Nearly 700,000 people in the United States are transgender,
meaning they have a difference between the gender they
identify as and the sex they were assigned at birth. While the
transgender population is not large, it is important for health
care providers to be equipped to care for transgender
patients. The transgender experience creates unique
health care needs, but many transgender individuals
avoid medical care because they fear discrimination
or have had a previous negative experience. Those
who do seek care may avoid discussing gender with
providers or find that few providers have an appropriate
understanding of their social and health concerns.

This lack of access to quality care has
historically led transgender people to self-manage their
health care, sometimes using medically unsupervised
hormone treatment and silicone injections that may
have serious complications.

BOX 1. HEALTH AND SOCIAL INEQUALITIES
AFFECTING THE TRANSGENDER COMMUNITY

People of transgender experience face increased risks of
- Depression and suicide
- Anxiety
- Trauma and posttraumatic stress
- Tobacco and substance use
- Poverty, homelessness, and unemployment
- Intimate partner violence
- Hate violence and sexual abuse
- Sexually transmitted infections, including HIV

What you should do for the transgender patient (box)
RESOURCES FOR PROVIDERS
RESOURCES FOR PATIENTS
You can support transgender patients and encourage them to seek quality health care. Take a sensitive, affirming approach in your practice by

- creating a welcoming environment (Box 2,7,8),
- discussing the patient’s needs and priorities,
- providing appropriate screenings and referrals to providers with specialized training and clinical competencies (eg, for hormone or surgical treatment and transgender-specific mental health concerns),
- addressing health concerns related to hormonal interventions or surgeries,
- assisting with corrections to legal documents such as birth certificates.

**GET TO KNOW YOUR PATIENT**

If you are uncertain of a patient’s gender identity, explain that you ask all patients about gender out of respect for their right to self-identify (see Box 4 for sample questions). Ask for clarification of unfamiliar terms and apologize promptly if you say anything that has offended the patient. Some providers choose to ask about gender identity on the patient intake form.

As with all patients, use a nonjudgmental and empathetic approach to the interview. Be sensitive and patient; fear or....

---

**BOX 2. CREATING A WELCOMING ENVIRONMENT**2,7,8

- Provide patient intake forms that use trans-inclusive language [Resources].
- Understand and train staff on gender-related terminology [Box 3],2,10,13-15.
- Ask patients about their preferred name and pronouns, which may not match their legal documentation or insurance card.
- Instruct staff to use respectful, nonjudgmental language and to use the patient’s preferred name and pronouns [Resources—Training].
- Provide gender-neutral bathrooms.2
- Post nondiscrimination statements that include gender identity and expression [Resources].

---

**BOX 3. GENDER-RELATED TERMINOLOGY**2,10,13-15

- **Sex:** a collection of primary (vagina, penis) and secondary (facial hair) biological, anatomical characteristics placed in male, female, or intersex categories.
- **Gender-affirming care:** medical or surgical treatments that alter a person’s biological sex to correspond with inner gender identity.
- **Gender identity:** one’s sense of self as a man, woman, or an alternative gender. Gender identity may not correspond with the biological sex assigned at birth.2
- **Gender expression:** the way a person represents or expresses their gender identity to others, often through behavior, clothing, hairstyles, voice, or body characteristics. Gender expression may not correspond with a person’s gender identity or gender perceived by an observer.2,10,13
- **Transgender:** describes a person whose gender identity and/or gender expression differs from or transcends the culturally defined gender that was assigned at birth. “Transgender” can describe a wide range of experiences and forms of expression.2,14
  - **Transgender man, transman, transmasculine person:** a person with a masculine identity who was assigned female sex at birth.
  - **Transgender woman, transwoman, transfeminine person:** a person with a feminine identity who was assigned male sex at birth.
- **Gender nonconforming or genderqueer:** a person who does not fully embrace either a female or male identity.
- **Transition:** the period when a transgender person starts to live as a member of a different gender than that assigned at birth. Transition may include changes in name, pronouns, and gender expression; cosmetic changes; medical treatment; and surgery. Length of transition is different for each person.2
- **Transsexual:** a medical term for a person who has pursued or wants to pursue body-altering hormone or surgical therapy to live as a member of a gender other than that assigned at birth.2
- **Gender dysphoria:** a clinical diagnosis in the DSM-5 defined as marked incongruence between a person’s experience/expressed gender and that person’s primary and secondary sexual characteristics. For clinical diagnosis, there must be evidence of significant distress or impairment to social, occupational, or other important areas of functioning.15

---

2American Psychiatric Association. Diagnostic and Statistical Manual of Mental Disorders, 5th Edition; 2013.15
BOX 4. TALKING ABOUT GENDER—SAMPLE QUESTIONS7,8
Ask only necessary or relevant questions and explain why you’re asking them.7
• What name and gender pronouns do you prefer?
• How would you describe your gender identity?
• Have there been changes to your gender identity over time?8
• Have you ever pursued any changes to your appearance or body to bring it closer to your sense of self? Is this something you’ve thought about pursuing in the future?9

Infections

Screen for Sexually Transmitted Infections
Screen for
• HIV, gonorrhea, chlamydia, and syphilis every 3 to 6 months if the patient reports recurrent STIs, sharing syringes, sex without condoms with a partner who might be at risk, or anal or vaginal sex without condoms with multiple partners.2

Don’t make assumptions about past or future sexual behavior or partners. Anyone can have sex partners of any gender, and sexual behavior can change over time. Make the sexual history part of routine ongoing care for all patients (see Box 5 for sample questions).12 Use the language your patients use to describe themselves, their bodies, their sexual activities, and their partners.10

Ask only clinically relevant questions about
• types of sex, partners’ gender, and number of partners,
• contraception, condom and barrier use, and frequency of use,
• STI history,
• potentially risky sex practices (eg, using drugs while having sex), which may indicate a need for safer sex counseling,
• experience of sexual abuse and intimate partner violence (Resources—City Health Information: Intimate Partner Violence),
• risk factors for HIV and viral hepatitis, such as sharing syringes or injectable liquid silicone or hormones.

ASCEND MENTAL HEALTH

Transgender people often face discrimination—which is more common among trans people of color—resulting in unequal access to housing, employment, and health care. These social inequalities, along with trauma, stigmatization, and the stress associated with the transgender experience, can contribute to increased risk for mental health concerns. Screen transgender patients for depression, anxiety, and other mental health conditions (Table46-22).
If a patient has a positive screen, strongly consider referral to a mental health specialist with experience in working with transgender people (Resources for Patients). A specialized provider can:

- address mental health diagnoses, which may or may not be related to gender concerns,
- help the patient explore identity,
- facilitate the coming-out process,
- assess and diagnose gender dysphoria, a criterion for accessing gender-affirming health care for most insurances,
- help assess informed consent and readiness for hormone treatment or surgery when needed,
- help provide psychological support for family members.

### PROVIDE PHYSICAL EXAMINATION AND PREVENTIVE CARE

Provide primary care appropriate to the person’s hormone status, sexual behavior, and physical anatomy, regardless of gender identity or expression. Physical exams may be physically and/or emotionally uncomfortable for the patient. If examination of breasts or genitals is indicated, assess the patient’s comfort level, explain the procedure and its risks and benefits, and obtain permission before proceeding. Ask the patient what would make him or her more comfortable with the exam and what words you should use for specific body parts.

Hormone treatment status is a major factor in determining what screenings are appropriate for the patient. Ask patients if

</table>
and for how long they’ve been taking hormones (with or without medical supervision). If the patient reports using hormones without medical supervision, test for HIV and HCV and refer to specialized care for further evaluation (Resources for Patients —Comprehensive Services). See Box 6 for information about hormone treatment that transgender patients may have had or may begin while in your care. Surgical history also affects screening; be sure to ask if the patient has had chest surgery, genital reconstruction (bottom surgery), or removal of uterus or ovaries.

**Primary care for transgender women**

**All Transgender Women**

Screen for

- **Prostate cancer**: digital rectal examination. (PSA is falsely low in androgen-deficient settings, even in the presence of cancer; only consider PSA screening in high-risk patients.)
- **Asthma, chronic obstructive pulmonary disease, and tuberculosis**, which could preclude surgical treatments.
- **Past or risk of future silicone injection**: counsel to avoid treatment outside a medical context or outside the US.

**With a Constructed Vagina**

- Perform periodic visual inspection with a speculum or anoscope for genital warts, erosions, and other lesions. First ask the patient about complications from the surgery, such as significant lack of depth or scar tissue, to allow best interpretation of the examination findings. Counsel women about vaginal capacity as it may relate to sex.
- Take a culture swab if STI is suspected.

**Past or Current Hormone Use**

Screen for

- **Breast cancer**: order screening mammography if the patient is older than 50 with risk factors (eg, estrogen and progestin use >5 years, positive family history, BMI > 35).

**Currently Taking Estrogen**

Routinely ask about cardiac events or symptoms, especially during the first 1 to 2 years of hormone therapy.

Monitor cardiovascular risk factors:

- **Hypertension**: check every 1 to 3 months (goal: systolic ≤130 mm Hg, diastolic ≤ 90 mm Hg). Consider spironolactone (an anti-androgen) as part of hypertension treatment.
- **Lipids**: perform annual fasting lipid profile: See 2013 ACC/AHA Guideline on the Treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults.
- **Diabetes**: consider annual testing, especially if there is a family history of diabetes and/or >12 pound weight gain; consider glucose tolerance testing and/or A1C test if there is evidence of impaired glucose tolerance without diabetes. Consult an expert if a reduction in hormones is needed to improve glucose control.

**BOX 6. WHAT YOU SHOULD KNOW ABOUT GENDER-AFFIRMING HORMONE TREATMENT**

**General**

- Cross-sex hormone treatment can cause overall endocrine imbalances, with or without gonadectomy. Maintain a high index of suspicion for thyroid disorders and screen appropriately.
- Patients in the early stages of hormone therapy may experience transient symptoms such as sleeplessness, leg cramps, and nausea.

**Feminizing hormones**

- Any feminizing hormone
  - Early effects (first 3 to 6 months): decreased libido, decreased facial and body hair, decreased skin oiliness, breast tissue growth, and redistribution of fat mass
  - Longer-term effects: atrophy of the prostate gland and testicles
- **Estrogen**
  - May increase risk for heart disease, diabetes, and hypertension
  - Oral estrogens (especially ethinyl estradiol) increase risk for venous thromboembolism (VTE).
  - Transdermal formulations safest in patients with higher VTE risk (age >35 or smokers)
- **Anti-androgens**
  - Include spironolactone, GnRH agonists (goserelin), and 5-alpha reductase inhibitors (finasteride)
  - Decrease masculine characteristics, reducing required dose of estrogen
  - Spironolactone often used in combination with estrogen
  - GnRH agonists less frequently used
  - Finasteride often used to slow male pattern balding

**Masculinizing hormone**

- **Testosterone**
  - Early effects (first 1 to 3 months): cessation of menses, increased libido, increased facial and body hair, increased skin oiliness, increased muscle, and redistribution of fat mass;
  - Longer-term (first year): deepening of the voice, clitoromegaly, and, in some individuals, male pattern baldness;
  - Intramuscular formulations may be more rapid acting.
- Not a contraceptive. Men with internal female organs are still at risk for pregnancy if having vaginal sex without condoms with fertile males.

**NOTE:** Progestins are not currently recommended; evidence for clinical effect and risk profile is unclear. For more information, see Resources—Transgender Health Guidelines.
Primary care for transgender men

Past or Current Hormone Use

Screen for

- **Breast cancer**: perform annual chest wall/axillary exam; perform mammography as for natal females if the patient has not had chest reconstruction.

- **Cervical cancer**
  - after total hysterectomy: if the patient has a history of high-grade cervical dysplasia and/or cervical cancer, do annual Pap smear of vaginal cuff until 3 normal tests are documented; continue Pap every 2 to 3 years.
  - after only oophorectomy: follow Pap guidelines for natal females; may defer if no history of genital sexual activity.
  - Inform pathologist of current or prior testosterone use (cervical atrophy can mimic dysplasia).

- **Uterine cancer**: evaluate spontaneous vaginal bleeding in the absence of a mitigating factor (eg, missed testosterone doses, excessive testosterone dosing leading to increased estrogen levels, weight changes, thyroid disorders) as for postmenopausal natal females. Consider hysterectomy if fertility is not an issue, patient is >40 years, and health will not be adversely affected by surgery.

Currently Taking Testosterone

Closely monitor for cardiac events or symptoms, especially during the first 1 to 2 years of use.

- **Cardiac events and symptoms**: routinely ask about events or symptoms, especially during the first 1 to 2 years of hormone therapy.

- **Blood pressure**: check every 1 to 3 months (goal: systolic ≤130 mm Hg, diastolic ≤ 90 mm Hg).

- **Lipids**: perform annual fasting lipid profile.
  - See 2013 ACC/AHA Guideline on the Treatment of Blood Cholesterol to Reduce Atherosclerotic Cardiovascular Risk in Adults.

Consider musculoskeletal health:

- **Exercise**: counsel transmen involved in strength training to increase weight load gradually and to emphasize repetitions rather than weight. Emphasize stretching.

- **Osteoporosis**
  - If the patient has used testosterone for >5-10 years and has ovaries, consider bone density screening beginning at age 50, and earlier if there are additional risk factors.
  - If the patient has had ovaries removed or had a total hysterectomy and past or present testosterone use, consider bone density screening if
    - age >60 and testosterone use for <5-10 years or
    - age ≥50, and testosterone use >5-10 years, and earlier if additional risk factors for osteoporosis.
  - Recommend supplemental calcium and vitamin D in accordance with current osteoporosis prevention guidelines.

UNDERSTAND TRANSITION

Transgender people who want to transition to living as a member of a different gender have many options, including gender expression changes, medical (hormone) therapy, and surgical treatment. In New York State, health insurance must cover gender-affirming medical treatment and some gender-affirming surgeries for people diagnosed with gender dysphoria, as described in Box 3; however, patients may not find in-network providers who offer such treatment. Refer patients who want to pursue medical or surgical options to specialized medical care for a full evaluation and a thorough discussion so that the patient can make an informed choice.

Nonmedical changes in gender expression include

- choosing a new name and pronouns;
- changing dress and grooming;
- official change of gender on a birth certificate (Box 7; Resources—Identification Documents);
- voice and communication therapy;
- for transwomen: hair removal, breast padding, genital tucking, packing of hips or buttocks;
- for transmen: chest binding, penile prosthesis.

BOX 7. CHANGING THE GENDER MARKER ON A NEW YORK CITY BIRTH CERTIFICATE

A patient can change the gender marker on their NYC birth certificate by submitting

- completed Birth Correction Application form (VR-172) (Resources),
- photocopy of current, signed photo identification,
- check or money order for $55 ($40 processing fee plus $15 fee for new certificate) made payable to the NYC Department of Health and Mental Hygiene. Walk-in customers may pay using a debit or credit card.
- signed Affidavit/Affidavit from a US-licensed physician (MD or DO), clinical psychologist (PhD or PsyD), social worker (LMSW or LCSW), physician assistant, nurse practitioner, marriage and family therapist, mental health counselor, or midwife.

The affidavit must include the provider’s

- professional credentials,
- statement that, in keeping with contemporary expert standards regarding gender identity, the applicant’s requested change of sex designation of male or female accurately reflects the applicant’s gender identity.

Affidavits provided by practitioners other than MD/DO must be notarized.

For more information, visit Frequently Asked Questions About Correcting a NYC Birth Certificate (Resources).
Hormone therapy. See Box 6 for information about hormone treatment that a transgender patient may receive while in your care.

Surgery may not be desired by everyone who wants to transition, but it may be essential to some.10 For transwomen, options include breast implants or lipofilling, facial feminization, voice surgery, tracheal shave, hysterectomy, oophorectomy, and genital reconstruction (bottom surgery) such as vaginoplasty, orchietomy, penectomy, clitoroplasty, and vulvoplasty. For transmen, options include subcutaneous mastectomy, hysterectomy/salpingo-oophorectomy, vaginectomy, and bottom surgery such as metoidioplasty, phalloplasty, scrotoplasty, and implantation of erection and/or testicular prostheses.

SUMMARY
Transgender people often experience barriers to health care access and are at increased risk for depression, trauma, sexually transmitted infections, and other conditions. As a primary care provider, you play a critical role in removing these barriers.

WHAT YOU SHOULD DO FOR THE TRANSGENDER PATIENT

- Be accepting and sensitive.
- Assess mental health.
- Take a sexual history.
- Screen for and vaccinate against sexually transmitted infections.
- Ask about prior or current hormone treatment.
- Provide cancer screenings and other preventive care based on the patient’s anatomy and hormone use.
- Assist with changes to birth certificates or other legal documents.
- Refer to specialized care if there are mental health concerns or a desire for medical or surgical gender-affirming treatment.
