How-to Guide: 
Supporting Documentation

In Compliance with
2020 New York City Energy Conservation Code

- GENERAL
  - BUILDING ENVELOPE
  - MECHANICAL SYSTEMS
  - LIGHTING & ELECTRICAL POWER
  - OTHER REQUIREMENTS

NOTE: In this How-To Guide: Supporting Documentation, selected Energy Code provisions have been generalized, summarized, rephrased, and/or highlighted. This guide is intended: 1) To provide general guidance for the job applications seeking compliance with the 2020 NYCECC; 2) Not to replace or represent the entire 2020 NYCECC and related regulations of the City of New York and the Department of Buildings; and 3) Not to provide complete compliance solutions for any particular type of job or work. Comprehensive mandates, applicability, exemptions, exceptions and options will be found in the 2020 NYCECC and related regulations of the City of New York and the Department of Buildings.
What is Supporting Documentation?

- **A Requirement to Demonstrate Compliance with NYCECC**
  - Supporting Documentation is required for all job applications that are *not* exempt from the NYCECC in accordance with 1 RCNY §5000-01 (e)(2).
  - Job applications submitted through DOB BIS indicating NYCECC Compliance in the PW1-Section 10 must submit supporting documentation through DOB BIS.
  - Job applications with Work Types requiring DOB NOW filing must submit supporting documentation through DOB NOW.
  - See *Quick Reference Guide: How to Demonstrate Energy Code Compliance* for the summary list of requirements.
  - **Exempt from the NYCECC** Job applications claiming exemption from the 2020 NYCECC must:
    - Complete PW1-Section 10 to indicate the job is eligible to be exempt from the NYCECC, for DOB-BIS-filed jobs.
    - On drawings, provide Professional Statement for exemption (similar to the statement in PW1-Section 10), and specify the basis for exemption in accordance with 1 RCNY §5000-01 (e)(2).
    - On drawings, provide a simple Tabular Analysis listing the proposed work types and summary work scope to validate the exemption.

- **Essentially, Construction Documents**
  - To be submitted to the Department of Buildings for approval.
  - To inform means and methods of construction for all energy design elements in the form of technical drawings, schedules, specification notes, etc.
  - To prove that all proposed energy design elements will match or exceed the requirements of the NYCECC in their quality, quantity, size, capacity, efficiency, performance, location, configuration, composition, etc.

- **Must Match the Proposed Work Type and Scope**
  Supporting Documentation (Construction Documents) must provide construction data to match all proposed Work Types and work scope indicated in
  - DOB BIS PW1-Section 6 Work Types
  - DOB NOW filed Work Types, such as Mechanical Systems (MS), Plumbing (PL), and Boiler Equipment (BE)
  - TR8-Section 3 and Section 4

- **Must Support Energy Analysis**
  - Construction Documents must support the Energy Analysis reports. Specifically, the values and attributes of any energy-code-regulated element proposed in the construction documents must match or exceed those of the same element listed in the Energy Analysis (e.g., Tabular analysis, REScheck, COMcheck, and EN1).
  - Supporting Documentation and Energy Analysis must be submitted along with its associated work type either through DOB BIS or DOB NOW as required.
  - Job applications with Energy Modeling analysis must submit the completed EN1 workbook along with the primary job filed through DOB BIS.
**KEY PRINCIPLES**

*How Should Supporting Documentation be Prepared?*

- **Identify a Correct Code Version to Follow**
  - Job applications filed on and after May 12, 2020 must comply with the 2020 NYCECC.
  - Job applications filed between October 3, 2016 and May 11, 2020 must comply with the 2016 NYCECC.
  - Refer to ‘What Codes, Rules & Forms Apply When’ to identify which ECC Code version is applicable for a particular job application.

- **Identify Correct Code Sections to Follow**
  - *Mandatory* provisions must be satisfied by *all* applications, whereas *Prescriptive* provisions must be satisfied by applications that seek to prove compliance *prescriptively*.
  - Applicable Code sections must be carefully identified and selected according to the job application/project type.
  - For a Commercial building application, the *Single* chosen Code (NYCECC or ASHRAE; indicated as the Code compliance path on PW1–Section 10) must be referenced throughout the entire set of construction documents.

**KEY PRINCIPLES**

**How Should Supporting Documentation be Prepared?**

- **Label Energy Design Elements Consistently Among Drawings**
  - Identification keys for all proposed energy design elements, such as wall types, window/door types, light fixture types, mechanical equipment system types, etc., must be consistent between Supporting Documentation and Energy Analysis.

- **Values and Attributes Must Match**
  - Specifications (in values and attributes) of energy design elements reported in Energy Analysis must be validated through Supporting Documentation. For example, Energy-Code-relevant specifications (e.g., insulation type, R-value, U-factor, luminaire type, luminaire wattage, equipment size, equipment efficiency, etc.) declared in the COMcheck energy analysis, but not identified in the construction documents will not be accepted for Energy Code compliance.
  - Total numbers reported in Energy Analysis must be validated through Supporting Documentation. For example, the gross values such as exterior wall/fenestration areas, roof/floor areas, luminaire/equipment counts, area-weighted average values, etc. listed in the Tabular energy analysis must be easily identified in the drawings, schedules, and/or diagrams provided in the construction documents.

---

**Figure GE-3.**

Sample Lighting Fixture Layout Plan (top left), Matching Fixture Schedule (top right), and Matching Interior Lighting COMcheck Report (bottom right)
How Should Supporting Documentation be Prepared?

- **Specific Design Data in Proper Locations**
  - **Specific design values and characteristics** proposed for the work scope in the application must be provided in the construction documents in sufficient detail and clarity. For example, window schedules on drawings must list each proposed window assembly’s U-factor, SHGC, air leakage rating, and Visible Transmittance (as required) values furnished/published by the respective window manufacturer.
  - **Notes directly relevant to achieve the proposed design** must be provided in the construction documents in sufficient detail and clarity. In other words, mere duplicates of general Energy Code sections placed on the drawings will not be construed as Energy Code compliance.
  - **In proper locations within construction documents**, construction data must be presented. For example, 1) HVAC mechanical equipment schedules and a sequence-of-operations narrative must be found on Mechanical drawings; 2) Lighting control notes must be placed in conjunction with lighting fixture plans and schedules on drawings (typically on RCP drawings).

- **List of Progress Inspections on EN-Sheet**
  - All applicable progress inspections required for Energy Code compliance must be listed on an EN-labeled sheet in tabular format as shown in 1 RCNY §5000-01(h), and must match those identified on the TR8.

**NOTES:**

1. PROVIDE MOTORIZED SHUT-OFF DAMPER AT THE OA INTAKE WITH MAXIMUM LEAKAGE RATE OF 4 CFM/SF AT 1 IN. WG. DAMPER SHALL CLOSE WHEN THE UNIT IS OFF.
2. IN ECONOMIZER MODE, MINIMUM OCCUPIED AIRFLOW SETPOINT ON VAV TERMINALS SHALL BE AUTOMATICALLY RESET BASED ON PERCENTAGE OF OUTSIDE AIR ABOVE DESIGN MINIMUM.
   A. AS PERCENTAGE OF OA DAMPER AT 100% AND AS ECONOMIZER OUTPUT INCREASES FROM 0-100%, MINIMUM AIRFLOW SETPOINT AT TERMINAL UNITS SHALL PROPORTIONATELY RESET LOWER TO MAINTAIN REQUIRED MINIMUM FRESH AIR VENTILATION.
   B. RESETTING SHALL OCCUR BASED ON INCREMENTS OF 10% CHANGE OF VALUE OF ECONOMIZER OUTPUT.
3. PROVIDE HEAT WHEEL THAT SHALL RECOVER MINIMUM 50% OF THE ENTHALPY. HEAT WHEEL SHALL CONTAIN A BYPASS FOR ECONOMIZER MODE.
4. AT A MINIMUM, ALL VAV TERMINAL UNITS SERVED BY AN AHU SHALL BE LINKED WITH ASSOCIATED VAV AHU CONTROLLER TO PERFORM THE FOLLOWING FUNCTIONS.
   A. ZONE OCCUPANCY SCHEDULE (USER DEFINED FROM GRAPHIC INTERFACE) SHALL NORMALLY AUTOMATICALLY SELECT THE OCCUPIED OR UNOCCUPIED OPERATING MODE OF AH HANDLING UNIT.
      1) ACTIVATION OF TIMED OVERRIDE SWITCH ON ZONE THERMOSTATS SHALL ONLY RESET ZONE HEATING AND COOLING SETPOINTS TO “OCCUPIED” VALUES, BUT SHALL NOT AFFECT OTHERWISE SCHEDULED UNOCCUPIED OPERATING MODE OF AIR HANDLING UNIT.
   B. DUCT STATIC PRESSURE RESET AS DESCRIBED IN FAN CONTROL SECTION.
   C. DISCHARGE AIR TEMPERATURE SETPOINT OPTIMIZED AS DESCRIBED IN THE DISCHARGE TEMPERATURE CONTROL SECTION.
5. FAN POWER LIMITATION CHECK – PER Table C403.2.12.1(1)
   - $HP \leq \text{CFM} \times 0.0015$
   - $25 \leq 26000 \times 0.0015 = 39 \gg \text{OK}$

Energy Analysis Methods
In Compliance with
2020 New York City Energy Conservation Code

- GENERAL
- BUILDING ENVELOPE
- MECHANICAL SYSTEMS
- LIGHTING & ELECTRICAL POWER
- OTHER REQUIREMENTS

NOTE: In this How-To Guide: Supporting Documentation, selected Energy Code provisions have been generalized, summarized, rephrased, and/or highlighted. This guide is intended: 1) To provide general guidance for the job applications seeking compliance with the 2020 NYCECC; 2) Not to replace or represent the entire 2020 NYCECC and related regulations of the City of New York and the Department of Buildings; and 3) Not to provide complete compliance solutions for any particular type of job or work. Comprehensive mandates, applicability, exemptions, exceptions and options will be found in the 2020 NYCECC and related regulations of the City of New York and the Department of Buildings.
**Opaque Envelope Assemblies**

- **Minimum R-value**
  - For each building envelope type (e.g., roof, above-grade/below-grade walls, floors over unconditioned space, etc.), its section detail must indicate that the R-value of the insulation meets or exceeds the minimum allowed R-value prescribed for the envelope type (e.g., R-values shown in Table C402.1.3).
  - Specifically, in the assembly details, clearly call out each of the proposed insulation type, thickness and the manufacturer-published R-value to satisfy the thermal requirements for the envelope assembly type.

- **Maximum U-factor**
  - Alternatively, it must be demonstrated that the proposed assembly’s calculated U-factor (or C- or F-factor) value does not exceed the maximum allowed U-factor value prescribed for the envelope type (e.g., U-factors shown in Table C402.1.4).
  - Determination of an assembly’s overall U-factor (or C- or F-factor) value must be supported by the pre-calculated values or the calculation methods established in Appendix A of ASHRAE 90.1-2016.

- **Spandrel Panels** are Opaque walls. Determination of effective U-factors for the proposed Spandrel Panels must follow Table C402.1.4/ Table 5.5.3. See page [BE-9]. The proposed U-factor value identified from the Table must be compared against the baseline U-factor of metal-framed walls (U-0.061) in COMcheck.

---

**Figure BE-1. Sample Wall Assembly & Area-Weighted U-factor Calculation**

---

**NOTE:** One common error in the U-factor calculation is misrepresenting thermal values of assembly layers (e.g., face brick, gypsum board, air films, etc.) from unapproved sources.
**U-factor and SHGC values**
- For each fenestration type (e.g., fixed/operable window, skylight, exterior door, storefront, etc.), Assembly U-factor and Solar Heat Gain Coefficient (SHGC) values must be specified in the window/door schedule on drawings, and must not exceed the maximum allowed values. For Commercial building windows, the maximum assembly U-factors depend on the vertical location of the window on the above-grade wall, with more stringent U-factors for windows installed below 95’ above-grade. See page [BE-3]. The 95’ demarcation line must be indicated on building elevation drawings for Commercial buildings.
- Next to the U-factor and SHGC values specified in the schedule, provide the fenestration assembly manufacturer’s information (e.g., ‘ABC Windows/xyz 9000 series, or Approved equal’) that will satisfy the U-factor and SHGC requirements.

**Air Leakage Rate and Visible Transmittance (VT)**
- The window/door schedule on drawings must specify the air leakage rate of each proposed fenestration assembly type to demonstrate that the air leakage of fenestration assemblies do not exceed the maximum allowed leakage rate.
- Where required, the window/door schedule must identify Visible Transmittance (VT) of the proposed glazed fenestration products to meet the provisions in the applicable Code sections.

</tbody>
</table>

See Table 5.5-4 for ASHRAE-following job applications.

**NOTE 1:** To demonstrate compliance, provide COMcheck envelope analysis by:
- entering the Proposed Spandrel panel U-factor value identified from the Table C402.1.4.2; and
- choosing the Baseline U-factor of metal-framed walls (U-0.061).

**NOTE 2:** If the Proposed Spandrel panel type is not found in the Table – e.g., Assembly with backpans, Assembly with no insulation – THERM Analysis must be performed and documented on drawings.

Info for THERM is found in the link below. https://windows.lbl.gov/software/therm

**NOTE:** Where any portion of the window unit is installed above 95’ above-grade, U-factor requirement of 95’ and above may apply.
CONTINUOUS INSULATION

- **Balconies and Parapets**
  
  Balconies and Parapets that interrupt the building thermal envelope are required to be:
  
  a) Insulated with continuous insulation of a minimum R-value for the wall assembly as listed in Table C402.1.3/ Table 5.5-4. **OR**
  
  b) Insulated with a minimum R-3 thermal break where the structural element penetrates the building thermal envelope.

---

Figure BE-4. **Examples of Balcony and Parapet Insulation**
**Fenestration Area**

The *Window-to-Wall Ratio (WWR)* -- the ratio (%) of vertical fenestration area to gross above-grade wall area (or gross wall area for Appendix CA applications) -- must be noted on an EN-labeled drawing in conjunction with building envelope diagrams and the envelope energy analysis. The building envelope diagrams must list all opaque wall areas and vertical fenestration areas per each building orientation. The area values of each opaque wall type and fenestration type listed in the envelope diagrams must match the values entered in the envelope energy analysis (e.g., ‘Gross Area’ values in COMcheck).

- **Maximum Vertical Fenestration Area (when following ECC)**
  - Maximum WWR: 30%
  - Maximum WWR: 40% permitted with certain requirements including daylight responsive controls
  - When WWR > 40%: ASHRAE must be chosen as Code Compliance Path, as ECC does not allow WWR > 40%.

- **Maximum Vertical Fenestration Area (when following ASHRAE)**
  - Maximum WWR: 40%
  - When WWR > 40%: Energy Code compliance may be demonstrated through either
    a) COMcheck (with envelope tradeoff) envelope analysis, or
    b) Energy Modeling (total building performance) energy analysis.

- **Maximum Skylight Fenestration Area**
  - Maximum skylight fenestration area: 3% of the gross roof area
  - Maximum skylight fenestration area: 6% of the gross roof area permitted with daylight responsive controls

- **Minimum Skylight Fenestration Area**
  - For an enclosed space
    - ≥ 2,500 sf, and directly under a roof with ceiling height > 15’ and
    - of space types including office, lobby, atrium, concourse, corridor, warehouse storage, among others
  - Minimum skylight fenestration area requirement: Minimum 3% of the gross roof area, or
    Minimum 1% ‘Skylight Effective Aperture’

- See Section C402.4.2 and 5.5.4.2.3 for complete applicable space types, minimum total daylight area requirement, and definition of ‘Skylight Effective Aperture.’
**Air Barrier**

- **Continuous Air Barrier**
  To ensure air barrier continuity in the building thermal envelope, drawings must specify required continuous air barrier construction measures (Section C402.5.1.1), and indicate that the continuous air barrier shall be achieved by either
  1) **Materials** not exceeding maximum allowed air permeability (Section C402.5.1.2.1), or
  2) **Assemblies** not exceeding allowed maximum air leakage (Section C402.5.1.2.2).

- **Openings in the Building Envelope**
  Drawings must identify specific construction measures, configuration, devices and/or performance standards to limit air leakage in particular envelope areas including, but not limited to, the following:
  1) **Fenestration and doors**: Maximum allowed air leakage.
  2) **Outdoor air intakes and exhaust openings**: Motorized Shutoff dampers are required unless gravity dampers are allowed.
  3) **Doors/Access Openings to shafts, chutes, vents, stairways and elevator lobbies**: Gasketing, weatherstripping, and sealing.
  4) **Loading dock**: Weatherseals to restrict infiltration.
  5) **Vestibules**: Plan configuration and self-closing devices on doors.
     * **Note that Air Curtains are NO longer an acceptable alternative.**
  6) **Recessed lighting**: Luminaires installed in building envelope must be:
     a) IC-rated, b) Labeled with the Code-prescribed maximum air leakage rate, and c) Sealed with gasket or caulk.

*Figure BE-6: A Sample Acceptable Plan with Specific Notes Requiring Future Compliance*
**AIR LEAKAGE/BARRIER TESTING & AIR BARRIER CONTINUITY PLAN – NEW BUILDINGS**

Drawings must specify mandatory air barrier testing/inspection requirements specific to the building type.

**Residential Buildings** – See R202 for the definition of Residential Building

**Visual Inspection of Air Barrier**
Visual inspection of openings and penetrations in the building envelope, including site-built fenestration and doors to verify continuous air barrier installation.

**Whole Building Air Leakage Testing [maximum 3 ACH]**
Testing conducted at a pressure differential of 50 Pascals must verify that the Building air leakage rate does not exceed 3 air changes per hour (3 ACH).

**Air Leakage Testing of ALL “Testing Units”**
Testing conducted at a pressure differential of 50 Pascals must verify that the air leakage rate of EACH testing unit does not exceed 0.3 cfm/sf of the testing unit envelope.

**Air Leakage Testing of SAMPLE “Testing Units”**
Testing conducted at a pressure differential of 50 Pascals must verify that the air leakage rate of EACH Sample testing unit does not exceed 0.3 cfm/sf of the testing unit envelope. SAMPLE Testing Unit selection must follow the code provision.

**Commercial Buildings** – See C202 for the definition of Commercial Building

</tbody>
</table>

**Whole Building Air Leakage Testing [maximum 0.4 cfm/sf]**
Testing conducted at a pressure differential of 75 Pascals must verify that the Building air leakage rate does not exceed 0.4 cfm/sf of the building envelope.

**Testing/Inspection conducted per Air Barrier Continuity (ABC) Plan**
Air Barrier Continuity Plan must be developed to specify the below.
- List (Schedule of Details) of each unique assembly, joint, seam and penetration, keyed to building thermal/air boundary section diagrams (on Architectural Plans)
- Testing/Inspection standards (e.g., ASTM E1186) and performance criteria for each assembly, joint, seam and penetration type (on Architectural Plans)
- Specifications of sealing (continuity-ensuring) materials/measures, and Remediation procedures
- Sampling protocol, if applicable, and Test reporting/submittal guidelines

ABC Plan, and Final Reports of Testing/Inspection conducted per the ABC Plan shall be provided to DOB upon request.
**Air Leakage/Barrier Testing & Air Barrier Continuity Plan – Additions & Alterations**

Drawings must specify mandatory air barrier testing/inspection requirements specific to the building type.

**A) Visual Inspection of Air Barrier**

Visual inspection of openings and penetrations in the building envelope, including site-built fenestration and doors to verify continuous air barrier installation

**B) Whole Building Air Leakage Testing [maximum 3 ACH]**

Testing conducted at a pressure differential of 50 Pascals must verify that the Building air leakage rate does not exceed 3 air changes per hour (3 ACH).

**C) Air Leakage Testing of ALL “Testing Units”**

Testing conducted at a pressure differential of 50 Pascals must verify that the air leakage rate of EACH testing unit does not exceed 0.3 cfm/sf of the testing unit envelope.

**D) Air Leakage Testing of SAMPLE “Testing Units”**

Testing conducted at a pressure differential of 50 Pascals must verify that the air leakage rate of EACH Sample testing unit does not exceed 0.3 cfm/sf of the testing unit envelope. SAMPLE Testing Unit selection must follow the code provision.

**E) Whole Building Air Leakage Testing [maximum 0.4 cfm/sf]**

Testing conducted at a pressure differential of 75 Pascals must verify that the Building air leakage rate does not exceed 0.4 cfm/sf of the building envelope.

**F) Testing/Inspection conducted per Air Barrier Continuity (ABC) Plan**

Air Barrier Continuity Plan must be developed to specify the below.
- List (Schedule of Details) of each unique assembly, joint, seam and penetration, keyed to building thermal/air boundary section diagrams (on Architectural Plans)
- Testing/Inspection standards (e.g., ASTM E1186) and performance criteria for each assembly, joint, seam and penetration type (on Architectural Plans)
- Specifications of sealing (continuity-ensuring) materials/measures, and Remediation procedures
- Sampling protocol, if applicable, and Test reporting/submittal guidelines

ABC Plan, and Final Reports of Testing/Inspection conducted per the ABC Plan shall be provided to DOB upon request.
### Thermal Bridges in Building Envelope

#### Documentation of Thermal Bridges

- Architectural plan set drawings must report all thermal bridges in the building thermal envelope in **three categories** below.
- Documentation requirements apply to Residential and Commercial buildings for all New buildings, Additions, and Alterations to the building envelope work scope.

<table>
<thead>
<tr>
<th>Category</th>
<th>CLEAR FIELD Thermal Bridge</th>

Figure BE-11. Sample Balcony Edge Details & Matching Envelope COMcheck Reports
When not all building envelope components individually could meet the prescriptive minimum insulation requirements, compliance with ECC Envelope provisions could be demonstrated through Envelope Tradeoffs.

### Trade-Offs for Residential Buildings – Total UA Alternative
- To accomplish compliance with ECC Envelope provisions through Envelope Tradeoffs, Residential building envelope components must demonstrate that:

\[
\text{Total building thermal envelope UA} \quad \text{(Sum of Assembly area x its U-factor)} \quad \text{<} \quad \text{Total UA resulting from the Code-prescriptive U-factors} \quad \text{(Sum of Assembly area x Code U-factor value for the assembly type)}
\]

- Compliance could be verified by the REScheck envelope energy analysis by entering all building envelope components’ varying thermal values.

### Trade-Offs for Commercial Buildings – Component Performance Alternative [following ECC]
- Buildings Envelope Trade-Off Option [following ASHRAE]

- To accomplish compliance with ECC Envelope provisions through Envelope Tradeoffs, Commercial building envelope components must satisfy the formula in C402.1.5 for ECC, and the provision in 5.6.1.b for ASHRAE (calculation per Appendix C of ASHRAE).
- Compliance could be verified by the COMcheck envelope energy analysis by entering all building envelope components’ varying thermal values.

**Equipment Penetrations in Building Envelope**

### Calculation of Equipment Penetration Areas
When mechanical equipment listed in Table C403.3.2(3) or Table 6.8.1-4 are proposed in a New Commercial building application:
- Drawings must identify the calculated total area of the equipment penetrations in the opaque above-grade walls by the supporting diagrammatic building elevations.
- Drawings must also identify the percentage of the total equipment penetration area out of the total opaque above-grade wall area.

### U-factor 0.5 for Penetration Areas > 1% of Opaque Walls
- If the total area of penetrations from mechanical equipment specified above exceeds 1% of the total opaque above-grade wall area, the equipment penetration area must be identified as a separate wall assembly with a default U-factor of 0.5.
- Accordingly, in the envelope energy analysis (e.g., Component performance alternative calculation, COMcheck, or Energy Modeling) the total equipment penetration area must be entered as a separate exterior wall type of proposed U-factor 0.5 and budget U-factor identical to the surrounding wall.

**FUEL-BURNING APPLIANCES**

- **Thermally Isolated and Insulated Rooms**
  When open combustion air ducts provide combustion air to open combustion fuel-burning appliances (e.g., natural draft boilers or furnaces) in a room, the room must be thermally isolated from the building it serves, and sealed and insulated to meet the requirements of Table R402.1.2, Table C402.1.3 or C402.1.4.

- **Direct Vent Appliances**
  If the fuel-burning appliances are to be located in a room within the building thermal envelope, the appliances must be identified as direct vent appliances with both intake and exhaust pipes installed continuous to the outside.

- **Fireplaces with Tight-fitting Doors or Dampers**
  Fireplaces or fireplace units that are designed to allow an open burn must be specified with tight-fitting flue dampers or tight-fitting doors labeled with applicable Code-required UL listings.

*Figure BE-14. A direct-vent sealed-combustion furnace with dedicated pipes for combustion air and exhaust installed continuous to the outside. Source: basc.pnnl.gov/images*
FENESTRATION ORIENTATION – ASHRAE-ONLY, PRESCRIPTIVE REQUIREMENTS

The Vertical Fenestration on the West- and East-Oriented Walls

(must comply with either A or B below)

A) Limiting Fenestration Area
West-oriented vertical fenestration area must be ≤ 1/4 of the Total vertical fenestration area, and
East-oriented vertical fenestration area must be ≤ 1/4 of the Total vertical fenestration area.

B) Limiting SHGC Values
West-oriented vertical fenestration area x SHGC for West-oriented fenestration must be ≤
1/4 of the Total vertical fenestration area x Code-prescribed maximum SHGC for Climate Zone 4a (from Table 5.5-4), and
East-oriented vertical fenestration area x SHGC for East-oriented fenestration must be ≤
1/4 of the Total vertical fenestration area x Code-prescribed maximum SHGC for Climate Zone 4a (from Table 5.5-4).

1. Prescriptive requirements MUST be met when Prescriptive energy analysis method (e.g., Tabular analysis) is chosen to demonstrate Energy Code compliance. If COMcheck or Energy Modeling is used for the energy analysis, the software program automatically takes into account the vertical fenestration areas and SHGC values on the west and east-oriented wall in its computation.

Figure BE-15.
Buildings on Manhattan’s grid ± 29° off of true north are likely to have no West-oriented vertical fenestration.
**Residential Building Envelope**

- **Blown or Sprayed Roof/Ceiling Insulation**
  - The thickness of blown-in or sprayed roof/ceiling insulation (fiberglass or cellulose) in the attic must be indicated on markers for every 300 sf.
  - The markers must indicate minimum initial installed thickness with numbers of a minimum of 1 inch in height.  

- **Protection of Exposed Foundation Insulation**
  Rigid, opaque and weather-resistant protective coverings must be applied to protect the insulation over the exterior of basement walls, crawl space walls and the perimeter of slab-on-grade floors.

- **Slab-on-Grade Floor Insulation at the Perimeter**
  - Slab-on-grade floors with a floor surface < 12” below-grade must be insulated at the slab perimeter with minimum R-10. For heated slab floors on-grade, R-10 insulation must be provided under the full heated slab area in addition to the required slab perimeter insulation of minimum R-10.
  - The insulation must be extended downward or horizontally (as shown in the Figures below) a minimum of 4’ for Climate Zone 4A.
  - Insulation extending away from the building must be protected by pavement or by minimum 10” of soil.

- **Insulation at Tenant Separation Walls**
  Fire-separated walls between dwelling units in two-family houses or townhouses must be insulated at a minimum R-value of R-10.
**Residential Building Envelope**

- **Insulation in Ceilings**
  - **Ceiling with Attic Spaces**: Minimum R-49; or Uncompressed R-38 covering 100% of ceiling and extended over the wall top plate at the eaves (See Figures below).
  - **Ceiling without Attic Spaces**: When installation of required minimum R-49 insulation in 100% of the ceiling is unachievable, R-30 insulation is allowed for a maximum 500 sf or maximum 20% of the total insulated ceiling area, whichever is less. If partial R-30 insulation is proposed, provide roof area calculations with roof plan diagrams.

- **Access Hatches and Doors**
  Access doors to unconditioned spaces such as attics and crawl spaces must be weatherstripped and insulated to a level equivalent to the insulation on the surrounding surfaces (e.g., adjacent ceiling surface).

- **Sunroom Insulation and Fenestration**
  - Sunrooms enclosing conditioned space must meet the Residential building envelope insulation and fenestration requirements.
  - Sunrooms with thermal isolation and enclosing conditioned space must meet the following insulation and fenestration requirements:
    - **Ceiling Insulation**: Min. R-19
    - **Wall Insulation**: Min. R-13
    - **Vertical Fenestration**: Max. U-0.45
    - **Skylight**: Max. U-0.70
  - Conditioned space with thermal isolation must be controlled as a separate zone for heating and cooling, or conditioned by separate equipment.

![Figure BE-17.a. Raised-Heel Truss](source: basc.pnnl.gov/images)

![Figure BE-17.b. Access Hatch Properly Insulated](source: basc.pnnl.gov/images)
For new buildings ≥ 25,000 sf and Energy-modeled per the Energy Cost Budget Method (Section 11) or the Performance Rating Method (Appendix G), the building envelope must satisfy one of the following compliance options.

**Prescriptive Compliance - Section 5.5, “Prescriptive Building Envelope Option”**
- All building envelope components in the Architectural Plans must demonstrate compliance with Section 5.5.
- Tabular analysis must be submitted in an EN-s sheet listing both proposed envelope thermal performance values and code-prescriptive values of the entire building envelope components.

**Envelope Performance Factor Compliance**
- The proposed building’s Envelope Performance Factor in accordance with Appendix C of ASHRAE must be calculated through COMcheck Envelope energy analysis.
- To demonstrate compliance, the COMcheck Envelope report must indicate that:
  a) For **Multifamily**, hotel/motel and dormitory building types:
     The proposed envelope design does not exceed the allowable margin of -15% in the performance factor.
  b) For all **Other** building types:
     The proposed envelope design does not exceed the allowable margin of -7% in the performance factor.
  c) For **Mixed-Use** building types:
     The proposed envelope design does not exceed the allowable margin, determined from the area-weighted average of the gross wall area, auto-calculated by COMcheck.

- To start this COMcheck Envelope analysis, choose ‘2020 NYCECC Appendix CA Modeling Envelope Backstop” under the Code tab.

- Example of COMcheck Envelope analysis results appearing in the compliance bar at the bottom of the analysis:
  “Qualifies for 2020 NYCECC, App. CA Modeling: Envelope design -12% (allowable margin = -15.0%)” or
  “Qualifies for 2020 NYCECC, App. CA Modeling: Envelope design -3% (allowable margin = -11.4%)” or
  “FAILS to qualify for 2020 NYCECC, App. CA Modeling: Envelope design -16% (allowable margin = -15.0%)”: Note that this is NOT Compliant.
How-to Guide: Supporting Documentation

In Compliance with
2020 New York City Energy Conservation Code

- GENERAL
- BUILDING ENVELOPE
- MECHANICAL SYSTEMS
- LIGHTING & ELECTRICAL POWER
- OTHER REQUIREMENTS

NOTE: In this How-To Guide: Supporting Documentation, selected Energy Code provisions have been generalized, summarized, rephrased, and/or highlighted. This guide is intended: 1) To provide general guidance for the job applications seeking compliance with the 2020 NYCECC; 2) Not to replace or represent the entire 2020 NYCECC and related regulations of the City of New York and the Department of Buildings; and 3) Not to provide complete compliance solutions for any particular type of job or work. Comprehensive mandates, applicability, exemptions, exceptions and options will be found in the 2020 NYCECC and related regulations of the City of New York and the Department of Buildings.
OPTIMAL EQUIPMENT SIZE

- **Residential Buildings**
  - **Equipment Sizing per ACCA Manual S:** Heating and Cooling equipment of a Residential job application must be sized in accordance with ACCA Manual S based on building loads calculated per ACCA Manual J, or other approved calculation methodologies.
  - **Sizing Statement:** The drawings must include a statement indicating the total Heating and Cooling design loads have been determined as such.
  - **Duct Sizing per ACCA Manual D:** Ducts in a Residential job application must be sized in accordance with ACCA Manual D.
  - **Minimum Efficiency:** New or replacement heating and cooling equipment must meet or exceed the minimum efficiency rating required by Federal law.

- **Commercial Buildings**
  - **ANSI/ASHRAE/ACCA Standard 183:** Design loads associated with Heating, Ventilating and Air Conditioning (HVAC) of a Commercial job application must be determined in accordance with ANSI/ASHRAE/ACCA Standard 183, or by an approved equivalent computational method.
  - **Sizing Statement:** The drawings, preferably in an EN-labeled sheet, must include a statement indicating the total HVAC design loads have been determined as such.
  - **Design loads and System Commissioning:** Total HVAC design loads combined with Service Water Heating loads of a job application largely dictate whether System Commissioning (per Section C408 and Section 6.7.2.3) on the job is required or not. Refer to [OR-8] for the detailed requirements for System Commissioning.

*Figure MS-1. Sample Sizing Statement*
MINIMUM EQUIPMENT EFFICIENCY/PERFORMANCE

- Complete Equipment Specifications
  For all proposed HVAC and Service Water Heating (SWH) equipment, the equipment schedule on construction drawings must clearly list the equipment efficiency or performance rating along with the type, size, capacity, and fuel type of all equipment, and any additional specifications pertaining to the energy use of the equipment. For all Energy-Code-regulated equipment, their rated efficiency/performance ratings identified in the equipment schedule must meet or exceed the corresponding Code-prescribed value.

- Values on Construction Drawings First, and then on Energy Analysis
  Values and descriptions for HVAC and SWH equipment reported on Energy Analysis (on EN- labeled sheets) must be quoted from those in the equipment schedules and specifications on the relevant construction drawings—e.g., M-, or P- labeled drawings.

   AIR-COOLED CONDENSER & ZONED FAN UNITS
Project Title: New Multifamily Building
Location: New York, New York
Climate Zone: 4a
Project Type: New Construction

Additional Efficiency Package(s)
Reduced interior lighting power. Requirements are implicitly enforced within interior lighting allowance calculations.

Mechanical Systems List
Quantity System Type & Description
2 HWH-1 & 2:
- Proposed Efficiency: 98.00 % Et, Required Efficiency: 80.00 % Et

Figure MS-4.
Sample Mechanical Equipment Schedules &
Matching Mechanical COMcheck Report
- SERVICE WATER HEATING:
  GAS FIRED STORAGE WATER HEATER
RESIDENTIAL-BUILDING-SPECIFIC REQUIREMENTS
The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Systems for Multiple Dwelling Units**
  - **Systems serving** multiple dwelling units must comply with Sections C403 and C404 (Commercial Buildings section) of ECC in lieu of Section R403.

- **Controls**
  - **Programmable Thermostat**: At least one thermostat for each separate heating and cooling system must be provided with controls, setback capabilities and temperature set points prescribed by this section of the Code.
  - **Heat Pump Supplementary Heat**: Heat pumps having supplementary electric-resistance heat must have controls that prevent unnecessary supplemental heat operation.
  - **Outdoor Temperature Setback for Hot Water Boilers**: Hot water boilers that supply heat to the building through one- or two-pipe heating systems must have an outdoor setback control.

- **Duct & Piping Insulation**
  - Duct system in new buildings and additions must be specified to be located in conditioned space.
  - Duct system in alterations must satisfy minimum R-values listed in R403.3.1 depending on the location of ducts.
  - For heating/cooling system pipes carrying fluids > 105°F, or < 60°F, drawings must specify the pipe insulation thickness in accordance with Table R403.4. The thickness and conductivity of the piping insulation must result in R-3 or greater.

- **Duct Leakage Testing**
  - Duct system where the Leakage Testing is required, drawings must include a statement specifying that duct leakage testing shall be performed at either Rough-in, or Post-construction, and the leakage shall be ≤ 4 cfm/100 sf of conditioned floor area.
**Residential-Building-Specific Requirements**

The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

### Service Water Heating

- **Heat Trace Temperature Control**: Any electric heat trace systems must be provided with controls that automatically adjust the energy input to the heat tracing to maintain the desired water temperature in response to the occupant’s hot water use.  
- **Demand Recirculation Systems**: Any circulation pump must be equipped with controls that automatically start/turn off the pump in response to the hot water demand and water temperature in the system.
- **Insulation**: Hot water pipes must be insulated with a minimum thermal resistance value of R-3.
- **Supply of Heated Water**: Service hot water supply piping must be designed in accordance of with one of the following:
  - Maximum allowable pipe length method
  - Maximum allowable pipe volume method
  - Drain water heat recovery units
  - Recirculation systems

### Ventilation

- **Dampers**: Outdoor air intakes and exhausts must have automatic or gravity dampers that close when the ventilation system is not operating.
- **Fan Efficacy**: Fans used to provide whole-house mechanical ventilation must meet or exceed the minimum system efficacies of Table R403.6.1.
- **Ventilation System Design**:
  - In new Residential buildings, ‘exhaust-only’ ventilation is No Longer accepted for energy code compliance.
  - Instead, ventilation system of every dwelling unit must be designed with:
    - (a) Supply and exhaust ventilation with heat recovery ventilator (HRV) or energy recovery ventilator (ERV), Or
    - (b) Balanced ventilation system satisfying air flow rates of Table R403.6.2(1), and fan capacities adjusted per Table R403.6.2(2).
**HVAC System Controls**

The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Thermostatic Controls**
  - All mandatory thermostatic controls applicable to the proposed system must be specified on drawings.
  - The required controls include:
    1) Heat pump supplementary heat controls
    2) Minimum 5°F Deadband
    3) Setpoint overlap restriction.
    Note that many programmable thermostats meet this requirement.

- **Off-Hour Controls**
  Thermostatic setback controls that are controlled by either an automatic time clock or programmable control system must be provided in each zone.

- **Narratives on Operations and Controls**
  A narrative must be provided for each mandatory control system describing its function and operation and specifying proper setpoints of equipment and controls.

---

**Figure MS-7. Sample Deadband Control Setup**

![Sample Deadband Control Setup](image-url)
**Economizers**
The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Requirement for Each Cooling System**
  - Most commercial buildings have spaces that need cooling all year long. If it is colder outside than inside, economizers provide “free cooling” by bringing in the outdoor air to cool the space in lieu of activating mechanical cooling equipment.
  - Air or water economizer must be provided on individual fan-cooling units ≥ 270 kBu/h for Group R occupancies, and ≥ 54 kBu/h for all other occupancies.
  - For ECC-following jobs:
    - Even if each fan cooling unit serving Group R occupancies is < 270 kBu/h, the total supply capacity of all fan cooling units not provided with economizers must be ≤ 20% of the total supply capacity, or 1,500 kBu/h, whichever is greater.
    - Even if each fan cooling unit serving all other occupancies is < 54 kBu/h, the total supply capacity of all fan cooling units not provided with economizers must be ≤ 20% of the total supply capacity, or 300 kBu/h, whichever is greater.

- **High-Efficiency Exemption**
  - ECC-following jobs: Individual cooling systems with minimum 20% efficiency improvement (IPLV or EER) are exempt from providing economizers.
  - ASHRAE-following jobs: Individual cooling systems with minimum 42% efficiency improvement (IPLV, IEER, SEER, or alternatively EER) are exempt from providing economizers.

- **Cooling Stage Requirements**
  Cooling systems with economizers are required to have two-, three- or four-stage cooling, depending on the size of the cooling system. The economizers are required to provide partial cooling even if the outdoor air is not cool enough to satisfy the entire cooling load.

- **High-Limit Shutoff**
  Economizers in lieu of mechanical cooling can save energy significantly when the outdoor air is cool and has low humidity. The Code sets the temperature and enthalpy limits when economizers are to shut off; these high-limit shutoffs must be noted in the construction documents.

- **Economizer Fault Detection and Diagnostics (FDD)**
  Systems equipped with an economizer must include a fault detection and diagnostics (FDD) system equipped with specific sensors that detect and reports faults.
VENTILATION

The relevant construction drawings (e.g., M-, P- labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Demand Controlled Ventilation (DCV)**
  For spaces larger than 500 sf and with an average occupant load of at least 25 people/1,000 sf of floor area, *demand control ventilation* (DCV) must be specified. For the average occupant load, Table 403.3 of NYC Mechanical Code must be referenced. See Figure below for example.

- **Energy Recovery Ventilation Systems (ERV)**
  - Each fan system operating < 8,000 hours/yr, where the supply airflow rate exceeds the values in Table C403.7.4(1) [for ECC-following jobs], or values in Table 6.5.6.1-1 [for ASHRAE-following jobs], exhaust air energy recovery ventilation (ERV) system is required. C403.7.4 6.5.6.1
  - Each fan system operating ≥ 8,000 hours/yr, where the supply airflow rate exceeds the values in Table C403.7.4(2) [for ECC-following jobs], or values in Table 6.5.6.1-2 [for ASHRAE-following jobs], exhaust air energy recovery ventilation (ERV) system is required.
  - The ERV operation must demonstrate a minimum total (sensible and latent) recovery effectiveness ratio of 50%, and be provided with controls that communicate with air economizer operation. This must be identified in the equipment schedule and controls notes.
  - Where the sum of the airflow rates exhausted within 30 feet of each other is ≥75 % of the design ventilation outdoor air flow rate, an ERV is required.

![Table 403.3 Minimum Ventilation Rates](image.png)

*Figure MS-9. Excerpt from Table 403.3 of 2014 NYC Mechanical Code Chapter 4*
**Fan Controls**

The relevant construction drawings (e.g., M-, P- labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **VAV System Controls for Multiple Zones**
  Supply air systems serving multiple zones must be variable air volume (VAV) systems that, during periods of occupancy, are capable of being controlled to reduce primary air supply before reheating, re-cooling or mixing.

- **Fan Airflow Control**
  - Direct expansion (DX) cooling systems ≥ 65 kBTU/h must have a minimum of two stages of fan speed control. For example, variable speed drive (VSD) or variable frequency drive (VFD) must be specified in the equipment schedule for these systems.
  - Chilled-water and evaporative cooling systems with fan motor power ≥ 1/4 hp must also have a minimum of two stages of fan speed control.

- **Fan Motor Power Limitation**
  - Drawings must indicate (ideally in the Fan Schedule) that each individual fan system power in the HVAC system does not exceed the allowable fan system motor nameplate horsepower (Option 1), or fan system brake horsepower (Option 2).
  - The fan brake horsepower for each fan listed on the schedule must be ≤ the first available motor size greater than the hp value calculated per Section C403.8.2.

- **Fan Efficiency**
  - Fans with a motor nameplate horsepower > 5 hp must be designed to have a fan efficiency grade (FEG) ≥ 67.
  - The total efficiency of the fan at the design point of operation must be within 15 percentage points of the maximum total efficiency of the fan.
BOILER CONTROLS

The relevant construction drawings (e.g., M-, P- labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Outdoor Temperature Setback Control**
  For one- or two-pipe systems, drawings must specify setback controls that automatically lower the boiler water temperature based on the outdoor air temperature.

- **Hot-Water Temperature Reset Controls**
  Hot water systems with design output capacity ≥ 300 kBtu/h must be provided with automatic controls to reset supply water temperatures by representative building loads or outdoor air temperature.

- **Modulating Burner**
  Hot water systems of a single boiler with input design capacity > 500 kBtu/h must be equipped with either a multi-staged or modulating burner.

- **Boiler Turndown**
  - A single boiler or boiler systems ≥ 1,000 kBtu/h must have a turndown ratio of 3 to 1, 4 to 1, or 5 to 1, as defined by the Code.
  - The turndown ratio may be met by a single boiler, modulating boilers or a combination of the two.

- **Condensing Boilers**
  For space heating gas-fired condensing boilers with rated thermal efficiency (Et) of ≥ 90%, the distribution system must be designed so that the hot water return temperature (entering water temperature) is ≤ 120°F, when the boiler is firing.
HEAT REJECTION CONTROLS
The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Heat Rejection Fan Power**
  Heat rejection fans with motors ≥ 7.5 hp must be equipped with controls to reduce the fan power to operate the fan at two-thirds of full speed or less.  

- **Multiple-Cell Cooling Towers**
  Heat rejection systems with multiple cells and equipped with VFD (variable frequency drive) controls must be operated in sequence as described in Section C403.9.2.

- **Cooling Tower Flow Turndown**
  Heat rejection systems operating with water-cooled chillers and configured with VFD condenser water pumps must be designed so that all open-circuit cooling tower cells are capable of running in parallel with sequencing as provided by the Code.
**Chiller Controls**

*The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.*

- **Chilled-Water Temperature Reset Controls**
  Chilled water systems with a design output capacity $\geq 300$ kBtu/h must be provided with automatic controls to reset supply water temperatures by representative building loads or outdoor air temperature.

- **Supply Temperature Reset and Deadband**
  Hydronic systems of heating fluids that have been previously mechanically cooled, and hydronic systems of cooling fluids that have been previously mechanically heated, must be provided with supply temperature reset controls and/or a supply temperature deadband between changeovers based on the system type.

- **Chiller Isolation**
  - A chilled-water plant including more than one chiller must be configured so that all fluid flow through the chiller is automatically reduced or shut off when the chiller is shut down.
  - A boiler plant including more than one boiler must be configured so that the flow through the boiler is automatically reduced or shut off when the boiler is shut down.
**Additional HVAC Controls**

The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Shutoff Dampers**  
  - Class-I *motorized* shutoff dampers with a maximum air leakage rate of 4 cfm/ft² at 1.0 inch water gauge must be provided in outdoor air intakes, exhaust openings, and stairway/shaft vents. Alternatively, where permitted by the Code, *gravity* (non-motorized) dampers may be provided in lieu of motorized dampers.
  
  - Alternatively, *gravity* (non-motorized) dampers may be provided in lieu of motorized dampers in buildings less than 3-stories above grade plane, or where the design exhaust capacity is ≤ 300 cfm. – *Only* when following NYCECC.
  
  - See Section 6.4.3.4.2 for exceptions where non-motorized dampers are permitted when following ASHRAE.

- **Enclosed Parking Garage Ventilation**
  Enclosed parking garage ventilation systems must have capacity to monitor contaminant (CO) levels and automatically throttle the fan power in response to the contaminant levels.

- **Pump Controls: Hydronic Variable Flow Systems**
  - HVAC pumping systems with 3 or more modulating control valves must be designed for variable fluid flow, and be capable of reducing pump flow rates to no more than the larger of 25% of the design flow rate or the minimum flow required by the heating/cooling equipment manufacturer for the proper operation of equipment.
  
  - Individual chilled-water pumps serving variable-flow systems having motors ≥ 5 hp must have controls or devices (such as variable-speed controls) that will result in pump motor demand of a maximum 30% of design wattage at 50% of design water flow.

- **Hot Gas Bypass Limitation**
  - Cooling systems must not use hot gas bypass or other evaporator pressure control systems unless the system is designed with multiple steps of unloading or continuous capacity modulation.
  
  - The capacity of the hot gas bypass, when permitted by Code, must be limited to:
    - For ECC-followings jobs, maximum 50% of the total capacity for the rated capacity ≤ 240 kBtu/h; and maximum 25% for the rated capacity > 240 kBtu/h.
    - For ASHRAE-following jobs, maximum 15% of the total capacity for the rated capacity ≤ 240 kBtu/h; and maximum 10% for the rated capacity > 240 kBtu/h.

- **Vestibule Heating/ Cooling**
  - The heating system must be provided with controls to shut off the source when the outdoor temperature is > 45 °F.
  
  - The heating and cooling systems must have a thermostat in the vestibule to limit heating to ≤ 60 °F and cooling to ≥ 85 °F.
**SERVICE WATER HEATING SYSTEMS**

The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Heat Traps**
  For water-heating equipment not supplied with integral heat traps and serving non-circulating systems, heat traps must be specified on both supply and discharge piping associated with the heating equipment.  
  - Heat Traps  
    C404.3  
    7.4.6

- **Circulation Pumps and Heat Trace Systems**
  - Heated-water circulation systems must be provided with circulation pumps that are automatically turned on and off by the hot water demand in the system.  
    - Circulation Pumps and Heat Trace Systems  
    C404.6  
    7.4.4.2
  - Electric heat trace systems must have controls to automatically adjust the energy input to maintain the desired water temperature in the piping, and to be automatically turned off when there is no hot water demand.  

- **Heat Recovery for Service Water Heating**
  Condenser heat recovery system must be installed for facilities as follows:  
  - Heat Recovery for Service Water Heating  
  C403.9.5  
  6.5.6.2.1
  1) operating 24 hours/day,  
  2) the total installed heat capacity of water-cooled systems > 6,000 kBtu/h of heat rejection, **and**  
  3) the total design service water heating load > 1,000 kBtu/h.

![Diagram of Heat Traps and Insulation Requirements for Non-Circulating Systems](image)

*Figure MS-15.*  
Heat Traps and Insulation Requirements for Non-Circulating Systems
DUCTS AND PIPING

The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Duct and Plenum Insulation**
  Supply and return air ducts and plenums must be designed as follows:

<table>
<thead>
<tr>
<th>Location</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Unconditioned space</td>
<td>Insulated with min. R-6 insulation</td>
</tr>
<tr>
<td>Outside the building</td>
<td>Insulated with min. R-8 insulation</td>
</tr>
<tr>
<td>Within a building envelope</td>
<td>Separated from the building exterior</td>
</tr>
<tr>
<td></td>
<td>or unconditioned space by min. R-8 insulation</td>
</tr>
</tbody>
</table>

- **Duct System Sealing**
  - Joints, seams and connections of ducts, air handlers, and filter boxes must be sealed.
  - Drawings must clearly indicate pressure classifications of the proposed duct systems in accordance with NYC Mechanical Code.
  - For high-pressure duct systems that operate at a static pressure > 3 inches water gauge, drawings must specify the duct leakage test requirements in accordance with the SMACNA HVAC Air Duct Leakage Test Manual.

- **Piping Insulation**
  - Piping to service heating, cooling and service water heating systems must be thermally insulated.
  - Minimum pipe insulation thicknesses depending on the fluid temperature range must be specified on drawings.

- **Maximum Pipe Length/Volume**
  Heater water supply piping systems must be designed in accordance with:
  a) **Maximum allowable pipe length method**: The piping length from the nearest source of heated water to the terminal fixture is within the maximum allowable pipe length per Table C404.5.1, or
  b) **Maximum allowable pipe volume method**: The water volume from the nearest source of heated water (i.e., hot water riser) to the terminal fixture is within the maximum allowable pipe volume calculated per C404.5.2.1.
REQUIREMENTS FOR SPECIFIC USE AND FUNCTION

The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Radiant Heating for Outside**
  - Systems to provide heat outside the building thermal envelope must be radiant systems, e.g., electrical unit heaters in parking garage
  - The heating systems must be controlled by an occupancy sensing device or timer switch.

- **Hotel Guest Rooms**
  - In each guestroom in hotels and motels (all Group R-1 buildings) with greater than 50 guestrooms, temperature setpoint controls and ventilation controls during unoccupied hours, and/or a captive key card system must be provided.

- **Refrigeration & Commercial Kitchen Equipment and System**
  - Refrigeration equipment and systems must be installed and provided in accordance with applicable Code provisions:
    - Maximum allowable daily energy use in kWh per equipment type – Section C403.10
    - Design of factory-built walk-in coolers/freezers and refrigerated warehouse coolers/freezers – Section C403.10.1
    - Design of site-built walk-in coolers/freezers – Section C403.10.2
    - Design of site-built refrigerated display cases – Section C403.10.3
    - Design of refrigeration systems with remote compressors/condensers not located in a condensing unit – Section C403.10.4
  - Commercial kitchen equipment – Section C405.10

- **Pools and Spas**
  - Energy use of pools and permanent spas must be controlled by 1) Heaters with readily accessible on-off switch and centrally set thermostat, 2) Time switches that automatically turn on and off heaters and pump motors, and 3) Vapor-retardant cover for outdoor heated pools.

- **Snow- and Ice-Melt System Controls**
  - Snow- and ice-melting systems must be provided with automatic and/or manual controls capable of shutting off the system in response to the pavement temperature and outdoor weather conditions.

- **Freeze Protection System Controls**
  - Freeze protection systems, such as heat tracing of outdoor piping and heat exchangers, including self-regulating heat tracing, must have controls to automatically shut off the system in response to the outdoor temperature (> 40°F) and the protected fluid conditions.
**ASHRAE-Specific Requirements**

The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

- **Direct Digital Control (DDC)**
  DDC controls and display are required for new buildings with chilled-water and hot-water plants ≥ 300 kBtu/h, or fan systems ≥ 10 hp. See Table 6.4.3.10.1 for extensive DDC requirements applicable per building types and system types.  

- **Door Switches**
  For doors separating conditioned space from the outdoors, controls must be provided to disable or reset mechanical heating and cooling operations within 5 minutes of the door opening.

- **Chilled-Water Plant Monitoring**
  - For electric-motor-driven chilled-water plants in new buildings, or for new plants in existing buildings, devices to measure and monitor the electric energy use and efficiency (in kW/ton) of the chilled-water plant must be installed for:
    - water-cooled chilled-water plants of > 1,000 tons peak cooling capacity
    - air-cooled chilled-water plants of > 570 tons peak cooling capacity
  - The chiller plant electrical energy use efficiency must be graphically displayed with data trending every 15 minutes.
POST-INSTALLATION DOCUMENTATION
The relevant construction drawings (e.g., M-, P-labeled drawings) must clearly document — through equipment schedules, notes, narratives, drawings, and/or diagrams, etc. — how the proposed system will comply with the applicable Code requirements, and where the proposed means and measures will be located.

▪ Operating and Maintenance Manual
  - Drawings must specify that an operating and maintenance manual is to be provided to the building owner within 90 days of the issuance of the certificate of occupancy (C/O) or letter of completion.
  - The operating and maintenance manual must document all HVAC/Service Water Heating equipment and controls, and also Lighting equipment and controls.

▪ System Balancing Report
  - Drawings must specify that HVAC/SWH systems are required to be tested, adjusted and balanced in accordance with ASHRAE 111 or other approved standards.
  - Subsequently, within 90 days of the issuance of the certificate of occupancy or letter of completion, the System Balancing Report describing the completed activities and measurements must be provided to the building owner.

▪ Final Commissioning Report
  - When System Commissioning is required in accordance with Section C408.2, drawings must specify that a Final Commissioning Report is to be provided to the building owner, and
  - The Commissioning Report Certification must be submitted to the Department:
    ▪ Within 30 months of the issuance of the C/O or letter of completion for new buildings ≥ 500,000 sf in conditioned space area, excluding R-2 occupancies; and
    ▪ Within 18 months of the issuance of the C/O or letter of completion for all other buildings.
  - Refer to ‘Other Requirements’ section of this How-To Guide, page [OR-8] for further information on the mechanical systems commissioning.

▪ Permanent Certificate for Residential Building Equipment
  - This requirement applies to all residential buildings and commercial buildings with R-3 occupancy
  - Refer to this How-to Guide, page [OR-6]
How-to Guide: 
Supporting Documentation

In Compliance with
2020 New York City Energy Conservation Code

- GENERAL
- BUILDING ENVELOPE
- MECHANICAL SYSTEMS
- LIGHTING & ELECTRICAL POWER
- OTHER REQUIREMENTS

**NOTE:** In this *How-To Guide: Supporting Documentation*, selected Energy Code provisions have been generalized, summarized, rephrased, and/or highlighted. This guide is intended: 1) To provide general guidance for the job applications seeking compliance with the 2020 NYCECC; 2) Not to replace or represent the entire 2020 NYCECC and related regulations of the City of New York and the Department of Buildings; and 3) Not to provide complete compliance solutions for any particular type of job or work. Comprehensive mandates, applicability, exemptions, exceptions and options will be found in the 2020 NYCECC and related regulations of the City of New York and the Department of Buildings.
INTERIOR LIGHTING POWER

- **Maximum Allowed Interior Lighting Power**
  - Light fixture layout plans and light fixture schedules must demonstrate that the proposed interior lighting power density (watts/sf) is not greater than the maximum allowed interior lighting power density.  
  - Light fixture schedules must be complete with the fixture identification key, lamp/fixture type, number of lamps per fixture, fixture wattage, lamp/fixture efficacy (in lumens/watt), and quantities that match the light fixture layout plans.
  - Light fixture schedules must support the lighting energy analysis report: e.g., Lamps/Fixture, # of Fixtures, and Fixture Wattage listed in Lighting COMcheck report on EN- drawings and must match those values in light fixture schedules on RCP drawings. Refer to the page [GE-3].
  - Fixture efficacy values (lumens/watt), and/or fixtures' low-voltage information, when pertaining to exemption of certain lighting power/controls requirements, must also be listed in the light fixture schedules.

- **Allowance Calculation Method**
  - The maximum allowed interior Lighting Power Density (LPD) must be determined by either the Building Area Method, or the Space-by-Space Method. These may not be used in combination.
  - The selection of one method between the two, by which the allowed LPD of the job application is determined, must be justified by the building/space programs and work scope of the job application.

- **Building Area Method**
  Interior Lighting Power Allowance = The floor area of each building area type × the LPD value for the building area type from Table C405.3.2(1), or Table 9.5.1
  - For the purposes of this method, an ‘area’ is defined as all contiguous spaces that accommodate or are associated with a single building area type, as listed in Table C405.3.2(1).

Figure LE-1. Sample Lighting Fixture Schedule for Residential Building
**INTERIOR LIGHTING POWER**

- **Space-by-Space Method**

  Interior Lighting Power Allowance = Sum of (the floor area of each Space type \( \times \) the LPD value for the Space type from Table C405.3.2(2), or Table 9.6.1)

  - The space type in the Table that most closely represents the proposed use of each space must be selected so that all spaces in the work scope are accounted for in the calculation.
  - Trade-offs among spaces are permitted in this method.

- **High-Efficacy Lamps or Luminaires**

  - For Residential buildings, also for Dwelling units within Commercial buildings, a minimum of 90% of the permanently installed lighting fixtures must have:
    a) Lamp efficacy \( \geq \) 65 lumens/watt, or
    b) Luminaire efficacy \( \geq \) 45 lumens/watt
  - To validate the above, light fixture schedules must clearly identify lamp/luminaire efficacy of each light fixture, and also lamp/luminaire counts of all lighting fixtures. See Figure LE-1 on the page [LE-1].

**Occupant Sensor Controls**

- **Where Required**
  - Occupant sensor controls are required in spaces including: classrooms, conference rooms, copy rooms, lounges/ break rooms, enclosed offices, open plan offices, restrooms, storage rooms, locker rooms, warehouse storage areas, janitor closets, corridors/transition areas, cafeteria/fast food dining areas, egress illumination (stairways, exit access), and other spaces ≤ 300 sf.
  - Light fixture layout plans, fixture schedules, and the controls narrative must clearly identify the location of occupant-sensor-controlled light fixtures and the connected sensor/control devices.

- **Occupant Sensor (OS) Control Function (NOT for Open Plan Offices, Cafeteria and Fast Food Dining Areas ≥ 300 sf)**
  - **Automatic-Off**: Drawings must specify that occupant sensor controlled luminaires are automatically turned off within 15 minutes of all occupants leaving the space.
  - **Manual-On or Maximum 50% Automatic-On**: Lights turned off by occupant sensor controls must be either manually on, or controlled to be automatically on maximum 50% of the lighting power in the space.
  - **Manual-On ONLY**: Lights turned off by occupant sensor controls must be only manually on – i.e., max. 50% automatic-on is not allowed – in the following spaces: classrooms, conference/meeting rooms, employee break rooms, and offices < 200 sf. The sensors and controls in these spaces must not have an override switch that converts from manual-on to automatic-on functionality.
  - **Full Automatic-On**: Only in the following spaces, occupant sensors with full automatic-on are allowed: open plan offices, public corridors, stairways, restrooms, primary building entrance areas and lobbies, and areas where manual-on operation would endanger the safety or security of the building occupants.
  - **Manual Control to Turn Off**: Occupant-sensor-controlled luminaires must also be equipped with manual controls that allow occupants to turn lights off.

- **OS Controls in Open Plan Offices, Cafeteria and Fast Food Dining Areas ≥ 300 sf**
  - The maximum control zone area controlled by one (1) occupant sensing device is 600 sf.
  - A minimum of 80% of all lighting must be automatically turned off within 15 minutes of all occupants leaving the space.
  - Daylight responsive control shall not activate general lighting controls when no occupancy is detected in these spaces.

- **OS Controls for Egress Illumination**
  - Luminaires servicing Exit access and providing Means of Egress illumination must have controls that automatically reduce the lighting power by 50% when unoccupied for more than 15 minutes.
  - OS with Full Automatic-On of the lighting are allowed
  - Means of Egress illumination of < 0.02 watt/sf and the Building-Code-designated Emergency lighting are exempt from this requirement.

*For complete controls requirements on ASHRAE 90.1 per space type, refer to Section 9.4.1 and Table 9.6.1.*
TIME-SWITCH & LIGHT-REDUCTION CONTROLS*

- **Where Required**
  - Spaces where “Occupant Sensor Control Function” in page [LE-3] are not provided, and
  - Open Plan Offices, Cafeteria and Fast Food Dining Areas $\geq 300$ sf

Both Time-switch controls and Light-reduction controls must be provided. The controls’ function and locations must be clearly specified on drawings.

- **Time-Switch Controls (Programmed)**
  Time-switch controls must be designed to:
  1) Have a minimum 7-day clock,
  2) Allow to program 7-different day types/week,
  3) Have an automatic holiday ‘shutoff’ feature,
  4) Have program backup capabilities in case of power interruption, and
  5) Include a manually-controlled override switch that, when initiated, permits the controlled lighting to remain on for a maximum of 2 hours, and that individually controls a maximum area of 5,000 sf.

- **Light-Reduction Controls (Manual)**
  - Spaces with time-switch controls must also be provided with manual light-reduction controls that allow the occupant to reduce the connected lighting load by minimum 50%.
  - Light fixture layout plans must clearly indicate the light-reduction control method, the options of which are as follows:
    1) Control of all lamps/luminaires
    2) Dual switching of alternate rows of luminaries
    3) Switching middle lamp luminaires independently
    4) Switching each lamp/luminaire

*For complete controls requirements on ASHRAE 90.1 per space type, refer to Section 9.4.1 and Table 9.6.1.

---

**Figure LE-4. Light-Reduction Controls Method by**

- a) Control of all lamps/luminaires
- b) Dual switching of alternate rows of luminaries
- c) Switching middle lamp luminaires independently

Source: energycodes.gov
**TIME-SWITCH & LIGHT-REDUCTION CONTROLS**

- **Where Time-Switch Controls are Exempt**
  If the spaces listed below are provided with manual lighting-reduction controls, time-switch controls are not required:
  1) Sleeping units
  2) Spaces where patient care is directly provided
  3) Spaces where an automatic shutoff would endanger occupant safety or security
  4) Lighting intended for continuous operation
  5) Shop and laboratory classrooms

- **Where Light-Reduction Controls are Exempt**
  Light reduction controls are not required in daylight zones with daylight responsive controls complying with Section C405.2.3.

*For areas/rooms where exemptions of certain lighting controls are sought, the lighting plans and narratives must provide clear information to satisfy the exemption requirements.*

*For complete controls requirements on ASHRAE 90.1 per space type, refer to Section 9.4.1 and Table 9.6.1.*
**Daylight-Responsive Controls***

- **Control Function**
  - For spaces having electric lights > 100 watts within daylight zones, independent controls for the lights within daylight zones must be specified.
  - For this purpose, light fixture layout plans must clearly *delineate the boundary of each daylight zone*, and indicate separate circuiting and switch control for each zone boundary.
  - Daylight-responsive controls must be designed to be capable of a complete shutoff of lights within each daylight zone, and must be installed such that authorized professionals can readily access the controls for calibration.

- **Sidelit Zone**
  - The sidelit zone must be identified on drawings in the floor area *adjacent to vertical fenestration*.
  - When the fenestration is located in a wall, the sidelit zone extends:
    - (a) Laterally to the nearest full-height wall, or up to 1-times the height from the floor to the top of the fenestration, and
    - (b) Longitudinally from the edge of the fenestration to the nearest full-height wall, or up to 2 ft, whichever is less.
  - For the criteria of the sidelit zone following ASHRAE, refer to the definition of ‘daylight area’ in ASHRAE Section 3.2.

*For complete controls requirements on ASHRAE 90.1, refer to Section 9.4.1 and Table 9.6.1.*
**DAYLIGHT-RESPONSIVE CONTROLS**

- **Toplit Zone**
  - The toplit zone must be identified on drawings in the floor area *underneath a roof fenestration assembly*.
  - The toplit zone extends laterally and longitudinally beyond the edge of the roof fenestration assembly:
    - (a) To the nearest obstruction that is taller than 0.7-times the ceiling height, or
    - (b) Up to 0.7-times the ceiling height, whichever is less.
  - For the criteria of the toplit zone following ASHRAE, refer to the definition of *daylight area* in ASHRAE Section 3.2.

\[C405.2.3.3\]  
3.2

\[\text{For complete controls requirements on ASHRAE 90.1, refer to Section 9.4.1 and Table 9.6.1.}\]
**Exterior Lighting Power**

- **Maximum Allowed Exterior Lighting Power**
  - Light fixture layout plans and light fixture schedules must demonstrate:
    - Proposed exterior lighting power density (watts/sf) ≤ Maximum allowed exterior lighting power density
  - Light fixture schedules must be complete with fixture identification keys, fixture/lamp type, number of lamps per fixture, and fixture wattages and quantities that match the light fixture layout plans.

- **Calculation of Maximum Allowance**
  - The maximum allowed building exterior lighting power must be computed based on Table C405.4.2(2) or Table 9.4.2-2 for the applicable Exterior Lighting Zone per 1 RCNY §5000-01(g)(3)(ii).
    \[
    \text{Maximum Allowed Exterior Lighting Power} = \text{Base Site Allowance (per Lighting Zone)} + \text{Individual Allowance per Area Type ( Tradable/Non-Tradable Surfaces)}
    \]
  - Trade-offs are allowed only among exterior lighting applications in the Tradable Surfaces of Table C405.4.2(2), or Table 9.4.2-2.

  - Lighting Zone 1: Park land
  - Lighting Zone 2: All R districts, R districts with C overlays and MX districts
  - Lighting Zone 3: M districts, except MX; C districts, except C5, C6 and C overlays on R districts
  - Lighting Zone 4: C5 and C6 districts

- **Exterior Lighting Controls**
  (a) Daylight shutoff: Lights automatically turned off when daylight satisfies the lighting needs
  (b) Decorative lighting shutoff: Building façade and landscape lighting automatically shut off within 1 hour of business closing and until 1 hour or less prior to business opening
  (c) Lighting setback: For lighting not controlled per the (b) above, controls to automatically reduce the lighting by minimum 50% during 12am - 6am, or from 1-hour after the business closing to 1-hour before opening, or when no activity detected for 15 minutes
  (d) Exterior time-switch control function: Controls with 7-different-day-type-programmable clock and automatic holiday setback
  (e) Outdoor parking area lighting control: Luminares of wattage > 78 W and mounted at 24’ or less above the ground controlled to automatically reduce the power by minimum 50% when no activity detected for 15 minutes
OTHER LIGHTING REQUIREMENTS

- **Narrative on Lighting System and Controls**
  On drawings where light fixture layout plans and schedules are documented, a narrative must be provided to describe the function and operation of mandatory lighting and power controls.  

- **Lighting System Functional Testing**
  Drawings must specify the requirements that:
  - The approved agency must certify that the installed lighting control systems including occupant sensor controls, time-switch controls, and daylight-responsive controls have been tested and perform as intended.
  - Documents certifying the installed lighting controls meet documented performance criteria of Section C405 must be provided to the building owner within 90 days of the receipt of the certificate of occupancy.

- **Hotel Guestrooms**
  For hotel and motel guestrooms (sleeping units or guest suites), drawings must specify a master control device that is capable of automatically switching off all installed luminaires and switched receptacles within 20 minutes of all occupants leaving the guestroom.

- **Display and Accent Lighting**
  Display lights, accent lights, and lighting in display cases must be controlled by a dedicated control that is independent of the controls for other lighting within the room or space. Controls’ locations must be clearly noted on the light fixture layout plans.

- **Parking Garage**
  Parking garage lighting must be designed so that:
  1) Lighting is automatically shut off during periods when the space is scheduled to be unoccupied.
  2) Luminaire lighting power is automatically reduced by minimum 30% within 15 minutes of no activity detected in each lighting zone of maximum 3,600 sf.
  3) Luminaires for covered garage entrances and exits are separately controlled so the lighting power is automatically reduced by minimum 50% from sunset to sunrise.
  4) The power to luminaires within 20 ft of perimeter walls with opening-to-wall ratio \( \geq 40\% \) and no exterior obstructions within 20 ft is reduced in responsive to daylight by minimum 50%.

- **Exit Signs**
  Light fixture schedules must indicate that the wattage of exit signs (internally illuminated type signs) is *maximum 5 watts per side.*
**ELECTRICAL POWER REQUIREMENTS**

- **Voltage Drop**
  The total voltage drop across the feeder conductors and branch circuits combined must not exceed 5%, unless the feeder conductors and branch circuits are dedicated to emergency services.

- **Automatic Receptacle Control**
  Drawings must specify that:
  - Minimum 50% of receptacles in spaces including private offices, conference rooms, and classrooms, etc., and
  - Minimum 25% of branch circuit feeders in modular furniture are automatically controlled:
    a) On a scheduled basis, or
    b) By occupant sensors, or
    c) By an automated signal from another control or alarm system.

- **Separate Metering for Dwelling Units and Large Tenant Spaces**
  Drawings must indicate that:
  - Each dwelling unit in a Group R-2 building must be provided with a separate electrical meter.
  - Each covered tenant space in a new building must be provided with a separate meter or sub-meter to measure the electrical consumption of each space. Refer to Section 28-311.2 of the Administrative Code of the City of New York for definitions.
  - Locations of electrical meters must be shown on plan drawings.

- **Electrical Energy Monitoring for Whole Building**
  (1) New buildings ≥ 25,000 sf, or new Group R buildings with common area ≥ 10,000 sf, must have measurement devices capable of recording electrical energy use every 60 minutes (every 15 minutes for ASHRAE) and the capability to report that use on an hourly, daily, monthly and annual basis.
  (2) New buildings and tenants of new buildings must have measurement devices capable of monitoring electrical energy use separately for:
    a) Total electrical energy,
    b) HVAC systems,
    c) Interior lighting,
    d) Exterior lighting,
    e) Receptacle circuits. [Note (2) is for ASHRAE only.]

- **Supplied Energy Monitoring for Whole Building**
  - For new buildings ≥ 25,000 sf, or new Group R buildings with common area ≥ 10,000 sf, measurement devices must be installed to individually monitor energy use of the following types of energy supplied by provider/plant outside the building:
    a) Natural gas
    b) Fuel oil
    c) Propane
    d) Steam
    e) Chiller water
    f) Hot water
**ELECTRICAL POWER REQUIREMENTS**

- **Elevator Cabs**
  Drawings must specify that:
  - **Lighting efficacy**: For each elevator cab’s interior lighting, total lumens divided by total watts must be ≥ 35 lumens/watt.
  - **Ventilation fan power**: Ventilation fans in elevator cabs without their own air-conditioning system must not consume power > 0.33 watts/cfm.
  - **Controls to de-energize**: When stopped and unoccupied with doors closed for over 15 minutes, cab interior lighting and ventilation systems must be automatically controlled to be de-energized.

- **Traction Elevator Power Conversion System**
  New traction elevators with a rise ≥ 75' in new buildings must have a power conversion system with the following:
  - **Induction Motors** with a Class IE2 efficiency rating, or approved alternative technologies
  - **Transmissions** not reducing the efficiency of the combined motor/transmission below that shown for the Class IE2 motor for elevators with capacities below 4,000 lbs.
  - **Regenerative Drive** recovering potential energy released during motion and supplying it to the building electrical system

- **Escalators and Moving Walks**
  - **Automatic speed reduction**: Drawings must specify that escalators and moving walks have controls to automatically reduce speed when not conveying passengers.
  - **Regenerative Drive**: An escalator designed either for one-way down operation only or for reversible operation must have a variable frequency regenerative drive that supplies electrical energy to the building electrical system when the escalator is loaded with passengers whose combined weight > 750 lbs. See Figure below.

- **Commercial Kitchen**
  Commercial kitchen equipment must comply with the minimum efficiency requirements of the Tables listed in the section (at right).
In Compliance with
2020 New York City Energy Conservation Code

- GENERAL
- BUILDING ENVELOPE
- MECHANICAL SYSTEMS
- LIGHTING & ELECTRICAL POWER
- OTHER REQUIREMENTS

NOTE: In this How-To Guide: Supporting Documentation, selected Energy Code provisions have been generalized, summarized, rephrased, and/or highlighted. This guide is intended: 1) To provide general guidance for the job applications seeking compliance with the 2020 NYCECC; 2) Not to replace or represent the entire 2020 NYCECC and related regulations of the City of New York and the Department of Buildings; and 3) Not to provide complete compliance solutions for any particular type of job or work. Comprehensive mandates, applicability, exemptions, exceptions and options will be found in the 2020 NYCECC and related regulations of the City of New York and the Department of Buildings.
Mandatory Additional Efficiency Package

[NOTE] In the 2020 NYCECC, this Additional Energy Efficiency requirement is mandatory provision for all new Commercial buildings regardless of the chosen Code Compliance Path (either ECC-following, or ASHRAE-following job application).

- Seven (7) Options for New Commercial Buildings
  New Commercial buildings must demonstrate compliance with **at least one of the seven options below** as an additionally required energy efficiency system. The chosen efficiency system must be clearly indicated through Energy analysis and/or EN- labeled drawings, and the construction drawings must provide detailed data to ensure implementation of the chosen system.

  Option 1. More Efficient HVAC Performance
  Option 2. Reduced Lighting Power Density
  Option 3. Enhanced Digital Lighting Controls
  Option 4. Dedicated Outdoor Air System (DOAS)
  Option 5. Reduced Energy Use in Service Water Heating
  Option 6. Enhanced Envelope Performance
  Option 7. Reduced Air Infiltration

- Five (5) Options for New Tenant Spaces
  New tenant space must demonstrate compliance with **at least one of the five options above – Option 1 through Option 5** – as an additionally required energy efficiency system. The chosen efficiency system must be clearly indicated through Energy analysis and/or EN- labeled drawings, and the construction drawings must provide detailed data to ensure implementation of the chosen system.
MANDATORY ADDITIONAL EFFICIENCY PACKAGE

Option 1.
More Efficient HVAC Performance
– Exceed the Minimum by 10%
 HVAC equipment exceed the minimum efficiency requirements of C403.3.2 [ECC] or 6.8.1 [ASHRAE] by 10%
 Equipment types that are not subject to the minimum 10% efficiency improvement are less than 10% of the total building system capacity.

To demonstrate compliance with this option:
- Provide HVAC equipment schedules specified with improved efficiency.
- Provide Energy analysis to compare proposed efficiencies against the minimum, 10%-improved efficiencies.
  • Note that the COMcheck software has capacity to auto-calculate the minimum, 10%-improved efficiency values.

Figure OR-2.
COMcheck Program Screenshot
- Project tab showing Additional Efficiency Options
MANDATORY ADDITIONAL EFFICIENCY PACKAGE

Option 2.

Reduced Lighting Power Density (LPD)

- Total LPD < 90% of the Allowed Maximum
  - Total interior lighting power < 90% the total allowed by the Building Area Method in C405.3.2.1[ECC] or 9.5.1 [ASHRAE]
  - Total interior lighting power < 90% the total allowed by the Space-by-Space Method in C405.3.2.2[ECC] or 9.6.1 [ASHRAE]

To demonstrate compliance with this option:
- Provide lighting fixture schedules complete with fixture wattages and fixture counts.
- Provide Energy analysis to compare the calculated proposed LPD against the reduced maximum (90%) LPD.
  - Note that the COMcheck software has capacity to auto-calculate the reduced maximum LPD values.

Option 3.

Enhanced Digital Lighting Controls

- Advanced Control Operation of Interior Lighting
  - Controls including Continuous dimming of luminaires and Tighter zone controls
  - Digital control systems including Reconfigurable controls and Load shedding
  - Submittal of lighting controls Sequence of Operations, and thorough implementation of functional testing

To demonstrate compliance with this option:
- Provide lighting plans with individual control locations and control zone boundaries.
- Provide lighting controls narratives that specify the required controls space-by-space in detail.
- A Sequence of Operations for the digital control systems shall be submitted to the DOB upon request.
MANDATORY ADDITIONAL EFFICIENCY PACKAGE

Option 4.

Dedicated Outdoor Air System (DOAS)

- **100% Outdoor Air Ventilation System with Energy Recovery**
  - Independent ventilation system is specified for each individual occupied space to provide 100% outdoor air. For the list of systems subject to this option, see C406.5 [ECC], or I5 [ASHRAE].
  - The ventilation system is equipped with energy recovery system.
  - The system includes controls that automatically reset the supply-air temperature in response to building loads or OA temperatures.

  To demonstrate compliance with this option:
  - Provide HVAC equipment schedules that specify DOAS+ERV for all applicable systems.

Option 5.

Reduced Energy Use in Service Water Heating (SWH)

- **Waste Heat Recovery, or On-site Renewable Energy Systems to Reduce SWH Energy**
  - Minimum **60 %** of the building’s annual hot water requirements, or
  - **100 %** of the building’s annual hot water requirements, with Condenser heat recovery system are provided by
    a) Waste heat recovery from service hot water, heat-recovery chillers, building equipment, or process equipment, and/or
    b) On-site renewable energy water-heating systems

  - This option is applicable to the following occupancy groups:
    - Group R-1: Boarding houses, hotel or motels
    - Group R-2: Buildings with residential occupancies
    - Group A-2: Restaurants and banquet halls or buildings containing food preparation areas
    - Group A-3: Health clubs and spas
    - Group I-2: Hospitals, psychiatric hospitals and nursing homes
    - Group F: Laundries

  To demonstrate compliance with this option:
  - Provide mechanical/plumbing drawings that specify in detail Waste heat recovery system and/or On-site renewable energy water-heating systems
  - Provide summary calculation of the building’s annual hot water requirements, and % of hot water supplied by this option.
Mandatory Additional Efficiency Package

Option 6.
Enhanced Envelope Performance
- Minimum 15% Improvement
  - The proposed building thermal envelope performance demonstrates a minimum 15 percent improvement compared to the code-prescriptive building envelope.

To demonstrate compliance with this option:
- Provide drawings that document entire building envelope assemblies and their thermal values – e.g. Opaque assemblies schedule and details (roof, walls, floors, etc.), Fenestration schedules (windows and doors)
- Provide Energy analysis to compare the proposed building envelope thermal values against the 15 %-improved envelope values.
  - Note that the COMcheck software has capacity to auto-calculate the 15 %-improved envelope thermal values.

Option 7.
Reduced Air Infiltration
- Maximum 0.25 cfm/sf Air Leakage @ 75 Pascals
  - Air Leakage Testing conducted in accordance with ASTM E779 or ASTM E1827 shall verify that the air leakage rate of the whole building does not exceed 0.25 cfm/sf at a pressure differential of 75 Pascals.
  - The testing report including the building data (e.g., envelope surface area, floor area, etc.) and the test results shall be submitted to the building owner.

To demonstrate compliance with this option:
- Provide on drawings statement to direct air leakage testing, and specify detailed requirements
- The testing report shall be submitted to the DOB upon request.
Residential Buildings and Group R-3 Commercial Buildings are required to have the Permanent Energy Efficiency Certificate posted inside the building. The Builder or Other Approved Party must complete and post the Certificate.

- **Required Data Contents in the Certificate**
  - **R-values in Opaque assemblies** and other components – insulation in ceiling/roofs, walls, floor/foundation components, and ducts outside the conditioned spaces
  - **U-factors and SHGC values of Fenestration** – windows and doors
  - **Air Leakage Testing results**
  - **Mechanical equipment Types and Efficiencies** - HVAC and Service water heating equipment

- **Location of the Permanent Certificate**
  - Drawings must specify that the Certificate shall be posted on a wall in the space where the furnace is located, a utility room or an approved location inside the building prior to final inspections of the application.
  - When specifying to post the Certificate near or on the electrical distribution panel, drawings must also instruct that the Certificate must be readily visible (at eye level and in plain sight), and yet must not obstruct the visibility of the other Code-required labels (e.g., circuit directory label, service disconnect label, etc.).

- **Additions & Alterations Job Applications**
  For Additions and Alterations applications affecting information on the existing Permanent Certificate, drawings must specify that the existing Certificate shall be updated and re-installed.
**ELECTRICAL VEHICLE SERVICE READY**

- **This Requirement Applies to**
  - One or Two-family dwellings with Parking area
  - Low-rise Multi-family buildings with Parking area
  - Townhouses with Parking area

- **For Each Dwelling Unit, provide:**
  - 208/240V 40-amp outlet, or
  - Panel capacity and conduit for the future installation of such an outlet adjacent to the parking area.

- **For Residential occupancies with Common Parking Area, provide:**
  - Panel capacity and conduit for the future installation of 208/240V 40-amp outlets for 5 percent of the total parking spaces, but not less than one outlet, or
  - 208/240V 40-amp outlets for 5 percent of the total parking spaces, but not less than one outlet.
ENERGY RATING INDEX (ERI) – COMPLIANCE ALTERNATIVE FOR RESIDENTIAL BUILDINGS

ERI is a score-based rating system which alternatively determines Energy Code compliance of a new residential building based on its energy performance. It allows applicants to approach the Energy Code with the same flexibility of the Simulated Performance Alternative (Section R405), yet it uses energy modeling and in-field inspection to confirm that results are achieved.

- **ERI ‘Reference Design’ vs. ‘Rated Design’**
  
  The ERI *Reference Design*, representing ERI score of 100, means the building design meets the minimum requirements of the 2006 IECC. For the *Rated Design* of a newly proposed residential building to demonstrate compliance with the 2020 NYCECC, the ERI analysis on the building must result in the **ERI score of 50 or less** (for Climate Zone 4). A residential building that achieves the rated ERI score of 50 is 50% more energy efficient than the *Reference Design* building, which meets the 2006 IECC (ERI score of 100).

- **For Compliance Through ERI Approach, Drawings Must Indicate:**
  
  1) Mandatory provisions for Residential buildings (Section R401 thru Section R404) and Section R403.5.3 are met.
  
  2) The building thermal envelope meets the 2011 NYCECC prescriptive requirements (Table 402.1.1 or Section 402.1.3 of the 2011 NYCECC). However, if on-site renewable energy is included in the calculation of the ERI score, the building thermal envelope is to meet the 2016 NYCECC prescriptive requirements (Table R402.1.2 or Table R402.1.4).
  
  3) Verification of compliance is required to be completed by an approved third party.
  
  4) Documentation is required regarding: a) Compliance software tools, b) Compliance report, and c) Other additional documentation that may be required to submit to the Department.
  
  5) Calculation software tools, where used, meet the requirements on: a) Minimum capabilities, b) Specific approval, and c) Input values.

• For job applications opting for this compliance path, on PW1-Section 10, ‘Energy Modeling (EN1)’ should be marked as chosen Energy Analysis method.
**SYSTEM COMMISSIONING**

- **Specify Total Proposed Heating and Cooling Capacity**
  - For **ALL Commercial building job applications** including New buildings, Additions, and Alterations
    - Total Heating Equipment Capacity (in Btu/h) being Installed, or
    - Total Heating Equipment Capacity (in Btu/h) Serving the Alteration space
    - Total Cooling Equipment Capacity (in Btu/h) being Installed, or
    - Total Cooling Equipment Capacity (in Btu/h) Serving the Alteration space
  Must be clearly calculated and documented on an EN-labeled sheet.

- **Specify Whether System Commissioning is Required**
  - Drawings must clearly state **whether or not** System Commissioning is required.
  - System Commissioning is **not required** for:
    - Mechanical systems of **Total Heating** capacity Installed, or Serving the Alteration Space < 600 k Btu/h
    - Mechanical systems of **Total Cooling** capacity Installed, or Serving the Alteration Space < 480 kBtu/h
    - **Renewable Energy** systems of Total generating capacity < 25 kW

- **Areas Where Commissioning is Required**
  - For systems for which Commissioning is required, drawings should clearly identify specifications of each Commissioning-required system with detailed information on the equipment/fixture schedules and complete narratives including controls notes.
  - Commissioning-required systems, at a minimum, include the following:
    - **Mechanical Systems**
      1) Heating, cooling, air handling and distribution, ventilation and exhaust systems;
      2) Energy recovery systems;
      3) Manual or automatic controls;
      4) Plumbing systems;
      5) Service water heating systems;
      6) Refrigeration systems;
      7) Renewable energy and energy storage systems; and
      8) Other systems/equipment/components supporting HVAC and affecting energy use.
    - **Lighting Control Systems**
      1) Occupant sensor controls;
      2) Time-switch controls; and
      3) Daylight responsive controls.
**Note 1)** Upon the owner’s receipt of the Preliminary Commissioning Report, the owner (owner’s authorized agent) shall send a letter acknowledging the receipt to DOB at cx@buildings.nyc.gov.

**Note 2)** Upon completion of the final commissioning procedures, the owner (owner’s authorized agent) shall send the Final Commissioning Report to DOB at cx@buildings.nyc.gov. Click here for more information in the FAQ under DOB Energy Code website.
Changes to Existing Buildings

- **Compliance**
  - Job applications of additions, alterations, repairs or relocation of existing buildings/structures, or changes of occupancy to existing buildings must demonstrate compliance with the NYCECC and other governing NYC Codes that are effective as of the job application filing date.
  - Job applications following ECC must comply with:
    1) Section R502/Section C502 for Additions
    2) Section R503/Section C503 for Alterations
    3) Section R504/Section C504 for Repairs
    4) Section R505/Section C505 for Changes of Occupancy or Use
  - Job applications following ASHRAE must comply with:
    1) Provisions of Sections 5, 6, 7, 8, 9 and 10 or Section 11 or Appendix G for Additions
    2) Provisions of Sections 5, 6, 7, 8, 9 and 10 or Section 11 or Appendix G for Alterations
    3) Provisions of Sections 5, 6, 7, 8, 9 and 10 for Repairs and Changes of Occupancy or Use

- **Clear Scope of Work**
  - Construction drawings must clearly define the proposed scope of work in the existing buildings by:
    1) Written descriptions of all proposed changes to the existing buildings, and
    2) Graphical delineations of the proposed work on drawings to separate the areas affected by ‘additions, alterations, repairs, relocations, or changes of C/O’ from the areas of ‘existing-to-remain.’

- **Alterations vs. Additions on ‘Historic Building’**
  - Repair, restoration and alteration work of, and change of occupancy to ‘Historic Building’ are exempt from the ECC compliance requirements. This base for exemption must be stated in the Professional Statement.
  - The ECC exemption for ‘Historic Building’ is limited to the National or New York State Historic Buildings, i.e., buildings that are registered or eligible for registration as a National or New York State Historic Building, or designated as a contributing building in a National or State Historic District. New York City-designated historic buildings are NOT exempt. For the complete definition of ‘Historic Building,’ refer to Section R202 or Section C202.
  - Job applications declaring exemptions of ECC compliance for the reason of ‘Historic Buildings’ must present evidence of such eligibility on drawings. An EN-labeled drawing with Professional Statement claiming exemption from ECC compliance must also include:
    1) Documentation obtained from the New York State Historic Preservation Office’s online tool called CRIS* clearly indicating the subject building is listed as, or is eligible for listing as an historic building, or
    2) A letter from the New York State Historic Preservation Office, or the United States Department of the Interior verifying the subject building is listed as, or is eligible for listing as an historic building.
  - Additions to ‘Historic Building’ are NOT exempt, and thus the ‘Added’ portion to the Historic Building must demonstrate compliance with the ECC according to provisions under Section R502 or Section C502.

*CRIS (Cultural Resource Information System): cris.parks.ny.gov*
**Changes to Existing Buildings**

A. Additions
- In general, *altered* portions that resulted from the proposed ‘addition’ in the existing building or building system are subject to the ECC requirements for new buildings.

- Specifically, *Residential* buildings must demonstrate compliance by: 1) Prescriptive compliance option per Section R502.1.1, or 2) Simulated Performance Alternative (Existing plus addition compliance) option per Section R502.1.2.

- Specifically, *Commercial* buildings must demonstrate compliance by: 1) Prescriptive compliance option per Section C502.2, or 2) satisfying Appendix CA (ASHRAE 90.1) applicable sections.

- Compliance of the ‘addition’ must be demonstrated by showing that:
  1) The ‘addition’ portion alone complies with the ECC prescriptively; or
  2) The existing building and the ‘addition’ combined, as a single building, comply with the ECC through the performance path; or
  3) For Residential buildings, the existing building with the ‘addition’ uses no more energy than the existing building prior to the ‘addition.’

B. Alterations
- In general, *altered* portions that resulted from the proposed ‘alteration’ in the existing building or building system are subject to the ECC requirements for new buildings.

- The following alterations, provided that the energy use of the building after the ‘alteration’ is not increased, need not comply with the requirements for new buildings:
  1) Storm windows installed over existing fenestration
  2) Surface-applied window film installed on existing single-pane fenestration assemblies reducing solar heat gain
  3) Existing ceiling, wall or floor cavities exposed during construction, provided that cavities are completely filled with insulation
  4) Construction where the existing roof, wall or floor cavity is not exposed
  5) Roof recover
  6) Re-roofing of roofs without insulation in the cavity, providing new insulation either above or below the exposed sheathing (Residential buildings only)
  7) Alterations that replace less than 10 % of the luminaires in a space *(commercial buildings only)*
  8) Air barriers are not required for roof recover and roof replacement unless the entire existing building envelope is in the work scope of alterations, renovations or repairs *(commercial buildings only)*

- Compliance requirements for ‘alterations’ in *Residential* buildings
  1) Replacement fenestration: Section R503.1.1.1
  2) Heating and cooling systems: Section R503.1.2
  3) Service hot water systems: Section R503.1.3
  4) Lighting: Section R503.1.4
**Changes to Existing Buildings**

**B. Alterations** *(continued from the previous page)*

- Compliance requirements for ‘alterations’ in Commercial buildings
  1) Building Envelope: Section C503.3
  2) Heating and cooling systems: Section C503.4
  3) Service hot water systems: Section C503.5
  4) Lighting systems: Section C503.6

- Alterations in Commercial buildings complying with Appendix CA (ASHRAE 90.1) need not comply with Section C503.

- Any areas converted from non-conditioned or low-energy space to conditioned space must demonstrate compliance according to Section R503 or Section C503.

**C. Repairs**

- While building maintenance and repairs must be conducted in compliance with relevant New York City Codes, work on damaged/non-damaged building components justified by the required repair/maintenance in the existing building are considered as ‘repairs’ work, and are not subject to the requirements for Alterations in Section R503/Section C503.

- The following are considered ‘repairs’:
  1) Glass-only replacements in fenestration
  2) Roof repairs
  3) Replacement of the bulb and/or ballast within the existing luminaires in a space, without increasing the installed interior lighting power
  4) Replacement of existing doors that separate conditioned space from the exterior, without removing the existing vestibule (Commercial buildings only)
  5) Air barriers are not required for roof repair unless the entire existing building envelope is in the work scope of alterations, renovations or repairs (Commercial buildings only)

- Repairs in Commercial buildings complying with Appendix CA (ASHRAE 90.1) need not comply with Section C504.

**D. Change of Occupancy or Use**

- Buildings/spaces seeking a *Change in Occupancy or Use* that would result in an *increase in energy use* – in demand for either fossil fuel or electrical energy – must meet the ECC requirements applicable to the new occupancy/use.

- *Residential* buildings/spaces may demonstrate compliance with this section (Section R505) by the *Simulated Performance Alternative* method (Section R405) proving that the annual energy cost of the proposed design is no more than 110% of the annual energy cost of the standard reference design.

- Spaces in *Commercial* buildings undergoing a change in use must comply with interior lighting power requirements (Section C405.4) for the new use.
