This publication was supported by the Epidemiology and Laboratory Capacity (ELC) for Infectious Diseases Cooperative Agreement (Grant Number: 6 NU50CK000407-01-07) from the Centers for Disease Control and Prevention (CDC). Its contents are solely the responsibility of the authors and do not necessarily represent the official views of the CDC or the New York City Department of Health and Mental Hygiene.

Acknowledgments
The New York City Department of Health and Mental Hygiene developed the Best Practices and Good Ideas Handbook for Infection Control in Nursing Homes as an infection control resource for nursing home staff at all levels and in every discipline.

This guide would not be possible without the many dedicated New York City (NYC) nursing home staff who participated in the Health Department and the Centers for Disease Control and Prevention’s (CDC) national Infection Control Assessment and Response (ICAR) program.

Participating nursing homes in NYC welcomed the Health Department team and gave them access to the people, processes and environments involved in infection control practices. Participants shared their knowledge and innovations with us and we present them here so that all nursing homes can benefit.

Introduction

The New York City Department of Health and Mental Hygiene (DOHMH) developed this guide for new infection preventionists and other nursing home staff. Nursing homes (i.e., long-term care facilities) are critical settings for infection control and prevention. Nursing home residents are often physically frail with faltering immune systems. They are exposed to microbes (“germs”) carried into the nursing home by staff, volunteers, clergy, family members, visitors and fellow residents. As a result, health care-associated infections (HAI) are responsible for at least 380,000 deaths among nursing home residents every year.\(^1\) The risks to older adults exist outside of nursing homes as well. For example, when transferred to acute care facilities, nursing home residents are at risk for acquiring and transmitting infections both within the acute care facility and upon return to the nursing home. Additionally, providers may not prescribe antibiotics to nursing home residents according to recommended guidelines, increasing the possibility that those residents will contract certain infections such as \textit{C. difficile}, or will develop an antibiotic resistant infection in the future.\(^2\)

The Infection Control Assessment and Response Program (ICAR)

The Centers for Disease Control and Prevention (CDC) developed the ICAR program in 2014 in response to lessons learned during the Ebola crisis. ICAR is an emergency preparedness program that helps health care facilities assess infection control practices and identify opportunities for improvement. State and local health department teams visited ICAR program sites from 2015 through 2017. Teams included physicians, nurses and other public health and infection-control specialists.

Clinical facilities at all levels (hospitals, clinics, urgent care centers and long-term care settings including nursing homes) were recruited by the Health Department’s ICAR team to voluntarily participate in the program. Nursing home staff used standardized CDC survey forms\(^3\) and worked with state and local health department teams to self-evaluate their

---

\(^3\) CDC Infection Control Assessment Tools at [https://www.cdc.gov/ncidod/dhqp/tools.html](https://www.cdc.gov/ncidod/dhqp/tools.html)
infection control practices, successes and challenges. Participating nursing homes received site-specific recommendations and resources from the site visit teams. The recommendation categories provided below are based on the key infection control domains outlined in the CDC assessment tool:

- Infection Control Program and Infrastructure
- Health Care Personnel and Resident Safety
- Surveillance and Disease Reporting
- Hand Hygiene
- Personal Protective Equipment (PPE)
- Respiratory/Cough Etiquette
- Antibiotic Stewardship
- Injection Safety and Point of Care Testing
- Environmental Cleaning

**ICAR in New York City**

Between 2016 and 2017, the New York City Department of Health and Mental Hygiene recruited 73 nursing homes to participate in the ICAR program (43 percent of all NYC nursing homes). Key nursing home staff—including infection preventionists (IP), clinicians, administrators and environmental services staff—participated in the site visits. These staff members gave generously of their time, investing significant effort in completing the initial assessment survey, meeting with the Health Department team, establishing improvement goals and completing follow-up assessments to report on their progress.

For more information on the ICAR program, visit cdc.gov and search for “HAI Infection Control Assessment Tools.”

**How to Use This Handbook**

Infection preventionists and other nursing home staff can use this handbook as a quick review of CDC-recommended best practices for infection control in nursing homes. This handbook also includes creative approaches to getting things done that come directly from our nursing home colleagues. Provide copies of this handbook to staff in all departments, from the front desk to the bedside and beyond.
### Useful Definitions

<table>
<thead>

Infection Control Program

Infection control programs monitor, prevent and stop the spread of infections in health care settings.

In nursing homes, infection control best practices require a dedicated, trained and, ideally, certified infection preventionist (IP) to manage the infection control program. This person is responsible for implementing and/or coordinating infection control activities, including:

- Disease surveillance
- Implementing isolation precautions
- Investigating and controlling outbreaks
- Disease reporting and coordinating with the health department
- Resident care
- Employee health measures

Best Practice Recommendations

- Receive specialized training in infection prevention and control. Beginning in November 2019, the Centers for Medicare and Medicaid Services (CMS) will require all nursing homes to have a designated IP with specialized training in infection prevention and control. Examples of training may include:
  - Successful completion of initial and/or recertification exams developed by the Certification Board for Infection Control & Epidemiology
  - Participation in infection control courses organized by the CDC, the state or recognized professional societies
- Oversee the full range of infection control activities in a facility. These activities include:
  - Conducting ongoing disease surveillance
  - Maintaining ongoing awareness of infections in the facility
  - Monitoring the usage and evaluating the efficacy of infection control measures
  - Maintaining and updating policy and procedure manuals and making content accessible to staff

---

4 CMS Medicare and Medicaid Programs Reform of Requirements for Long-Term Care Facilities. https://www.cms.gov/Medicare/Provider-Enrollment-and-Certification/GuidanceforLawsAndRegulations/Nursing-Homes.html
— Training staff on infection prevention

• **Coordinate infection control activities** directly with state and local health authorities, particularly in the event of an outbreak in the facility.

• **Participate in pertinent trainings** and emergency preparedness activities.

• **Participate in your facility’s quality assessment and assurance committee**, and support antibiotic stewardship efforts.

Beginning in November 2019, **all long-term care facilities must also integrate infection prevention and control programs with quality assurance and improvement activities.**

The following are potential quality assurance and improvement activities:

• Ensure residents are educated on and offered influenza and pneumococcal vaccine(s).

• Ensure staff are offered influenza vaccines.

• Monitor rates of infections.

• Track antibiotic usage rates.

• Provide robust trainings and competency evaluations for staff.

• Organize regular and standardized audits.

---

5 CMS Medicare and Medicaid Programs Reform of Requirements for Long-Term Care Facilities.  
https://www.cms.gov/Medicare/Provider-Enrollment-and-Certification/GuidanceforLawsAndRegulations/Nursing-Homes.html
Good Ideas!

✔ **Obtain a certification in infection prevention and control (CIC)**

While not required, the IP should consider board certification. Nursing homes should assume responsibility for certification costs, including providing compensation to IPs for time taken to complete the certification.

✔ **Encouragement and support from management**

Management can provide financial support and compensated leave for them to participate in professional associations such as the Association for Professionals in Infection Control (APIC). Many APIC chapters hold regular local meetings, which are a great opportunity to network, share best practices and stay up-to-date on new information. To find an APIC chapter, visit apic.org/Member-Services/Chapters.

✔ **Infection Control Champions**

IPs can invite staff from within each patient care unit to join an IP committee or advisory group to learn more about key infection prevention practices, and assist in audits, surveillance and staff education. These champions can help extend the reach of the IP in the clinical setting. They can directly intervene to correct or improve infection control practice through demonstration, assistance and feedback.

✔ **Infection Control Checklists**

Infection control checklists ensure standardized infection control practices throughout the facility. These can be specific to each unit or discipline. See Appendix A for a list of sample checklists.

✔ **Infection Control Manual Question of the Month**

To help staff become familiar with the infection control manual, IPs can post an infection control question of the month that requires staff to research the manual for the answer. Present winners with an award.

✔ **Multi-Disciplinary Staff Involvement**

Involve staff from multiple disciplines (e.g., clinical, environmental, dietary, physical therapy or admissions) in infection control training, planning and policy development. Group involvement can improve competency, strengthen commitment, promote a shared understanding of pertinent principles and inspire ownership of infection control processes.

✔ **Celebrate International Infection Prevention Week (IIPW)**

IIPW takes place every year during the third week of October. This can be a great opportunity to organize events and educational activities to raise staff awareness of the role infection prevention plays in improving patient safety. Search for “international infection prevention week” to find more information and toolkits.

---

6 For more information on obtaining a Certification in Infection Control go to [https://www.cbic.org/](https://www.cbic.org/)
✓ Periodic Skills Days and Skills Fairs
Dedicate time for annual group skills training and competency evaluations. Invite staff from all disciplines to participate. Provide refreshments, prizes and/or favors to create a festive atmosphere. If your organization allows for it, invite vendors to demonstrate new products, or provide training and useful product samples. Include non-clinical staff, such as administration and food service providers.

✓ Infection Control Manual Annual Review
Choose a slow month or season to review and update the infection control manual annually. Select a multi-disciplinary committee to help with this task.

✓ Long-term Care Emergency Management Programs
State and local health departments offer free, essential all hazards training in emergency management for nursing homes and long-term care facilities. These trainings can help facilities meet the Centers for Medicare and Medicaid Services (CMS) requirements for emergency preparedness. Facilities can also learn how to develop tailored emergency preparedness and response procedures for their sites and populations.

✓ Annual Infection Control Town Halls
Host a town hall for staff at all levels and disciplines to discuss infection control processes, procedures and problems.

✓ Networking With External IPs
Many disease-causing microbes are spread between patients and health care facilities. Good communication and coordination within a referral network can reduce the likelihood of transmission. Get to know IPs in hospitals to which nursing home residents are most likely to be referred. Developing partnerships with external IPs can enhance communication about the status of transferred patients and infection control concerns (e.g., presence of a multi-drug resistant infection), and ensure that nursing homes can manage infections acquired in the hospital.  

✓ Networking With Public Health Colleagues
Develop relationships with state and local public health colleagues and external IPs. In the event of an outbreak or other communicable disease incident, you will know exactly who to call for advice and assistance.

Additional Resources for Infection Control Programs

To find CMS final rules for long-term care, visit CMS.gov and search for “nursing homes.”

For a free CDC/CMS online training course for nursing home IPs with free continuing medical education/continuing education credits (CME/CE), go to train.org/cdctrain/home and search for “Nursing Home Infection Preventionist Training” (course ID 3814)

For free CDC/Medscape CME/CE trainings on infection control for clinicians and nurses, visit cdc.gov and search for “Infection Control” then click on the “Training and Education Resources” link.

For additional CDC infection control resources, visit cdc.gov and search for “nursing home prevention tools.” To find scenario and disease-specific information, visit cdc.gov and search for “health care-associated infections.”

For Society for Healthcare Epidemiology of America/APIC guidelines, visit shea-online.org and search for “Infection prevention and control in the long-term care facility.”

For APIC/CDC tools for observations and audits, visit http://ipcobservationtools.site.apic.org.

For a free auditing app, search for “SpeedyAudit” or “iScrub” in your app store.

For more information on certification in infection prevention and control (CIC), visit cbic.org.

For information on APIC trainings go to APIC.org and click on the “Education and Certification” tab. For additional training resources, visit cdc.gov and search for “infection control training and education resources.”

For APIC “Infection Prevention and You” program resources, including a sample infection control pledge, visit professionals.site.apic.org.
Health Care Personnel and Resident Safety
Health Care Personnel and Resident Safety

Infection control programs monitor and protect the nursing home community—residents, staff and visitors—from exposure to infectious diseases.

Best Practice Recommendations

Infection control policies and procedures should be specific to the facility and in accordance with federal and state regulations.

- Policies protecting residents, staff, visitors and volunteers include, at a minimum, an evaluation of the tuberculosis (TB) status of staff and residents at the time of employment or intake, respectively. Facilities should conduct further screenings based on state regulations or risk assessment outcomes.7

- Work exclusion policies should be clearly explained to new employees during new staff orientation and supervisors should be reminded of these policies regularly. Staff who are ill with a potentially infectious disease should not report for duty and employees who become ill at work should not remain on duty. Employees should not suffer loss of pay or status when they comply with this directive. This policy is essential in all clinical facilities to protect residents and coworkers.8

- Nursing home facilities should offer the hepatitis B vaccine free of charge to all unvaccinated staff whose tasks may involve exposure to blood or other bodily fluids.

- All staff and volunteers must get vaccinated annually for influenza. The IP program should note in the employee’s record if the employee declines the vaccine and implement measures to protect other members of the nursing home community from staff who decline influenza vaccination.9 For example, staff who are not vaccinated may be required to wear masks while on duty during influenza season. This is a law in many states, including New York.10

- All residents should receive the trivalent inactivated influenza vaccine unless there is a medical contraindication or the resident or legal representative refuses. Vaccines should be given before flu season starts if possible. Check the New York State Influenza Reports to know when flu season starts.

---

9 Recommended Vaccines for Health care Workers (CDC): https://www.cdc.gov/vaccines/adults/rec-vac/how.html
• The Occupational Safety and Health Administration (OSHA)’s Bloodborne Pathogen Standard requires that each facility have well-defined policies and procedures to ensure prompt post-exposure prophylaxis for staff exposed to blood or other potentially infectious material. This is generally managed by the infection prevention or employee health programs. Staff should be trained on established exposure control plans at the time of hire and annually.11

• Facilities must include formal, documented competency evaluations of hazardous (e.g., administering parenteral injections) or essential (e.g., hand hygiene) procedures at new hire and annual trainings. Facilities should regularly audit these competencies throughout the year.

• IPs should provide feedback to the employee for each competency evaluation and audit, and document this feedback in the employee record.

11 OSHA’s Bloodborne Pathogen and Needlestick Prevention requirements: https://www.osha.gov/SLTC/bloodbornepathogens/index.html
✓ **Influenza Vaccination Badges**
Provide staff who get a seasonal influenza vaccine with a badge or sticker that says, “I got the flu shot.” This makes it easier to determine which staff may need to wear a mask while at work during the flu season.

✓ **A Daily Safety Huddle**
Host a brief daily meeting or safety huddle with leadership from all disciplines to address infection control concerns and identify areas for intervention and quality improvement.

✓ **Active Outreach to Families and Visitors**
Emphasize to families at the start of the cold and flu season or during the intake process that they should not visit the facility when they are ill.

✓ **Special Funding**
Earmark additional funds for staff without paid leave who are acutely ill and reluctant to take uncompensated time off due to financial concerns. You may also want to start a voluntary sick leave donation program where staff can donate sick time.

✓ **Infection-Specific Educational Events**
Host educational sessions for residents and their families on infection-related topics (e.g., influenza, antibiotic-resistant infections). These sessions can explain infection transmission and the importance of infection control measures, including vaccination.

✓ **Family Council Meetings**
Host a meeting where staff and families can discuss the family’s role in keeping residents safe by protecting them from illnesses. Your organization can host this annually, at the start of the cold or flu season, or in response to a specific outbreak.
Additional Resources for Health Care Personnel and Resident Safety

To download CDC/HICPAC’s “Guideline for Infection Control in Health Care Personnel,” visit cdc.gov and search for “Infection control in HCW Guidelines.”

To download the CDC’s “Toolkit for Increasing Influenza Vaccination among Health Care Personnel in Long-Term Care Settings,” visit cdc.gov and search for “toolkit for long-term care employers.”

For resources and treatment guidelines from the National Institute for Occupational Safety and Health on HIV/AIDS, hepatitis B and hepatitis C, visit cdc.gov and search for “bloodborne infectious diseases.”

To download a sample exposure control plan that meets the requirements of the OSHA Bloodborne Pathogens Standard, visit osha.gov and search for “osha3186.”

To download the CDC’s “Guideline for Isolation Precautions: Preventing Transmission of Infectious Agents in Health Care Settings,” visit cdc.gov and search for “isolation precautions.”

To download “A Step by Step Guide to Implementing Quality Assurance and Performance Improvement (QAPI) in Your Nursing Home,” visit cms.gov and search for “nursing home QAPI.”
Surveillance and Disease Reporting
Surveillance and Disease Reporting

Monitoring the presence and new occurrences of diseases in a facility—or disease surveillance—is an essential component of an infection control program and allows a nursing home to quickly recognize, respond to and prevent potential outbreaks.

Best Practice Recommendations

The IP should work closely with clinical, laboratory and pharmacy services to continuously monitor for infectious diseases within the facility. IPs are responsible for the following activities:

- Record, report and monitor diseases within the facility and track infections that are listed as reportable to public health authorities, such as C. difficile. Through continuous monitoring, IPs should be able to identify background infection rates and detect increases above those rates.

- Report any outbreak or increase in infections among residents or employees to the state or local public health agency. Visit health.ny.gov and search for “Outbreak Reporting in Health Care Facilities” to find disease reporting requirements for all nursing homes in New York State. For nursing homes in New York City, visit nyc.gov/health and search for “Reporting Diseases & Conditions.” Clinical staff should have easy access to these lists either in hard copy or electronic form.

- Enroll with the state health department. IPs in New York State nursing homes should enroll in the New York State Health Commerce System. This ensures that IPs receive health alerts and are able to report outbreaks.

- Continuously monitor the status of residents who have been transferred to acute care hospitals by working closely with the IP at the acute care facility.

13 New York State Health Commerce System https://commerce.health.state.ny.us/hcs/index.html
Facilities should have written plans for infection surveillance, outbreak response and responding to antibiotic-resistant organisms. The following are best practices for these written plans:

- As part of the surveillance plan, your facility should have procedures to screen for and identify potentially infectious agents at the time of admission. Examples include documenting recent antibiotic use and history of infections or colonization with *C. difficile* or antibiotic-resistant organisms.

- As part of the outbreak response plan, your facility should include definitions, procedures for surveillance and containment, and a list of syndromes or pathogens that your IP monitors. The IP should also coordinate with state and/or local health departments.

- As part of its plan to respond to antibiotic-resistant organisms, your facility’s laboratory should promptly contact the IP or, in off-hours, the nursing supervisor, when they identify antibiotic-resistant organisms or *C. difficile*. 
Daily Rounds
Conduct daily unit rounds to discuss and evaluate the status of residents with an infection or who are on antibiotics. This is also an opportunity to review which residents have an invasive device that could be removed (such as urinary catheters or IVs) to decrease their risk for infection.

24/7 Monitoring
Check for signs of infection in all residents on a unit where a single resident has a fever and is potentially contagious. During influenza season remain aware that people can be contagious for days prior to symptom onset.

Hospitalized Patient Rounds
Routinely hold case management meetings on the status of hospitalized residents to prepare the facility for their readmission.

Root Cause Analysis
When significant breaches in infection control leading to staff or resident harm occur, a root cause analysis can help your facility determine what happened, why and how you can prevent it from happening again. For each cause identified, determine which processes or systems may have led to the error. Then create an action plan to reduce the risk of repeating a similar error.

Hospital Liaison
Create a dedicated case management team or assign a hospital liaison to monitor the clinical status of residents who have been transferred to acute care facilities. The case management team or liaison are responsible for getting status updates from the inpatient care team. They may also visit the acute care facility to improve inter-facility cooperation, identify infections ahead of readmission or inform the receiving hospital of any infectious risks.

Admitting Privileges
Transfer residents to hospitals where clinicians from their facility have admitting privileges. These providers can continue to care for residents, following them from the time of hospital admission until readmission to the nursing home, and can prepare nursing home staff for residents’ return.

Inter-Facility Infection Control Transfer or Referral Forms
These forms help communicate important infection control information to a receiving facility. They should accompany new hospital patients and readmitted residents. Nursing home IPs can use these forms to inform staff of any active infections or isolation precautions and note any pending cultures or test results. Visit cdc.gov and search for “Long-term Care Assessment and Transfer Tools” to find a sample inter-facility transfer form.
Additional Resources for Surveillance and Disease Reporting

For long-term care assessment and transfer tools, including transfer and referral forms, visit cdc.gov and search for “nursing homes prevention tools.”

For guidance from the National Healthcare Safety Network on how to track infections, visit cdc.gov and search for “NHSN LTC.”

For guidance on performing a root cause analysis refer to the following organizations:

- Centers for Medicare and Medicaid Services: visit cms.gov and search for “ProcessToolFramework”
- The Joint Commission: visit jointcommission.org and search for “Joint Commission root cause analysis”
Hand Hygiene

The most common mode of transmitting pathogens is via your hands. This makes hand hygiene, or making sure your hands are clean, a low-cost, high-impact way to reduce health care associated infections. In addition to hand-washing, the introduction of alcohol-based hand sanitizers in health care settings has greatly improved hand hygiene among health care workers.

Best Practice Recommendations

- Have written hand hygiene policies in place that promote the preferential use of alcohol-based hand sanitizers.
- Gloves should be used during patient care activities that may involve exposure to blood and/or other body fluids, during contact precautions and in certain outbreak situations. Hand hygiene should be performed before putting on and after removing gloves.
- Make sure that hand hygiene supplies are readily accessible at entrances and throughout the facility, especially in patient care areas, hallways and resident rooms. Place alcohol-based hand sanitizer dispensers near the doorways of rooms to promote hand hygiene from entry to exit.
- Provide hand hygiene training to all staff and all volunteers (e.g., food handlers, clergy, hairdressers, pet therapists, recreation therapists and others). Ensure staff are trained to clean thumbs, between fingers and under fingernails—these areas are most often missed when using alcohol-based hand sanitizers.
- Provide formal hand hygiene training for new hires and annually.
- Routinely audit staff throughout the year to ensure ongoing hand hygiene skill and compliance.
- Document every training session, each audit and all significant feedback in the employee’s record.
- When hands are visibly soiled and when there is the likelihood of exposure to C. difficile or norovirus, wash hands with soap and water, rather than using an alcohol-based sanitizer.

16 The NYC Fire Code allows the use and placement of ABHRs in resident corridors/hallways (NYC Fire Code 2014, Chapter 34, FC 3405)
✓ **Hand Hygiene Pledge**
Encourage staff and all volunteers to pledge their commitment to hand hygiene. To download a sample hand hygiene pledge, visit the Association for Professionals in Infection Control at professionals.site.apic.org and search for “sign the pledges.”

✓ **Secret Shopper**
Ask senior staff from a number of disciplines to observe and reinforce hand hygiene competency and compliance. Designate Hand Hygiene Champions, who can also conduct these audits. See the Resources section for sample hand hygiene audit forms.

✓ **Monthly Hand Hygiene Rates**
Consider setting goals for hand hygiene rates and posting monthly hand hygiene rates for all units. Think of ways to reward top performers or demonstrating significant improvement in rates.

✓ **Care Coins**
Have managerial staff award “coins” (actual or digital) for observed excellence in hand hygiene. All staff should be eligible to win. Staff can spend the “coins” on a selection of attractive prizes provided by facility administrators.

✓ **Hand Hygiene and Residents**
Follow these tips to encourage hand hygiene among residents:

- Make sure hand hygiene supplies are always available and easy to access.
- Post signs about the importance of hand hygiene in common areas. Make sure the signs are visible.
- Provide residents with individual hand sanitizer bottles during flu season.

✓ **Hand Hygiene in Psychiatric and Dementia Units**
Provide soap and water rather than alcohol-based hand sanitizers in these units, as hand sanitizers might be ingested by residents. Consider providing staff in these settings with individual hand sanitizer bottles.
Additional Resources for Hand Hygiene

To download hand hygiene tools and training resources from the CDC, visit cdc.gov and search for “hand hygiene.”

For World Health Organization hand hygiene resources, visit who.int and search for “clean your hands” (Figure 1).

For sample hand hygiene competency validation forms, refer to the following organizations:
- The University of North Carolina at Chapel Hill: visit spice.unc.edu, click on “All resources” and search for “competency.”
- John’s Hopkins: visit hopkinsmedicine.org and search for “hand hygiene.”

For free Medscape CME training on hand hygiene and non-sterile glove use, visit medscape.com and search for “CME glove use.”

Figure 1: Sample visual aid to remind staff about hand hygiene (World Health Organization)

http://www.who.int/gpsc/5may/background/5moments/en/

My 5 Moments for Hand Hygiene

1. Before touching a patient
2. Before clean or aseptic procedures
3. After body fluid exposure or risk
4. After touching a patient
5. After touching patient surroundings
Personal Protective Equipment (PPE)
Personal Protective Equipment (PPE)

Personal protective equipment (PPE) is specialized clothing or equipment an employee wears for protection against injury or infection. Different types of infection prevention practices have different PPE requirements:

- **Standard Precautions** refer to the minimum level of infection control actions a health care worker should take to prevent the spread of infection. It can include the use of PPE in certain circumstances (e.g., when in contact with body fluids).

- **Transmission-Based Precautions** outline the different types of PPE that a health care worker needs to use depending on the type of infection they are exposed to and how that infection is transmitted.

It is critical that nursing home employees know how to select the appropriate PPE for a given situation and are trained to properly put on and remove PPE to avoid endangering other staff members and residents.

**Best Practice Recommendations**

Be sure to include written policies on Standard Precautions and Transmission-Based Precautions in the facility’s infection control policies and procedures manual. These guidelines should include the following:

- Procedures for the selection and correct use of PPE, especially when working with residents who may be contagious
- Which staff members are responsible for checking and restocking PPE supplies. Supplies should be placed in a central location and directly outside resident rooms with visible signage outlining what PPE should be used when Transmission-Based Precautions are in place.
- Who performs PPE training audits, and documents all trainings, audits and feedback in the employee record.
The ability to correctly select, put on (don), remove and safely dispose of used equipment requires practice. The following are best practices for IPs or their designees to ensure safe use of PPE equipment:

- Routinely and rigorously train all staff, including environmental staff, on how to use and select PPE. Training and practice should take place at the time of hire and annually.
- Re-evaluate and reinforce PPE best practices as needed or when there are staff members or residents with an infectious disease.
- Post clear signage on the doors of residents who require Transmission-Based Precautions. These signs should not reveal diagnoses, specific organisms or resident identifiers, but should state the types of precautions required and ideally what PPE should be used.¹⁷

¹⁷ NYSDOH Memo on Transmission-Based Precautions in Long-Term Care
✓ You’ve Got the Power
Ensure that any health care worker in your facility, regardless of position or credentials, is trained and empowered to stop anyone, including providers from entering a resident’s room without wearing the appropriate PPE. Employees should be recognized and praised whenever they ensure fellow staff follow PPE protocols.

✓ Hands-on/Directly Observed Training
Prioritize in-person PPE training rather than reliance on electronic learning. In-person training allows staff to become familiar with the feel and fit of equipment during donning and removal exercises. Routine practice decreases the likelihood of errors in procedure and sequence.

✓ Gloves
Provide focused training on glove use. Gloves are the most commonly used and most commonly misunderstood form of PPE. Training should include understanding which tasks require gloves, hand hygiene requirements before donning and after removing gloves, and safe disposal procedures. Fluorescent markers can be useful when training on glove removal.

✓ PPE Storage
Store PPE in dedicated closed cabinets or carts to reduce the likelihood of contamination.

✓ PPE Audits
Use actual events to monitor for correct PPE use. Provide feedback that reinforces best practices.
Additional Resources for Personal Protective Equipment (PPE)

To download the CDC’s guidelines for isolation precautions, as well as tools and training resources, visit cdc.gov/hai/prevent/ppe.html.

For recommendations for infection prevention and control for Candida auris, visit cdc.gov and search for “Candida auris.”

For guidance on infection control and containment of multidrug-resistant organisms, visit cdc.gov and search for “MDRO Containment.”

For free CE training modules on PPE and other infection control topics, visit spice.unc.edu; click on “Facility Type” and select “Long-Term Care”

To download a PPE competency validation checklist, refer to the following organizations:

- The University of North Carolina at Chapel Hill: visit spice.unc.edu, click on “All resources” and search for “PPE”
- Winnipeg Regional Health Authority: visit wrha.mb.ca and search for “audit tools”
Respiratory Hygiene and Cough Etiquette
Respiratory Hygiene and Cough Etiquette

Respiratory illnesses, particularly influenza, are a major cause of outbreaks in nursing homes. While a virus can be an irritation for staff members, it can cause serious illness in elderly residents and can result in hospitalization or even death.

Best Practice Recommendations

Infection prevention begins at the front door. All staff should be empowered to enforce and reinforce respiratory hygiene and cough etiquette from the front door and throughout the facility at all times.

- Post cough etiquette signs and posters at all entrances even when it is not influenza season. Signage should be clearly visible. It should include instructions on how to cover the mouth and nose when coughing or sneezing, how to dispose of tissues and how to perform hand hygiene after coughing and sneezing (Figure 2).
- Educate staff, residents and their visitors about the importance of covering their cough or sneeze, and performing hand hygiene.
- Inform family members at the time of the resident’s admission and periodically throughout the resident’s stay that they should avoid visiting when they are ill or if they have symptoms of a respiratory infection such as coughing or sneezing. Exceptions may be made but visitors must tell the front desk staff when they are entering the facility.
- Instruct front desk staff to offer masks and tissues to visitors who report having a respiratory illness or are coughing and sneezing. Front desk staff should call the nursing supervisor for approval prior to permitting the masked visitor to leave the front lobby and enter the residence areas.
- Make sure that masks, tissues and hand hygiene supplies are easily accessible at the entrances and throughout the facility—especially in common areas. Be sure to post eye-catching signs with instructions on how to use the supplies.
- Staff should tell their supervisors when they or other staff members have symptoms of a respiratory infection and they should be excluded from work until illness has resolved—this is especially important during flu season.18

18 Prevention Strategies for Seasonal Influenza in Healthcare Settings: Guidelines and Recommendations (CDC); https://www.cdc.gov/flu/professionals/infectioncontrol/healthcaresettings.htm
Good Ideas!

✓ **Focus on the Front Desk**
Help front desk staff understand that they are the first line of defense in protecting the facility, its residents and its staff from respiratory illnesses. Front desk staff who are specifically trained to recognize and address visitors with potentially infectious respiratory illnesses can reduce the risk of infection to residents and staff. A sample, easy-to-follow job action sheet for front desk staff can be found in Appendix B.

✓ **Enhanced Point of Entry Screening**
The IP should develop influenza-specific protocols to screen for potentially infectious visitors when they enter the facility so that infection control measures can be implemented quickly.

✓ **Communication Skills Training**
Consider offering communication skills training for staff, especially front desk staff, who have regular contact with family members and other visitors. Knowing what to say and how to say it can increase staffs’ comfort levels when they have to inform visitors who are ill that they should leave or take appropriate precautions. Make sure nursing staff are also available to speak to visitors who may be ill.

✓ **Influenza Education Sessions**
Provide in-person educational sessions or educational videos about the flu prior to the flu season. Host these events at times and locations that are convenient to residents, family members and other visitors.
Additional Resources for Respiratory Hygiene/Cough Etiquette

For cough etiquette information from the CDC, visit cdc.gov and search for “respiratory hygiene/cough etiquette.”

For seasonal influenza brochures and posters from the New York City Health Department, visit nyc.gov/health and search for “flu seasonal.”

For seasonal influenza communication resources from the CDC, visit cdc.gov and search for “prevent seasonal flu.” Click on “Communication Resource Center” at the bottom of page.

For tips on how to increase flu vaccination among long-term care staff members, visit cdc.gov and search for “toolkit for long-term care employers.”

Figure 2: Example poster for entryways and common areas from NYC Health
Antibiotic Stewardship
Antibiotic stewardship (also called antimicrobial stewardship) is the practice of appropriately prescribing antibiotics—that is, using them only when truly needed and ensuring the use of the right antibiotic at the right dose for the right length of time. Antibiotic stewardship is a global effort to halt a worldwide increase in antibiotic resistance. According to the CDC, at least 2 million people in the United States are infected by antibiotic-resistant bacteria each year, and about 23,000 people die as a result.19

Overexposure to antibiotics leads to antibiotic resistance and increases the risk for more severe and harder-to-treat infections, including *C. difficile*. The result is increased resident mortality, hospitalizations and cost. Antibiotic stewardship programs aim to preserve the effectiveness of antibiotics. The CMS Final Rule (2016) and the Joint Commission require that all participating nursing homes have an antibiotic stewardship program that includes antibiotic use protocols and a system to monitor antibiotic use.20, 21

Best Practice Recommendations

- Assess your antibiotic stewardship policies and practices against the CDC’s “Checklist for Core Elements of Antibiotic Stewardship in Nursing Homes” (2015). Use the checklist to initiate or expand stewardship activities in your facility.

- Ensure that your facility has access to and support from individuals with antibiotic expertise, ideally a physician or pharmacist with specialized training in infectious diseases.

- You should have written policies on antibiotic prescribing and other antibiotic stewardship activities, including appropriate use of diagnostic testing, such as urinalysis and cultures.

- Use national guidelines and local antibiotic susceptibilities to develop facility-specific algorithms for the assessment and treatment of residents with a suspected infection.22 This can minimize unnecessary antibiotic use and optimize antibiotic selection and duration (Figure 3).

---

A program director, ideally a physician or pharmacist with specialized training in infectious diseases, should monitor antibiotic prescribing and use in the facility. This person should:

- Create a program to conduct and support stewardship activities in your facility as outlined in the “Core Elements.”
- Work with the quality assurance committee to incorporate stewardship activities and measures into their program.
- Work with providers to improve prescribing practices.
- Oversee education and guidance of prescribers.
- Help clinicians communicate with residents and their families about appropriate antibiotic use.
- Ensure that nurses are educated and included in antibiotic stewardship activities.
Good Ideas!

✓ **Daily stewardship rounds**
During morning meetings, review any new and existing antibiotic prescriptions for each unit. This is an opportunity to evaluate indications, culture or test results, clinical response and appropriate duration of therapy.

✓ **Engage the Infection Preventionist (IP)**
Even if they are not directing antibiotic stewardship programs, IPs can be key participants in stewardship activities, such as surveillance and quality improvement initiatives.

✓ **Involve the Families**
Use family meetings and other occasions to educate families about antibiotic stewardship. These proactive conversations may help reduce family requests for antibiotics when antibiotic treatment is not indicated.

✓ **Invite Speakers**
Invite specialists, such as pulmonologists and infectious disease physicians, to speak to staff on the evaluation and treatment of complicated infections. This can help improve clinical practices around antibiotic use and can also be a great opportunity to build collaborative relationships with the local medical community and hospitals.

✓ **Watchful Waiting With Alternate Therapies**
Provide non-antibiotic treatment options for upper respiratory and other infections as appropriate, while monitoring the resident’s clinical status. Watchful waiting can reassure residents and families that staff are addressing their concerns and supervising the resident’s condition.

✓ **Provide Comfort Care for Viral Respiratory Infections**
“Prescribe” lozenges, hot drinks, honey and other non-antibiotic approaches to soothe symptoms of viral upper respiratory infection as appropriate.

✓ **Utilize Your Consultant Pharmacist**
If not already part of your stewardship team, establish a professional or consultative relationship with a clinical pharmacist to provide medication reviews and to assist in monitoring antibiotic use. This can be a powerful addition to your antibiotic stewardship program.
Additional Resources for Antibiotic Stewardship

To download the CDC’s “The Core Elements of Antibiotic Stewardship for Nursing Homes,” visit cdc.gov and search for “core elements for nursing homes.”

To download the Agency for Healthcare Research and Quality’s “Nursing Home Antimicrobial Stewardship Guide,” visit ahrq.gov and search for “ahrq nursing home antimicrobial stewardship guide.”

For information on how to educate families and residents, visit ahrq.gov and search for “Toolkit To Educate and Engage Residents and Family Members – AHRQ”

The following organizations offer tools, trainings and implementation resources:

- Rochester Nursing Home Collaborative: visit rochesterpatientsafety.com and click on the “For Nursing Homes” tab
- Minnesota Department of Health: visit health.state.mn.us and search for “Antimicrobial Stewardship Program Toolkit for Long-term Care”
- The University of North Carolina at Chapel Hill: visit unc.edu and search for “antibiotic use in nursing homes”
Figure 3: An example of evidence-based treatment guidelines based on Loeb’s Minimum Criteria for Initiating Antibiotic Therapy

<table>
<thead>
<tr>
<th>Minimum Criteria for Initiation of Antibiotics in Long-Term Care Residents</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Suspected Urinary Tract Infection</strong></td>
</tr>
<tr>
<td>NO indwelling catheter:</td>
</tr>
<tr>
<td>• Acute dysuria</td>
</tr>
<tr>
<td>• Fever (&gt;37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature) and at least one of the following: New or worsening:</td>
</tr>
<tr>
<td>• Urgency</td>
</tr>
<tr>
<td>• Frequency</td>
</tr>
<tr>
<td>• Suprapubic pain</td>
</tr>
<tr>

<tr>
<td>• Costovertebral angle tenderness</td>
</tr>
<tr>
<td>• Urinary incontinence</td>
</tr>
<tr>
<td>WITH indwelling catheter (Foley or suprapubic):</td>
</tr>
<tr>
<td>• At least one of the following:</td>
</tr>
<tr>
<td>• Fever (&gt;37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature)</td>
</tr>
<tr>
<td>• New costovertebral tenderness</td>
</tr>
<tr>
<td>• Rigors</td>
</tr>
<tr>
<td>• New onset of delirium</td>
</tr>
</tbody>
</table>
| Note: Foul smelling or cloudy urine is not a valid indication for initiating antibiotics. Asymptomatic bacteriuria should not be treated with antibiotics.

**Suspected Lower Respiratory Tract Infection**
- Fever >38.9°C [102°F] and at least one of the following:
  - Respiratory rate >25
  - Productive cough
- Fever (>37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature, but ≤38.9°C [102°F]) and cough and at least one of the following:
  - Pulse >100
  - Rigors
  - Delirium
  - Respiratory rate >25
- Afebrile resident with COPD and >65 years and new or increased cough with purulent sputum production
- Afebrile resident without COPD and new cough with purulent sputum production and at least one of the following:
  - Respiratory rate >25
  - Delirium
- New infiltrate on chest X-ray thought to represent pneumonia and at least one of the following:
  - Fever (>37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature) and cough and Respiratory rate >25
  - Productive cough

Chest X-ray and complete cell count with differential is reasonable for residents with fever, cough, and at least one of the following: pulse >100, worsening mental status, rigors

**Suspected Skin and Soft-tissue Infection**
- New or increasing purulent drainage at a wound, skin, or soft-tissue site
- At least 2 of the following:
  - Fever (>37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature)
  - Redness
  - Tenderness
  - Warmth
  - New or increasing swelling

**Fever with Unknown Focus of Infection**
- Fever (>37.9°C [100°F] or a 1.5°C [2.4°F] increase above baseline temperature) and at least one of the following:
  - New onset delirium
  - Rigors

Note: fever + mental status changes that do not meet delirium criteria (e.g. reduced functional activities, withdrawal, loss of appetite) need to be investigated but empiric antibiotics are not needed.

Injection Safety and Point of Care Testing
Injection Safety and Point of Care Testing

According to the CDC, between 2001 and 2011 there were at least 50 disease outbreaks linked to unsafe injection practices, affecting more than 150,000 patients. These outbreaks included transmissions of hepatitis B and C, as well as bacterial infections and even malaria.\(^{24}\) Safe injection practices, or injection safety, are Standard Precautions that include health care worker and equipment safety practices that prevent the spread of blood-borne diseases.

Best Practice Recommendations

- IPs should train all staff who administer injections or perform blood glucose monitoring on injection safety and glucometer use. Assess their competency at the time of hire and annually. Staff must show that they understand safe injection practices before they are allowed to give injections.
- Document training attendance, competency and any significant feedback in the employee record.
- Reinforce and monitor safe injection practices through routine audits.
- Support safe injection practices by providing safer technologies such as auto-disabling syringes; single-use needles, syringes and medication vials; and accessible sharps containers.

\(^{24}\) https://www.cdc.gov/injectionsafety/proviers.html
✓ “One and Only”
Use the CDC’s injection safety campaign materials to reinforce the importance of “one resident, one needle, one time.” Visit cdc.gov and search for “injection safety” to order free materials and see if your state is a campaign partner.

✓ Get Clinical Staff Input
Involve clinical staff in selecting the types of single use, disposable, auto-retracting devices when purchasing decisions are made.

✓ Competency Evaluation for All
Evaluate injection safety competence for all staff who provide parenteral injections regardless of professional licensure or experience.
Additional Resources for Injection Safety and Point of Care Testing

For CDC injection safety guidance and resources, visit cdc.gov and search for “injection safety.”

For free CME/CE training activities, visit medscape.com and search for “injection safety CME.”

To download the CDC’s “Infection Prevention during Blood Glucose Monitoring and Insulin Administration” guide, visit cdc.gov and search for “blood glucose monitoring.”

To download a competency validation tool, visit spice.unc.edu. Click on “All Resources” and search for “injection safety.”
Environmental Cleaning and Disinfection

A clean environment helps prevent the spread of diseases. The environment includes the facility and any shared patient care equipment. Dangerous microorganisms can live on surfaces and can spread to patients, staff, and visitors. Educate all staff about their role in keeping the facility and equipment clean and disinfected.

Best Practice Recommendations

- Ensure written policies and procedures include instructions on routine and terminal cleaning (when residents leave) and disinfection of resident rooms, high-touch surfaces in common areas, shared equipment and reusable medical devices (e.g., blood pressure cuffs, rehab equipment, etc.). Plans should address specific pathogens such as \textit{C. difficile}, \textit{C. auris} and \textit{norovirus} that require special procedures.

- Clearly identify which staff are responsible for specific tasks and equipment, and how often they should clean or inspect them.

- Provide Environmental Protection Agency (EPA)-registered cleaning and disinfecting supplies. These should be easily accessible to staff. Label disinfectants as “EPA-registered hospital disinfectant” and require staff to use them according to the manufacturer’s instructions, paying particular attention to contact times.\textsuperscript{25}

- In general, use EPA-registered hospital disinfectants to clean most surfaces and patient areas. However, some surfaces and areas may require special products specifically labeled as effective against \textit{C. difficile} and norovirus.\textsuperscript{26} Include these exceptions in your written policies and procedures manual.

- Clean blood and body substances with tuberculocidal or registered germicides on the EPA Lists D and E (i.e., products with specific label claims for HIV or hepatitis B virus [HBV]) following label instructions.

- Train all staff on job-specific cleaning policies and procedures and assess their competency at the time of hire, annually and when new equipment and/or procedures are introduced.

- If a contractor provides your environmental services, you should ensure they are training their staff appropriately.

- Reinforce and monitor cleaning practices through routine audits of both your facility staff and contractors.

- Document training attendance, competency and any significant feedback in the employee record.

- Provide external service providers (e.g., podiatrists) with clean spaces but clarify that they and not the facility are responsible for cleaning, disinfesting and sterilizing their own equipment.

\textsuperscript{25} Identify and using hospital grade disinfectants: https://www.cleanlink.com/hs/article.aspx?id=16318

\textsuperscript{26} A listing of approved products are found on List K: EPA’s Registered Antimicrobial Products Effective against Clostridium difficile Spores https://www.epa.gov/sites/production/files/2017-01/documents/20170201_listk_.pdf
Good Ideas!

 ✓ Fluorescent Products
 Use a fluorescent gel, powder or lotion to assess staff and ensure that they have properly cleaned hard-to-reach areas that are sometimes skipped. Use these products as part of ongoing audits and feedback, and in trainings.

 ✓ Wheelchair Washing Machines
 If you have a large amount of wheelchairs that require regular cleaning, consider investing in specialized cleaning equipment for wheelchairs to efficiently clean these shared resources.

 ✓ Broad Staff Involvement
 Invite Environmental Services colleagues to participate in multi-disciplinary rounds. Assign environmental staff at all levels to accompany managers to multi-disciplinary infection control meetings to help them feel included in the infection control team.

 ✓ A Top-to-Bottom Checklist
 Consider using a stepwise room cleaning process to standardize and assure cleaning of every touch point in a resident room.

 ✓ Disposable or Dedicated Equipment
 Use disposable equipment to maintain the cleanliness of shared equipment, such as disposable stethoscopes or disposable sheaths for blood pressure cuffs. Whenever possible, dedicate specific equipment for residents on contact precautions.
Additional Resources for Antibiotic Stewardship

The following organizations offer environmental infection control guidance:

- CDC: visit cdc.gov and search for “Environmental Guidelines”
- Asia Pacific Society of Infection Control: visit pubmed.gov and search for “APSIC Guidelines for environmental cleaning and decontamination”

To download the CDC’s environmental cleaning evaluation toolkit, including checklists, visit cdc.gov and search for “evaluating environmental cleaning”

The following organizations offer recommendations on environmental disinfection for *Candida auris*:

- CDC: visit cdc.gov and search for “Environmental disinfection for candida auris”
- Environmental Protection Agency: visit epa.gov and search for “candida auris”; this resource also includes a list of antimicrobial products effective against *Clostridium difficile* spores

The following organizations offer free CME/CE activities on Environmental Services and Infection Control:

- Medscape: visit medscape.com and search for “CME Environmental Services and Infection Prevention”

</table>
ONE! TWO! THREE! FOUR!
Stop Infection at the Door

Point of entry basics for front desk personnel: a four step process to manage potentially infectious visitors, volunteers, or other individuals who want to enter the nursing home.

1. **RECOGNIZE:** Teach front desk staff how to identify potentially infectious visitors. Use signage — such as a Cover Your Cough poster — explaining people should wait to visit if they feel unwell.

2. **CONTAIN SECRETIONS:** If a potentially infectious visitor chooses to remain, offer them a mask and tissues, and point out trash bins and hand sanitizer stations.

3. **SEPARATE:** Try to place the potentially infectious person away from others in the waiting area.

4. **EVALUATE:** Refer the visitor to the Nursing Supervisor for evaluation and education.
**Candida auris: A drug-resistant yeast that spreads in healthcare facilities**

**A CDC message to infection preventionists**

*Candida auris* is a yeast that causes serious infections. Infection preventionists, healthcare workers, and laboratory staff can all help stop it from spreading.

**Why is Candida auris a problem?**

- **It causes serious infections.** *C. auris* can cause bloodstream and other types of invasive infections, particularly in patients in hospitals and nursing homes who have multiple medical problems. More than 1 in 3 patients die within a month of *C. auris* infection.

- **It is often multidrug-resistant.** Antifungal medications commonly used to treat Candida infections often don’t work for *C. auris*. Some *C. auris* isolates are resistant to all three major classes of antifungal medications.

- **It’s becoming more common.** Although *C. auris* was just recognized in 2009, it has emerged quickly. Since then, it has been reported from over 20 countries, including the United States.

- **It’s difficult to identify.** *C. auris* can be misidentified as other types of yeast unless specialized laboratory methods are used. Unrecognized *C. auris* can spread to other patients in a facility, causing an outbreak. Identifying *C. auris* is critical to knowing what steps to take to control it in a healthcare setting.

- **It can spread in healthcare facilities.** Just like other multidrug-resistant organisms such as CRE and MRSA, *C. auris* can be transmitted in healthcare settings and cause outbreaks. It can colonize patients for many months, persist in the environment, and withstand many routinely used disinfectants in healthcare facilities.

**Early detection and infection control can limit the spread of *C. auris***

**Prepare for *C. auris* in your facility**

1. Work with your laboratory to ensure the yeast identification method used in your facility can identify *C. auris*. If it cannot, know when to suspect *C. auris* and send suspected isolates to your state or local public health department for further identification.

2. Begin surveillance. Establish a protocol with your laboratory so that your department is promptly informed when *C. auris* is suspected.
   i. If your laboratory is not equipped to identify *C. auris*, begin surveillance for organisms that commonly represent a *C. auris* misidentification. See [www.cdc.gov/fungal/candida-auris](http://www.cdc.gov/fungal/candida-auris) for common misidentifications by yeast identification method.
3. Know which patients are at higher risk for *C. auris*. These include:
   
i. Patients who have received healthcare in post-acute care facilities (e.g., nursing homes), especially those with ventilator units.

   ii. Patients with a recent history of receiving healthcare outside the United States in a country with known *C. auris* transmission (visit [www.cdc.gov/fungal/candida-auris](http://www.cdc.gov/fungal/candida-auris) for a map of countries). These patients have a higher risk of *C. auris* infection or asymptomatic colonization.

4. Have a response plan. Discuss recommendations for infection prevention and control of *C. auris* with healthcare staff, including environmental services.

**What should I do if there is *C. auris* in my facility?**

1. Check the CDC website for the most up-to-date guidance on identifying and managing *C. auris*: [www.cdc.gov/fungal/candida-auris](http://www.cdc.gov/fungal/candida-auris).

2. Report possible or confirmed *C. auris* immediately to your public health department.

3. Ensure adherence to CDC recommendations for infection control, including:
   
i. Place patients infected or colonized with *C. auris* in a single room on contact precautions

   ii. Assess and enhance gown and glove use

   iii. Reinforce hand hygiene

   iv. Coordinate with environmental services to ensure the patient care environment is cleaned with a disinfectant that is effective against *C. auris* (i.e., those effective against *Clostridium difficile*) by searching “List K” at [www.epa.gov](http://www.epa.gov). Work with the environmental services team to monitor the cleaning process.

4. After consulting with public health personnel, screen contacts of case-patients to identify patients with *C. auris* colonization. Use the same infection control measures for patients found to be colonized.

5. When a patient is being transferred from your facility (e.g., to a nursing home or other hospital), clearly communicate the patient’s *C. auris* status to receiving healthcare providers.
