COVID-19 At-home Testing

COVID-19 at-home testing allows some or all parts of the testing process to happen at home. Some at-home tests have you collect a nasal or saliva sample and send it to a lab. Others allow you to test the sample yourself, with results in minutes.

Tips for Performing an At-home Test

- Read the instructions carefully and view any step-by-step videos from the test makers before beginning the test.
- Before and after testing, wash your hands with soap and water, and disinfect the table or other surface where you are performing the test.
- Do not use expired tests, or test components that are damaged or discolored.
- Read the test result within the amount of time written in the test kit instructions. A result read before or after the written timeframe may be incorrect.
- Do not reuse test kits or components.

At-home testing may be less accurate than tests performed by a health care provider. For this reason, there are times when you should go to a provider for a test to confirm the results.

Additional Resources

- For information about COVID-19 treatment, visit nyc.gov/health/covidtreatments. Treatment works best the sooner you start, so call your provider right away if you test positive.
- For information on quarantine and isolation, including precautions you should take, visit on.nyc.gov/quarantine-isolation.
- For resources to help you isolate, call 212-COVID19 (212-268-4319) or visit www.nychearthandhospitals.org/take-care.
- To find a testing site, many of which are no cost, visit nyc.gov/covidtest.
- Visit nyc.gov/health/testingtips or scan this QR code for links to videos with instructions on performing at-home tests.

The NYC Health Department may change recommendations as the situation evolves. 4.5.22

---

¹ You can end isolation after five full days (where Day 1 is the day after symptoms begin, or if no symptoms, the day after your COVID-19 test) if you have no symptoms or symptoms are improving and you have not had a fever for the last 24 hours without taking medicine. People unable to wear a well-fitting mask must isolate for 10 days. People with weakened immune systems may need to isolate for longer than five days. Some settings, such as nursing homes, may have longer isolation requirements, and your employer may have different requirements for returning to work.

² Close contacts are people who have been within 6 feet of you for 15 minutes or more over a 24-hour period while you have COVID-19. This can be from two days before your symptoms began (or if you had no symptoms, two days before your positive test) to the time you started isolation. If you were at work during this time, tell your employer. If your child tests positive and was in school during this time, tell their school.

³ Symptoms include fever, chills, cough, shortness of breath, difficulty breathing, muscle or body aches, headache, loss of taste or smell, sore throat, congestion, runny nose, nausea, vomiting and diarrhea.

⁴ Up to date means you are fully vaccinated (received both doses of a two-dose vaccine or the single-dose Johnson & Johnson vaccine) and have received additional doses and boosters if eligible.

⁵ This applies to anyone who had confirmed COVID-19 (meaning they had a positive viral test) in the past 90 days and recovered.

⁶ You can end quarantine after five days (where Day 1 is the day after your last exposure) if you are always able to wear a well-fitting mask around others. Otherwise, quarantine for 10 days. Some settings, such as nursing homes, may have different quarantine requirements.
