipe shall not be used.

403.4.4 Aluminum. Aluminum-alloy pipe shall not be used.

403.5 Metallic tubing. Metallic tubing shall not be used except as provided in Section 405.5.

403.5.1 Standards. Stainless steel flexible multiple leg hose assemblies shall be designed in accordance with the requirements of this code and the manufacturer's recommendation.

403.5.2 Seismic requirements. Stainless steel flexible multiple leg hose assemblies shall be designed to withstand seismic force and displacement in accordance with Section 1613 of the *New York City Building Code*.

403.5.3 Special inspection required. The installation of stainless steel flexible multiple leg hose assemblies shall be subject to special inspection in accordance with Section 1707.7 of the *New York City Building Code* and Section 406 of this code.

403.6 [Plastic pipe, tubing and fittings. Plastic pipe, tubing and fittings shall not be used except as provided for in Sections 401.1.1 and 401.1.2.] **Reserved.**

403.7 Workmanship and defects. Pipe and fittings shall be clear and free from cutting burrs and defects in structure or threading, and shall be thoroughly brushed, and chip and scale blown. Defects in pipe and fittings shall not be repaired. Defective pipe and fittings shall be replaced (see Section 406.1.2).

403.8 Protective coating. Where in contact with material or atmosphere exerting a corrosive action, metallic piping and fittings coated with a corrosion-resistant material shall be used. External coatings or linings used on piping or components shall not be considered as adding strength.

403.9 Metallic pipe threads. Metallic pipe and fitting threads shall be taper pipe threads and shall comply with ASME B 1.20.1.

403.9.1 Damaged threads. Pipe with threads that are stripped, chipped, corroded or otherwise damaged shall not be used. Where a weld opens during the operation of cutting or threading, that portion of the pipe shall not be used.

403.9.2 Number of threads. Field threading of metallic pipe shall be in accordance with Table 403.9.2.

**TABLE 403.9.2
SPECIFICATIONS FOR THREADING METALLIC PIPE**

IRON PIPE SIZE (inches)	APPROXIMATE LENGTH OF THREADED PORTION	APPROXIMATE NUMBER OF THREADS
$\frac{1}{2}$	$\frac{3}{4}$	10
$\frac{3}{4}$	$\frac{3}{4}$	10
1	$\frac{7}{8}$	10
$1\frac{1}{4}$	1	11
$1\frac{1}{2}$	1	11
2	1	11
$2\frac{1}{2}$	$1\frac{1}{2}$	12
3	$1\frac{1}{2}$	12
4	$1\frac{5}{8}$	13

For SI: 1 inch = 25.4 mm.

403.9.3 Thread compounds. Thread (joint) compounds (pipe dope) shall be resistant to the action of liquefied petroleum gas or to any other chemical constituents of the gases to be conducted through the piping. Use of cotton thread (lamp wick) is prohibited.

403.10 Metallic piping joints and fittings. The type of piping joint used shall be suitable for the pressure-temperature conditions and shall be selected giving consideration to joint tightness and mechanical strength under the service conditions. The joint shall be able to sustain the maximum end force caused by the internal pressure and any additional forces caused by temperature expansion or contraction, vibration, fatigue or the weight of the pipe and its contents.

403.10.1 Pipe joints. Pipe joints shall be threaded, flanged, or welded.

403.10.2 Tubing joints. Tubing joints shall not be used.

403.10.3 Flared joints. Flared joints shall not be used.

403.10.4 Metallic fittings. Metallic fittings [, including valves, strainers and filters,] shall comply with the following:

1. Threaded fittings in sizes larger than 4 inches (102 mm) shall not be used.
2. Fittings used with steel or wrought-iron pipe shall be steel or malleable iron.
3. [Cast-iron fittings:] Bushings shall not be used.

[3.1. Flanges shall be permitted.

3.2. Bushings shall not be used.]

403.11 Reserved.

403.12 Flanges. All flanges shall comply with ASME B 16.1, ASME B 16.20, [AWWA C11 1/A21.11] or MSS SP-6. The pressure-temperature ratings shall equal or exceed that required by the application.

403.12.1 Flange facings. Standard facings shall be permitted for use under this code. Where 150-pound (1034 kPa) pressure-rated steel flanges are bolted to Class 125 cast-iron flanges, the raised face on the steel flange shall be removed.

403.13 Flange gaskets. Material for gaskets shall be capable of withstanding the design temperature and pressure of the piping system, and the chemical constituents of the gas being conducted, without change to its chemical and physical properties. The effects of fire exposure to the joint shall be considered in choosing material. Acceptable materials include metal or nonasbestos fiber and aluminum “O” rings and spiral wound metal gaskets. When a flanged joint is opened, the gasket shall be replaced. Full-face gaskets shall be used with all cast-iron flanges.

SECTION FGC 404 PIPING SYSTEM INSTALLATION

404.1 Prohibited locations. Piping shall not be installed in or through a [circulating air duct,] ducted supply, return or exhaust duct, or a trash or clothes chute, chimney or gas vent, ventilating duct, dumbwaiter or elevator shaft. Piping installed downstream of the point of delivery shall not extend through any townhouse unit other than the unit served by such piping. Piping, fixtures, or equipment shall be located so as not to interfere with the normal operation of windows or doors and other exit openings. The following installation limitations shall apply:

1. **Stair enclosures.** Gas piping shall not be installed within a stair enclosure or required exit or exit way.
2. **Fire standpipe riser.** Gas piping shall not be installed in any shaft containing standpipe risers.

3. **Fire pump and fire pump rooms.** Gas piping [or], gas consumption devices or any other gas equipment shall not be installed within any space housing a fire pump. Access to gas meter rooms shall not be permitted thru rooms housing a fire pump.
4. **Fire-rated construction.** Gas piping shall not be installed within [concealed spaces of] fire-rated [construction] assemblies.
5. **Public corridor.** Gas piping shall not be installed in public corridors [providing access to required exits] and exit enclosures.

Exception: Gas piping may be installed in public corridors in residential buildings that do not have floors below grade or in multi-use buildings that have a residential occupancy in accordance with the following:

1. Gas piping shall be permitted to be installed within a public corridor at the lowest level of the building or the lowest residential level of the building.
2. All gas valves located within the public corridor shall be accessible for maintenance and inspection.
3. Gas pressure within the public corridor piping shall not exceed ½ psi (14 inch w.c.). The completed piping within the public corridor is to be tested and proven tight at 10 psig (69 kPa gauge) for a minimum of 30 minutes.
4. The public corridor shall be ventilated in accordance with the *New York City Mechanical Code*. The pipe shall not be installed in a return air plenum.
5. Pipes must be welded.

404.2 Piping in solid partitions and walls. Concealed piping shall not be located in solid partitions and solid walls, unless installed in a ventilated chase or casing.

404.3 Piping in concealed locations. Portions of a piping system installed in concealed locations shall not have unions, tubing fittings, bushings, compression couplings or swing joints made by combinations of fittings.

404.4 Piping through foundation wall. Underground piping, where installed below grade through the outer foundation or basement wall of a building, shall be encased in a protective pipe sleeve. The annular space between the gas piping and the sleeve shall be sealed.

404.5 Branch take-off. Branches shall be taken off the riser with not less than a two-elbow swing.

404.6 Piping in solid floors. Piping in solid floors shall be laid in channels in the floor and covered in a manner that will allow access to the piping with a minimum amount of damage to the building. Where such piping is subject to exposure to excessive moisture or corrosive substances, the piping shall be protected in an approved manner. As an alternative to installation in channels, the piping shall be installed in a [casing] conduit of Schedule 40 steel or wrought iron pipe with tightly sealed ends and joints. At least one end shall have a vented outlet piped to a safe location outdoors. The vent terminal shall be outdoors, minimum 18 inches (457 mm) above grade, not under an opening to building or overhang, and shall be installed so as to prevent the entrance of water and insects. Both ends of such [casing] conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.

404.6.1 Conduit with one end terminating outdoors. The conduit shall extend into an occupiable portion of the building and, at the point where the conduit terminates in the building, the space between the conduit and the gas piping shall be sealed to prevent the possible entrance of any gas leakage. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor. If the end sealing is capable of withstanding the full pressure of the gas pipe, the conduit shall be designed for the same pressure as the pipe. Such conduit shall extend not less than 4 inches (102 mm) outside the building, shall be vented above grade to the outdoors and shall be installed so as prevent the entrance of water and insects.

404.6.2 Conduit with both ends terminating indoors. Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.

404.7 Above-ground outdoor piping. All piping installed outdoors shall be elevated not less than 3½ inches (152 mm) above ground and where installed across roof surfaces, shall be elevated not less than 3½ inches (152 mm) above the roof surface. Piping installed above ground, outdoors, and installed across the surface of roofs shall be securely supported to the structure and located where it will be protected from physical damage. Where passing through an outside wall, the piping shall also be protected against corrosion by coating or wrapping with an inert material. Where piping is encased in a protective pipe sleeve, the annular space between the piping and the sleeve shall be sealed. At least one end shall have a vented outlet piped to a safe location outdoors. The vent terminal shall be outdoors, minimum 18 inches (457 mm) above grade, not under an opening to building or overhang, and shall be installed so as to prevent the entrance of water and insects.

404.8 Reserved.

404.[8]9 Protection against corrosion. Metallic pipe exposed to corrosive action, such as soil condition or moisture, shall be protected in an approved manner. Zinc coatings (galvanizing) shall not be deemed adequate protection for gas piping underground. Ferrous metal exposed in exterior locations shall be protected from corrosion. Zinc coatings (galvanizing) shall be deemed

adequate protection for gas piping exposed in exterior locations. Where dissimilar metals are joined underground, an insulating coupling or fitting shall be used. Piping shall not be laid in contact with cinders.

404.[8]9.1 Prohibited use. Uncoated threaded or socket-welded joints shall not be used in piping in contact with soil or where internal or external crevice corrosion is known to occur.

404.[8]9.2 Protective coatings and wrapping. Pipe protective coatings and wrappings shall be approved for the application and shall be factory applied.

Exception: Where installed in accordance with the manufacturer's installation instructions, field application of coatings and wrappings shall be permitted for pipe nipples, fittings and locations where the factory coating or wrapping has been damaged or necessarily removed at joints.

404.[9]10 Minimum burial depth. Underground piping systems shall be installed a minimum depth of 24 inches (610 mm) below grade.

404.[10]11 Trenches. The trench shall be graded so that the pipe has a firm, substantially continuous bearing on the bottom of the trench.

404.[11]12 Piping underground beneath buildings. Piping installed underground beneath buildings is prohibited except where the piping is encased in a conduit of wrought iron or steel pipe designed to withstand the superimposed loads. [Such conduit shall extend into an occupiable portion of the building and, at the point where the conduit terminates in the building, the space between the conduit and the gas piping shall be sealed to prevent the possible entrance of any gas leakage. The conduit shall be designed for the same pressure as the pipe. Such conduit shall extend not less than 4 inches (102 mm) outside the building, and shall be vented. The vent terminal shall be outdoors, minimum 18 inches (457 mm) above grade, not under an opening to building or overhang, and shall be installed so as to prevent the entrance of water and insects.] The conduit shall be protected from corrosion in accordance with Section 404.[8] 9 and shall be installed in accordance with Section 404.12.1 or 404.12.2.

404.12.1 Conduit with one end terminating outdoors. The conduit shall extend into an occupiable portion of the building and, at the point where the conduit terminates in the building, the space between the conduit and the gas piping shall be sealed to prevent the possible entrance of any gas leakage. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor. Where the end sealing is capable of withstanding the full pressure of the gas pipe, the conduit shall be designed for the same pressure as the pipe. Such conduit shall extend not less than 4 inches (102 mm) outside of the building, shall be vented above grade to the outdoors and shall be installed so as to prevent the entrance of water and insects.

404.12.2 Conduit with both ends terminating indoors. Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.

404.[12]13 Outlet closures. [Gas outlets that do not connect to appliances shall be capped gas tight.] Gas outlets shall be permitted only under the following conditions:

[Exception:]

1. Valved and capped gas tight outlets for single appliance outlets as approved.
2. Valved and capped outlets on each floor in non-production laboratory buildings for future laboratories.
3. Listed and labeled flush-mounted-type quick disconnect devices and listed and labeled gas convenience outlets [shall be] installed in accordance with the manufacturer's installation instructions.

404.[13] 14 Location of outlets. The unthreaded portion of piping outlets shall extend not less than 1 inch (25 mm) through finished ceilings and walls and where extending through floors or outdoor patios and slabs, shall not be less than 2 inches (51 mm) above them. The outlet fitting or piping shall be securely supported. Outlets shall not be placed behind doors. Outlets shall be located in the room or space where the appliance is installed.

Exception: Listed and labeled flush-mounted-type quick disconnect devices and listed and labeled gas convenience outlets shall be installed in accordance with the manufacturer's installation instructions.

404.[14] 15 Reserved.

404.[15] 16 Prohibited devices. A device shall not be placed inside the piping or fittings that will reduce the cross-sectional area or otherwise obstruct the free flow of gas.

Exceptions:

1. Approved gas filters.
2. An approved fitting or device where the gas piping system has been sized to accommodate the pressure drop of the fitting or device

404.[16] 17 Testing of piping. Before any system of piping is put in service or concealed, it shall be tested to ensure that it is gas tight. Testing, inspection and purging of piping systems shall comply with Section 406.

SECTION FGC 405
PIPING BENDS AND CHANGES IN DIRECTION

405.1 General. Changes in direction of pipe shall be permitted to be made by the use of fittings.

405.2 Reserved

405.3 Reserved

405.4 Elbows. Factory-made welding elbows or transverse segments cut therefrom shall have an arc length measured along the crotch at least 1 inch (25 mm) in pipe sizes 2 inches (51 mm) and larger.

405.5 Pipe movement. Stainless steel flexible multiple leg hose assemblies listed and labeled as an assembly per UL 536 shall be installed for low pressure flammable and combustible gas piping systems where pipe movement resulting from thermal changes and random seismic shifts can occur in the piping systems.

405.5.1 Seismic requirements. Stainless steel flexible multiple leg hose assemblies shall be designed to withstand seismic force and displacement in accordance with Section 1613 of the *New York City Building Code*.

405.5.2 Inspection. The installation of stainless steel flexible multiple leg hose assemblies shall be subject to special inspections in accordance with Chapter 17 of the *New York City Building Code*.

SECTION FGC 406
INSPECTION, TESTING AND PURGING

406.1 General. Prior to acceptance and initial operation, all piping installations shall be inspected and pressure tested to determine that the materials, design, fabrication, and installation practices comply with the requirements of this code.

406.1.1 Inspections. Inspection shall consist of visual examination, during or after manufacture, fabrication, assembly, or pressure tests as appropriate. Supplementary types of nondestructive inspection techniques, such as magnetic-particle, radiographic, ultrasonic, etc., shall not be required unless specifically listed herein or in the engineering design.

406.1.1.1 Welder's qualifications. Welders installing gas piping within buildings at any pressure shall [be qualified for all pipe sizes, wall thicknesses and all positions in accordance with *ASME Boiler and Pressure Vessel Code*, Section IX and requalified on an annual basis. The qualification testing shall be performed by an approved agency, and the inspector shall have a minimum radiography qualification of Level II in

accordance with the ASNT, Document No. SNT-TC-1A, Supplement A. Copies of the certified welder qualification reports shall be maintained by the welder and shall be made available to the department upon request.] comply with the following:

1. Welders shall be qualified for all pipe sizes, wall thicknesses and all positions in accordance with the ASME Boiler and Pressure Vessel Code, Section IX. Requalification of welders is required on an annual basis and when requested by the commissioner.
2. Welder qualification testing shall be performed by an approved agency and the inspector witnessing the test shall be an authorized AWS Certified Welding Inspector. Radiographic test specimens shall be evaluated by a radiographic inspector having a minimum radiography qualification of Level II in accordance with the ASNT, Document No. SNT-TC-1A, Supplement A.
3. Copies of the certified welder qualification reports shall be maintained by both the approved agency and the licensed master plumber employing the welder(s) for at least six years and shall be made available to the department upon request.
4. The approved agency shall submit certified welder qualification reports to the department upon successful qualification of a welder and when requested by the commissioner.
5. The licensed master plumber employing the welder(s) shall submit a statement to the department including who welded the gas piping along with a copy(s) of the certified welder qualification report(s) witnessed by a representative of the licensed master plumber, at the time of the first roughing inspection.

406.1.1.2 Welding requirements. All welded gas distribution and meter piping main and branch supplies to customer equipment operating in excess of [3] 5 psig ([20] 34.5 kPa gauge) inside buildings shall be welded; and shall be subject to special inspection in accordance with Chapter 17 of the *New York City Building Code*. All piping 2 ½ inches (63.5 mm) or greater in diameter shall be butt-welded, and piping less than 2 ½ (63.5 mm) inches in diameter may be socket-welded or butt-welded.

[Radiography] Radiographic testing shall be performed on all butt welds in gas meter and gas distribution piping operating at pressures exceeding [3] 5 psig ([20] 34.5 kPa gauge) within buildings, in accordance with *ASME Boiler and Pressure Vessel Code*, Section IX.

406.1.1.3 Welding records. The licensed master plumber employing the welder(s) shall assign to each welder an identification symbol or number to identify the welds performed

by that particular welder. The welder shall identify all welds with his or her symbol or number. The licensed master plumber shall maintain records identifying the weld(s) made by each welder for at least six years and shall make such records available to the department upon request.

406.1.2 Repairs and additions. In the event repairs or additions are made after the pressure test, the affected piping shall be tested.

406.1.3 New branches. [Where new branches are installed from the point of delivery to new appliances, only the newly installed branches shall be required to be pressure tested. Connections between the new piping and the existing piping shall be tested with a noncorrosive leak-detecting fluid or other approved leak-detecting methods.] A piping system shall be tested as a complete unit.

406.1.4 [Section] System testing. A piping system shall [be permitted to] be tested as a complete unit [or in sections. Under no circumstances shall a valve in a line be used as a bulkhead between gas in one section of the piping system and test medium in an adjacent section, unless two valves are installed in series with a valved “telltale” located between these valves. A valve shall not be subjected to the test pressure unless it can be determined that the valve, including the valve-closing mechanism, is designed to safely withstand the test pressure].

406.1.5 Regulators and valve assemblies. Regulator and valve assemblies fabricated independently of the piping system in which they are to be installed shall be permitted to be tested with inert gas or air at the time of fabrication.

406.2 Test medium. The test medium shall be air, nitrogen, carbon dioxide or an inert gas. Oxygen shall not be used. Fresh water may be used as the test medium only where the required test pressure exceeds 100 psig (689 kPa).

406.3 Test preparation. Pipe joints, including welds, shall be left exposed for examination during the test.

Exception: Covered or concealed pipe end joints that have been previously tested in accordance with this code.

406.3.1 Expansion joints. Expansion joints shall be provided with temporary restraints, if required, for the additional thrust load under test.

406.3.2 Appliance and [E]equipment isolation. Appliances and [E] equipment that [is] are not to be included in the test shall be either disconnected from the piping or isolated by blanks, blind flanges, or caps. Flanged joints at which blinds are inserted to blank off other equipment during the test shall not be required to be tested.

406.3.3 Appliance and [E]quipment disconnection. Where the piping system is connected to appliances or equipment [or components] designed for operating pressures of less than the test pressure, such appliances or equipment [or equipment components] shall be isolated from the piping system by disconnecting them and capping the outlet(s).

406.3.4 Valve isolation. Where the piping system is connected to appliances or equipment [or components] designed for operating pressures equal to or greater than the test pressure, such appliances or equipment shall be isolated from the piping system by closing the individual appliance or equipment shutoff valve(s).

406.3.5 Testing precautions. All testing of piping systems shall be done with due regard for the safety of employees and the public during the test. Bulkheads, anchorage, and bracing suitably designed to resist test pressures shall be installed if necessary. Prior to testing, the interior of the pipe shall be purged to flush out all foreign material, including weld splatter, dirt, rags, and other debris left inside the pipe during welding operations and piping installation.

406.4 Test pressure measurement. Upon completion of the installation of a section of a gas system or of the entire gas system, and before appliances are connected thereto, the completed section or system shall be verified as to materials, and tested and proven tight as follows:

1. Gas distribution piping shall comply with the following:
 - 1.1. Distribution pressures up to ½ psig (3.5 kPa gauge). The completed piping is to be tested with a nonmercury gauge at a pressure of 3 psig (20 kPa gauge) for a minimum of 30 minutes.
 - 1.2. Distribution pressures over ½ psig (3.5 kPa gauge) through [3] 5 psig ([20] 34.5 kPa gauge). The completed piping is to be tested at 50 psig (340 kPa gauge) for a minimum of 30 minutes.
 - 1.3. Distribution pressures over [3] 5 psig ([20] 34.5 kPa gauge) through 15 psig (100 kPa gauge). The completed piping is to be tested at 100 psig (689 kPa gauge) for a minimum of 1 hour.
 - 1.4. Distribution pressures above 15 psig (100 kPa gauge). The completed piping is to be tested to twice the maximum allowable operating pressure, but not less than 100 psig (689 kPa gauge), for a minimum of 1 hour.
 - 1.5. Where the test pressure exceeds 125 psig (862 kPa gauge), the test pressure shall not exceed a value that produces a hoop stress in the piping greater [that] than 50 percent of the specified minimum yield strength of the pipe.
2. Meter piping shall be pressure tested in accordance with the requirements of the serving

utility. These requirements shall be either the same as those for testing distribution piping in numbered paragraph 1 of this section or, if different, the piping shall be certified by the local utility as being tested in compliance with their requirements.

3. Notwithstanding the above, all factory applied coated and wrapped pipe shall be pressure tested at a minimum of 90 psig (621 kPa gauge). For testing, the piping shall be filled with air or an inert gas, and the source of pressure shall be isolated before the pressure readings are made. All test duration time periods are to be measured after stabilization of testing medium. Fresh water may be used as the test medium only where the required test pressure exceeds 100 psig (689 kPa gauge).

406.4.1 Minimum standards for nonmercury gauges.

1. This section establishes minimum standards for nonmercury gauges to test gas piping, drainage and vent systems.
2. Each gauge shall meet the following requirements:
 - 2.1. The gauge shall be manufactured and used in accordance with ASME B 40.100, which incorporates ASME B 40.1 and ASME B 40.7, and the manufacturer shall provide with the gauge a written statement that the gauge is manufactured in accordance with such ASME standard;
 - 2.2. The gauge shall be labeled with the name of the manufacturer;
 - 2.3. The gauge shall be kept in a padded separate rigid box and the manufacturer's instructions for use and protection of the gauge shall be complied with;
 - 2.4. The units of measurement "psig" shall appear on the face of the gauge; and
 - 2.5. The gauge shall be kept in good working order.

406.4.2 Analog gauges used to measure pressure in the magnitude of 3 psig (20 kPa gauge). Each analog gauge used to measure pressure in the magnitude of 3 psig (20 kPa gauge) shall meet the following requirements in addition to satisfying the minimum requirements set forth in section 406.4.1:

1. The face of the gauge shall not be smaller than 2¹/₄ inches (57 mm) in diameter;
2. The gauge shall have a minimum of 270 [°] degree (5 rad) dial arc;
3. The gauge shall be calibrated in increments of not greater than one-tenth of a pound;
4. The range of the gauge shall not exceed 5 psig (34.5 kPa gauge) when a 2¹/₄-inch (57

- mm) diameter gauge is used;
5. The $\frac{1}{10}$ psig (0.69 kPa gauge) interval on the gauge shall not be smaller than one-tenth of an inch (2.5 mm) of arc;
 6. The gauge shall be provided with an effective stop for the indicating pointer at the zero point;
 7. The gauge shall be protected from excessive pressure with a shutoff valve and prior to using the 5 psig (34.5 kPa gauge) the snifter valve shall be tested with a tire gauge to determine the magnitude of pressure; and
 8. The gauge shall have a calibration screw.

406.4.3 Analog gauges used to measure pressure in the magnitude of 5 psig (34.5 kPa gauge). Each analog gauge used to measure pressure in the magnitude of 5 psig (34.5 kPa gauge) shall meet the following requirements in addition to satisfying the minimum requirements set forth in Section 406.4.1:

1. The face of the gauge shall not be smaller than $2\frac{1}{4}$ inches (57 mm) in diameter;
2. The gauge shall have a minimum of 270 [°] degree (5 rad) dial arc;
3. The gauge shall be calibrated in increments not greater than one-fifth of a pound;
4. The range of the gauge shall not exceed 10 psig (69 kPa gauge) when a $2\frac{1}{4}$ inch (57 mm) diameter gauge is used;
5. The one-fifth interval on the gauge shall not be smaller than one-tenth of an inch (2.5 mm) of arc;
6. The gauge shall be provided with an effective stop for the indicating pointer at the zero point;
7. The gauge shall be protected from excessive pressure with a shutoff valve and prior to using the 10 psig (69 kPa gauge) the snifter valve shall be tested with a tire gauge to determine the magnitude of pressure; and
8. The gauge shall have a calibration screw.

406.4.4 Digital gauges used to measure pressure in the magnitude of 3 psig (20 kPa gauge) and higher. Each digital gauge used to measure pressure in the magnitude of 3 psig (20 kPa gauge) and higher shall meet the following requirements in addition to satisfying the minimum requirements set forth in Section 406.4.1:

1. The gauge shall have a minimum reading of $\frac{1}{100}$ of a psig (69 Pa), and
2. An extra charged battery shall be readily available for immediate use with the gauge.

406.4.5 Witnessing tests of gas-piping systems. Tests of gas piping systems in accordance with this code shall be witnessed by department plumbing inspectors, or approved agencies. The department shall prescribe qualifications for individuals who are authorized to witness such tests on behalf of approved agencies, including but not limited to the requirement that such individuals shall be licensed master plumbers or registered design professionals with not less than 5 years' experience in the inspection and testing of gas piping systems. Such tests may be conducted without any verifying inspection of tests by the department, provided that verified statements and supporting inspectorial and test reports are filed with the department within one working day of such tests.

406.4.6 Notification. The holder of the plumbing permit shall give at least 2 days prior written notice to the commissioner that the plumbing work covered by the permit is ready for inspections and test.

406.5 Detection of leaks and defects. The piping system shall withstand the test pressure specified without showing any evidence of leakage or other defects. Any reduction of test pressures as indicated by pressure gauges shall be deemed to indicate the presence of a leak unless such reduction can be readily attributed to some other cause.

406.5.1 Detection methods. The leakage shall be located by means of an approved gas detector, a noncorrosive leak detection fluid, or other approved leak detection methods. Matches, candles, open flames, or other methods that could provide a source of ignition shall not be used.

406.5.2 Corrections. Where leakage or other defects are located, the affected portion of the piping system shall be repaired or replaced and retested.

406.6 Piping [S]system and equipment leakage [test] check. Leakage [testing] checking of systems and equipment shall be in accordance with Sections 406.6.1 through 406.6.4.

406.6.1 [Test] Check gases. Leak checks using fuel gas shall be permitted in piping systems that have been pressure tested in accordance with Section 406.

406.6.2 Before turning gas on. [Before gas is introduced] During the process of turning gas on into a system of new gas piping, the entire system shall be inspected to determine that there are no open fittings or ends and that all valves at unused outlets are closed and plugged or capped.

406.6.2.1 Establishing gas supply. It shall be unlawful for any utility company to supply gas to a building, place or premises in which new meters other than replacement are required until a certificate of approval of gas installation from the department is filed with such utility company. When new gas service piping has been installed it shall be locked-off by the utility either by locking the gas service line valve or by installing a locking device on the outside gas service line valve. The lock shall not be removed until the gas meter piping (other than utility-owned) and gas distribution piping has been inspected and certified as required by the department as being ready for service.

406.6.2.2 Alterations to gas piping systems. When alterations, extensions or repairs to existing gas meter piping or gas distribution piping requires the shutoff of gas flow to a building, the utility shall be notified by the owner or his or her authorized representative.

406.6.3 [Test for leakage] Leak check. Immediately after the gas is turned on into a new system or into a system that has been initially restored after an interruption of service, the piping system shall be [tested] checked for leakage. Where leakage is indicated, the gas supply shall be shut off until the necessary repairs have been made.

406.6.4 Placing appliances and equipment in operation. Gas utilization appliances and equipment shall be permitted to be placed in operation after the piping system has been [tested] checked for leakage in accordance with Section 406.6.3 and determined to be free of leakage and purged in accordance with Section 406.7.2.

406.6.4.1 Requirements for placing equipment in operation. The following will be required prior to placing equipment in operation as applicable:

1. Required fire protection[s] systems (sprinkler or standpipe) are completed, inspected and ready for service.
2. Such equipment and related gas piping[s] are inspected by the department or authorized inspector.
3. Associated fire suppression system is inspected and approved by the Fire Department.

406.7 Purging. The [P]purging of piping shall [comply] be in accordance with Sections 406.7.1 through 406.7.[4]3.

[406.7.1 Removal from service. Where gas piping is to be opened for servicing, addition, or modification, the section to be worked on shall be turned off from the gas supply at the nearest convenient point, and the line pressure vented to the outdoors, or to ventilated areas of

sufficient size to prevent accumulation of flammable mixtures. The remaining gas in this section of pipe shall be displaced with an inert gas as required by Table 406.7.1.

406.7.2 Placing in operation. Where piping full of air is placed in operation, the air in the piping shall be displaced with fuel gas, except where such piping is required by Table 406.7.2 to be purged with an inert gas prior to introduction of fuel gas. The air can be safely displaced with fuel gas provided that a moderately rapid and continuous flow of fuel gas is introduced at one end of the line and air is vented out at the other end. The fuel gas flow shall be continued without interruption until the vented gas is free of air. The point of discharge shall not be left unattended during purging. After purging, the vent shall then be closed. Where required by Table 406.7.2, the air in the piping shall first be displaced with an inert gas, and the inert gas shall then be displaced with fuel gas.

**TABLE 406.7.1
LENGTH OF PIPING REQUIRING PURGING WITH
INERT GAS FOR SERVICING OR MODIFICATION**

NOMINAL PIPE SIZE (inches)	LENGTH OF PIPING REQUIRING PURGING
2½	>50 feet
3	>30 feet
4	>15 feet
+6	>10 feet
8 or larger	Any length

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

**TABLE 406.7.2
LENGTH OF PIPING REQUIRING PURGING WITH
INERT GAS BEFORE PLACING IN OPERATION**

NOMINAL PIPE SIZE (inches)	LENGTH OF PIPING REQUIRING PURGING
-------------------------------	---------------------------------------

3	>30 feet
4	>15 feet
6	>10 feet
8 or larger	Any length

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

406.7.3 Discharge of purged gases. The open end of piping systems being purged shall not discharge into confined spaces or areas where there are sources of ignition unless precautions are taken to perform this operation in a safe manner by ventilation of the space, control of purging rate, and elimination of all hazardous conditions.

406.7.4 Placing equipment in operation. After the piping has been readied for operation, all equipment shall be purged and then placed in operation, as necessary.]

406.7.1 Piping systems required to be purged outdoors. The purging of piping systems shall be in accordance with the provisions of Sections 406.7.1.1 through 406.7.1.4 where the piping system meets either of the following:

1. The design operating gas pressure is greater than 2 psig (13.79 kPa).
2. The piping being purged contains one or more sections of pipe or tubing that meet(s) the size and length criteria of Table 406.7.1.1.

406.7.1.1 Removal from service. Where existing gas piping is opened, the section that is opened shall be isolated from the gas supply and the line pressure vented in accordance with Section 406.7.1.3. Where gas piping meeting the criteria of Table 406.7.1.1 is removed from service, the residual fuel gas in the piping shall be displaced with an inert gas.

TABLE 406.7.1.1
SIZE AND LENGTH OF PIPING

<u>NOMINAL PIPE SIZE</u> <u>(inches)</u>	<u>LENGTH OF PIPING</u> <u>(feet)</u>
$\geq 2 \frac{1}{2} < 3$	≤ 50
$\geq 3 < 4$	≤ 30

<u>$\geq 4 < 6$</u>	<u>< 15</u>
<u>$\geq 6 < 8$</u>	<u>< 10</u>
<u>≥ 8</u>	<u>Any length</u>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

406.7.1.2 Placing in operation. Where gas piping containing air and meeting the criteria of Table 406.7.1.1 is placed in operation, the air in the piping shall first be displaced with an inert gas. The inert gas shall then be displaced with fuel gas in accordance with Section 406.7.1.3.

406.7.1.3 Outdoor discharge of purged gases. The open end of a piping system being pressure vented or purged shall discharge directly to an outdoor location. Purging operations shall comply with all of the following requirements:

1. The point of discharge shall be controlled with a shutoff valve.
2. The point of discharge shall be located at least 10 feet (3048 mm) from sources of ignition, at least 10 feet (3048 mm) from building openings and at least 25 feet (7620 mm) from mechanical air intake openings.
3. During discharge, the open point of discharge shall be continuously attended and monitored with a combustible gas indicator that complies with Section 406.7.1.4.
4. Purging operations introducing fuel gas shall be stopped when 90 percent fuel gas by volume is detected within the pipe.
5. Persons not involved in the purging operations shall be evacuated from all areas within 10 feet (3048 mm) of the point of discharge.

406.7.1.4 Combustible gas indicator. Combustible gas indicators shall be listed and shall be calibrated in accordance with the manufacturer's instructions. Combustible gas indicators shall numerically display a volume scale from zero percent to 100 percent in 1 percent or smaller increments.

406.7.2 Piping systems allowed to be purged indoors or outdoors. The purging of piping systems shall be in accordance with the provisions of Section 406.7.2.1 where the piping system meets both of the following:

1. The design operating gas pressure is 2 psig (13.79 kPa) or less.
2. The piping being purged is constructed entirely from pipe or tubing not meeting the size and length criteria of Table 406.7.1.1.

406.7.2.1 Purging procedure. The piping system shall be purged in accordance with one or more of the following:

1. The piping shall be purged with fuel gas and shall discharge to the outdoors.
2. The piping shall be purged with fuel gas and shall discharge to the indoors or outdoors through an appliance burner not located in a combustion chamber. Such burner shall be provided with a continuous source of ignition.
3. The piping shall be purged with fuel gas and shall discharge to the indoors or outdoors through a burner that has a continuous source of ignition and that is designed for such purpose.
4. The piping shall be purged with fuel gas that is discharged to the indoors or outdoors, and the point of discharge shall be monitored with a listed combustible gas detector in accordance with Section 406.7.2.2. Purging shall be stopped when fuel gas is detected.
5. The piping shall be purged by the gas supplier in accordance with written procedures of the utility company.

406.7.2.2 Combustible gas detector. Combustible gas detectors shall be listed and shall be calibrated or tested in accordance with the manufacturer's instructions. Combustible gas detectors shall be capable of indicating the presence of fuel gas.

406.7.3 Purging appliances and equipment. After the piping system has been placed in operation, appliances and equipment subsequently installed shall be purged before being placed into operation.

SECTION FGC 407 PIPING SUPPORT

407.1 General. Piping shall be provided with support in accordance with Section 407.2. In addition, when earthquake loads are applicable in accordance with the *New York City Building Code*, a detailed piping system stress analysis including seismic analysis shall be performed. The pipe supports and restraints shall be designed and installed to accommodate the resultant seismic forces, moments and displacements from this stress analysis in accordance with the *New York City Building Code*.

407.2 Design and installation. Piping shall be supported with metal pipe hooks, metal pipe straps, metal bands, metal brackets, [or] metal hangers or building structural components suitable for the size of piping, of adequate strength and quality, and located at intervals so as to prevent or damp out excessive vibration. Piping shall be anchored to prevent undue strains on

connected [equipment] appliances and shall not be supported by other piping. Pipe hangers and supports shall conform to the requirements of MSS SP-58 and shall be spaced in accordance with Section 415. Supports, hangers, and anchors shall be installed so as not to interfere with the free expansion and contraction of the piping between anchors. All parts of the supporting equipment shall be designed and installed so they will not be disengaged by movement of the supported piping.

SECTION FGC 408 DRIPS AND SLOPED PIPING

408.1 Slopes. Piping for other than dry gas conditions shall be sloped not less than ¼ inch in 15 feet (6.3 mm in 4572 mm) to prevent traps. The local gas supplier/utility company should be consulted to determine the type of fuel gas available for the intended service.

408.2 Drips. Where the local gas supplier/utility company requires, a manufactured test fitting or drip leg shall be installed downstream of a lockable supply/riser valve in accordance with the requirements for installation of the serving utility. No other locations will be allowed to prevent additional unapproved gas connections.

408.3 Reserved.

408.4 Sediment trap. Where a sediment trap is not incorporated as part of the [gas utilization equipment] appliance, a sediment trap shall be installed downstream of the [equipment] appliance shutoff valve as close to the inlet of the [equipment] appliance as practical. The sediment trap shall be either a tee fitting [with] having a capped nipple of any length installed vertically in the bottom most opening of the [run of the] tee or other device approved as an effective sediment trap. Illuminating appliances, ranges, clothes dryers, decorative vented appliances for installation in vented fireplaces, gas fireplaces, and outdoor grills need not be so equipped.

SECTION FGC 409 SHUTOFF VALVES

409.1 General. Piping systems shall be provided with shutoff valves in accordance with this section.

[409.1.1 Valve approval. Shutoff valves shall be of an approved type. Shutoff valves shall be constructed of materials compatible with the piping. Shutoff valves installed in a portion of a piping system operating above 0.5 psig (3.5 kPa gauge) shall comply with ASME B 16.33. Shutoff valves installed in a portion of a piping system operating at 0.5 psig (3.5 kPa gauge) or less shall comply with ANSI Z 21.15 or ASME B 16.33.]

409.1.1 Valve approval. Shutoff valves shall be of an approved type; shall be constructed of materials compatible with the piping; and shall comply with the standard that is applicable for the pressure and application, in accordance with Table 409.1.1.

TABLE 409.1.1
MANUAL GAS VALVE STANDARDS

<u>VALVE STANDARDS</u>	<u>APPLIANCE SHUTOFF VALVE APPLICATION UP TO 1/2 psig PRESSURE</u>	<u>OTHER VALVE APPLICATIONS</u>			
		<u>UP TO 1/2 psig PRESSURE</u>	<u>UP TO 2 psig PRESSURE</u>	<u>UP TO 5 psig PRESSURE</u>	<u>UP TO 125 psig PRESSURE</u>
<u>ANSI Z21.15</u>	<u>X</u>	=	=	=	=
<u>CSA Requirement 3-88</u>	<u>X</u>	<u>X</u>	<u>Xa</u>	<u>Xb</u>	=
<u>ASME B 16.44</u>	<u>X</u>	<u>X</u>	<u>Xa</u>	<u>Xb</u>	=
<u>ASME B16.33</u>	<u>X</u>	<u>X</u>	<u>X</u>	<u>X</u>	<u>X</u>

For SI: 1 pound per square inch gauge = 6.895 kPa.

- a. If labeled 2G.
- b. If labeled 5G.

409.1.2 Prohibited locations. Shutoff valves shall be prohibited in concealed locations and furnace plenums.

409.1.3 Access to shutoff valves. Shutoff valves shall be located in places so as to provide access for operation and shall be installed so as to be protected from damage.

409.2 Meter valve. Every meter shall be equipped with a shutoff valve located on the supply side of the meter.

409.3 Shutoff valves for multiple-house line systems. Where a single meter is used to supply gas to more than one building or tenant, a separate shutoff valve shall be provided for each building or tenant.

409.3.1 Multiple tenant buildings. In multiple tenant buildings, where a common piping system is installed to supply other than [one- and two-family dwellings] individual dwelling units, shutoff valves shall be provided for each tenant. Each tenant shall have access to the shutoff valve serving that tenant's space.

409.3.2 Individual buildings. In a common system serving more than one building, shutoff valves shall be installed outdoors at each building.

409.3.3 Identification of shutoff valves. Each house line shutoff valve shall be plainly marked with an identification tag attached by the installer so that the piping systems supplied by such valves are readily identified.

409.4 MP regulator valves. A listed shutoff valve shall be installed immediately ahead of each MP regulator.

[409.5 Equipment shutoff valve. Each appliance shall be provided with a shutoff valve separate from the appliance. The shutoff valve shall be located in the same room as the appliance, not further than 6 feet (1829 mm) from the appliance, and shall be installed upstream from the union, connector or quick disconnect device it serves. Such shutoff valves shall be provided with access.

Exception: Shutoff valves for vented decorative appliances and decorative appliances for installation in vented fireplaces shall not be prohibited from being installed in an area remote from the appliance where such valves are provided with ready access. Such valves shall be permanently identified and shall serve no other equipment. Piping from the shutoff valve to within 3 feet (914mm) of the appliance connection shall be sized in accordance with Section 402.

409.5.1 Shutoff valve in fireplace. Equipment shutoff valves located in the firebox of a fireplace shall be installed in accordance with the appliance manufacturer's instructions.]

409.5 Appliance shutoff valve. Each appliance shall be provided with a shutoff valve in accordance with Section 409.5.1, 409.5.2 or 409.5.3.

409.5.1 Located within same room. The shutoff valve shall be located in the same room as the appliance. The shut-off valve shall be within 6 feet (1829 mm) of the appliance, and shall be installed upstream of the union, connector or quick disconnect device it serves. Such shutoff valves shall be provided with access. Appliance shutoff valves located in the

firebox of a fireplace shall be installed in accordance with the appliance manufacturer's instructions. Where the shutoff valve is located in the firebox a remote shutoff valve shall also be provided

409.5.2 Vented decorative appliances and room heaters. Shutoff valves for vented decorative appliances, room heaters and decorative appliances for installation in vented fireplaces shall be permitted to be installed in an area remote from the appliances where such valves are provided with ready access. Such valves shall be permanently identified and shall serve no other appliance. The piping from the shutoff valve to within 6 feet (1829 mm) of the appliance shall be designed, sized and installed in accordance with Sections 401 through 408.

409.6 Shutoff valve for laboratories. Where provided with two or more fuel gas outlets, including table-, bench- and hood-mounted outlets, each laboratory space in educational, research, commercial and industrial occupancies shall be provided with a single dedicated shutoff valve through which all such gas outlets shall be supplied. The dedicated shutoff valve shall be readily accessible, located within the laboratory space served, located adjacent to the egress door from the space and shall be identified by approved signage stating "Gas Shutoff."

409.[6]7 Outside gas cut-off. An outside gas service line valve or other outside shutoff device or method acceptable to the commissioner shall be provided in accordance with Section E.2 of Appendix E of this code.

SECTION FGC 410 FLOW CONTROLS

410.1 Pressure regulators. A line pressure regulator shall be installed where the appliance is designed to operate at a lower pressure than the supply pressure. Line gas pressure regulators shall be listed as complying with ANSI Z21.80. Access shall be provided to pressure regulators. Pressure regulators shall be protected from physical damage. Regulators installed on the exterior of the building shall be approved for outdoor installation.

410.2 MP regulators. MP [pressure] regulators shall comply with the following:

1. The MP regulator shall be approved and shall be suitable for the inlet and outlet gas pressures for the application.
2. The MP regulator shall maintain a reduced outlet pressure under lockup (no-flow) conditions.
3. The capacity of the MP regulator, determined by published ratings of its manufacturer, shall be adequate to supply the appliances served.
4. The MP [pressure] regulator shall be provided with access. Where located indoors, the

regulator shall be vented to the outdoors or shall be equipped with a leak-limiting device, in either case complying with Section 410.3.

5. A tee fitting with one opening capped or plugged shall be installed between the MP regulator and its upstream shutoff valve. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument and to serve as a sediment trap.
6. A tee fitting with one opening capped or plugged shall be installed not less than 10 pipe diameters downstream of the MP regulator outlet. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument.

410.3 Venting of regulators. Pressure regulators that require a vent shall [have an independent vent] be vented directly to the [outside of the building] outdoors. [The vent shall be designed to prevent the entry of water or foreign objects.] The vent terminal shall be [outdoors,] a minimum of 18 inches (457 mm) above grade, not under an opening to the building or overhang, and shall be installed so as to prevent the entrance of water and insects.

Exception: A vent to the [outside of the building] outdoors is not required for regulators less than 1¼ inches (31.7 mm) NPS equipped with and labeled for utilization with approved vent-limiting devices installed in accordance with the manufacturer's instructions.

410.3.1 Vent piping. Vent piping for relief vents and breather vents shall be constructed of materials allowed for gas piping in accordance with Section 403. Vent piping shall be not smaller than the vent connection on the pressure regulating device. Vent piping serving relief vents and combination relief and breather vents shall be run independently to the outdoors and shall serve only a single device vent. Vent piping serving only breather vents is permitted to be connected in a manifold arrangement where sized in accordance with an approved design that minimizes back pressure in the event of diaphragm rupture. Regulator vent piping shall not exceed the length specified in the regulator manufacturer's installation instructions.

410.4 Flashback arrestor check valve. Where fuel gas is used with oxygen in any hot work operation, a listed protective device that serves as a combination flashback arrestor and backflow check valve shall be installed at an approved location on both the fuel gas and oxygen supply lines. Where the pressure of the piped fuel gas supply is insufficient to ensure such safe operation, approved equipment shall be installed between the gas meter and the appliance that increases pressure to the level required for such safe operation.

SECTION FGC 411

APPLIANCE AND MANUFACTURED HOME CONNECTIONS

411.1 Connecting appliances. Except as required by Section 411.1.1, [A]appliances shall be connected to the piping system by one of the following:

1. Rigid metallic pipe and fittings. Space heaters and water heaters within dwelling units shall be connected using rigid piping and fittings only. Use of semirigid (flexible) metallic tubing, fittings, appliance connectors or quick-disconnect devices is not permitted for this application. [
2. Semirigid (flexible) metallic tubing and metallic fittings. Lengths shall not exceed 6 feet (1829 mm) and shall be located entirely in the same room as the appliance. Semirigid metallic tubing shall not enter a motor-operated appliance through an unprotected knockout opening.]
- [3.] 2. Listed and labeled appliance connectors in compliance with ANSI Z21.24 and installed in accordance with the manufacturer's installation instructions and located entirely in the same room as the appliance.
- [4.] 3. Listed and labeled quick-disconnect devices used in conjunction with listed and labeled appliance connectors.
- [5.] 4. Listed and labeled convenience outlets used in conjunction with listed and labeled appliance connectors.
- [6.] 5. Listed and labeled outdoor appliance connectors complying with ANSI [Z 21.69] Z21.75/CSA 6.27 and [listed for use with food service equipment having casters, or that is otherwise subject to movement for cleaning, and other large movable equipment.] installed in accordance with the manufacturer's installation instructions.

411.1.1 Commercial cooking appliances. Commercial cooking appliances installed on casters and appliances that are moved for cleaning and sanitation purposes shall be connected to the piping system with an appliance connector listed as complying with ANSI Z21.69 and NSF/ANSI 169 or in accordance with Item 1 of Section 411.1.

411.1.[1]2 Protection [from] against damage. Connectors and tubing shall be installed so as to be protected against physical damage.

411.1.[2]3 [Appliance fuel connectors]Connector installation. [Connectors shall have an overall length not to exceed 3 feet (914 mm), except for range and domestic clothes dryer connectors, which shall not exceed 6 feet (1829 mm) in length. Connectors shall not be concealed within, or extended through, walls, floors, partitions, ceilings or appliance housings. A shutoff valve not less than the nominal size of the connector shall be installed ahead of the connector in accordance with Section 409.5. Connectors shall be sized to provide the total demand of the connected appliance.

Exception: Fireplace inserts factory equipped with grommets, sleeves, or other means of protection in accordance with the listing of the appliance.] Fuel connectors shall be

installed in accordance with the manufacturer's instructions and Sections 411.1.3.1 through 411.1.3.4.

411.1.3.1 Maximum length. Connectors shall have an overall length not to exceed 6 feet (1829 mm). Measurement shall be made along the centerline of the connector. Only one connector shall be used for each appliance.

411.1.3.2 Minimum size. Connectors shall have the capacity for the total demand of the connected appliance.

411.1.3.3 Prohibited locations and penetrations. Connectors shall not be concealed within, or extended through, walls, floors, partitions, ceilings or appliance housings.

Exceptions:

1. Connectors constructed of materials allowed for piping systems in accordance with Section 403 shall be permitted to pass through walls, floors, partitions and ceilings where installed in accordance with Section 409.5.2.
2. Rigid steel pipe connectors shall be permitted to extend through openings in appliance housings.
3. Fireplace inserts that are factory equipped with grommets, sleeves or other means of protection in accordance with the listing of the appliance.
4. Listed connectors shall be permitted to extend through an opening in an appliance housing, cabinet or casing where the tubing or connector is protected against damage.

411.1.3.4 Shutoff valve. A shutoff valve not less than the nominal size of the piping system shall be installed ahead of the connector in accordance with Section 409.5.

411.1.[3]4 Movable appliances. Where appliances are equipped with casters or are otherwise subject to periodic movement or relocation for purposes such as routine cleaning and maintenance, such appliances shall be connected to the supply system piping by means of an approved flexible connector designed and labeled for the application. Such flexible connectors shall be installed and protected against physical damage in accordance with the manufacturer's installation instructions.

411.1.5 Connection of gas engine-powered air conditioners. Internal combustion engines shall not be rigidly connected to the gas supply piping.

411.1.6 Unions. A union fitting shall be provided for appliances connected by rigid metallic pipe. Such unions shall be accessible and located within 6 feet (1829mm) of the appliance.

411.2 Manufactured home connections. Manufactured homes shall be connected to the distribution piping system by one of the following materials:

1. Metallic pipe in accordance with Section 403.4.
2. Listed and labeled connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's installation instructions.

411.3 Suspended low-intensity infrared tube heaters. Suspended low-intensity infrared tube heaters shall be connected to the building piping system with a connector listed for the application complying with ANSI Z21 .24/CGA 6.10. The connector shall be installed as specified by the tube heater manufacturer's instructions.

SECTION FGC 412 LIQUEFIED PETROLEUM GAS MOTOR VEHICLE FUEL-DISPENSING STATIONS

412.1 Applicability. Motor fuel-dispensing facilities for LP-gas fuel shall be designed and operated in accordance with the *New York City Fire Code*.

412.2 Reserved.

412.3 Reserved.

412.4 Reserved.

412.5 Reserved.

412.6 Reserved.

412.7 Reserved.

412.8 Reserved.

SECTION FGC 413 COMPRESSED NATURAL GAS MOTOR VEHICLE FUEL-DISPENSING STATIONS

413.1 Applicability. Motor fuel-dispensing facilities for CNG fuel shall be designed and operated in accordance with the *New York City Fire Code*.

413.2 Reserved.

413.3 Reserved.

413.4 Reserved.

413.5 Reserved.

413.7 Reserved.

413.8 Reserved.

**SECTION FGC 414
RESERVED**

**SECTION FGC 415
PIPING SUPPORT INTERVALS**

415.1 Interval of support. Piping shall be supported at intervals not exceeding the spacing specified in Table 415.1.

**TABLE 415.1
SUPPORT OF PIPING**

STEEL PIPE, NOMINAL SIZE OF PIPE (inches)	SPACING OF SUPPORTS (feet)	[NOMINAL SIZE OF TUBING (SMOOTH- WALL) (inch O.D.)]	[SPACING OF SUPPORT S (feet)]
$\frac{1}{2}$	6	$[\frac{1}{2}]$	[4]
$\frac{3}{4}$ or 1	8	$[\frac{5}{8}$ or $\frac{3}{4}]$	[6]
$1\frac{1}{4}$ or larger (horizontal)	[10] <u>12</u>	$[\frac{7}{8}$ or 1 (Horizontal)]	[8]
[$1\frac{1}{4}$ or larger (vertical)] <u>All vertical piping</u>	Every floor level	[1 or Larger (vertical)]	[Every floor level]

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

SECTION 416
OVERPRESSURE PROTECTION DEVICES

416.1 General. Overpressure protection devices shall be provided in accordance with this section to prevent the pressure in the piping system from exceeding the pressure that would cause unsafe operation of any connected and properly adjusted appliances.

416.2 Protection methods. The requirements of this section shall be considered to be met and a piping system deemed to have overpressure protection where a service or line pressure regulator plus one other device are installed such that the following occur:

1. Each device limits the pressure to a value that does not exceed the maximum working pressure of the downstream system.
2. The individual failure of either device does not result in the over pressurization of the downstream system.

416.3 Device maintenance. The overpressure protection device shall be properly maintained and inspected every two years by a Licensed Master Plumber and inspection records shall be maintained by the Owner and made available for the Department; and inspection procedures shall be in accordance with the commissioner; and replacements or repairs shall be promptly made.

Exception: Where the gas pressure is 15 psig (103 kPa gauge) or above, the overpressure protection device shall be inspected annually.

416.4 Where required. A pressure-relieving or pressure-limiting device shall not be required where: (1) the gas does not contain materials that could seriously interfere with the operation of the service or line pressure regulator; (2) the operating pressure of the gas source is 5 psi (34.5 kPa) or less; and (3) the service or line pressure regulator has all of the following design features or characteristics:

1. Pipe connections to the service or line regulator do not exceed 2 inches (51 mm) nominal diameter.
2. The regulator is self-contained with no external static or control piping.
3. The regulator has a single port valve with an orifice diameter not greater than that recommended by the manufacturer for the maximum gas pressure at the regulator inlet.
4. The valve seat is made of resilient material designed to withstand abrasion of the gas, impurities in the gas and cutting by the valve, and to resist permanent deformation where it is pressed against the valve port.

5. The regulator is capable, under normal operating conditions, of regulating the downstream pressure within the necessary limits of accuracy and of limiting the discharge pressure under no-flow conditions to not more than 150 percent of the discharge pressure maintained under flow conditions.

416.5 Devices. Pressure-relieving or pressure-limiting devices shall be one of the following:

1. Spring-loaded relief device.
2. Pilot-loaded back pressure regulator used as a relief valve and designed so that failure of the pilot system or external control piping will cause the regulator relief valve to open.
3. A monitoring regulator installed in series with the service or line pressure regulator.
4. An automatic shutoff device installed in series with the service or line pressure regulator and set to shut off when the pressure on the downstream piping system reaches the maximum working pressure or some other predetermined pressure less than the maximum working pressure. This device shall be designed so that it will remain closed until manually reset.
5. A liquid seal relief device that can be set to open accurately and consistently at the desired pressure.

The devices shall be installed either as an integral part of the service or line pressure regulator or as separate units. Where separate pressure-relieving or pressure-limiting devices are installed, they shall comply with Sections 416.5.1 through 416.5.6.

416.5.1 Construction and installation. Pressure relieving and pressure-limiting devices shall be constructed of materials so that the operation of the devices will not be impaired by corrosion of external parts by the atmosphere or of internal parts by the gas. Pressure-relieving and pressure-limiting devices shall be designed and installed so that they can be operated to determine whether the valve is free. The devices shall also be designed and installed so that they can be tested to determine the pressure at which they will operate and examined for leakage when in the closed position.

416.5.2 External control piping. External control piping shall be protected from falling objects, excavations and other causes of damage and shall be designed and installed so that damage to any control piping will not render both the regulator and the overpressure protective device inoperative.

416.5.3 Setting. Each pressure-relieving or pressure-limiting device shall be set so that the pressure does not exceed a safe level beyond the maximum allowable working pressure for the connected piping and appliances.

416.5.4 Unauthorized operation. Precautions shall be taken to prevent unauthorized operation of any shutoff valve that will make a pressure-relieving valve or pressure-limiting device inoperative. The valve shall be locked or continuously monitored in the open position.

416.5.5 Vents. The discharge stacks, vents and outlet parts of all pressure-relieving and pressure-limiting devices shall be located so that gas is safely discharged to the outdoors. Discharge stacks and vents shall be designed to prevent the entry of water, insects and other foreign material that could cause blockage. The discharge stack or vent line shall be at least the same size as the outlet of the pressure-relieving device.

416.5.6 Size of fittings, pipe and openings. The fittings, pipe and openings located between the system to be protected and the pressure-relieving device shall be sized to prevent hammering of the valve and to prevent impairment of relief capacity.

Subpart 5 (Chapter 5 of the New York City Fuel Gas Code)

§1. Chapter 5 of the New York city fuel gas code, as added by local law number 33 for the year 2007, section 501.1.1.1, item 3 of section 503.5.6.5.1, item 1 of section 503.6.10.2, and sections 503.6.10.2, 503.7.5, 504.3.2, 504.3.4, 504.3.5, 504.3.14 and 504.3.15 as amended by local law number 8 for the year 2008, is amended to read as follows:

**CHAPTER 5
CHIMNEYS AND VENTS**

**SECTION FGC 501
GENERAL**

501.1 Scope. This chapter shall govern the installation, alteration, maintenance, design, minimum safety requirements, repair and approval of factory-built chimneys, chimney liners, vents and connectors, field-built chimneys and connectors and the utilization of masonry chimneys serving gas-fired appliances. The requirements for the installation, maintenance, repair and approval of factory-built chimneys, chimney liners, vents and connectors serving appliances burning fuels other than fuel gas shall be regulated by the *New York City Mechanical Code*. The construction, repair, maintenance and approval of masonry chimneys shall be regulated by the *New York City Building Code*. Venting systems shall be designed in accordance with this chapter and comply with the requirements of the *New York City Air Pollution Control Code*.

501.1.1 Adjoining chimneys and vents. Adjoining chimneys and vents shall be in accordance with Sections 501.1.1.1 [to] through 501.1.1.8.

501.1.1.1 Responsibility of owner of taller building. Whenever a building is erected, enlarged, or increased in height so that any portion of such building, except chimneys or vents, extends higher than the top of any previously constructed chimneys or vents within 100 feet (30 480 mm), the owner of such new or altered building shall have the responsibility of altering such chimneys or vents to make them conform with the requirements of this chapter. A chimney or vent that is no longer connected with a fireplace or combustion or other equipment for which a chimney or vent was required shall be exempt from this requirement. Such alterations shall be accomplished by one of the following means or a combination thereof:

1. Carry up the previously constructed chimneys or vents to the height required in this chapter.
2. Offset such chimneys or vents to a distance beyond that required [in Chapter 5 of this code] by this chapter from the new or altered building provided that the new location of the outlet of the offset chimney or vent shall otherwise comply with the requirements of this chapter.

Such requirements shall not dispense with or modify any additional requirements that may be applicable pursuant to rules of the New York City Department of Environmental Protection.

501.1.1.2 Protection of draft. After the alteration of a chimney or vent as required by this section, it shall be the responsibility of the owner of the new or altered building to provide any mechanical equipment or devices necessary to maintain the proper draft in the equipment.

501.1.1.3 Written notification. The owner of the new or altered building shall notify the owner of the building affected in writing at least 45 days before starting the work required and request written consent to do such work. Such notice shall be accompanied by plans indicating the manner in which the proposed alterations are to be made.

501.1.1.4 Approval. The plans and method of alteration shall be subject to the approval of the commissioner.

501.1.1.5 Refusal of consent. If consent is not granted by the owner of the previously constructed building to do the alteration work required by this section, such owner shall signify his or her refusal in writing to the owner of the new or altered building and to the commissioner; and the owner of the new or altered building having submitted plans that conform to the requirements of this section, shall thereupon be released from any responsibility for the proper operation of the equipment due to loss of draft and for any health hazard or nuisance that may occur as a result of the new or altered building. Such responsibilities shall then be assumed by the owner of the previously constructed building.

Similarly, should such owner fail to grant consent within 45 days from the date of written request or fail to signify his or her refusal, he or she shall then assume all responsibilities as prescribed above.

501.1.1.6 Procedure. It shall be the obligation of the owner of the new or altered building to:

1. Schedule this work so as to create a minimum of disturbance to the occupants of the affected building;
2. Provide such essential services as are normally supplied by the equipment while it is out of service;
3. Where necessary, support such extended chimneys, vents and equipment from this building or to carry up such chimneys or vents within his or her building;
4. Provide for the maintenance, repair, and/or replacement of such extensions and added equipment; and
5. Make such alterations of the same material as the original chimney or vent so as to maintain the same quality and appearance, except where the affected owner of the chimney or vent shall give his or her consent to do otherwise. All work shall be done in such fashion as to maintain the architectural aesthetics of the existing building. Where there is practical difficulty in complying strictly with the provisions of this item, the commissioner may permit an equally safe alternative.

501.1.1.7 Existing violations. Any existing violations on the previously constructed equipment shall be corrected by the owner of the equipment before any equipment is added or alterations made at the expense of the owner of the new or altered building.

501.1.1.8 Variance. The commissioner may grant a variance in accordance with the provisions of this code.

501.2 General. Every appliance shall discharge the products of combustion to the outdoors, except for appliances exempted by Section 501.8.

Exception: Commercial cooking appliances vented by a Type I hood installed in accordance with MC Section 507.

501.2.1 Design. Chimneys and vents shall be designed and constructed so as to provide the necessary draft and capacity for each appliance connected to completely exhaust the products of combustion to the outside air. The temperature on adjacent combustible surfaces shall not be raised above 160°F (71°C). [Condensation shall not be developed to an extent that can cause deterioration of the chimney or vent.]Chimneys and vents shall

be designed to resist the effects of condensation that would cause deterioration of the chimney or vent.

501.2.2 Outlets. The outlet shall be arranged so that the flue gases are not directed so that they jeopardize people, overheat combustible structures, or enter building openings in the vicinity of the outlet. Gas-fired appliances shall be vented in accordance with this code and NFPA 54.

501.2.3 Support. Chimneys and vents shall not be supported by the equipment they serve unless such equipment has been specifically designed for such loads.

501.2.4 Changes in appliance fuels. Masonry chimneys shall be constructed in accordance with Section 507.

501.2.5 Exhaust gases from internal combustion engines and turbines. Exhaust pipes shall be constructed in accordance with Section 508.

501.3 Masonry chimneys. Masonry chimneys shall be constructed in accordance with Section 503.5.3 and the *New York City Building Code*.

501.4 Minimum size of chimney or vent. Chimneys and vents shall be sized in accordance with [Section]Sections 503 and 504.

501.5 Abandoned inlet openings. Abandoned inlet openings in chimneys and vents shall be closed by an approved method.

501.6 Positive pressure. Where an appliance equipped with a mechanical forced draft system creates a positive pressure in the venting system, the venting system shall be designed for positive pressure applications.

501.7 Connection to fireplace. Connection of appliances to chimney flues serving fireplaces shall be in accordance with Sections 501.7.1 through 501.7.3.

501.7.1 Closure and access. A noncombustible seal shall be provided below the point of connection to prevent entry of room air into the flue. Means shall be provided for access to the flue for inspection and cleaning.

501.7.2 Connection to factory-built fireplace flue. An appliance shall not be connected to a flue serving a factory-built fireplace unless the appliance is specifically listed for such installation. The connection shall be made in accordance with the appliance manufacturer's installation instructions.

501.7.3 Connection to masonry fireplace flue. A connector shall extend from the appliance to the flue serving a masonry fireplace such that the flue gases are exhausted

directly into the flue. The connector shall be accessible or removable for inspection and cleaning of both the connector and the flue. Listed direct connection devices shall be installed in accordance with their listing.

501.8 [Equipment]Appliances not required to be vented. The following appliances shall not be required to be vented:

1. Ranges.
2. Built-in domestic cooking units listed and marked for optional venting.
3. Hot plates and laundry stoves.
4. Type 1 clothes dryers (Type 1 clothes dryers shall be exhausted in accordance with the requirements of Section 614).
5. A single booster-type automatic instantaneous water heater, where designed and used solely for the sanitizing rinse requirements of a dishwashing machine, provided that the heater is installed in a commercial kitchen having a mechanical exhaust system. Where installed in this manner, the draft hood, if required, shall be in place and unaltered and the draft hood outlet shall be not less than 36 inches (914 mm) vertically and 6 inches (152 mm) horizontally from any surface other than the heater.
6. Refrigerators.
7. Counter appliances.
8. Specialized [equipment]appliances of limited input such as laboratory burners and gas lights.
9. Recirculating direct-fired industrial air heaters as provided for in Section 612.

Where the appliances [and equipment] listed in Items 5 through 9 above are installed so that the aggregate input rating exceeds 20 British thermal units (Btu) per hour per cubic feet (207 watts per m³) of volume of the room or space in which such appliances [and equipment] are installed, one or more shall be provided with venting systems or other approved means for conveying the vent gases to the outdoor atmosphere so that the aggregate input rating of the remaining unvented appliances [and equipment]does not exceed [the]20 Btu per hour per cubic foot (207 watts per m³)[figure]. Where the room or space in which the [equipment] appliance is installed is directly connected to another room or space by a doorway, archway, or other opening of comparable size that cannot be closed, the volume of such adjacent room or space shall be permitted to be included in the calculations.

501.9 Chimney entrance. Connectors shall connect to a masonry chimney flue at a point not less than 12 inches (305 mm) or one chimney diameter above the lowest portion of the interior of the chimney flue.

501.10 Connections to exhauster. Appliance connections to a chimney or vent equipped with a power exhauster shall be made on the inlet side of the exhauster. Joints and vent systems on the positive pressure side of the exhauster shall be sealed to prevent flue-gas leakage as specified by the manufacturer's installation instructions for the exhauster or in accordance with this code.

501.11 Masonry chimneys. Masonry chimneys utilized to vent appliances shall be located, constructed and sized as specified in the manufacturer's installation instructions for the appliances being vented and Section 503.

501.12 Residential and low-heat appliances flue lining systems. Flue lining systems for use with residential-type and low-heat appliances shall be limited to the following:

1. Clay flue lining complying with the requirements of ASTM C 315 or equivalent. Clay flue lining shall be installed in accordance with the *New York City Building Code*.
2. Listed chimney lining systems complying with UL 1777 (new and existing chimneys) or ULC-S635 (existing chimneys) or ULC-S640 (new chimneys).
3. Other approved materials that will resist, without cracking, softening or corrosion, flue gases and condensate at temperatures up to 1,800°F (982°C).

501.13 Category I appliance flue lining systems. Flue lining systems for use with Category I appliances shall be limited to the following:

1. Flue lining systems complying with Section 501.12.
2. Chimney lining systems listed and labeled for use with gas appliances with draft hoods and other Category I gas appliances listed and labeled for use with Type B vents.

501.14 Category II, III and IV appliance venting systems. The design, sizing and installation of vents for Category II, III and IV appliances shall be in accordance with the appliance manufacturer's installation instructions.

501.15 Existing chimneys and vents. Where an appliance is permanently disconnected from an existing chimney or vent, or where an appliance is connected to an existing chimney or vent during the process of a new installation, the chimney or vent shall comply with Sections 501.15.1 through 501.15.4.

501.15.1 Size. The chimney or vent shall be resized as necessary to control flue gas condensation in the interior of the chimney or vent and to provide the appliance or appliances

served with the required draft. For Category I appliances, the resizing shall be in accordance with Section 502.

501.15.2 Flue passageways. The flue gas passageway shall be free of obstructions and combustible deposits and shall be cleaned if previously used for venting a solid or liquid fuel-burning appliance or fireplace. The flue liner, chimney inner wall or vent inner wall shall be continuous and shall be free of cracks, gaps, perforations or other damage or deterioration which would allow the escape of combustion products, including gases, moisture and creosote.

501.15.3 Cleanout. Masonry chimney flues shall be provided with a cleanout opening having a minimum height of 6 inches (152 mm). The upper edge of the opening shall be located not less than 6 inches (152 mm) below the lowest chimney inlet opening. The cleanout shall be provided with a tight-fitting, noncombustible cover of a minimum size of 8 inches by 8 inches (203 mm by 203 mm).

501.15.4 Clearances. Chimneys and vents shall have air-space clearance to combustibles in accordance with the *New York City Building Code* and the chimney or vent manufacturer's installation instructions. [Noncombustible firestopping or fireblocking shall be provided in accordance with the *New York City Building Code*.]

[Exception: Masonry chimneys equipped with a chimney lining system tested and listed for installation in chimneys in contact with combustibles in accordance with UL 1777, and installed in accordance with the manufacturers instructions, shall not be required to have clearance between combustible materials and exterior surfaces of the masonry chimney.]

Exception: Masonry chimneys without the required air-space clearances shall be permitted to be used if lined or relined with a chimney lining system listed for use in chimneys with reduced clearances in accordance with UL 1777 or ULc-S635. The chimney clearance shall be not less than permitted by the terms of the chimney liner listing and the manufacturer's instructions.

501.15.4.1 Fireblocking. Noncombustible fireblocking shall be provided in accordance with the *New York City Building Code*.

501.16 Drains. A drain shall be provided for all chimneys and gas vents to remove rain water and condensation. The drain shall be a minimum of 1 inch (25 mm) in size and shall be equipped with an appropriately-sized p-trap with automatic trap seal primer in accordance with Section 1002 of the *New York City Plumbing Code* or a float drain trap installed in accordance with the manufacturer's installation requirements. The drain shall be sized by the design engineer and shall be suitable for the chimney area. For listed chimneys and gas vents, the connection tap into the chimney shall be determined by the manufacturer and connected to the drain piping in accordance with the listing and installation instructions. On all outdoor chimneys and gas vents,

the connection and drain shall be installed indoors as close as practicable to the chimney base to prevent freezing.

501.17 Thermal safety (spill) switches. Thermal safety (spill) switches shall be installed on barometric dampers, draft hoods, draft diverters, and all other appurtences that allow dilution air into chimneys or gas vents. Thermal safety (spill) switches shall be interlocked with all of the appliances connected to the same chimney or gas vent.

SECTION FGC 502 VENTS

502.1 General. All vents, except as provided in Section 503.7, shall be listed and labeled. Type B and BW vents shall be tested in accordance with UL 441 and labeled or field fabricated in accordance with NFPA 211. Type L vents shall be tested in accordance with UL 641. Vents for Category II and III appliances shall be tested in accordance with UL 1738. [Plastic vents for Category IV appliances shall not be required to be listed and labeled where such vents are as specified by the appliance manufacturer and are installed in accordance with the appliance manufacturer's installation instructions.] Plastic piping shall be listed and installed in accordance with the terms of its listing and the manufacturers' instructions.

502.2 Connectors required. Connectors shall be used to connect appliances to the vertical chimney or vent, except where the chimney or vent is attached directly to the appliance. Vent connector size, material, construction and installation shall be in accordance with Section 503.

502.3 Vent application. The application of vents shall be in accordance with Table 503.4.

502.4 Insulation shield. Where vents pass through insulated assemblies, an insulation shield constructed of [not less than 26 gage sheet (0.016 inch) (0.4mm) metal] steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) shall be installed to provide clearance between the vent and the insulation material. The clearance shall not be less than the clearance to combustibles specified by the vent manufacturer's installation instructions. Where vents pass through attic space, the shield shall terminate not less than 2 inches (51 mm) above the insulation materials and shall be secured in place to prevent displacement. Insulation shields provided as part of a listed vent system shall be installed in accordance with the manufacturer's installation instructions.

502.5 Installation. Vent systems shall be sized, installed and terminated in accordance with the vent and appliance manufacturer's installation instructions and Section 503.

502.6 Support of vents. All portions of vents shall be adequately supported for the design and weight of the materials employed.

502.7 Protection against physical damage. In concealed locations, where a vent is installed through holes or notches in studs, joists, rafters or similar members less than 1½ inches (38 mm)

from the nearest edge of the member, the vent shall be protected by shield plates. Protective steel shield plates having a minimum thickness of 0.0575 inch (1.463 mm) (No. 16 gage) shall cover the area of the vent where the member is notched or bored and shall extend a minimum of 4 inches (102 mm) above sole plates, below top plates and to each side of a stud, joist or rafter.

SECTION FGC 503 VENTING OF [EQUIPMENT] APPLIANCES

503.1 General. This section recognizes that the choice of venting materials and the methods of installation of venting systems are dependent on the operating characteristics of the [equipment] appliance being vented. The operating characteristics of vented [equipment] appliances can be categorized with respect to (1) positive or negative pressure within the venting system; and (2) whether or not the [equipment] appliance generates flue or vent gases that might condense in the venting system. See Section 202 for the definition of these vented appliance categories.

503.2 Venting systems required. Except as permitted in Sections 503.2.1 through 503.2.3 and 501.8, all [equipment] appliances shall be connected to venting systems.

503.2.1 Ventilating hoods. Ventilating hoods and exhaust systems shall be permitted to be used to vent [equipment] appliances installed in commercial applications (see Section 503.3.4) and to vent industrial [equipment] appliances, such as where the process itself requires fume disposal.

503.2.2 Direct-vent [equipment]appliances. Listed direct-vent [equipment] appliances shall be considered properly vented where installed in accordance with the terms of its listing, the manufacturer's instructions and Section 503.8.

503.2.3 [Equipment]Appliances with integral vents. [Equipment] An appliance incorporating integral venting means shall be considered properly vented [when] where installed in accordance with its listing, the manufacturer's instructions and Section 503.8.

503.3 Design and construction. A venting system shall be designed and constructed so as to develop a positive flow adequate to convey flue or vent gases to the [outdoor atmosphere] outdoors.

503.3.1 [Equipment] Appliance draft requirements. A venting system shall satisfy the draft requirements of the [equipment] appliance in accordance with the manufacturer's instructions.

503.3.2 Design and construction. [Gas utilization equipment] Appliances required to be vented shall be connected to a venting system designed and installed in accordance with the provisions of Sections 503.4 through [503.15] 503.16.

503.3.3 Mechanical draft systems. Mechanical draft systems shall comply with the following:

1. Mechanical draft systems shall be listed and shall be installed in accordance with the terms of their listing and both the appliance and the mechanical draft system manufacturer's instructions.
2. [Equipment]Appliances, except incinerators, requiring venting shall be permitted to be vented by means of mechanical draft systems of either forced or induced draft design.
3. Forced draft systems and all portions of induced draft systems under positive pressure during operation shall be designed and installed so as to prevent leakage of flue or vent gases into a building.
4. Vent connectors serving [equipment] appliances vented by natural draft shall not be connected into any portion of mechanical draft systems operating under positive pressure.
5. [When] Where a mechanical draft system is employed, [provision] provisions shall be made to prevent the flow of gas to the main burners when the draft system is not performing so as to satisfy the operating requirements of the [equipment] appliance for safe performance.
6. The exit terminals of mechanical draft systems shall be not less than 7 feet (2134 mm) above finished ground level where located adjacent to public walkways and shall be located as specified in [in compliance with] Section 503.8, Items 1 and 2.

503.3.4 Ventilating hoods and exhaust systems. Ventilating hoods and exhaust systems shall be permitted to be used to vent [gas utilization equipment] appliances installed in commercial applications. Where automatically operated [equipment] appliances, other than commercial cooking appliances, are vented through a ventilating hood or exhaust system equipped with a damper or with a power means of exhaust, provisions shall be made to allow the flow of gas to the main burners only when the damper is open to a position to properly vent the [equipment] appliance and when the power means of exhaust is in operation.

503.3.5 [Circulating air]Air ducts and furnace plenums. [No portion of a venting system] Venting systems shall not extend into or pass through any [circulating] fabricated air duct or furnace plenum.

503.3.6 Above-ceiling air-handling spaces. Where a venting system passes through an above-ceiling air-handling space or other nonducted portion of an air-handling system, such

space shall be accessible for inspection. The venting system shall conform to one of the following requirements:

1. The venting system shall be a listed special gas vent; other venting system serving a Category III or Category IV appliance; or other positive pressure vent, with joints sealed in accordance with the appliance or vent manufacturer's instructions.
2. The venting system shall be installed such that fittings and joints between sections are not installed in the above-ceiling space.
3. The venting system shall be installed in a sealed metal conduit or enclosure with sealed joints separating the interior of the conduit or enclosure from the ceiling space.

503.4 Type of venting system to be used. The type of venting system to be used shall be in accordance with Table 503.4.

503.4.1 Plastic piping. Plastic piping used for venting [equipment] appliances listed for use with such venting materials shall be [permitted when approved by the commissioner] listed and installed in accordance with the terms of its listing and the manufacturers' instructions. Installation shall be in accordance with the *New York City Building Code*. PVC shall not be permitted.

503.4.2 Special gas vent. Special gas vent shall be listed and installed in accordance with the terms of the special gas vent listing and the manufacturers' instructions.

**TABLE 503.4
TYPE OF VENTING SYSTEM TO BE USED**

GAS UTILIZATION EQUIPMENT	TYPE OF VENTING SYSTEM
Listed Category I equipment Listed equipment equipped with draft hood Equipment listed for use with Type B gas vent	Type B gas vent (Section 503.6) Chimney (Section 503.5) Single-wall metal pipe (Section 503.7) Listed chimney lining system for gas venting (Section 503.5.3) Special gas vent listed for this equipment (Section 503.4.2)
Listed vented wall furnaces	Type B-W gas vent (Sections 503.6, 608)
Category II equipment	As specified or furnished by manufacturers of listed equipment (Sections 503.4.1, 503.4.2)
Category III equipment	As specified or furnished by manufacturers of listed equipment (Sections 503.4.1, 503.4.2)
Category IV equipment	As specified or furnished by manufacturers of listed equipment (Sections 503.4.1, 503.4.2)
Incinerators, indoors	Chimney (Section 503.5)
Incinerators, outdoors	Single-wall metal pipe (Sections 503.7, 503.7.6)
Equipment which may be converted to use of solid fuel	Chimney (Section 503.5)
Unlisted combination gas and oil-burning equipment	Chimney (Section 503.5)

Listed combination gas and oil-burning equipment	Type L vent (Section 503.6) or chimney (Section 503.5)
Combination gas and solid fuel-burning equipment	Chimney (Section 503.5)
Equipment listed for use with chimneys only	Chimney (Section 503.5)
Unlisted equipment	Chimney (Section 503.5)
Decorative appliance in vented fireplace	Chimney
Direct vent equipment	See Section 503.2.2, 503.2.3
[Equipment] <u>Appliances</u> with integral vent	See Section 503.2.3, 503.2.4

503.5 Masonry, metal, and factory-built chimneys. Masonry, metal and factory-built chimneys shall comply with Sections 503.5.1 through 503.5.10.

503.5.1 Factory-built chimneys. Factory-built chimneys shall be installed in accordance with their listing and the manufacturers' instructions. Factory-built chimneys used to vent appliances that operate at positive vent pressure shall be listed for such application.

503.5.2 Metal chimneys. Metal chimneys shall be built and installed in accordance with NFPA 211.

503.5.3 Masonry chimneys. Masonry chimneys shall be built and installed in accordance with Chapter 21 of the *New York City Building Code* and NFPA 211, and shall be lined with approved clay flue lining, a listed chimney lining system, or other approved material that will resist corrosion, erosion, softening, or cracking from vent gases at temperatures up to 1800°F (982°C).

Exception: Masonry chimney flues serving listed gas appliances with draft hoods, Category I appliances and other gas appliances listed for use with Type B vent shall be permitted to be lined with a chimney lining system specifically listed for use only with such appliances. The liner shall be installed in accordance with the liner manufacturer's instructions and the terms of the listing. A permanent identifying label shall be attached at the point where the connection is to be made to the liner. The label shall read: "This chimney liner is for appliances that burn gas only. Do not connect to solid or liquid fuel-burning appliances or incinerators."

For information on installation of gas vents in existing masonry chimneys, see Section [503.6.5] 503.6.3.

503.5.4 Chimney termination. Chimneys serving gas-fired equipment shall comply with the appliance listing, the manufacturer's instructions and the following requirements:

1. Chimneys serving appliances less than 600°F (316°C) shall extend at least 3 feet (914 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the chimney outlet, whether the

construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, vents, or open structural framing. Any chimney located beyond 10 feet (3048 mm) from such construction, but not more than the distance determined by Equation 5-1 shall be at least as high as the construction.

2. Chimneys serving appliances between 600°F (316°C) and 1000°F (538°C) shall extend at least 10 feet (3048 mm) above the highest construction, such as a roof ridge, or parapet wall or penthouse within 20 feet (6096 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, and vents or open structural framing. Any chimney located beyond 20 feet (6096 mm) from such construction but not more than the distance determined by Equation 5-1 shall be at least as high as the construction.
3. Chimneys serving appliances greater than 1000°F (538°C) shall extend at least 20 feet (6096mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or in another building. However, such constructions do not include other chimneys, vents, or open structural framing. Any chimney located beyond 50 feet (15 240 mm) from such construction but not more than the distance determined by Equation 5-1 shall be at least as high as the construction.
4. Termination caps shall not be permitted[and a 3-inch (76mm) minimum drain installed to receive collected water shall be required]. A drain shall be installed in accordance with Section 801.21 of the *New York City Mechanical Code*. A positive means shall be provided to prevent water from entering the appliance.

Exception: Termination caps shall be permitted on listed factory-built chimneys[.].

5. Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with the manufacturers' installation instructions.
6. The following equation shall be used for determining the distances referred to in Items 1, 2 and 3 of this section.

Equation 5-1

$$D = F \times \sqrt{A}$$

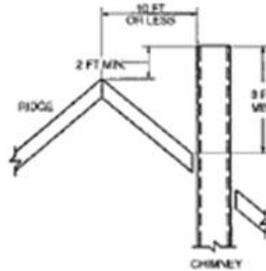

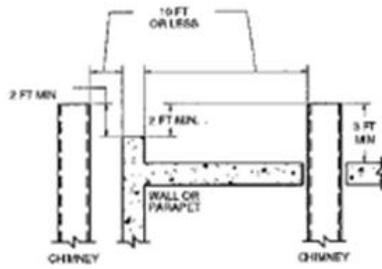

where:

D = Distance, in feet, measured from the center of the chimney outlet to the nearest edge of the construction.

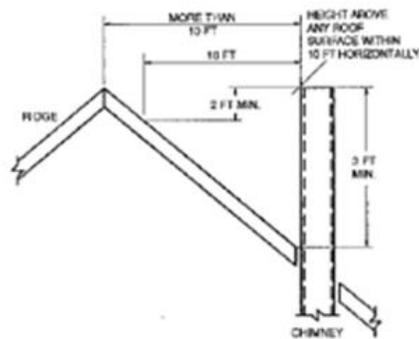

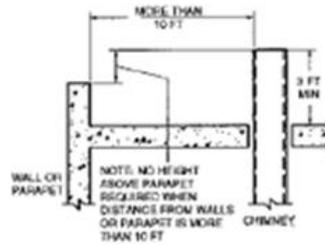

F = Value determined from the table below.

A = Free area, in square inches, of chimney flue space.

"F" FACTOR FOR DETERMINING CHIMNEY DISTANCES			
Type of Fuel	"F" Factor		
	600°F (316°C) and less	600°F (316°C) to 1000°F (538°C)	Greater than 1000°F (538°C)
Gas	2	2	3

A. TERMINATION 10 FT OR LESS FROM RIDGE, WALL, OR PARAPET

B. TERMINATION MORE THAN 10 FT FROM RIDGE, WALL, OR PARAPET

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

FIGURE 503.5.4
TYPICAL TERMINATION LOCATIONS FOR
CHIMNEYS AND SINGLE-WALL METAL PIPES SERVING
RESIDENTIAL-TYPE AND LOW-HEAT APPLIANCES

[EQUIPMENT]

503.5.5 Size of chimneys. The effective area of a chimney venting system serving listed appliances with draft hoods, Category I appliances, and other appliances listed for use with Type B vents shall be determined in accordance with one of the following methods:

1. The provisions of Section 504.
2. For sizing an individual chimney venting system for a single appliance with a draft hood, the effective areas of the vent connector and chimney flue shall be not less than the area of the appliance flue collar or draft hood outlet, nor greater than seven times the draft hood outlet area.
3. For sizing a chimney venting system connected to two appliances with draft hoods, the effective area of the chimney flue shall be not less than the area of the larger draft hood outlet plus 50 percent of the area of the smaller draft hood outlet, nor greater than seven times the smallest draft hood outlet area.
4. Chimney venting systems using mechanical draft shall be sized in accordance with approved engineering methods.
5. Other approved engineering methods.

[503.5.5.1 Incinerator venting. Where an incinerator is vented by a chimney serving other gas utilization equipment, the gas input to the incinerator shall not be included in calculating chimney size, provided the chimney flue diameter is not less than 1 inch (25 mm) larger in equivalent diameter than the diameter of the incinerator flue outlet.]

503.5.6 Inspection of chimneys. Before replacing an existing appliance or connecting a vent connector to a chimney, the chimney passageway shall be examined to ascertain that it is clear and free of obstructions and it shall be cleaned if previously used for venting solid or liquid fuel-burning appliances or fireplaces.

503.5.6.1 Chimney lining. Chimneys shall be lined in accordance with NFPA 211.

[Exception: Existing chimneys shall be permitted to have their use continued when an appliance is replaced by an appliance of similar type, input rating, and efficiency.]

Exception: Where an existing chimney complies with Sections 503.5.6 through 503.5.6.5 and its sizing is in accordance with Section 503.5.5, its continued use shall be allowed where the appliance vented by such chimney is replaced by an appliance of similar type, input rating and efficiency.

503.5.6.2 Cleanouts. Cleanouts shall be examined to determine if they will remain tightly closed when not in use.

503.5.6.3 Unsafe chimneys. Where inspection reveals that an existing chimney is not safe for the intended application, it shall be repaired, rebuilt, lined, relined, or replaced with a vent or chimney to conform to NFPA 211 and it shall be suitable for the [equipment] appliances to be vented.

503.5.6.4 Test run. All new chimneys shall be test run by the [design professional engineer] registered design professional responsible for the testing under operating conditions to demonstrate fire safety and the complete exhausting of smoke and the products of combustion to the outer air. The results of such test run shall be certified as correct by the [design professional engineer] registered design professional responsible for the test and shall be submitted in writing to the department.

503.5.6.5 Requirement of a smoke test. A smoke test shall be made as outlined below. Any faults or leaks found shall be corrected. Such smoke test shall be witnessed by a representative of the commissioner. In lieu thereof, the commissioner may accept the test report of the [design professional engineer] registered design professional or special inspector responsible for the test which shall be submitted in writing to the department.

503.5.6.5.1 Smoke test. To determine the tightness of chimney construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The equipment, materials, power and labor necessary for such test shall be furnished by, and at the expense of, the owner or holder of the work permit.
2. If the test shows any evidence of leakage or other defects, such defects shall be corrected in accordance with the requirement of this chapter and the test shall be repeated until the results are satisfactory.
3. Method of test. The chimney shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs, or other equivalent method. As the smoke appears at the stack opening on the roof, such opening shall be tightly closed and a pressure equivalent to $1/2$ inch (12.7 mm) column of water measured at the base of the stack, shall be applied. The test shall be applied for a length of time sufficient to permit the inspection of the chimney.

503.5.7 Chimneys serving [equipment]appliances burning other fuels. Chimneys serving [equipment] appliances burning other fuels shall comply with Sections 503.5.7.1 through 503.5.7.4.

503.5.7.1 Solid fuel-burning appliances. [Gas utilization equipment] An appliance shall not be connected to a chimney flue serving a separate appliance designed to burn solid fuel.

503.5.7.2 Liquid fuel-burning appliances. Where one chimney flue serves gas [utilization equipment and equipment] appliances and [burning] liquid [fuel] fuel-burning appliances, the [equipment] appliances shall be connected through separate openings or shall be connected through a single opening where joined by a suitable fitting located as close as practical to the chimney. Where two or more openings are provided into one chimney flue, they shall be at different levels. Where the [gas utilization equipment] appliances [is] are automatically controlled, [it] they shall be equipped with [a] safety shutoff [device] devices.

503.5.7.3 Combination gas and solid fuel-burning appliances. A combination gas- and solid fuel-burning appliance shall be permitted to be connected to a single chimney flue where equipped with a manual reset device to shut off gas to the main burner in the event of sustained back draft or flue gas spillage. The chimney flue shall be sized to properly vent the appliance.

503.5.7.4 Combination gas- and oil fuel-burning appliances. A listed combination gas- and oil fuel-burning appliance shall be permitted to be connected to a single chimney flue. The chimney flue shall be sized to properly vent the appliance.

503.5.8 Support of chimneys. All portions of chimneys shall be supported for the design and weight of the materials employed. Factory-built chimneys shall be supported and spaced in accordance with their listings and the manufacturer's instructions.

503.5.9 Cleanouts. Where a chimney that formerly carried flue products from liquid or solid fuel-burning appliances is used with an appliance using fuel gas, an accessible cleanout shall be provided. The cleanout shall have a tight-fitting cover and shall be installed at the base of all chimneys in accordance with the rules of the New York City Department of Environmental Protection. The cleanout shall be gas tight if the chimney is to be of positive pressure.

503.5.10 Space surrounding lining or vent. The remaining space surrounding a chimney liner, gas vent, special gas vent, or plastic piping installed within a masonry chimney flue shall not be used to vent another appliance. The insertion of another liner or vent within the chimney as provided in this code and the liner or vent manufacturer's instructions shall not be prohibited.

The remaining space surrounding a chimney liner, gas vent, special gas vent, or plastic piping installed within a masonry, metal or factory-built chimney, shall not be used to supply combustion air. Such space shall not be prohibited from supplying combustion air to

direct-vent appliances designed for installation in a solid fuel-burning fireplace and installed in accordance with the listing and the manufacturer's instructions.

503.6 Gas vents. Gas vents shall comply with Sections 503.6.1 through [503.6.12] 503.6.13 (see Section 202, Definitions).

503.6.1 Installation, general. Gas vents shall be installed in accordance with the terms of their listings and the manufacturer's instructions.

503.6.2 Type B-W vent capacity. A Type B-W gas vent shall have a listed capacity not less than that of the listed vented wall furnace to which it is connected.

[**503.6.3 Roof penetration.** A gas vent passing through a roof shall extend through the roof flashing, roof jack, or roof thimble and shall be terminated by a listed termination cap.]

[**503.6.4 Offsets.** Type B and Type L vents shall extend in a generally vertical direction with offsets not exceeding 45 degrees (0.79 rad), except that a vent system having not more than one 60-degree (1.04 rad) offset shall be permitted. Any angle greater than 45 degrees (0.79 rad) from the vertical is considered horizontal. The total horizontal length of a vent plus the horizontal vent connector length serving draft-hood-equipped appliances shall not be greater than 75 percent of the vertical height of the vent.

Exception: Systems designed and sized as provided in Section 504 or in accordance with other approved engineering methods.

Vents serving Category I fan-assisted appliances shall be installed in accordance with the appliance manufacturer's instructions and Section 504 or other approved engineering methods.]

[**503.6.5** 503.6.3 Gas vents installed within masonry chimneys. Gas vents installed within masonry chimneys shall be installed in accordance with the terms of their listing and the manufacturer's installation instructions. Gas vents installed within masonry chimneys shall be identified with a permanent label installed at the point where the vent enters the chimney. The label shall contain the following language: "This gas vent is for appliances that burn gas. Do not connect to solid or liquid fuel-burning appliances or incinerators."

[**503.6.6** 503.6.4 Gas vent terminations. A gas vent shall terminate in accordance with one of the following:

1. [Above the roof surface with a listed cap or listed roof assembly. Gas vents 12 inches (305 mm) in size or smaller with listed caps shall be permitted to be terminated in accordance with Figure 503.6.6, provided that such vents are at least 8 feet (2438 mm) from a vertical wall or similar obstruction. All other gas vents shall terminate not less than 2 feet (610mm) above the highest point where they pass through the roof

and at least 2 feet (610 mm) higher than any portion of a building within 10 feet (3048 mm).] Gas vents that are 12 inches (305 mm) or less in size and located not less than 8 feet (2438 mm) from a vertical wall or similar obstruction shall terminate above the roof in accordance with Figure 503.6.6.

2. Gas vents that are over 12 inches (305 mm) in size or are located less than 8 feet (2438 mm) from a vertical wall or similar obstruction shall terminate not less than 2 feet (610 mm) above the highest point where they pass through the roof and not less than 2 feet (610 mm) above any portion of a building within 10 feet (3048 mm) horizontally.

[2.] 3. As provided for direct-vent systems in Section 503.2.2.

[3.] 4. As provided for [equipment] appliances with integral vents in Section 503.2.3.

[4.] 5. As provided for mechanical draft systems in Section 503.3.3.

[5.] 6. As provided for ventilating hoods and exhaust systems in Section 503.3.4.

However, such constructions do not include chimneys or other vents, or open structural framing. The vent shall be as high as such construction which is located beyond 10 feet (3048 mm) from the vent and up to and including the distance determined by the following formula:

(Equation 5-2)

$$D = 2 \sqrt{A}$$

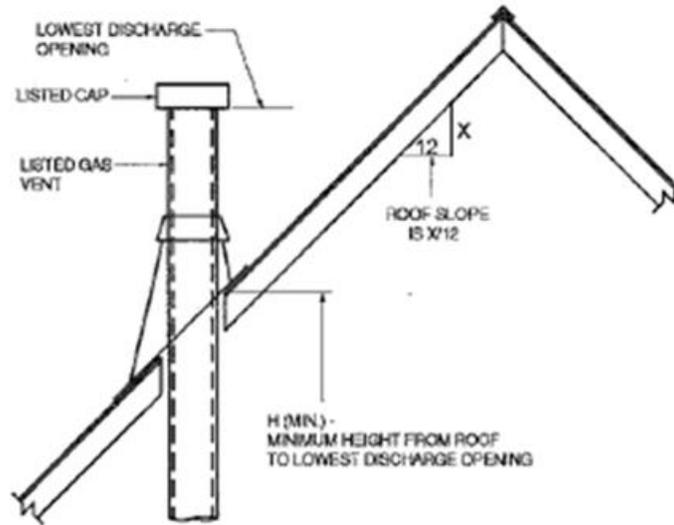

where:

D = Distance, in feet, measured from the center of the vent outlet to the nearest edge of the construction.

A = Free area, in square inches, of vent flue space.

[503.6.6.1]503.6.4.1 Decorative shrouds. Decorative shrouds shall not be installed at the termination of gas vents except where such shrouds are listed for use with the specific gas venting system and are installed in accordance with the manufacturer's installation instructions.

[503.6.6.2]503.6.4.2 Rain and debris. All gas vents shall terminate in an approved vent or cowl, which shall prevent downdrafts and prevent rain and debris from entering the vent.

ROOF SLOPE	H (min) ft
Flat to 6/12	1.0
Over 6/12 to 7/12	1.25
Over 7/12 to 8/12	1.5
Over 8/12 to 9/12	2.0
Over 9/12 to 10/12	2.5
Over 10/12 to 11/12	3.25
Over 11/12 to 12/12	4.0
Over 12/12 to 14/12	5.0
Over 14/12 to 16/12	6.0
Over 16/12 to 18/12	7.0
Over 18/12 to 20/12	7.5
Over 20/12 to 21/12	8.0

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
[503.6.6]

FIGURE 503.6.4

[GAS VENT] → **TERMINATION LOCATIONS FOR GAS VENTS WITH LISTED CAPS 12 INCHES OR LESS IN SIZE AT LEAST 8 FEET FROM A VERTICAL WALL**

[503.6.7]503.6.5 Minimum height. A Type B or a Type L gas vent shall terminate at least 5 feet (1524 mm) in vertical height above the highest connected equipment draft hood or flue collar. A Type B-W gas vent shall terminate at least 12 feet (3658 mm) in vertical height above the bottom of the wall furnace.

503.6.6 Roof terminations. Gas vents shall extend through the roof flashing, roof jack or roof thimble and terminate with a listed cap or listed roof assembly.

503.6.7 Forced air inlets. Gas vents shall terminate not less than 3 feet (914 mm) above any forced air inlet located within 10 feet (3048 mm).

503.6.8 Exterior wall penetrations. A gas vent extending through an exterior wall shall not terminate adjacent to the wall or below eaves or parapets, except as provided in Sections 503.2.3 and 503.3.3.

503.6.9 Size of gas vents. Venting systems shall be sized and constructed in accordance with Section 504 or other approved engineering methods acceptable to the commissioner. Gas vents shall also comply with the manufacturers' instructions.

503.6.9.1 Category I appliances. The sizing of natural draft venting systems serving one or more listed appliances equipped with a draft hood or appliances listed for use with Type B gas vent, installed in a single story of a building, shall be in accordance with one of the following methods:

1. The provisions of Section 504.
2. For sizing an individual gas vent for a single, draft-hood-equipped appliance, the effective area of the vent connector and the gas vent shall be not less than the area of the appliance draft hood outlet, nor greater than seven times the draft hood outlet area.
3. For sizing a gas vent connected to two appliances with draft hoods, the effective area of the vent shall be not less than the area of the larger draft hood outlet plus 50 percent of the area of the smaller draft hood outlet, nor greater than seven times the smaller draft hood outlet area.
4. Engineering practices acceptable to the commissioner.

503.6.9.2 Vent offsets. Type B and L vents sized in accordance with Item 2 or 3 of Section 503.6.9.1 shall extend in a generally vertical direction with offsets not exceeding 45 degrees (0.79 rad), except that a vent system having not more than one 60-degree (1.04 rad) offset shall be permitted. Any angle greater than 45 degrees (0.79 rad) from the vertical is considered horizontal. The total horizontal distance of a vent plus the horizontal vent connector serving draft hood-equipped appliances shall be not greater than 75 percent of the vertical height of the vent.

[503.6.9.2] 503.6.9.3 Category II, III, and IV appliances. The sizing of gas vents for Category II, III, and IV [equipment] appliances shall be in accordance with the [equipment] appliance manufacturer's instructions.

[503.6.9.3] 503.6.9.4 Mechanical draft. Chimney venting systems using mechanical draft shall be designed and sized to develop a positive flow adequate to carry all products of combustion to the outside atmosphere.

503.6.10 [Gas vents serving equipment on more than one floor. A single or common gas vent shall be permitted in multistory installations to vent Category I equipment located on more than one floor level, provided the venting system is designed and installed in accordance with this section and approved engineering methods.] **Multistory prohibited.** Common venting systems for appliances located on more than one floor level shall be prohibited.

[503.6.10.1 Equipment separation. All equipment connected to the common vent shall be located in rooms that do not communicate with occupiable and/or habitable spaces. Each of these rooms shall have provisions for an adequate supply of combustion, ventilation, and dilution air that is not supplied from habitable space (see Figure 503.6.10.1).

503.6.10.2 Sizing. The size of the connectors and common segments of multistory venting systems for equipment listed for use with Type B double-wall gas vent shall be in accordance with Table 504.3(1) and Figures 503.6.10.2(1) and 503.6.10.2(2), provided:

1. The available total height (H) for each segment of a multistory venting system is the vertical distance between the level of the highest draft hood outlet or flue collar on that floor and the centerline of the next highest interconnection tee [see Figure 503.6.10.2(1)].
2. The size of the connector for a segment is determined from its gas utilization equipment heat input and available connector rise, and shall not be smaller than the draft hood outlet or flue collar size.
3. The size of the common vertical segment, and of the interconnection tee at the base of that segment, shall be based on the total gas utilization equipment heat input entering that segment and its available total height.]

[

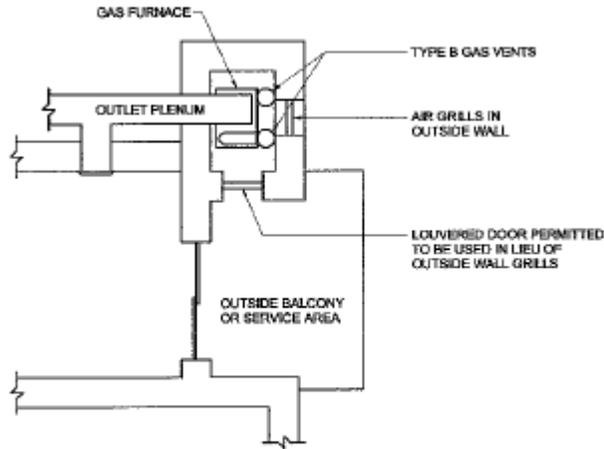

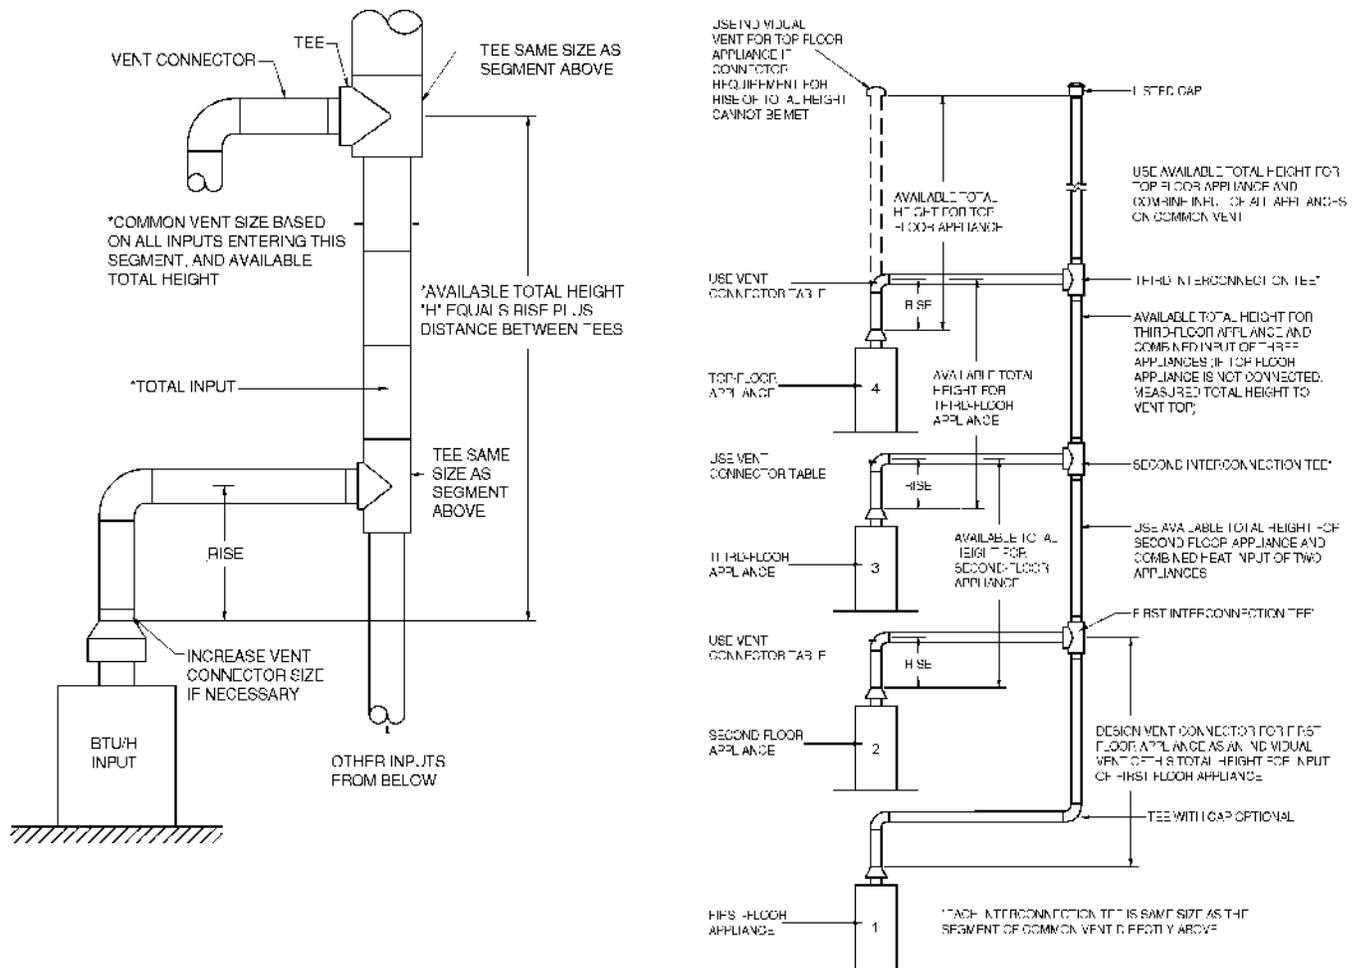

FIGURE 503.6.10.1
PLAN VIEW OF PRACTICAL SEPARATION
METHOD FOR MULTISTORY GAS VENTING

503.6.11 Support of gas vents. Gas vents shall be supported and spaced in accordance with their listings and the manufacturer's instructions.

503.6.12 Marking. Gas vents shall be permanently identified by a label attached to the wall or ceiling at a point where the vent connector enters the gas vent. The label shall read:

“This gas vent is for appliances that burn gas. Do not connect to solid or liquid fuel-burning appliances or incinerators.”

503.6.13 Fastener penetrations. Screws, rivets and other fasteners shall not penetrate the inner wall of double-wall gas vents, except at the transition from an appliance draft hood outlet, a flue collar or a single-wall metal connector to a double-wall vent.

503.7 Single-wall metal pipe. Single-wall metal pipe vents shall comply with Sections 503.7.1 through [503.7.12] 503.7.13.

503.7.1 Construction. Single-wall metal pipe shall be constructed of galvanized sheet steel not less than 0.0304 inch (0.7 mm) thick or other approved, noncombustible, corrosion-resistant material.

503.7.2 Climate protection. Uninsulated single-wall metal pipe shall not be used outdoors for venting [gas utilization equipment] appliances.

503.7.3 Termination. Single-wall metal pipe shall terminate at least 5 feet (1524 mm) in vertical height above the highest connected [equipment] appliance draft hood outlet or flue collar. Single-wall metal pipe shall extend at least 2 feet (610 mm) above the highest point where it passes through a roof of a building and at least 2 feet (610 mm) higher than any portion of a building within a horizontal distance of 10 feet (3048 mm) (see Figure 503.5.4). An approved cap or roof assembly shall be attached to the terminus of a single-wall metal pipe (see also Section [503.7.8] 503.7.9, Item 3). However, such constructions do not include chimneys or other vents, or open structural framing. The single-wall metal pipe shall be as high as such construction which is located beyond [ten] 10 feet (3048 mm) from the vent and up to and including the distance determined by Equation 5-2.

503.7.4 Limitations of use. Single-wall metal pipe shall be used only for runs directly from the space in which the [equipment] appliance is located through the roof or exterior wall to the outdoor atmosphere.

503.7.5 Roof penetrations. A pipe passing through a roof shall extend without interruption through the roof flashing, roof jack, or roof thimble. Where a single-wall metal pipe passes through a roof constructed of combustible material, a noncombustible, non-ventilating thimble shall be used at the point of passage. The thimble shall extend at least 18 inches (457 mm) above and 6 inches (152 mm) below the roof with the annular space open at the

bottom and closed only at the top. The thimble shall be sized in accordance with Section [503.10.16] 503.7.7.

503.7.6 Installation. Single-wall metal pipe shall not originate in any unoccupied attic or concealed space and shall not pass through any attic, inside wall, concealed space, or floor. The installation of a single-wall metal pipe through an exterior combustible wall shall comply with Section [503.10.15] 503.7.7. Single-wall metal pipe used for venting an incinerator shall be exposed and readily examinable for its full length and shall have suitable clearances maintained.

503.7.7 Single-wall penetrations of combustible walls. A single-wall metal pipe shall not pass through a combustible exterior wall unless guarded at the point of passage by a ventilated metal thimble not smaller than the following:

1. For listed appliances equipped with draft hoods and appliances listed for use with Type B gas vents, the thimble shall be not less than 4 inches (102 mm) larger in diameter than the metal pipe. Where there is a run of not less than 6 feet (1829 mm) of metal pipe in the open between the draft hood outlet and the thimble, the thimble shall be permitted to be not less than 2 inches (51 mm) larger in diameter than the metal pipe.
2. For unlisted appliances having draft hoods, the thimble shall be not less than 6 inches (152 mm) larger in diameter than the metal pipe.
3. For residential and low-heat appliances, the thimble shall be not less than 12 inches (305 mm) larger in diameter than the metal pipe.

Exception: In lieu of thimble protection, all combustible material in the wall shall be removed a sufficient distance from the metal pipe to provide the specified clearance from such metal pipe to combustible material. Any material used to close up such opening shall be noncombustible.

[503.7.7] **503.7.8 Clearances.** Minimum clearances from single-wall metal pipe to combustible material shall be in accordance with Table [503.7.7] 503.10.5. The clearance from single-wall metal pipe to combustible material shall be permitted to be reduced where the combustible material is protected as specified for vent connectors in Table 308.2.

[TABLE 503.7.7^a
CLEARANCES FOR CONNECTORS

EQUIPMENT	MINIMUM DISTANCE FROM COMBUSTIBLE MATERIAL			
	Listed Type B gas vent material	Listed Type L vent material	Single-wall metal pipe	Factory-built chimney sections

Listed equipment with draft hoods and equipment listed for use with Type B gas vents	As listed	As listed	6 inches	As listed
Residential boilers and furnaces with listed gas conversion burner and with draft hood	6 inches	6 inches	9 inches	As listed
Residential appliances listed for use with Type L vents	Not permitted	As listed	9 inches	As listed
Listed gas-fired toilets	Not permitted	As listed	As listed	As listed
Unlisted residential appliances with draft hood	Not permitted	6 inches	9 inches	As listed
Residential and low-heat equipment other than above	Not permitted	9 inches	18 inches	As listed
Medium-heat equipment	Not permitted	Not permitted	36 inches	As listed

For SI: 1 inch = 25.4 mm.

a. These clearances shall apply unless the listing of an appliance or connector specifies different clearances, in which case the listed clearances shall apply.]

[503.7.8] 503.7.9 Size of single-wall metal pipe. A venting system constructed of single-wall metal pipe shall be sized in accordance with one of the following methods and the [equipment] appliance manufacturer's instructions:

1. For a draft-hood-equipped appliance, in accordance with Section 504.
2. For a venting system for a single appliance with a draft hood, the areas of the connector and the pipe each shall be not less than the area of the appliance flue collar or draft hood outlet, whichever is smaller. The vent area shall not be greater than seven times the draft hood outlet area.
3. Other approved engineering methods.

[503.7.9] 503.7.10 Pipe geometry. Any shaped single-wall metal pipe shall be permitted to be used, provided that its equivalent effective area is equal to the effective area of the round pipe for which it is substituted, and provided that the minimum internal dimension of the pipe is not less than 2 inches (51mm).

[503.7.10] 503.7.11 Termination capacity. The vent cap or a roof assembly shall have a venting capacity not less than that of the pipe to which it is attached.

[503.7.11] 503.7.12 Support of single-wall metal pipe. All portions of single-wall metal pipe shall be supported for the design and weight of the material employed.

[503.7.12]503.7.13 Marking. Single-wall metal pipe shall comply with the marking provisions of Section 503.6.12.

503.8 Venting system termination location. The location of venting system terminations shall comply with the following:

1. Gas venting systems shall be extended at least [2] 3 feet ([610] 914 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the vent outlet whether the construction is on the same building as the chimney or on another building. However, such constructions do not include chimneys or other vents, or open structural framing. The vent shall be as high as such construction which is located beyond 10 feet (3048 mm) from the vent and up to and including the distance determined by Equation 5-2.

Exception: Direct-vent appliances and integral vent appliances approved by the commissioner and installed in accordance with the manufacturer's instructions and Section 503.8 Item 3.

2. Where permitted, through-the-wall vents for Category I, II, III and IV appliances and noncategorized condensing appliances shall not terminate over public walkways or over an area where condensate or vapor could create a nuisance or hazard or could be detrimental to the operation of regulators, relief valves or other equipment. [Where local experience indicates that condensate is a problem with Category I and III appliances, this provision shall also apply.]
3. Horizontal terminations shall only be allowed if they are in a nonhazardous location and if the appliance has a sealed combustion chamber (direct vent) or integral vent in accordance with the appliance listing and manufacturer's instructions. In addition, horizontal terminations shall comply with the following requirements:
 - 3.1. Where located adjacent to walkways, the termination shall be not less than 7 feet (2134 mm) above the level of the walkway.
 - 3.2. Vents shall terminate at least 3 feet (914 mm) above any forced air inlet, other than the forced air inlet for the subject direct vent or integral vent appliance, located within 10 feet (3048 mm).
 - 3.3. The vent system shall terminate at least 4 feet (1219 mm) below, 4 feet (1219 mm) horizontally from or 1 foot (305 mm) above any door, window or gravity air inlet into the building.
 - 3.4. The vent termination point shall not be located closer than 3 feet (914 mm) to an interior corner formed by two walls perpendicular to each other.
 - 3.5. The vent termination shall not be mounted directly above or within 3 feet (914 mm) horizontally from any gas or electric metering, regulating, venting relief equipment or other building opening.

3.6. The bottom of the vent termination shall be located at least 24 inches (610 mm) above finished grade.

3.7. The maximum heat input of an appliance served by single horizontal vent termination shall be 350,000 Btu/h (1025 kW), unless otherwise approved by the Commissioner.

3.8 The maximum heat input of all appliances served by horizontal vent terminations located within a 10 foot (3048 mm) radius shall be 350,000 Btu/h (1025 kW), unless otherwise approved by the commissioner.

3.9 The vent termination shall be located a minimum of 4 feet from the lot line or from adjacent buildings. The termination shall be installed in accordance with the gas vent manufacturer's listing and installation instructions.

[3. A mechanical draft venting system shall terminate at least 3 feet (914 mm) above any forced-air inlet located within 10 feet (3048 mm).]

[Exceptions:

1. This provision shall not apply to the combustion air intake of a direct-vent appliance.
2. This provision shall not apply to the separation of the integral outdoor air inlet and flue gas discharge of listed outdoor appliances.]

503.9 Condensation drainage. Provision shall be made to collect and dispose of condensate from venting systems serving Category II and IV [equipment] appliances and noncategorized condensing appliances in accordance with Section [503.8, Item 2] 307.

503.10 Vent connectors for Category I [equipment] appliances. Vent connectors for Category I [equipment] appliances shall comply with Sections 503.10.1 through [503.10.16] 503.10.15.

503.10.1 Where required. A vent connector shall be used to connect [equipment] an appliance to a gas vent, chimney, or single-wall metal pipe, except where the gas vent, chimney, or single-wall metal pipe is directly connected to the [equipment] appliance.

503.10.2 Materials. Vent connectors shall be constructed in accordance with Sections 503.10.2.1 through 503.10.2.5.

503.10.2.1 General. A vent connector shall be made of noncombustible corrosion-resistant material capable of withstanding the vent gas temperature produced by the [equipment] appliance and of sufficient thickness to withstand physical damage.

503.10.2.2 Vent connectors located in unconditioned areas. Where the vent connector used for [equipment] an appliance having a draft hood or a Category I appliance is located in or passes through attics, crawl spaces or other unconditioned spaces, that portion of the vent connector shall be listed Type B, Type L or listed vent material [or listed material] having equivalent insulation properties.

503.10.2.3 Residential-type appliance connectors. Where vent connectors for residential-type appliances are not installed in attics or other unconditioned spaces, connectors for listed appliances having draft hoods[and for], appliances having draft hoods and equipped with listed conversion burners and Category I appliances shall be one of the following:

1. Type B or Type L vent material;
2. Galvanized sheet steel not less than 0.018 inch (0.46 mm) thick;
3. Aluminum (1100 or 3003 alloy or equivalent) sheet not less than 0.027 inch (0.69 mm) thick;
4. Stainless steel sheet not less than 0.012 inch (0.31 mm) thick;
5. Smooth interior wall metal pipe having resistance to heat and corrosion equal to or greater than that of Item 2, 3 or 4 above; or
6. A listed vent connector.

Vent connectors shall not be covered with insulation.

Exception: Listed insulated vent connectors shall be installed according to the terms of their listing and the manufacturer's installation instructions.

503.10.2.4 Low-heat equipment. A vent connector for a non-residential low-heat appliance shall be a factory-built chimney section or steel pipe having resistance to heat and corrosion equivalent to that for the appropriate galvanized pipe as specified in Table 503.10.2.4. Factory-built chimney sections shall be joined together in accordance with the chimney manufacturers' instructions.

**TABLE 503.10.2.4
MINIMUM THICKNESS FOR GALVANIZED STEEL VENT
CONNECTORS FOR LOW-HEAT APPLIANCES**

DIAMETER OF CONNECTOR (inches)	MINIMUM THICKNESS (inch)
Less than 6	0.019
6 to less than 10	0.023
10 to 12 inclusive	0.029
14 to 16 inclusive	0.034
Over 16	0.056

For SI: 1 inch = 25.4 mm.

503.10.2.5 Medium-heat appliances. Vent connectors for medium-heat [equipment] appliances and commercial and industrial incinerators shall be constructed of factory-built medium-heat chimney sections or steel of a thickness not less than that specified in Table 503.10.2.5 and shall comply with the following:

1. A steel vent connector for [equipment] an appliance with a vent gas temperature in excess of 1000°F (538°C), measured at the entrance to the connector shall be lined with medium-duty fire brick (ASTM C 64, Type F), or the equivalent.
2. The lining shall be at least 2½ inches (64 mm) thick for a vent connector having a diameter or greatest cross-sectional dimension of 18 inches (457 mm) or less.
3. The lining shall be at least 4½ inches (114 mm) thick laid on the 4½-inch (114 mm) bed for a vent connector having a diameter or greatest cross-sectional dimension greater than 18 inches (457mm).
4. Factory-built chimney sections, if employed, shall be joined together in accordance with the chimney manufacturers' instructions.

[EQUIPMENT]

**TABLE 503.10.2.5
MINIMUM THICKNESS FOR STEEL VENT CONNECTORS FOR
MEDIUM-HEAT APPLIANCES AND COMMERCIAL AND
INDUSTRIAL INCINERATORS VENT CONNECTOR SIZE**

DIAMETER (inches)	AREA (square inches)	MINIMUM THICKNESS (inch)
Up to 14	Up to 154	0.053
Over 14 to 16	154 to 201	0.067
Over 16 to 18	201 to 254	0.093
Over 18	Larger than 254	0.123

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm².

503.10.3 Size of vent connector. Vent connectors shall be sized in accordance with Sections 503.10.3.1 through 503.10.3.5.

503.10.3.1 Single draft hood and fan-assisted. A vent connector for [equipment] an appliance with a single draft hood or for a Category I fan-assisted combustion system appliance shall be sized and installed in accordance with Section 504 or other approved engineering methods.

503.10.3.2 Multiple draft hoods. For a single appliance having more than one draft hood outlet or flue collar, the manifold shall be constructed according to the instructions of the appliance manufacturer. Where there are no instructions, the manifold shall be designed and constructed in accordance with approved engineering practices. As an alternate method, the effective area of the manifold shall equal the combined area of the flue collars or draft hood outlets and the vent connectors shall have a minimum 1-foot (305 mm) rise.

503.10.3.3 Multiple appliances. Where two or more appliances are connected to a common vent or chimney, each vent connector shall be sized in accordance with Section 504 or other approved engineering methods.

As an alternative method applicable only when all of the appliances are draft hood equipped, each vent connector shall have an effective area not less than the area of the draft hood outlet of the appliance to which it is connected.

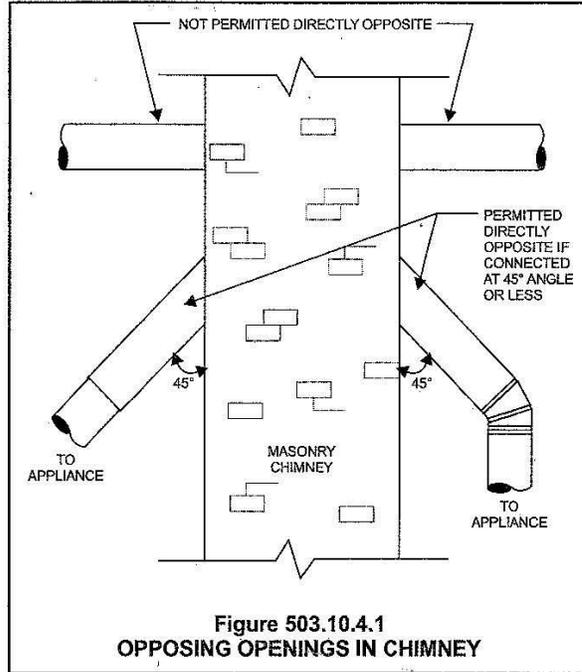

503.10.3.4 Common connector/manifold. Where two or more [gas] appliances are vented through a common vent connector or vent manifold, the common vent connector or vent manifold shall be located at the highest level consistent with available headroom and the required clearance to combustible materials and shall be sized in accordance with Section 504 or other approved engineering methods.

As an alternate method applicable only where there are two draft hood equipped appliances, the effective area of the common vent connector or vent manifold and all junction fittings shall be not less than the area of the larger vent connector plus 50 percent of the area of the smaller flue collar outlet.

503.10.3.5 Size increase. Where the size of a vent connector is increased to overcome installation limitations and obtain connector capacity equal to the [equipment] appliance input, the size increase shall be made at the [equipment] appliance draft hood outlet.

503.10.4 Two or more appliances connected to a single vent or chimney. Where two or more vent connectors enter a common gas vent, chimney flue, or single-wall metal pipe, the smaller connector shall enter at the highest level consistent with the available headroom or clearance to combustible material. Vent connectors serving Category I appliances shall not be connected to any portion of a mechanical draft system operating under positive static pressure, such as those serving Category III or IV appliances.

503.10.4.1 Two or more openings. Where two or more openings are provided into one chimney flue or vent, the openings shall be at different levels, or the connectors shall be attached to the vertical portion of the chimney or vent at an angle of 45 degrees (0.79 rad) or less relative to the vertical.

503.10.5 Clearance. Minimum clearances from vent connectors to combustible material shall be in accordance with Table [503.7.7] 503.10.5.

Exception: The clearance between a vent connector and combustible material shall be permitted to be reduced where the combustible material is protected as specified for vent connectors in Table 308.2.

TABLE 503.10.5^a
CLEARANCES FOR CONNECTORS

<u>APPLIANCE</u>	<u>MINIMUM DISTANCE FROM COMBUSTIBLE MATERIAL</u>			
	<u>Listed Type B gas vent material</u>	<u>Listed Type L vent material</u>	<u>Single-wall metal pipe</u>	<u>Factory-built chimney sections</u>
<u>Listed appliances with draft hoods and appliances listed for use with Type B gas vents</u>	<u>As listed</u>	<u>As listed</u>	<u>6 inches</u>	<u>As listed</u>
<u>Residential boilers and furnaces with listed gas conversion burner and with draft hood</u>	<u>6 inches</u>	<u>6 inches</u>	<u>9 inches</u>	<u>As listed</u>
<u>Residential appliances listed for use with Type L vents</u>	<u>Not permitted</u>	<u>As listed</u>	<u>9 inches</u>	<u>As listed</u>
<u>Listed gas-fired toilets</u>	<u>Not permitted</u>	<u>As listed</u>	<u>As listed</u>	<u>As listed</u>
<u>Unlisted residential appliances with draft hood</u>	<u>Not permitted</u>	<u>6 inches</u>	<u>9 inches</u>	<u>As listed</u>
<u>Residential and low-heat appliances other than above</u>	<u>Not permitted</u>	<u>9 inches</u>	<u>18 inches</u>	<u>As listed</u>
<u>Medium-heat appliances</u>	<u>Not permitted</u>	<u>Not permitted</u>	<u>36 inches</u>	<u>As listed</u>

For SI: 1 inch = 25.4 mm.

a. These clearances shall apply unless the manufacturer's installation instructions for a listed appliance or connector specify different clearances, in which case the listed clearances shall apply.

503.10.6 Flow resistance. A vent connector shall be installed so as to avoid turns or other construction features that create excessive resistance to flow of vent gases.

503.10.7 Joints. Joints between sections of connector piping and connections to flue collars and hood outlets shall be fastened by one of the following methods:

1. Sheet metal screws.
2. Vent connectors of listed vent material assembled and connected to flue collars or draft hood outlets in accordance with the manufacturers' instructions.
3. Welding.

503.10.8 Slope. A vent connector shall be installed without dips or sags and shall slope upward toward the vent or chimney at least ¼ inch per foot (21 mm/m).

Exception: Vent connectors attached to a mechanical draft system installed in accordance with the manufacturers' instructions.

503.10.9 Length of vent connector. A vent connector shall be as short as practical and the [equipment] appliance located as close as practical to the chimney or vent. [Except as provided for in Section 503.10.3, the] The maximum horizontal length of a single-wall connector shall be 75 percent of the height of the chimney or vent except for engineered systems. [Except as provided for in Section 503.10.3, the] The maximum horizontal length of a Type B double-wall connector shall be 100 percent of the height of the chimney or vent except for engineered systems. [For a chimney or vent system serving multiple appliances, the maximum length of an individual connector, from the appliance outlet to the junction with the common vent or another connector, shall be 100 percent of the height of the chimney or vent.]

503.10.10 Support. A vent connector shall be supported in accordance with the manufacturer's recommendations for the design and weight of the material employed to maintain clearances and prevent physical damage and separation of joints.

503.10.11 Chimney connection. Where entering a flue in a masonry or metal chimney, the vent connector shall be installed above the extreme bottom to avoid stoppage. Where a thimble or slip joint is used to facilitate removal of the connector, the connector shall be firmly attached to or inserted into the thimble or slip joint to prevent the connector from falling out. Means shall be employed to prevent the connector from entering so far as to restrict the space between its end and the opposite wall of the chimney flue (see Section 501.9).

503.10.12 Inspection. The entire length of a vent connector shall be provided with ready access for inspection, cleaning, and replacement.

503.10.13 Fireplaces. A vent connector shall not be connected to a chimney flue serving a fireplace.

503.10.14 Passage through ceilings, floors, or walls. [A vent connector] Single-wall metal pipe connectors shall not pass through any [ceiling] wall, floor or ceiling except as permitted by Section 503.7.4. [A single-wall metal pipe connector shall not pass through any interior wall.]

[Exception: Vent connectors made of listed Type B or Type L vent material and serving listed equipment with draft hoods and other equipment listed for use with Type B gas vents shall be permitted to pass through walls or partitions constructed of combustible material if the connectors are installed with not less than the listed clearance to combustible material.

503.10.15 Single-wall connector penetrations of combustible walls. A vent connector made of a single-wall metal pipe shall not pass through a combustible exterior wall unless guarded at the point of passage by a ventilated metal thimble not smaller than the following:

1. For listed appliances equipped with draft hoods and appliances listed for use with Type B gas vents, the thimble shall be not less than 4 inches (102 mm) larger in diameter than the vent connector. Where there is a run of not less than 6 feet (1829 mm) of vent connector in the open between the draft hood outlet and the thimble, the thimble shall be permitted to be not less than 2 inches (51 mm) larger in diameter than the vent connector.
2. For unlisted appliances having draft hoods, the thimble shall be not less than 6 inches (152 mm) larger in diameter than the vent connector.
3. For residential and low-heat appliances, the thimble shall be not less than 12 inches (305 mm) larger in diameter than the vent connector.

Exception: In lieu of thimble protection, all combustible material in the wall shall be removed from the vent connector a sufficient distance to provide the specified clearance from such vent connector to combustible material. Any material used to close up such opening shall be noncombustible.]

[503.10.16] 503.10.15 Medium-heat connectors. Vent connectors for medium-heat [equipment] appliances shall not pass through walls or partitions constructed of combustible material.

503.11 Vent connectors for Category II, III, and IV appliances. Vent connectors for Category II, III and IV appliances shall be as specified for the venting systems in accordance with Section 503.4.

503.12 Draft hoods and draft controls. The installation of draft hoods and draft controls shall comply with Sections 503.12.1 through 503.12.7.

503.12.1 [Equipment]Appliances requiring draft hoods. Vented [equipment] appliances shall be installed with draft hoods.

Exception: Incinerators, direct-vent [equipment] appliances, fan-assisted combustion system appliances, [equipment] appliances requiring chimney draft for operation, [equipment] appliances equipped with blast, power, or pressure burners that are not listed for use with draft hoods, and [equipment] appliances designed for forced venting.

503.12.2 Installation. A draft hood supplied with or forming a part of a listed vented [equipment] appliance shall be installed without alteration, exactly as furnished and

specified by the [equipment] appliance manufacturer. Draft hoods shall be equipped with a thermal safety (spill) switch installed in accordance with its listing and the manufacturer's instructions.

503.12.2.1 Draft hood required. If a draft hood is not supplied by the [equipment] appliance manufacturer where one is required, a draft hood shall be installed, shall be of a listed or approved type and, in the absence of other instructions, shall be of the same size as the [equipment] appliance flue collar. Where a draft hood is required with a conversion burner, it shall be of a listed or approved type.

503.12.2.2 Special design draft hood. Where it is determined that a draft hood of special design is needed or preferable for a particular installation, the installation shall be in accordance with the recommendations of the [equipment] appliance manufacturer and shall be approved by the department.

503.12.3 Draft control devices. Where a draft control device is part of the [equipment] appliance or is supplied by the [equipment] appliance manufacturer, it shall be installed in accordance with the manufacturers' instructions. In the absence of manufacturers' instructions, the device shall be attached to the flue collar of the [equipment] appliance or as near to the [equipment] appliance as practical.

503.12.4 Additional devices. [Equipment] Appliances requiring a controlled chimney draft shall be permitted to be equipped with a listed double-acting barometric-draft regulator installed and adjusted in accordance with the manufacturers' instructions. Barometric-draft regulators shall be equipped with a thermal safety (spill) switch installed in accordance with its listing and the manufacturer's instructions.

503.12.5 Location. Draft hoods and barometric draft regulators shall be installed in the same room or enclosure as the [equipment] appliance in such a manner as to prevent any difference in pressure between the hood or regulator and the combustion air supply.

503.12.6 Positioning. Draft hoods and draft regulators shall be installed in the position for which they were designed with reference to the horizontal and vertical planes and shall be located so that the relief opening is not obstructed by any part of the [equipment] appliance or adjacent construction. The [equipment] appliance and its draft hood shall be located so that the relief opening is accessible for checking vent operation.

503.12.7 Clearance. A draft hood shall be located so its relief opening is not less than 6 inches (152 mm) from any surface except that of the [equipment] appliance it serves and the venting system to which the draft hood is connected. Where a greater or lesser clearance is indicated on the [equipment] appliance label, the clearance shall be not less than that specified on the label. Such clearances shall not be reduced.

503.13 Manually operated dampers. A manually operated damper shall not be placed in the vent connector for any [equipment] appliance. Fixed baffles shall not be classified as manually operated dampers.

503.14 Automatically operated vent dampers. An automatically operated vent damper shall be of a listed type complete with safety controls to prove open position of the damper before equipment operation.

503.15 Obstructions. Devices that retard the flow of vent gases shall not be installed in a vent connector, chimney, or vent. The following shall not be considered as obstructions:

1. Draft regulators and safety controls specifically listed for installation in venting systems and installed in accordance with the terms of their listing and manufacturer's installation instructions.
2. Approved draft regulators and safety controls that are designed and installed in accordance with approved engineering methods.
3. Listed heat reclaimers and automatically operated vent dampers installed in accordance with the terms of their listing and manufacturer's installation instruction.
4. Approved economizers, heat reclaimers, and recuperators installed in venting systems of [equipment] appliances not required to be equipped with draft hoods, provided that the [gas utilization equipment] appliance manufacturer's instructions cover the installation of such a device in the venting system and performance in accordance with Sections 503.3 and 503.3.1 is obtained.
5. Vent dampers serving listed appliances installed in accordance with Sections 504.2.1 and 504.3.1 or other approved engineering methods.

503.16 Outside wall penetrations. Where vents, including those for direct-vent appliances, penetrate outside walls of buildings, the annular spaces around such penetrations shall be permanently sealed using approved materials to prevent entry of combustion products into the building.

SECTION FGC 504 SIZING OF CATEGORY I APPLIANCE VENTING SYSTEMS

504.1 Definitions. The following definitions apply to the tables in this section.

APPLIANCE CATEGORIZED VENT DIAMETER/AREA. The minimum vent area/diameter permissible for Category I appliances to maintain a non-positive vent static pressure when tested in accordance with nationally recognized standards.

FAN-ASSISTED COMBUSTION SYSTEM. An appliance equipped with an integral mechanical means to either draw or force products of combustion through the combustion chamber or heat exchanger.

FAN Min. The minimum input rating of a Category I fan-assisted appliance attached to a vent or connector.

FAN Max. The maximum input rating of a Category I fan-assisted appliance attached to a vent or connector.

NAT Max. The maximum input rating of a Category I draft-hood-equipped appliance attached to a vent or connector.

FAN + FAN. The maximum combined appliance input rating of two or more Category I fan-assisted appliances attached to the common vent.

FAN + NAT. The maximum combined appliance input rating of one or more Category I fan-assisted appliances and one or more Category I draft-hood-equipped appliances attached to the common vent.

NA. Vent configuration is not allowed due to potential for condensate formation or pressurization of the venting system, or not applicable due to physical or geometric restraints.

NAT + NAT. The maximum combined appliance input rating of two or more Category I draft-hood-equipped appliances attached to the common vent.

504.2 Application of single-appliance vent Tables 504.2(1) through [504.2(5)] 504.2(6). The application of Tables 504.2(1) through [504.2(5)] 504.2(6) shall be subject to the requirements of Sections 504.2.1 through [504.2.15] 504.2.16.

504.2.1 Vent obstructions. These venting tables shall not be used where obstructions, as described in Section 503.15, are installed in the venting system. The installation of vents serving listed appliances with vent dampers shall be in accordance with the appliance manufacturer's instructions or in accordance with the following:

1. The maximum capacity of the vent system shall be determined using the "NAT Max" column.
2. The minimum capacity shall be determined as if the appliance were a fan-assisted appliance, using the "FAN Min" column to determine the minimum capacity of the vent system. Where the corresponding "FAN Min" is "NA," the vent configuration shall not be permitted and an alternative venting configuration shall be utilized.

504.2.2 Minimum size. Where the vent size determined from the tables is smaller than the appliance draft hood outlet or flue collar, the smaller size shall be permitted to be used provided that all of the following requirements are met:

1. The total vent height (H) is at least 10 feet (3048mm).
2. Vents for appliance draft hood outlets or flue collars 12 inches (305 mm) in diameter or smaller are not reduced more than one table size.
3. Vents for appliance draft hood outlets or flue collars larger than 12 inches (305 mm) in diameter are not reduced more than two table sizes.
4. The maximum capacity listed in the tables for a fan-assisted appliance is reduced by 10 percent ($0.90 \times$ maximum table capacity).
5. The draft hood outlet is greater than 4 inches (102 mm) in diameter. Do not connect a 3-inch-diameter (76 mm) vent to a 4-inch-diameter (102 mm) draft hood outlet. This provision shall not apply to fan-assisted appliances.

504.2.3 Vent offsets. [Single-appliance venting configurations with zero (0) lateral lengths in Tables 504.2(1), 504.2(2), and 504.2(5) shall not have elbows in the venting system. For vent configurations with lateral lengths, the venting tables include allowance for two 90-degree (1.57 rad) turns. For each elbow up to and including 45 degrees (0.79 rad), the maximum capacity listed in the venting tables shall be reduced by 5 percent. For each elbow greater than 45 degrees (0.79 rad) up to and including 90 degrees (1.57 rad), the maximum capacity listed in the venting tables shall be reduced by 10 percent.] Single-appliance venting configurations with zero (0) lateral lengths in Tables 504.2(1), 504.2(2) and 504.2(5) shall not have elbows in the venting system. Single-appliance venting configurations with lateral lengths include two 90-degree (1.57 rad) elbows. For each additional elbow up to and including 45 degrees (0.79 rad), the maximum capacity listed in the venting tables shall be reduced by 5 percent. For each additional elbow greater than 45 degrees (0.79 rad) up to and including 90 degrees (1.57 rad), the maximum capacity listed in the venting tables shall be reduced by 10 percent. Where multiple offsets occur in a vent, the total lateral length of all offsets combined shall not exceed that specified in Tables 504.2(1) through 504.2(5).

504.2.4 Zero lateral. Zero (0) lateral (L) shall apply only to a straight vertical vent attached to a top outlet draft hood or flue collar.

504.2.5 Reserved.

504.2.6 Multiple input rate appliances. For appliances with more than one input rate, the minimum vent capacity (FAN Min) determined from the tables shall be less than the lowest

appliance input rating, and the maximum vent capacity (FAN Max/NAT Max) determined from the tables shall be greater than the highest appliance rating input.

504.2.7 Liner system sizing. Listed corrugated metallic chimney liner systems in masonry chimneys shall be sized by using Table 504.2(1) or 504.2(2) for Type B vents with the maximum capacity reduced by 20 percent ($0.80 \times$ maximum capacity) and the minimum capacity as shown in Table 504.2(1) or 504.2(2). Corrugated metallic liner systems installed with bends or offsets shall have their maximum capacity further reduced in accordance with Section 504.2.3. The 20-percent reduction for corrugated metallic chimney liner systems includes an allowance for one long-radius 90-degree (157 rad) turn at the bottom of the liner.

504.2.8 Vent area and diameter. Where the vertical vent has a larger diameter than the vent connector, the vertical vent diameter shall be used to determine the minimum vent capacity, and the connector diameter shall be used to determine the maximum vent capacity. The flow area of the vertical vent shall not exceed seven times the flow area of the listed appliance categorized vent area, flue collar area, or draft hood outlet area unless designed in accordance with approved engineering methods.

504.2.9 Chimney and vent locations. Tables 504.2(1), 504.2(2), 504.2(3), 504.2(4) and 504.2(5) shall be used only for chimneys and vents not exposed to the outdoors below the roof line. A Type B vent or listed chimney lining system passing through an unused masonry chimney flue shall not be considered to be exposed to the outdoors. A Type B vent shall not be considered to be exposed to the outdoors where it passes through an unventilated enclosure or chase insulated to a value of not less than R8. Table 504.2(3) in combination with Table [504.3(6)] 504.2(6) shall be used for clay-tile-lined exterior masonry chimneys, provided that all of the following are met:

1. Vent connector is a Type B double-wall.
2. Vent connector length is limited to 1½ feet for each inch (18 mm per mm) of vent connector diameter.
3. The appliance is draft hood equipped.
4. The input rating is less than the maximum capacity given by Table 504.2(3).
5. For a water heater, the outdoor design temperature is not less than 5°F (-15°C).
6. For a space-heating appliance, the input rating is greater than the minimum capacity given by Table [504.3(6)] 504.2(6).

Where these conditions cannot be met, an alternative venting design shall be used, such as a listed chimney lining system.

Exception: The installation of vents serving listed appliances shall be permitted to be in accordance with the appliance manufacturer's instructions and the terms of the listing.

504.2.10 Corrugated vent connector size. Corrugated vent connectors shall be not smaller than the listed appliance categorized vent diameter, flue collar diameter, or draft hood outlet diameter.

504.2.11 Vent connector size limitation. Vent connectors shall not be increased in size more than two sizes greater than the listed appliance categorized vent diameter, flue collar diameter, or draft hood outlet diameter.

504.2.12 Component commingling. In a single run of vent or vent connector, different diameters and types of vent and connector components shall be permitted to be used, provided that all such sizes and types are permitted by the tables.

504.2.13 Draft hood conversion accessories. Draft hood conversion accessories for use with masonry chimneys venting listed Category I fan-assisted appliances shall be listed and installed in accordance with the manufacturer's installation instructions for such listed accessories.

[504.2.13] 504.2.14 Table interpolation. Interpolation shall be permitted in calculating capacities for vent dimensions that fall between the table entries.

[504.2.14] 504.2.15 Extrapolation prohibited. Extrapolation beyond the table entries shall not be permitted.

[504.2.15] 504.2.16 Engineering calculations. For vent heights less than 6 feet (1829mm) and greater than shown in the tables, engineering methods shall be used to calculate vent capacities. Signed and sealed calculations shall be submitted with filing application.

Not recommended for any vent configurations								

504.3 Application of multiple appliance vent Tables 504.3(1) through 504.3(7). The application of Tables 504.3(1) through [504.3(8)] 504.3(7) shall be subject to the requirements of Sections 504.3.1 through [504.3.2.5] 504.3.27.

504.3.1 Vent obstructions. These venting tables shall not be used where obstructions, as described in Section 503.15, are installed in the venting system. The installation of vents serving listed appliances with vent dampers shall be in accordance with the appliance manufacturer's instructions or in accordance with the following:

1. The maximum capacity of the vent connector shall be determined using the NAT Max column.
2. The maximum capacity of the vertical vent or chimney shall be determined using the FAN+NAT column when the second appliance is a fan-assisted appliance, or the NAT+NAT column when the second appliance is equipped with a draft hood.
3. The minimum capacity shall be determined as if the appliance were a fan-assisted appliance.
 - 3.1. The minimum capacity of the vent connector shall be determined using the FAN Min column.
 - 3.2. The FAN+FAN column shall be used where the second appliance is a fan-assisted appliance, and the FAN+NAT column shall be used where the second appliance is equipped with a draft hood, to determine whether the vertical vent or chimney configuration is not permitted (NA). Where the vent configuration is NA, the vent configuration shall not be permitted and an alternative venting configuration shall be utilized.

504.3.2 Connector length limit. The vent connector shall be routed to the vent utilizing the shortest possible route. Except as provided in Section 504.3.3, the maximum vent connector horizontal length shall be 1½ feet for each inch (18 mm per mm) of connector diameter as shown in Table 504.3.2.

**TABLE 504.3.2

24	36

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

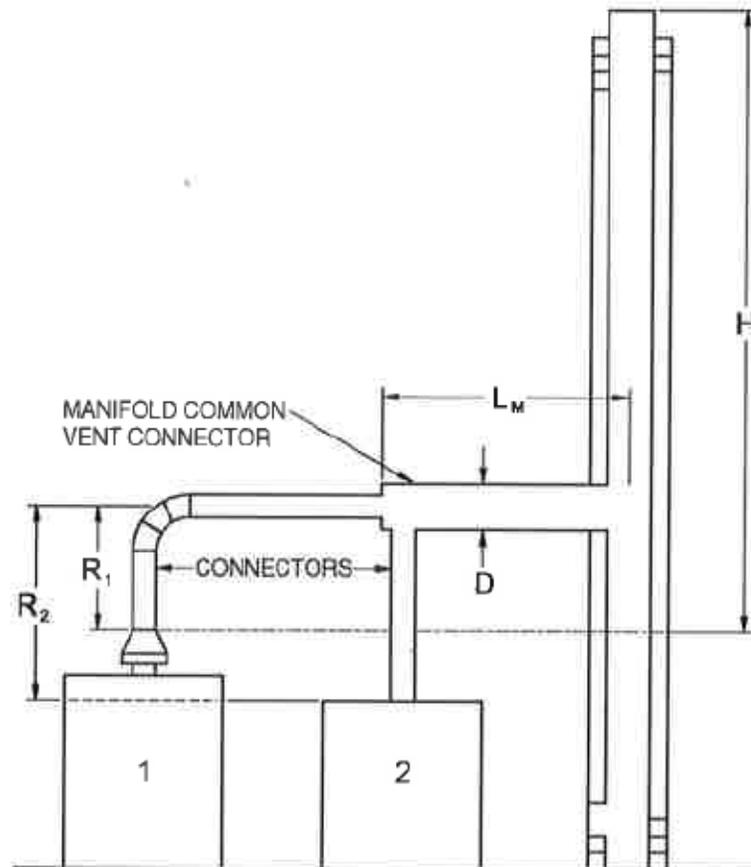

504.3.3 Connectors with longer lengths. Connectors with longer horizontal lengths than those listed in Section 504.3.2 are permitted under the following conditions:

1. The maximum capacity (FAN Max or NAT Max) of the vent connector shall be reduced 10 percent for each additional multiple of the length [listed above] allowed by Section 504.3.2. For example, the maximum length listed [above] in Table 504.3.2 for a 4-inch (102 mm) connector is 6 feet (1829 mm). With a connector length greater than 6 feet (1829 mm) but not exceeding 12 feet (3658 mm), the maximum capacity must be reduced by 10 percent ($0.90 \times$ maximum vent connector capacity). With a connector length greater than 12 feet (3658 mm) but not exceeding 18 feet (5486 mm), the maximum capacity must be reduced by 20 percent (0.80 maximum vent capacity).
2. For a connector serving a fan-assisted appliance, the minimum capacity (FAN Min) of the connector shall be determined by referring to the corresponding single appliance table. For Type B double-wall connectors, Table 504.2(1) shall be used. For single-wall connectors, Table 504.2(2) shall be used. The height (H) and lateral (L) shall be measured according to the procedures for a single-appliance vent, as if the other appliances were not present.

504.3.4 Vent connector manifold. Where the vent connectors are combined prior to entering the vertical portion of the common vent to form a common vent manifold, the size of the common vent manifold and the common vent shall be determined by applying a 10-percent reduction ($0.90 \times$ maximum common vent capacity) to the common vent capacity part of

the common vent tables. The length of the common vent connector manifold (L_M) shall not exceed $1\frac{1}{2}$ feet for each inch (457 mm for each 25.4 mm) of common vent connector manifold diameter (D) (see [(Figure B-1 1)] Figure 504.3.4).

FIGURE 504.3.4
USE OF A MANIFOLD COMMON VENT CONNECTOR

Example: Manifolded Common Vent Connector L_M shall be no greater than 18 times the common vent connector manifold inside diameter; i.e., a 4-inch (102 mm) inside diameter common vent connector manifold shall not exceed 72 inches (1829 mm) in length (see Section 504.3.4).

Note: This is an illustration of a typical manifolded vent connector. Different appliance, vent connector, or common vent types are possible. Consult Section 502.3.

504.3.5 Common vertical vent offset. Where the common vertical vent is offset, the maximum capacity of the common vent shall be reduced in accordance with Section 504.3.6. The horizontal length of the common vent offset (L_o) shall not exceed $1\frac{1}{2}$ feet for each inch ([457]18 mm per mm) of common vent diameter (D). Where multiple offsets

occur in a common vent, the total horizontal length of all offsets combined shall not exceed 1½ feet for each inch (18 mm per mm) of common vent diameter (D).

504.3.6 Elbows in vents. For each elbow up to and including 45 degrees (0.79 rad) in the common vent, the maximum common vent capacity listed in the venting tables shall be reduced by 5 percent. For each elbow greater than 45 degrees (0.79 rad) up to and including 90 degrees (1.57 rad), the maximum common vent capacity listed in the venting tables shall be reduced by 10 percent.

504.3.7 Elbows in connectors. The vent connector capacities listed in the common vent sizing tables include allowance for two 90-degree (1.57 rad) elbows. For each additional elbow up to and including 45 degrees (0.79 rad), the maximum vent connector capacity listed in the venting tables shall be reduced by 5 percent. For each elbow greater than 45 degrees (0.79 rad) up to and including 90 degrees (1.57 rad), the maximum vent connector capacity listed in the venting tables shall be reduced by 10 percent.

504.3.8 Common vent minimum size. The cross-sectional area of the common vent shall be equal to or greater than the cross-sectional area of the largest connector.

504.3.9 Common vent fittings. At the point where tee or wye fittings connect to a common vent, the opening size of the fitting shall be equal to the size of the common vent. Such fittings shall not be prohibited from having reduced size openings at the point of connection of appliance vent connectors.

504.3.9.1 Tee and wye fittings. Tee and wye fittings connected to a common gas vent shall be considered as part of the common gas vent and shall be constructed of materials consistent with that of the common gas vent.

504.3.10 Reserved.

[504.3.10] **504.3.11 Connector rise measurement.** Connector rise (R) for each appliance connector shall be measured from the draft hood outlet or flue collar to the centerline where the vent gas streams come together.

[504.3.11] **504.3.12 Vent height measurement.** For multiple units of [equipment]appliances all located on one floor, available total height (H) shall be measured from the highest draft hood outlet or flue collar up to the level of the outlet of the common vent.

[504.3.12] **504.3.13 Multistory height measurement.** For multistory installations, available total height (H) for each segment of the system shall be the vertical distance between the highest draft hood outlet or flue collar entering that segment and the centerline of the next higher interconnection tee.

[504.3.13] **504.3.14 Multistory lowest portion sizing.** The size of the lowest connector and of the vertical vent leading to the lowest interconnection of a multistory system shall be in

accordance with Table 504.2(1) or 504.2(2) for available total height (H) up to the lowest interconnection.

[504.3.14] 504.3.15 Multistory common vents. Where used in multistory systems, vertical common vents shall be Type B double wall and shall be installed with a listed vent cap.

[504.3.15] 504.3.16 Multistory common vents offsets[‡]. Offsets in multistory common vent systems shall be limited to a single offset in each system, and systems with an offset shall comply with all of the following:

1. The offset angle shall not exceed 45 degrees (0.79 rad) from vertical.
2. The horizontal length of the offset shall not exceed 1½ feet for each inch ([457] 18 mm for each 25.4 mm) of common vent diameter of the segment in which the offset is located.
3. For the segment of the common vertical vent containing the offset, the common vent capacity listed in the common venting tables shall be reduced by 20 percent (0.80 × maximum common vent capacity).
4. A multistory common vent shall not be reduced in size above the offset.

[504.3.16] 504.3.17 Vertical vent maximum size. Where two or more appliances are connected to a vertical vent or chimney, the flow area of the largest section of vertical vent or chimney shall not exceed seven times the smallest listed appliance categorized vent areas, flue collar area, or draft hood outlet area unless designed in accordance with approved engineering methods.

[504.3.17] 504.3.18 Multiple input rate appliances. For appliances with more than one input rate, the minimum vent connector capacity (FAN Min) determined from the tables shall be less than the lowest appliance input rating, and the maximum vent connector capacity (FAN Max or NAT Max) determined from the tables shall be greater than the highest appliance input rating.

[504.3.18] 504.3.19 Liner system sizing and connections. Listed, corrugated metallic chimney liner systems in masonry chimneys shall be sized by using Table 504.3(1) or 504.3(2) for Type B vents, with the maximum capacity reduced by 20 percent (0.80 × maximum capacity) and the minimum capacity as shown in Table 504.3(1) or 504.3(2). Corrugated metallic liner systems installed with bends or offsets shall have their maximum capacity further reduced in accordance with Sections 504.3.5 and 504.3.6. The 20-percent reduction for corrugated metallic chimney liner systems includes an allowance for one long-radius 90-degree (1.57 rad) turn at the bottom of the liner. Where double-wall connectors are required, tee and wye fittings used to connect to the common vent chimney liner shall be listed double-wall fittings. Connections between chimney liners and listed double-wall fittings shall be made with listed adapter fittings designed for such purpose.

[504.3.19] 504.3.20 Chimney and vent location. Tables 504.3(1), 504.3(2), 504.3(3), 504.3(4), and 504.3(5) shall be used only for chimneys and vents not exposed to the outdoors below the roof line. A Type B vent or listed chimney lining system passing through an unused masonry chimney flue shall not be considered to be exposed to the outdoors. A Type B vent shall not be considered to be exposed to the outdoors where it passes through an unventilated enclosure or chase insulated to a value of not less than R8. Tables [504.3(7)] 504.3(6) and [504.3(8)] 504.3(7) shall be used for clay-tile-lined exterior masonry chimneys, provided all of the following conditions are met:

1. Vent connector is Type B double-wall.
2. At least one appliance is draft hood equipped.
3. The combined appliance input rating is less than the maximum capacity given by Table [504.3(7a)] 504.3(6a) for NAT+NAT or Table [504.3(8a)] 504.3(7a) for FAN+NAT.
4. The input rating of each space-heating appliance is greater than the minimum input rating given by Table [504.3(7b)] 504.3(6b) for NAT+NAT or Table [504.3(8b)] 504.3(7b) for FAN+NAT.
5. The vent connector sizing is in accordance with Table 504.3(3).

[504.3.20] 504.3.21 Connector maximum and minimum size. Vent connectors shall not be increased in size more than two sizes greater than the listed appliance categorized vent diameter, flue collar diameter, or draft hood outlet diameter. Vent connectors for draft hood-equipped appliances shall not be smaller than the draft hood outlet diameter. Where a vent connector size(s) determined from the tables for a fan-assisted appliance(s) is smaller than the flue collar diameter, the use of the smaller size(s) shall be permitted provided that the installation complies with all of the following conditions:

1. Vent connectors for fan-assisted appliance flue collars 12 inches (305 mm) in diameter or smaller are not reduced by more than one table size [] (e.g., 12 inches to 10 inches (305 mm to 254 mm) is a one-size reduction[]) and those larger than 12 inches (305 mm) in diameter are not reduced more than two table sizes [] (e.g., 24 inches to 20 inches (610 mm to 508 mm) is a two-size reduction[]).
2. The fan-assisted appliance(s) is common vented with a draft-hood-equipped appliances(s).
3. The vent connector has a smooth interior wall.

[504.3.21] 504.3.22 Component commingling. All combinations of pipe sizes, single-wall, and double-wall metal pipe shall be allowed within any connector run(s) or within the common vent, provided all of the appropriate tables permit all of the desired sizes and types of pipe, as if they were used for the entire length of the subject connector or vent. Where

single-wall and Type B double-wall metal pipes are used for vent connectors within the same venting system, the common vent must be sized using Table 504.3(2) or 504.3(4), as appropriate.

504.3.23 Draft hood conversion accessories. Draft hood conversion accessories for use with masonry chimneys venting listed Category I fan-assisted appliances shall be listed and installed in accordance with the manufacturer's installation instructions for such listed accessories.

[504.3.22] **504.3.24 Multiple sizes permitted.** Where a table permits more than one diameter of pipe to be used for a connector or vent, all the permitted sizes shall be permitted to be used.

[504.3.23] **504.3.25 Table interpolation.** Interpolation shall be permitted in calculating capacities for vent dimensions that fall between table entries.

[504.3.24] **504.3.26 Extrapolation prohibited.** Extrapolation beyond the table entries shall not be permitted.

[504.3.25] **504.3.27 Engineering calculations.** For vent heights less than 6 feet (1829 mm) and greater than shown in the tables, engineering methods shall be used to calculate vent capacities.

SECTION FGC 505
DIRECT-VENT, INTEGRAL VENT, MECHANICAL
VENT AND VENTILATION/EXHAUST HOOD
VENTING

505.1 General. The installation of direct-vent and integral vent appliances shall be in accordance with Section 503. Mechanical venting systems and exhaust hood venting systems shall be designed and installed in accordance with Section 503.

505.1.1 Commercial cooking appliances vented by exhaust hoods. Refer to Chapter 5 of the *New York City Mechanical Code*.

505.1.2 Interlock requirements. Where commercial cooking appliances are vented by means of the Type I or Type II kitchen exhaust hood system that serves such appliances, the exhaust system shall be fan powered and the appliances shall be interlocked with the exhaust hood system to prevent appliance operation when the exhaust hood system is not operating. The method of interlock between the exhaust hood system and the appliances equipped with standing pilot burner ignition systems shall not cause such pilots to be extinguished. Where a solenoid valve is installed in the gas piping as part of an interlock system, gas piping shall not be installed to bypass such valve. Dampers shall not be installed in the exhaust system.

Exception: An interlock between the cooking appliances and the exhaust hood system shall not be required where heat sensors or other approved methods automatically activate the exhaust hood system when cooking operations occur.

SECTION FGC 506
FACTORY-BUILT CHIMNEYS

506.1 Building heating appliances. Factory-built chimneys for building heating appliances producing flue gases having a temperature not greater than 1,000°F (538°C), measured at the entrance to the chimney, shall be listed and labeled in accordance with UL 103 and shall be installed and terminated in accordance with the manufacturer's installation instructions and this code.

506.2 Support. Where factory-built chimneys are supported by structural members, such as joists and rafters, such members shall be designed to support the additional load.

506.3 Medium-heat appliances. Factory-built chimneys for medium-heat appliances producing flue gases having a temperature above 1,000°F (538°C), measured at the entrance to the chimney, shall be listed and labeled in accordance with UL 959 and shall be installed and terminated in accordance with the manufacturer's installation instructions and this code.

SECTION FGC 507
CHANGES IN APPLIANCE FUELS

507.1 Changes in appliance fuels. Conversion of appliances from solid or liquid fuel to natural gas or the addition of natural gas, shall be made in accordance with this code. Conversion from natural gas to, or the addition of, #2 fuel oil for a heating appliance shall be made only if:

1. The chimney design meets the requirements of this chapter for the conversion fuel and the chimney is test run and smoke tested in accordance with Section 503.5.6.4 and 503.5.6.5.
2. The chimney is sized to provide adequate draft and to vent the combustion products for the new fuel.
3. The chimney is thoroughly cleaned prior to the conversion to remove collected flue deposits.

SECTION FGC 508

EXHAUST GASES FROM INTERNAL COMBUSTION ENGINES AND TURBINES

508.1 Exhaust pipe construction. The exhaust pipe from internal combustion engines shall be constructed in accordance with NFPA 211, NFPA 37, and based on the temperature of the gases entering the exhaust pipe, and in accordance with the following:

1. The exhaust pipe, if factory fabricated, shall be installed in accordance with its listing and the manufacturer's instructions.
2. The exhaust pipe, if field fabricated, shall be constructed of at least ³/₁₆-inch (5 mm) steel, or of other equivalent metal of similar strength and resistance to the temperature and corrosive action of the exhaust gases. No lining shall be required.
3. Where the exhaust pipe runs inside a building, it shall be insulated with insulation adequate for the temperature of the pipe, so that the surface temperature shall be not more than 200°F (93°C).
4. Where the exhaust pipe runs inside a building outside of the generator room, it shall be enclosed in fire-rated construction equal to the construction of the generator room.
5. All joints shall be constructed so as to be gas tight under all operating conditions and tested in accordance with Section 503.5.6.4 and Section 503.5.6.5.

Subpart 6 (Chapter 6 of the New York City Fuel Gas Code)

§1. Section 607 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION FGC 607
COMMERCIAL-INDUSTRIAL INCINERATORS
AND CREMATORIES**

607.1 Incinerators and crematories, commercial-industrial. Commercial-industrial-type incinerators and crematories shall be constructed and installed in accordance with NFPA 82.

607.2 Compliance. All new and existing refuse disposal systems shall be installed, altered and maintained in buildings in conformity with the applicable provisions of the Administrative Code and the New York City Air Pollution Control Code.

§2. Section 608 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION FGC 608
VENTED WALL FURNACES**

608.1 General. Vented wall furnaces shall be tested in accordance with ANSI Z21[.49 or Z21].86/CSA 2.32 and shall be installed in accordance with the manufacturer's installation instructions.

608.2 Venting. Vented wall furnaces shall be vented in accordance with Section 503.

608.3 Location. Vented wall furnaces shall be located so as not to cause a fire hazard to walls, floors, combustible furnishings or doors. Vented wall furnaces installed between bathrooms and adjoining rooms shall not circulate air from bathrooms to other parts of the building.

608.4 Door swing. Vented wall furnaces shall be located so that a door cannot swing within 12 inches (305 mm) of an air inlet or air outlet of such furnace measured at right angles to the opening. Doorstops or door closers shall not be installed to obtain this clearance.

608.5 Ducts prohibited. Ducts shall not be attached to wall furnaces. Casing extension boots shall not be installed unless listed as part of the appliance.

608.6 Access. Vented wall furnaces shall be provided with access for cleaning of heating surfaces, removal of burners, replacement of sections, motors, controls, filters and other working parts, and for adjustments and lubrication of parts requiring such attention. Panels, grilles and access doors that are required to be removed for normal servicing operations shall not be attached to the building construction.

§3. Section 609 of the New York city fuel gas code, as added by local law number 33 for the year 2007, section 609.8 as amended by local law number 8 for the year 2008, is amended to read as follows:

SECTION FGC 609 FLOOR FURNACES

609.1 General. Floor furnaces shall be tested in accordance with ANSI Z21[.48 or Z21].86/CSA 2.32 and shall be installed in accordance with the manufacturer's installation instructions.

609.2 Placement. The following provisions apply to floor furnaces.

1. **Floors.** Floor furnaces shall not be installed in the floor of any doorway, stairway landing, aisle or passageway of any enclosure, public or private, or in an exit way from any such room or space.
2. **Walls and corners.** The register of a floor furnace with a horizontal warm-air outlet shall not be placed closer than 6 inches (152 mm) to the nearest wall. A distance of at least 18 inches (457mm) from two adjoining sides of the floor furnace register to walls shall be provided to eliminate the necessity of occupants walking over the warm-air discharge. The remaining sides shall be permitted to be placed not closer than 6 inches (152mm) to a wall. Wall register models shall not be placed closer than 6 inches (152 mm) to a corner.
3. **Draperies.** The furnace shall be placed so that a door, drapery or similar object cannot be nearer than 12 inches (305 mm) to any portion of the register of the furnace.
4. **Floor construction.** Floor furnaces shall be located so as to be readily accessible. Means shall be provided for supporting the furnace when the grille is removed. Floor furnaces shall be installed only on floors of noncombustible construction having at least a 2-hour fire rating, except that floor furnace enclosures in one- and two-family dwellings shall be constructed of noncombustible materials with a fire-resistance rating of at least 1 hour.
5. **Thermostat.** The controlling thermostat for a floor furnace shall be located within the same room or space as the floor furnace or shall be located in an adjacent room or space that is permanently open to the room or space containing the floor furnace.

609.3 Bracing. The floor around the furnace shall be braced and headed with a support framework designed in accordance with the *New York City Building Code*.

609.4 Clearance. The lowest portion of the floor furnace shall have not less than a 6-inch (152 mm) clearance from the grade level; except where the lower 6-inch (152 mm) portion of the floor furnace is sealed by the manufacturer to prevent entrance of water, the minimum clearance shall be not less than 2 inches (51 mm). Where such clearances cannot be provided, the ground below and to the sides shall be excavated to form a pit under the furnace so that the required clearance is provided beneath the lowest portion of the furnace. A 12-inch (305 mm) minimum clearance shall be provided on all sides except the control side, which shall have an 18-inch (457 mm) minimum clearance.

609.5 Reserved.

609.6 Reserved.

609.7 Enclosures. Enclosures of floor furnaces shall be constructed entirely of [non-combustible] noncombustible materials with a fire-resistance rating of at least [one]1-hour and the enclosure shall be provided with adequate outdoor air to ensure proper combustion. The enclosure shall be provided with adequate means of access for servicing the furnace.

609.8 Duct temperature. The outlet duct temperature of warm-air heating furnaces shall not be greater than 250°F (121°C).

609.9 One- and two-family dwellings. Floor furnace enclosures shall be constructed of noncombustible materials with a fire-resistance rating of at least 1-hour. Means shall be provided for supporting the furnace when the grille is removed. Clearances shall be provided as per NFPA 54.

§4. Section 610 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 610 DUCT FURNACES

610.1 General. Duct furnaces shall be tested in accordance with ANSI [Z83.9] Z83.8 or UL 795 and shall be installed in accordance with the manufacturer's installation instructions.

610.2 Access panels. Ducts connected to duct furnaces shall have removable access panels on both the upstream and downstream sides of the furnace.

610.3 Location of draft hood and controls. The controls, combustion air inlets and draft hoods for duct furnaces shall be located outside of the ducts. The draft hood shall be located in the same enclosure from which combustion air is taken.

610.4 Circulating air. Where a duct furnace is installed so that supply ducts convey air to areas outside the space containing the furnace, the return air shall also be conveyed by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace. The duct furnace shall be installed on the positive pressure side of the circulating air blower.

610.5 Unvented duct furnaces. Unvented duct furnaces are prohibited.

§5. Section 614 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 614 CLOTHES DRYER EXHAUST

614.1 Installation. Clothes dryers shall be exhausted in accordance with the manufacturer's instructions. Dryer exhaust systems shall be independent of all other systems and shall convey the moisture and any products of combustion to the outside of the building.

Exception: This section shall not apply to listed and labeled condensing (ductless) clothes dryers.

614.2 Duct penetrations. Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draftstopping or any wall, floor/ceiling or other assembly required by the *New York City Building Code* to be fire-resistance rated, unless such duct is constructed of galvanized steel or aluminum of the thickness specified in Table 603.4 of the *New York City Mechanical Code* and the fire-resistance rating is maintained in accordance with the *New York City Building Code*. Fire dampers shall not be installed in clothes dryer exhaust duct systems.

614.3 Cleaning access. Each vertical duct riser or dryers listed to ANSI Z21.5.2 shall be provided with a cleanout or other means for cleaning the interior of the duct.

614.4 Exhaust installation. Exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

614.5 Makeup air. Installations exhausting more than 200 cfm (0.09 m³/s) shall be provided with makeup air. Where a closet is designed for the installation of a clothes dryer, an opening having an area of not less than 100 square inches (645 mm²) for makeup air shall be provided in the closet enclosure, or makeup air shall be provided by other approved means.

[614.6 Domestic clothes dryer ducts. Exhaust ducts for domestic clothes dryers shall be constructed of metal and shall have a smooth interior finish. The exhaust duct shall be a minimum nominal size of 4 inches (102 mm) in diameter. The entire exhaust system shall be supported and secured in place. The male end of the duct at overlapped duct joints shall extend in the direction of airflow. Clothes dryer transition ducts used to connect the appliance to the exhaust duct system shall be metal and limited to a single length not to exceed 8 feet (2438 mm) and shall be listed and labeled for the application. Transition ducts shall not be concealed within construction.

614.6.1 Maximum length. The maximum length of a clothes dryer exhaust duct shall not exceed 25 feet (7620 mm) from the dryer location to the outlet terminal. The maximum length of the duct shall be reduced 2.5 feet (762 mm) for each 45-degree (0.79 rad) bend and 5 feet (1524mm) for each 90-degree (1.6 rad) bend.

Exception: Listed clothes dryers may be installed in accordance with the manufacturer's installation instructions.

614.6.2 Rough-in required. Where a compartment or space for a domestic clothes dryer is provided, an exhaust duct system shall be installed.]

614.6 Domestic clothes dryer exhaust ducts. Exhaust ducts for domestic clothes dryers shall conform to the requirements of Sections 614.6.1 through 614.6.7.

614.6.1 Material and size. Exhaust ducts shall have a smooth interior finish and shall be constructed of metal that is a minimum of 0.016 inches (0.4 mm) thick. The exhaust duct size shall be 4 inches minimum (102 mm) nominal diameter, unless a larger duct size is specifically required by the dryer manufacturer.

614.6.2 Duct installation. Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The inserted end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude into the inside of the duct.

614.6.3 Protection required. Protective shield plates shall be placed where nails or screws from finish or other work are likely to penetrate the clothes dryer exhaust duct. Shield plates shall be placed on the finished face of all framing members where there is less than 1¼ inches (32 mm) between the duct and the finished face of the framing member. Protective shield plates shall be constructed of steel, shall have a minimum thickness of 0.062 inch (1.6mm) and shall extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

614.6.4 Transition ducts. Transition ducts used to connect the dryer to the exhaust duct system shall be a single length that is listed and labeled in accordance with UL 2158A. Transition ducts shall be a maximum of 8 feet (2438 mm) in length, and shall not be concealed within construction.

614.6.5 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Section 614.6.5.1 or 614.6.5.2.

614.6.5.1 Specified length. The maximum length of the exhaust duct shall be 35 feet (10668 mm) from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are utilized, the maximum length of the exhaust duct shall be reduced in accordance with Table 614.6.5.1.

**[M] TABLE 614.6.5.1
DRYER EXHAUST DUCT FITTING EQUIVALENT LENGTH**

DRYER EXHAUST DUCT FITTING TYPE	EQUIVALENT LENGTH
4 inch radius mitered 45-degree elbow	2 feet, 6 inches
4 inch radius mitered 90-degree elbow	5 feet
6 inch radius smooth 45-degree elbow	1 foot
6 inch radius smooth 90-degree elbow	1 foot, 9 inches
8 inch radius smooth 45-degree elbow	1 foot
8 inch radius smooth 90-degree elbow	1 foot, 7 inches
10 inch radius smooth 45-degree elbow	9 inches
10 inch radius smooth 90-degree elbow	1 foot, 6 inches

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 degree = 0.01745 rad.

❖ The equivalent length column of the table indicates how much length must be added to the exhaust duct total length for each fitting used.

614.6.5.2 Manufacturer’s instructions. The maximum length of the exhaust duct shall be determined by the dryer manufacturer’s installation instructions. The special inspector shall be provided with a copy of the installation instructions for the make and model of the dryer. Where the exhaust duct is to be concealed, the installation instructions shall be provided to the special inspector prior to the concealment inspection. In the absence of fitting equivalent length calculations from the clothes dryer manufacturer, Table 614.6.5.1 shall be utilized.

614.6.6 Length identification. Where the exhaust duct is concealed within the building construction, the equivalent length of the exhaust duct shall be identified on a permanent label or tag. The label or tag shall be located within 6 feet (1829 mm) of the exhaust duct connection.

614.6.7 Exhaust duct required. Where space for a clothes dryer is provided, an exhaust duct system shall be installed.

Where the clothes dryer is not installed at the time of occupancy, the exhaust duct shall be capped at the location of the future dryer.

Exception: Where a listed condensing clothes dryer is installed prior to occupancy of the structure.

614.7 Commercial clothes dryers. The installation of dryer exhaust ducts serving Type 2 clothes dryers shall comply with the appliance manufacturer’s installation instructions. Exhaust fan motors installed in exhaust systems shall be located outside of the airstream. In multiple installations, the fan shall operate continuously or be interlocked to operate when any individual unit is operating. Ducts shall have a minimum clearance of 6 inches (152 mm) to combustible materials.

614.8 Common exhaust systems for clothes dryers located in multistory structures. Where a common multistory duct system is designed and installed to convey exhaust from

multiple clothes dryers, the construction of such system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistant rated as required by the *New York City Building Code*.
2. Dampers shall be prohibited in the exhaust duct.
3. Rigid metal ductwork shall be installed within the shaft to convey the exhaust. The ductwork shall be constructed of sheet steel having a minimum thickness of 0.0187 inch (0.471 mm) (No. 26 gage) and in accordance with *SMACNA Duct Construction Standards*.
4. Exhaust ducts 20 square inches or less connected into dryer exhaust shaft shall not require fire dampers when the exhaust fan runs continuously.
5. The exhaust fan motor design shall be in accordance with Section 503.2 of the *New York City Mechanical Code*.
6. The exhaust fan motor shall be located outside of the airstream.
7. The exhaust fan shall run continuously, and shall be connected to a standby power source, where a building emergency or standby power source is required by the *New York City Building Code*.
8. The exhaust fan operation shall be monitored in an approved location and shall initiate an audible or visual signal when the fan is not in operation.
9. Makeup air shall be provided for the exhaust system.
10. Cleanout openings shall be located at the base of the shaft and the bases of all offsets to provide access to the duct to allow for cleaning and inspection. The finished opening shall be not less than 12 inches by 12 inches (305 mm by 305 mm).
11. Screens shall not be installed at the termination.

§6. Section 616 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION FGC 616
ENGINE AND GAS TURBINE-POWERED
EQUIPMENT AND APPLIANCES**

616.1 Powered equipment. Permanently installed equipment powered by internal combustion engines and turbines shall be installed in accordance with the manufacturer's installation

instructions and NFPA 37. Stationary engine generator assemblies shall meet the requirements of UL 2200.

616.2 Gas supply connection. Equipment powered by internal combustion engines and turbines shall not be rigidly connected to the gas supply piping.

§7. Section 618 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 618 FORCED-AIR WARM-AIR FURNACES

618.1 General. Forced-air warm-air furnaces shall be tested in accordance with ANSI Z21.47 or UL 795 and shall be installed in accordance with the manufacturer's installation instructions.

618.2 Forced-air furnaces. The minimum unobstructed total area of the outside and return air ducts or openings to a forced-air warm-air furnace shall be not less than 2 square inches for each 1,000 Btu/h (4402 mm²/W) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions. The minimum unobstructed total area of supply ducts from a forced-air warm-air furnace shall be not less than 2 square inches for each 1,000 Btu/h (4402 mm²/W) output rating capacity of the furnace and not less than that specified in the furnace manufacturer's installation instructions.

Exception: The total area of the supply air ducts and outside and return air ducts shall not be required to be larger than the minimum size required by the furnace manufacturer's installation instructions.

618.3 Dampers. Volume dampers shall not be placed in the air inlet to a furnace in a manner that will reduce the required air to the furnace.

618.4 Circulating air ducts for forced-air warm-air furnaces. Circulating air for fuel-burning, forced-air-type, warm-air furnaces shall be conducted into the blower housing from outside the furnace enclosure by continuous air-tight ducts.

618.5 Prohibited sources. [Outside] Outdoor or return air for a forced-air heating system shall not be taken from the following locations:

1. [Closer] Less than 10 feet (3048 mm) from an appliance vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the [outside] outdoor air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in

the *New York City Mechanical Code*.

4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an appliance where such a room or space serves as the sole source of return air.

Exception: This shall not apply where:

1. The appliance is a direct-vent appliance or an appliance not requiring a vent in accordance with Section 501.8.
 2. The room or space complies with the following requirements:
 - 2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning appliances therein.
 - 2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
 - 2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of any appliance firebox or draft hood in the same room or space.
 3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.
6. A closet, bathroom, toilet room, kitchen, garage, mechanical room, boiler room [or], furnace room or attic.

Exception: Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.

7. A crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.

618.6 Screen. Required outdoor air inlets for residential portions of a building shall be covered with a screen having ¼-inch (6.4mm) openings. Required outdoor air inlets serving a nonresidential portion of a building shall be covered with screen having openings larger than ¼ inch (6.4 mm) and not larger than 1 inch (25 mm).

618.7 Return-air limitation. Return air from one dwelling unit shall not be discharged into another dwelling unit.

618.8 Furnace plenums and air ducts. Where a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside of the space containing the furnace, the return air shall also be handled by a duct(s) sealed to the furnace casing and terminating outside of the space containing the furnace.

§8. Section 619 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 619 CONVERSION BURNERS

619.1 Conversion burners. The installation of conversion burners shall conform to ANSI Z21.8 and ASME CSD-1, including Appendix C.

§9. Section 620 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 620 UNIT HEATERS

620.1 General. Unit heaters shall be tested in accordance with ANSI Z83.8 and shall be installed in accordance with the manufacturer's installation instructions.

620.2 Support. Suspended-type unit heaters shall be supported by elements that are designed and constructed to accommodate the weight and dynamic loads. Hangers and brackets shall be of noncombustible material.

620.3 Ductwork. Ducts shall not be connected to a unit heater unless the heater is listed for such installation.

620.4 Clearance. Suspended-type unit heaters shall be installed with clearances to combustible materials of not less than 18 inches (457mm) at the sides, 12 inches (305mm) at the bottom and 6 inches (152 mm) above the top where the unit heater has an internal draft hood or 1 inch (25mm) above the top of the sloping side of the vertical draft hood.

Floor-mounted-type unit heaters shall be installed with clearances to combustible materials at the back and one side only of not less than 6 inches (152 mm). Where the flue gases are vented horizontally, the 6-inch (152mm) clearance shall be measured from the draft

hood or vent instead of the rear wall of the unit heater. Floor-mounted-type unit heaters shall not be installed on combustible floors unless listed for such installation.

Clearances for servicing all unit heaters shall be in accordance with the manufacturer's installation instructions.

Exception: Unit heaters listed for reduced clearance shall be permitted to be installed with such clearances in accordance with their listing and the manufacturer's instructions and as approved by the department.

620.5 Installation in commercial garages and aircraft hangars. Unit heaters installed in garages for more than three motor vehicles or in aircraft hangars shall be installed in accordance with Sections 305.9, 305.10 and 305.11.

§10. Section 622 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 622 VENTED ROOM HEATERS

622.1 General. Vented room heaters shall be tested in accordance with [ANSI Z21.11.1 or] ANSI Z21.86/CSA 2.32, shall be designed and equipped as specified in Section 602.2 and shall be installed in accordance with the manufacturer's installation instructions.

§11. Section 623 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 623 COOKING APPLIANCES

623.1 Cooking appliances. Cooking appliances that are designed for permanent installation, including ranges, ovens, stoves, broilers, grills, fryers, griddles, hot plates and barbecues, shall be tested in accordance with ANSI Z21.1, ANSI Z21.58 or ANSI Z83.11 and shall be installed in accordance with the manufacturer's installation instructions.

623.1.1 LPG. Except as may be permitted by the *New York City Fire Code*, cooking appliances using LPG are prohibited.

623.2 Prohibited location. Cooking appliances designed, tested, listed and labeled for use in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

623.2.1 Barbecue grills. Barbecue grills piped to natural gas shall not be installed or operated within 10 feet (3048 mm) of any combustible waste or combustible material including combustible building surfaces, balconies and decks.

623.3 Domestic appliances. Cooking appliances installed within dwelling units and within areas where domestic cooking operations occur shall be listed and labeled as household-type appliances for domestic use.

623.4 Domestic range installation. Domestic ranges installed on combustible floors shall be set on their own bases or legs and shall be installed with clearances of not less than that shown on the label.

623.5 Open-top broiler unit hoods. A ventilating hood shall be provided above a domestic open-top broiler unit, unless otherwise listed for forced down draft ventilation.

623.5.1 Clearances. A minimum clearance of 24 inches (610 mm) shall be maintained between the cooking top and combustible material above the hood. The hood shall be at least as wide as the open-top broiler unit and be centered over the unit.

623.6 Commercial cooking appliance venting. Commercial cooking appliances, other than those exempted by Section 501.8, shall be vented by connecting the appliance to a vent or chimney in accordance with this code and the appliance manufacturer's instructions or the appliance shall be vented in accordance with Section 505.1.1.

623.7 Domestic ventilation. When a hood is provided for a domestic cooking appliance, the exhaust and make-up air systems shall be properly engineered and designed in accordance with Chapter 5 of this code and the *New York City Mechanical Code*. Household cooking appliances shall have a vertical clearance above the cooking top of not less than 30 inches (760mm) to combustible material and metal cabinets. A minimum clearance of 24 inches (610 mm) is permitted where one of the following is installed:

1. The underside of the combustible material or metal cabinet above the cooking top is protected with not less than 1/4-inch (6 mm) insulating millboard covered with sheet metal not less than 0.0122 inch (0.3 mm) thick.
2. A metal ventilating hood constructed of sheet metal not less than 0.0122 inch (0.3 mm) thick is installed above the cooking top with a clearance of not less than 1/4 inch (6.4 mm) between the hood and the underside of the combustible material or metal cabinet. The hood shall have a width not less than the width of the appliance and shall be centered over the appliance.
3. A listed cooking appliance or microwave oven is installed over a listed cooking appliance and in compliance with the terms of the manufacturer's installation instructions for the upper appliance.

§12. Section 624 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION FGC 624
WATER HEATERS**

624.1 General. Water heaters shall be tested in accordance with ANSI Z 21.10.1 and ANSI Z 21.10.3 and shall be installed in accordance with the manufacturer's installation instructions. Water heaters utilizing fuels other than fuel gas shall be regulated by the *New York City Mechanical Code*. Approval for water heaters 350,000Btu/h input (1025kW) and above shall be obtained from the New York City Department of Environmental Protection.

624.1.1 Installation requirements. The requirements for water heaters relative to sizing, relief valves, drain pans and scald protection shall be in accordance with the *New York City Plumbing Code* and the following:

1. No person shall install or maintain in any dwelling unit a gas fuel-fired water heater unless the heater obtains combustion air directly from the outside of the building.
2. No person shall install or maintain a gas-fueled water heater in a room occupied for sleeping purposes, or cause or permit to be occupied for sleeping purposes any room in which a gas-fueled heater is installed.
3. Each heater shall be connected to a flue or outlet pipe.

624.2 Water heaters utilized for space heating. Water heaters utilized both to supply potable hot water and provide hot water for space-heating applications shall be listed and labeled for such applications by the manufacturer, and shall be built in accordance with Section IV of the *ASME Boiler and Pressure Vessel Code* with an "H" code stamp. [and] They shall be installed in accordance with the manufacturer's installation instructions, the ASME Boiler and Pressure Vessel Code and the *New York City Plumbing Code*.

§13. Section 627 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 627 AIR CONDITIONING [EQUIPMENT] APPLIANCES

627.1 General. Gas-fired air-conditioning [equipment] appliances shall be tested in accordance with ANSI Z21.40.1 or ANSI Z21.40.2 and shall be installed in accordance with the manufacturer's installation instructions.

627.2 Independent piping. Gas piping serving heating [equipment] appliances shall be permitted to also serve cooling [equipment] appliances where such heating and cooling [equipment] appliances cannot be operated simultaneously (see Section 402).

627.3 Connection of gas engine-powered air conditioners. To protect against the effects of normal vibration in service, gas engines shall not be rigidly connected to the gas supply piping. Where units are powered by internal combustion engines and turbines, installation shall comply with Section 616.1.

627.4 Clearances for indoor installation. Air-conditioning [equipment] appliances installed in rooms other than alcoves and closets shall be installed with clearances not less than those specified in Section 308.3 except that air-conditioning [equipment] appliances listed for installation at lesser clearances than those specified in Section 308.3 shall be permitted to be installed in accordance with such listing and the manufacturer's instructions and air-conditioning [equipment] appliances listed for installation at greater clearances than those specified in Section 308.3 shall be installed in accordance with such listing and the manufacturer's instructions.

Air-conditioning [equipment] appliances installed in rooms other than alcoves and closets shall be permitted to be installed with reduced clearances to combustible material, provided that the combustible material is protected in accordance with Table 308.2.

627.5 Alcove and closet installation. Air-conditioning [equipment] appliances installed in spaces such as alcoves and closets shall be specifically listed for such installation and installed in accordance with the terms of such listing. The installation clearances for air-conditioning [equipment] appliances in alcoves and closets shall not be reduced by the protection methods described in Table 308.2.

627.6 Installation. Air-conditioning [equipment] appliances shall be installed in accordance with the manufacturer's instructions. Unless the [equipment] appliance is listed for installation on a combustible surface such as a floor or roof, or unless the surface is protected in an approved manner, [equipment] appliances shall be installed on a surface of noncombustible construction with noncombustible material and surface finish and with no combustible material against the underside thereof.

627.7 Plenums and air ducts. A plenum supplied as a part of the air-conditioning [equipment] appliance shall be installed in accordance with the [equipment] appliance manufacturer's instructions. Where a plenum is not supplied with the [equipment] appliance, such plenum shall be installed in accordance with the fabrication and installation instructions provided by the plenum and [equipment] appliance manufacturer. The method of connecting supply and return ducts shall facilitate proper circulation of air.

Where an air-conditioning [equipment] appliance is installed within a space separated from the spaces served by the [equipment] appliance, the air circulated by the [equipment] appliance shall be conveyed by ducts that are sealed to the casing of the [equipment] appliance and that separate the circulating air from the combustion and ventilation air.

627.8 Refrigeration coils. A refrigeration coil shall not be installed in conjunction with a forced-air furnace where circulation of cooled air is provided by the furnace blower, unless the blower has sufficient capacity to overcome the external static resistance imposed by the duct system and cooling coil at the air throughput necessary for heating or cooling, whichever is greater. Furnaces shall not be located upstream from cooling units, unless the cooling unit is designed or equipped so as not to develop excessive temperature or pressure. Refrigeration coils shall be installed in parallel with or on the downstream side of central furnaces to avoid condensation in the heating element, unless the furnace has been specifically listed for downstream installation. With a parallel flow arrangement, the dampers or other means used to

control flow of air shall be sufficiently tight to prevent any circulation of cooled air through the furnace.

Means shall be provided for disposal of condensate and to prevent dripping of condensate onto the heating element.

627.9 Cooling units used with heating boilers. Boilers, where used in conjunction with refrigeration systems, shall be installed so that the chilled medium is piped in parallel with the heating boiler with appropriate valves to prevent the chilled medium from entering the heating boiler. Where hot water heating boilers are connected to heating coils located in air-handling units where they might be exposed to refrigerated air circulation, such boiler piping systems shall be equipped with flow control valves or other automatic means to prevent gravity circulation of the boiler water during the cooling cycle.

627.10 Switches in electrical supply line. Means for interrupting the electrical supply to the air-conditioning [equipment] appliance and to its associated cooling tower (if supplied and installed in a location remote from the air conditioner) shall be provided within sight of and not over 50 feet (15 240 mm) from the air conditioner and cooling tower.

§14. Section 630 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 630 INFRARED RADIANT HEATERS

630.1 General. Infrared radiant heaters shall be tested in accordance with ANSI Z83.6 and shall be installed in accordance with the manufacturer's installation instructions.

630.2 Support. Infrared radiant heaters shall be safely and adequately fixed in an approved position independent of gas and electric supply lines. Hanger and brackets shall be of noncombustible material.

630.3 Combustion and ventilation air. Where unvented infrared heaters are installed, natural or mechanical means shall provide outdoor ventilation air at a rate of not less than 4 cfm per 1,000 Btu/h (0.38 m³/min/kW) of the aggregate input rating of all such heaters installed in the space. Exhaust openings for removing flue products shall be above the level of the heaters.

630.4 Installation in commercial garages and air-craft hangars. Overhead infrared heaters installed in garages for more than three motor vehicles or in aircraft hangars shall be installed in accordance with Sections 305.9, 305.10 and 305.11.

§15. Section 631 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 631 BOILERS

631.1 Standards. Boilers shall be listed in accordance with the requirements of ANSI Z21.13 or UL 795. If applicable, the boiler shall be designed and constructed in accordance with the requirements of ASME CSD- 1 and as applicable, the ASME *Boiler and Pressure Vessel Code*, Sections I, II, IV, V, VI and IX, NFPA 8501, NFPA 8502 and NFPA 8504. Low-pressure boilers shall conform to the requirements of 12 NYCRR Part 4 and high-pressure boilers shall conform to the requirements of 12 NYCRR Part 14.

631.2 Installation. In addition to the requirements of this code, the installation of boilers shall be in accordance with the manufacturer's instructions and the *New York City Mechanical Code*. Operating instructions of a permanent type shall be attached to the boiler. Spill switches must be installed on all flue gas draft openings and interlocked with all vented appliances. Boilers shall have all controls set, adjusted and tested by the installer. A complete control diagram together with complete boiler operating instructions shall be furnished by the installer. The manufacturer's rating data and the nameplate shall be attached to the boiler.

631.3 Clearance to combustible materials. Clearances to combustible materials shall be in accordance with Section 308.4.

§16. Section 633 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 633 FUEL CELL POWER [PLANTS] SYSTEMS

633.1 General. Stationary fuel-cell power [plants] systems having a power output not exceeding [1,000 kW] 1 MW shall be tested in accordance with [ANSI Z21 .83] CSA America FC 1 and shall be installed in accordance with the manufacturer's installation instructions [and], NFPA 853, the New York City Building Code, the New York City Fire Code, and comply with National Electric Code Article 692 Fuel Cell Systems.

§17. Section 635 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION FGC 635
GASEOUS HYDROGEN SYSTEMS

635.1 Installation. The installation of gaseous hydrogen systems shall be in accordance with the applicable requirements of the *New York City Fire Code*, the *New York City Building Code*, and Chapter 7 of this code..

Subpart 7 (Chapter 7 of the New York City Fuel Gas Code)

§1. Chapter 7 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

CHAPTER 7
[RESERVED]
GASEOUS HYDROGEN SYSTEMS

SECTION FGC 701
GENERAL

701.1 Scope. The installation of gaseous hydrogen systems shall comply with this chapter and Chapters 30 and 35 of the *New York City Fire Code*. Compressed gases shall also comply with Chapter 27 of the *New York City Fire Code* for general requirements.

701.2 Permits. Permits shall be required as set forth in Section 105 of this code and as required by the *New York City Fire Code*.

Subpart 8 (Chapter 8 of the New York City Fuel Gas Code)

§1. Section 802 of the New York city fuel gas code, as added by local law number 33 for the year 2007, is REPEALED, and a new Section 802 is added to read as follows:

Subpart 9 (Appendix E of the New York City Fuel Gas Code)

§1. Section E.1 of appendix E of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

E.1 General. This appendix addresses the requirements for meters and service piping, underground or aboveground, as the piping enters the building. Service piping includes fuel-gas piping, valves, and fittings upstream of the point of delivery. Service piping may include piping supplied by the gas service utility [, as well as other service piping furnished by the owner serving multiple buildings on the same lot].

§2. Section E.3 of appendix E of the New York city fuel gas code, as added by local law number 33 for the year 2007, is amended to read as follows:

E.3 Gas meter location. Gas meter location shall comply with the following:

1. When located inside the building, meters shall be located as near as practicable to the

point of entrance of the service and, where possible, the meters shall be located in the cellar or basement unless otherwise permitted by the commissioner. The meter location shall be clean, dry, and free of refuse, steam or chemical fumes and located not less than 3 feet (914 mm) from any source of ignition or any source of heat which might cause damage to the meter. Meters shall be adequately protected against extreme cold or heat and shall be readily accessible for reading and inspection. The area in which the meter is located shall be properly ventilated as per Section E.4. Notwithstanding the foregoing, outside meter installation shall be permitted in areas where the utility company certifies that dry gas is being distributed.

2. [In a multiple dwelling, no] No gas meter, other than the replacement of an existing meter shall be located in any boiler room or other room or space containing a heating boiler, in any stair hall, nor in any public hall above the cellar or above the lowest story if there is no cellar. However, [in any multiple dwelling] where there is an existing gas meter located in any boiler room or other room or space containing a heating boiler, one additional gas meter may be installed in such room or space, provided such additional gas meter is installed adjacent to the existing gas meter and is used in conjunction with the supply of gas for a gas-fired heating boiler or a gas-fired water heater used as a central source of supply of heat or hot water for the tenants [residing in such multiple dwelling]. Such additional gas meter may be installed only upon the condition that space heaters or hot water appliances in the [dwelling units] tenant spaces are eliminated.
3. Gas meter rooms, when provided, shall at all times be kept clear of all rubbish; and shall not be used in any way for storage purposes, including material or equipment of any kind. A legible sign reading “Gas meter room—No storage permitted” shall be permanently and conspicuously posted on the exterior of the meter room door, except that the sign may be posted on the interior of the meter room door in Occupancy Group R-3. The lettering of such signs shall be of bold type at least 1 inch (25 mm) in height and shall be properly spaced to provide good legibility. The lettering and background shall be of contrasting colors. Where gas meters and related equipment are not located in a separate room but are located in an open floor area, no combustible material shall be stored or kept within 5 feet (1524 mm) of such equipment; nor shall the gas meter be within 3 feet (914 mm) of any heating boiler or sources of ignition and, except Occupancy Group R-3, there shall be a physical barrier required if the room is also used for storage purposes or the like.
4. The installation of gas meter piping shall be made in accordance with the requirements of this code and the local utility company.
5. Piping containing gas with a pressure exceeding ½ psig (3.4 kPa gauge) and the gas service pressure regulator which may be subjected to accidental vehicular impact shall be suitably protected.

§1. Appendix F of the New York city fuel gas code is REPEALED.

Subpart 11 (Appendix G of the New York City Fuel Gas Code)

§1. The New York City Fuel Gas Code is amended by adding a new Appendix G to read as follows:

FGC APPENDIX G

HIGH PRESSURE NATURAL GAS INSTALLATIONS

G.1 General. This Appendix addresses natural gas distribution piping requirements for systems where the gas pressure is at or above 15 psig (103 kPa gauge). Installations of gas piping at pressures at or above 15 psig (103 kPa gauge) and equipment and appliances using gas with an inlet pressure at or above 15 psig (103 kPa gauge) shall be considered as high pressure natural gas installations.

G.1.1 Fire Department approval. High pressure natural gas installations shall be approved by the Fire Department. All design documents associated with the installation shall be submitted to the Fire Department for approval. The Fire Department shall witness and approve final testing of the installation.

G.1.2 Certificate of fitness. High pressure natural gas installations shall be operated under the supervision of a person holding a Certificate of Fitness issued by the Fire Department when required by the *New York City Fire Code*.

G.2 Construction requirements. Buildings with high pressure natural gas installations shall meet the requirements of this section.

G.2.1 Structural requirements. The structural integrity of the building shall meet the requirements of Section 1615.6 of the *New York City Building Code* for gas explosions. An explosion analysis shall be conducted where the gas pressure exceeds 125 psig (862 kPa gauge). Where an explosion analysis shows explosion pressure exceeding 430 psf (20.5 kPa gauge), the building's structural integrity shall be maintained at pressure levels determined by the explosion analysis. The explosion scenario and explosion analysis shall be approved by the Fire Department.

G.2.2 Fire-resistance rated rooms and spaces. Rooms and spaces containing high pressure natural gas piping shall be separated from all other areas of the building by fire barriers or horizontal assemblies, or both, having a fire-resistance rating of not less than 3 hours.

G.2.2.1 Shaft requirements. Vertical runs of high pressure gas piping within a building shall be enclosed in masonry shafts constructed of walls not less than 4 inches in thickness and sealed to prevent any gas leakage from the shaft. Such shaft shall be vented

to the outdoors at the top. Such shaft shall not be located adjacent to an exit stairway or exit passageway unless the shaft wall separating the exit stairway or exit passageway from the shaft is designed to resist a potential gas explosion in accordance with Section 1615.6 of the *New York City Building Code*.

G.2.3 Automatic sprinkler system. Buildings and structures shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *New York City Building Code*, except where an alternative fire-extinguishing system is approved in accordance with Section 904.1 of the *New York City Building Code*.

G.2.4 Gas detection. Rooms and spaces containing the high pressure gas piping must be equipped with an approved and listed gas detection alarm system.

G.2.4.1 Gas detection system. A gas detection system including placement of gas detectors shall be installed in accordance with the manufacturer's recommendations, its listing and Section 908 of the *New York City Building Code*.

G.2.4.2 Supervision. Gas detectors shall be supervised by a building fire alarm system in buildings where fire alarm systems are required or installed.

G.2.4.3 Power supply. Power supply to the system, wiring of the system, its associated components and outputs shall be in accordance with NFPA 72 and Section 907 of the *New York City Building Code*.

G.2.4.4 Alarm. An audible and visual alarm shall be provided at the gas detection panel with an audible silence switch only.

G.2.4.5 Alarm transmission. The gas detection system shall transmit a trouble signal and an alarm to the supervising station and to a 24-hour supervised location within the building.

G.2.4.6 Shutoff valves closure. The gas detection system alarm activation shall trigger emergency gas shutoff valves serving the affected area to close and stop the gas flow.

G.2.5 Ventilation. Rooms containing appliances or equipment operating with gas pressure at or above 15 psig (103 kPa gauge) shall be provided with ventilation in accordance with the requirements of Chapter 4 of the *New York City Mechanical Code*.

G.2.5.1 Explosion prevention. For rooms or spaces containing appliances operating with gas pressure at or above 15 psig (103 kPa gauge) and less than 125 psig (862 kPa gauge), explosion prevention systems shall be provided in accordance with NFPA 69.

G.3 High hazard. Rooms and areas containing appliances and equipment operating with gas pressure at or above 125 psig (862 kPa gauge) shall be classified as a Group H-2 occupancy and shall comply with the requirements of this section.

G.3.1 Explosion venting. Appliances and equipment using gas at or above 125 psig (862 kPa gauge) shall be located in rooms provided with explosion venting in accordance with NFPA 68.

G.3.1.1 Gas turbines. Gas turbine installations shall comply with the requirements of NFPA 37 and the requirements of Title 28 of the *Administrative Code*.

G.3.1.2 Gas turbine rooms. For rooms containing gas turbines and fuel gas compressors, the design of the explosion venting system shall be based on the explosion resulting from the lower explosion limit being achieved within the room housing the turbine or fuel gas compressor, including its enclosure. All control valve stations, filters, and related accessories shall be placed in the gas turbine room or a separately protected room.

G.3.2 Emergency ventilation. An emergency ventilation system shall be provided in accordance with NFPA 69 and shall be approved by the Fire Department. Ventilation calculations as listed in Annex D Ventilation Calculations of NFPA 69 shall be provided, and the gas release rate shall be approved.

G.3.3 Electrical equipment. Electrical equipment within rooms and enclosures requiring emergency ventilation shall conform to the *New York City Electrical Code* for Class 1 Division 2 requirements.

G.4 Gas meter room. A gas meter room served by gas at a pressure at or above 15 psig (103 kPa gauge) shall meet the requirements of Appendix E of this code and the *New York City Electrical Code* for Class 1 Division 2 requirements.

G.5 Piping requirements. High pressure gas piping shall comply with the requirements of this section.

G.5.1 Piping material. Installations of natural gas piping operating at pressures of 125 psig (862 kPa gauge) and above shall comply with the requirements of ASME B 31.1.

G.5.2 Double wall piping. Horizontal piping that traverses within a building from a protected room or shaft to a protected room or shaft shall be run in an outer pipe of the same pressure rating as the inner pipe. The outer pipe shall be welded and the annular space between the inner and outer pipe shall be equal to or greater than the inside diameter of the inner pipe. The annular space shall be monitored for natural gas with an approved gas detection alarm system and shall be vented to the exterior of the building. The outer pipe must open to the shaft and/or protected room or to the outside air.

G.5.3 Piping identification. Piping shall be identified with markings in accordance with ASME A13.1.

G.5.4 Emergency gas shutoff. An emergency gas shutoff valve shall be provided on the gas supply outside of any room containing an appliance utilizing gas at a pressure at or above 15 psig (103 kPa gauge). The emergency shutoff valve shall be controlled from a break glass station located outside the room served and from the gas detection system monitoring the room. The emergency shutoff valve shall automatically stop the gas flow to the room(s) containing the appliance(s) in the event of an unsafe condition. The emergency shutoff valve shall be manually operable. Emergency gas shutoff valve bypasses shall be prohibited.

G.6 Special inspection required. The entire high pressure natural gas installation, including piping, equipment, appliances, gas detection and control systems, shall be subject to special inspection as set forth in Section 1704.19 of the *New York City Building Code*.

G.7 Cleaning and purging procedures. Cleaning and purging procedures for high pressure natural gas piping, equipment and appliances shall be in accordance with NFPA 56PS.

Section 2. Notwithstanding any other law or rule, tables, figures or equations in PDF or other electronic format to be added to the New York city construction codes or amended pursuant to this local law need not be underlined to denote new matter being added. The absence of underlining to denote new matter being added shall not affect the validity of new tables, figures or equations in PDF or other electronic format to be added to the New York city construction codes or amended pursuant to this local law.

Section 3. Section 3 of local law number 41 for the year 2012 is amended to read as follows:

§3. This local law shall take effect [on the same date as the effective date of a local law amending the administrative code of the city of New York in relation to bringing the New York city building code up to date with the 2009 edition of the International Building Code published by the International Code Council] on October 1, 2014 except that this local law shall not apply to plumbing work related to applications for construction document approval filed prior to such effective date.

Section 4. Section 3 of local law number 79 for the year 2013 is amended to read as follows:

§3. This local law shall take effect [on the same date as a local law of the city of New York for the year 2013 amending the administrative code of the city of New York, the New York city plumbing code, the New York city building code, the New York city mechanical code and the New York city fuel gas code, relating to bringing such codes up to date with the 2009 editions of the international building, mechanical, fuel gas and plumbing codes, as proposed in Intro. 1056, takes effect] on October 1, 2014 except that this local law shall not apply to work related to applications for construction document approval filed prior to such effective date.

Section 5. Section 6 of local law number 108 for the year 2013 is amended to read as follows:

§6. This local law shall take effect on [the same date that a local law of the city of New York for the year 2013 amending the administrative code of the city of New York, the New York City plumbing code, the New York city building code, the New York city mechanical code and the New York city fuel gas code, relating to bringing such codes up to date with the 2009 editions of the international building, mechanical, fuel gas and plumbing codes, as proposed in introduction number 1056, takes effect] October 1, 2014 except that this local law shall not apply to work related to applications for construction document approval filed prior to such effective date.

Section 6. Section 4 of local law number 110 for the year 2013 is amended to read as follows:

§ 4. This local law shall take effect [on the same date as a local law of the city of New York for the year 2013 amending the administrative code of the city of New York, the New York city plumbing code, the New York city building code, the New York city mechanical code and the New York city fuel gas code, relating to bringing such codes up to date with the 2009 editions of the international building, mechanical, fuel gas and plumbing codes, as proposed in Intro. 1056, takes effect] on October 1, 2014 except that this local law shall not apply to work related to applications for construction document approval filed prior to such effective date.

Section 7. Section 16 of local law number 100 for the year 2013 is amended to read as follows:

§16. This local law shall take effect [on the same date that a local law of the city of New York for the year 2013 amending the administrative code of the city of New York, the New York city plumbing code, the New York city building code, the New York city mechanical code and the New York city fuel gas code, relating to bringing such codes up to date with the 2009 editions of the international building, mechanical, fuel gas and plumbing codes, as proposed in introduction number 1056, takes effect] on October 1, 2014 except that this local law shall not apply to work related to applications for construction document approval filed prior to such effective date.

Section 8. Section 6 of local law number 101 for the year 2013 is amended to read as follows:

§6. This local law shall take effect on [the same date as a local law of the city of New York for the year 2013 amending the administrative code of the city of New York, the New York city plumbing code, the New York city building code, the New York city mechanical code and the New York city fuel gas code, relating to bringing such codes up to date with the 2009 editions of the international building, mechanical, fuel gas and plumbing codes, as proposed in Intro. 1056, takes effect] October 1, 2014 except that this local law shall not apply to work related to applications for construction document approval filed prior to such effective date.

Section 9. Section 4 of local law number 130 for the year 2013 is amended to read as follows:

§4. This local law shall take effect on [the same date that a local law of the city of New York for the year 2013, amending the administrative code of the city of New York, the New York city plumbing code, the New York city building code, the New York city mechanical code and the New York city fuel gas code, relating to bringing such codes up to date with the 2009 editions of the international building, mechanical, fuel gas and plumbing codes, as proposed in Intro. 1056 takes effect] October 1, 2014 except that this local law shall not apply to work related to applications for construction document approval filed prior to such effective date.

Section 10. Sections 27-123.1 and 27-123.2 of the administrative code of the city of New York are REPEALED.

Section 11. Subarticle 2 of article 2 of subchapter 4 of chapter 1 of title 27 of the administrative code of the city of New York is REPEALED.

Section 12. Articles 8, 9 and 10 of subchapter 4 of chapter 1 of title 27 of the administrative code of the city of New York are REPEALED.

Section 13. Reference Standard RS 4 of the Building Code Reference Standards set forth in the appendix to chapter 1 of title 27 of the administrative code of the city of New York is REPEALED.

Section 14. This local law shall take effect on October 1, 2014 except (i) that this local law shall not apply to construction work related to applications for construction document approval filed prior to such effective date (ii) sections 28-304.6.4, 28-304.6.5 and 28-304.6.6 of the administrative code of the city of New York as amended by section 61 of part A of this local law and sections 2 through 9 of this local law shall take effect immediately and (iii) section 403.5.2 of the New York city building code as added by section 1 of subpart 4 of part C of this local law shall take effect the later of 18 months after the date of enactment of this local law or the date of an amendment of the definition of floor area in the New York city zoning resolution providing for the exclusion of the floor area of the additional exit stairway and additional exit stairway width from the calculation of floor area for purposes of the New York city zoning resolution. The commissioner of buildings may promulgate rules or take other actions for the implementation of this local law prior to such effective date.

THE CITY OF NEW YORK, OFFICE OF THE CITY CLERK, s.s.:

I hereby certify that the foregoing is a true copy of a local law of The City of New York, passed by the Council on December 19, 2013 and approved by the Mayor on December 30, 2013.

MICHAEL M. McSWEENEY, City Clerk Clerk of the Council.

CERTIFICATION OF CORPORATION COUNSEL

I hereby certify that the form of the enclosed local law (Local Law No. 141 of 2013, Council Int. No. 1056-A of 2013) to be filed with the Secretary of State contains the correct text of the local law passed by the New York City Council and approved by the Mayor.

JEFFREY D. FRIEDLANDER, Acting Corporation Counsel.
