The Health of East Harlem

Manhattan
This community health profile highlights important health issues facing the residents of East Harlem, with a special focus on preventable causes of illness and death. Preventing illness requires people making healthy life choices, neighborhood resources that promote healthy living, and high-quality, accessible medical care.

New York City is the most diverse city in the U.S. This is reflected in the unique character of each neighborhood. Strategies to improve New Yorkers’ health should take local concerns into account and be based on an understanding of how decisions at the city level affect local residents. The burden of illness and death does not fall equally across New York City’s neighborhoods. One of the primary goals of the Department of Health and Mental Hygiene is to reduce and eliminate these disparities by improving health in communities with the greatest need.

Improving the health of all New Yorkers requires the involvement and cooperation of individual residents, community-based organizations, and the public health community. We hope that this health profile will support this effort in East Harlem and across New York City.

Thomas R. Frieden, MD, MPH
Commissioner
This summary shows how the health of residents of East Harlem compares to 41 other neighborhoods in New York City. In general, people living in East Harlem have a heavy burden of illness and mortality. The challenge of improving these indicators does not fall only on neighborhood residents but is a shared responsibility between all sectors of society.

East Harlem compared to 41 other NYC neighborhoods

Please see the technical notes on page 11 for details on how these measures were calculated.

In a recent survey, adults in East Harlem and across New York City were asked to rate their own health. The options were “Excellent,” “Very Good,” “Good,” “Fair,” and “Poor.” In East Harlem, 30% said their health is "Poor" or "Fair." How people rate their own health is a good indication of the overall health of a community.
Heart disease and cancer caused the most deaths in 2001 among East Harlem residents. Death rates for all causes were higher in East Harlem than in New York City as a whole, particularly for AIDS, neurologic and liver disease, drug-related causes, and diabetes.

**Premature death**

People who die before age 75 can be thought of as dying prematurely. The difference between 75 years and the age of a person who dies before that is called the “years of potential life lost.” Almost half the years of potential life lost in East Harlem were due to 3 causes: AIDS, heart disease/stroke, and cancer.

**More than 12,000 years of potential life were lost before age 75 in East Harlem in 2001**

- Heart disease and stroke: 16% (1,991 years lost)
- Cancer: 14% (1,721 years lost)
- AIDS: 17% (2,048 years lost)
- Other causes: 53% (6,709 years lost)
The Health of East Harlem

Heart disease is the leading cause of adult hospitalization in East Harlem. The hospitalization data also reveal the burden of illness due to mental illness and drug and alcohol abuse, as well as injuries and asthma. Hospitalization rates in East Harlem are higher than in New York City as a whole.

*Age-adjusted

Mental illness

Depression is a common and serious health problem that often goes undiagnosed but is treatable. Other treatable mental health problems, such as anxiety, affect many New Yorkers. The high number of hospitalizations for mental illness among East Harlem residents is one indication of the burden of mental illness there. In addition, in a recent telephone survey, 9% of adults in East Harlem — corresponding to about 7,000 people — reported experiencing serious emotional distress.
HIV/AIDS

While the number of AIDS deaths has dropped dramatically across New York City over the past decade, HIV/AIDS remains a very serious public health problem. Nearly two hundred people are diagnosed with HIV each year in East Harlem, and over two thousand people are living with HIV/AIDS.

Reducing risky sexual behavior, getting tested for HIV, and ensuring high-quality treatment of all HIV-infected people are effective ways of preventing new HIV infections and AIDS.

The health of mothers and children is an important measure of the overall health of a community. Ensuring that children get a healthy start and learn healthy behaviors has many long-term benefits.

Maternal and infant health

Three important measures of maternal and infant health are:

1. Early prenatal care (care initiated in the first trimester)
2. Low birthweight, which increases the risk for many health problems
3. Infant mortality (deaths of babies under one year of age)

East Harlem is higher than the citywide average for all these indicators.
The Health of East Harlem

Asthma
Asthma affects a large number of New York City’s children and is a leading cause of missed school days and hospitalizations. The asthma hospitalization rate in East Harlem is higher than in New York City as a whole. There were 407 asthma hospitalizations among children in East Harlem in 2001.

Injuries
Injury is a preventable threat to children’s health. In 2001, 170 children in East Harlem were hospitalized with injuries, including those from falls, burns, and motor-vehicle crashes. The rate of hospitalization for injuries among children in East Harlem is almost twice the citywide rate.

Lead poisoning
Lead can cause neurologic, learning, and behavioral problems, and lowered intelligence. While the number of lead-poisoned children in New York City has decreased over the past decade, the goal is to eliminate lead poisoning by preventing children’s exposure to lead paint and other sources of lead. There were 92 children newly diagnosed with lead poisoning in East Harlem in 2001 (defined as blood levels over 10 µg/dL).
Promoting healthy behaviors and reducing risks

Smoking
Smoking causes heart disease, stroke, emphysema, lung cancer, and many other illnesses. Currently, nearly one quarter of adults in East Harlem smoke. Most, however, want to quit, and more than half tried last year. There are a number of highly effective strategies, including medication (such as the nicotine patch) and counseling, to help smokers quit.

Exercise, obesity, and diabetes
As New Yorkers exercise less and eat more, we are becoming more overweight. Being overweight puts people at risk for heart disease and many other health problems, especially diabetes. Diabetes is a chronic illness that can lead to heart attack, blindness, kidney failure, and amputations. Many New Yorkers are not getting enough exercise and are obese.* Even modest increases in exercise and reductions in weight can reduce the risk of diabetes by more than half.

* The Centers for Disease Control and Prevention recommends that adults get either moderate exercise for at least 30 minutes, 5 or more times per week, or vigorous exercise for at least 20 minutes, 3 or more times per week. Obesity is defined by someone’s “weight for height” — otherwise known as the “body mass index” or BMI — being over 30. “Overweight” is defined by a BMI over 25. Everyone should aim for a BMI less than 25. For example, a 5’10” man who weighs less than 175 lbs and a 5’4” woman who weighs less than 145 lbs have BMIs less than 25. To calculate BMI, visit www.cdc.gov/nccdphp/dnpa/bmi/bmi-adult.htm.
**Alcohol**

Heavy drinking is responsible for many preventable illnesses, injuries, and deaths, including those caused by motor-vehicle crashes and other accidents, liver disease, and cancer. One pattern of alcohol misuse that can lead to violence and health problems is “binge” drinking (consuming 5 or more drinks on one occasion).

---

**Risk behaviors for HIV**

Many adults in East Harlem — nearly 1 in 11 — report at least one of the following behaviors that put them at risk for HIV: using injection drugs, having unprotected anal intercourse, exchanging sex or drugs for money, or having a sexually transmitted disease.
Opportunities for prevention
The medical community — doctors, nurses, counselors, and others — can help prevent illness. Screening and treatment for high blood pressure, high cholesterol, and cancer can prolong life. Flu and pneumonia vaccinations prevent many hospitalizations and deaths. Counseling to quit smoking or control drinking is highly effective and helps people who want to improve their health.

Access to care
Preventing and treating illness depends on people’s ability to access high-quality medical care. This means having health insurance and a "medical home" — a personal doctor or nurse practitioner. Many East Harlem residents have poor access to medical care: about 7,000 people report no current health care coverage; 10,000 people did not get needed medical care in the past year; and 21,000 people do not have a personal doctor.

Cancer screening and other preventive services
Cancer screening and other clinical services can prevent or reduce the severity of many illnesses. This graph shows how rates in East Harlem compare to New York City as a whole and to some national goals.
People’s ability to increase healthy behaviors and improve their health is influenced by the conditions in which they live. A healthy environment that includes adequate housing, neighborhood resources such as supermarkets and parks, community services such as daycare, and safety, is essential in preventing disease and promoting health. The graph below gives an indication of the vulnerability of East Harlem residents, reflected in high rates of not graduating from high school, living in poverty, and feeling unsafe in their neighborhood.
