TAKE CARE

Southern Brooklyn

(Including Brighton Beach, Coney Island, and Sheepshead Bay)
Community Health Profile, Second Edition: Southern Brooklyn

New York City is the most diverse city in the U.S. — a fact reflected in the distinct character of each neighborhood. The second edition of the Community Health Profiles uses Take Care New York (TCNY), the city’s health policy, to examine preventable causes of illness and death in all of NYC’s 42 neighborhoods. This report updates the 2002 profile (available at nyc.gov/health) by providing more recent and time-trend data, and a greater variety of health statistics. Key health issues in Southern Brooklyn include:

- Nearly 1 in 5 Southern Brooklyn adults smokes, and the heart disease hospitalization and death rates are higher in this community than in NYC overall (page 6).
- Women in Southern Brooklyn are less likely to get timely Pap tests for cervical cancer than women in NYC overall (page 11).
- Hospitalizations for falls among older adults, as well as related hip fractures, are more common in Southern Brooklyn than in New York City overall (page 14).

Methods: While this report provides important information, it is not intended to be an exhaustive examination of the health of Southern Brooklyn residents, as not all health problems and their causes could be covered. Only statistically significant findings are discussed in the text. For complete information on methods, see Technical Notes (page 15).

Southern Brooklyn at a Glance

### Population

<table>
<thead>
<tr>
<th>Total number of people living in Southern Brooklyn in 2000: 286,900</th>

### Education

Almost half of Southern Brooklyn residents aged 25 and older have completed some college education — more than in Brooklyn overall

| Education |
| Southern Brooklyn | Brooklyn | NYC |
| --- |
| Up to 8th grade | 11% | 13% | 12% |
| Some high school, no diploma | 14% | 18% | 16% |
| High school diploma | 28% | 27% | 25% |
| Some college, no degree | 21% | 20% | 20% |
| College graduate | 26% | 22% | 27% |

### Poverty

In Southern Brooklyn, the percent of residents living below the poverty level is similar to the percent in NYC overall

| Poverty |
| Southern Brooklyn | Brooklyn | NYC |
| --- |
| Percent of residents | 22 | 25 | 21 |

### Race / Ethnicity

Southern Brooklyn has a higher proportion of white residents than Brooklyn and NYC overall

Data Source: U.S. Census 2000/NYC Department of City Planning
In 2004, the Health Department created a citywide health policy called Take Care New York (TCNY) to help improve the health of New Yorkers. TCNY identifies 10 key areas that cause significant illness and death but can be improved through intervention by individuals, health care providers, government agencies, and other organizations.

This report examines how well Southern Brooklyn residents are doing on health indicators for each of the 10 TCNY goals. It examines areas in which the community is a health leader, as well as areas that need improvement. The TCNY report card below shows where Southern Brooklyn ranks among all 42 New York City neighborhoods. (See Technical Notes for information about how neighborhoods were defined and ranked.)

### How Residents Rate Their Own Health

**Overall health**

One quarter of adults in Southern Brooklyn consider themselves to be in fair or poor health

People are good at rating their own health. In general, when asked to rate their general health as excellent, very good, good, fair, or poor, those who say “fair” or “poor” are more likely to have health problems than those who report better health.

In Southern Brooklyn, residents are more likely to report being in fair or poor health (25%) than those in New York City overall (21%).
Overall Death Rates in Southern Brooklyn

Death rates
In Southern Brooklyn, death rates have declined in the past 10 years

The death rate in Southern Brooklyn has decreased by more than 10% in the past decade, mirroring the rate drop in New York City overall.

In 2003-2004, the average annual death rate in Southern Brooklyn was slightly lower than in Brooklyn and similar to the rate in New York City overall (710/100,000 vs. 754/100,000 in Brooklyn and 718/100,000 in NYC). Throughout this profile, cause-specific death rates are provided for TCNY goals.

Premature death

People who die before age 75 can be thought of as dying early, or prematurely. If a person dies early, their years of potential life lost (YPLLs) can be calculated by subtracting their age at death from 75 years to get a measure of premature death.

The causes of premature death differ across communities. The primary cause of premature death in Southern Brooklyn is cancer, as well as in both Brooklyn and New York City overall.

Top 5 causes of years of potential life lost
Cancer causes the most years of potential life lost in Southern Brooklyn

Death before age 75
The 2003-2004 average annual death rate for people younger than 75 years in Southern Brooklyn ranks 17th among 42 NYC neighborhoods

Data Sources: Bureau of Vital Statistics, NYC DOHMH, 2003-04; U.S. Census 2000/NYC Department of City Planning
Access to good medical care helps people prevent illnesses, identify health conditions early, and treat health problems. Some conditions can and should be managed regularly outside the hospital. Higher rates of these avoidable hospitalizations can indicate reduced access to health care in a community.

Having a “medical home”—a personal doctor or other health care provider and a regular place of care other than the emergency department (ED)—is a critical component of good health care access. In Southern Brooklyn, 20% of residents do not have a regular doctor, nearly meeting the TCNY target. In addition, 1 in 20 Southern Brooklyn residents goes to the ED when they are sick or need health advice (5%).

**Access to care**

Without a primary provider, people may seek routine health care in the emergency department (ED)

Health insurance is important for access to health care. Residents in Southern Brooklyn are more likely to have been insured for the entire past year than those in Brooklyn (77% vs. 70%). In addition to those currently uninsured (14%), another 9% of residents in this community went without health insurance at some time during the past year.
GOAL 2  Be Tobacco-Free

Smoking is the leading cause of preventable death in New York City and the cause of many illnesses, including heart disease, stroke, emphysema, and lung cancer. Nearly one quarter of Southern Brooklyn residents (23%) currently smoke. Many methods to quit smoking are available, and more than half of smokers in Southern Brooklyn (62%) are trying to kick the habit.

Residents who smoke

Nearly 1 in 4 adults in Southern Brooklyn smokes . . .

Attempts to quit smoking in the past year

. . . but most smokers are trying to quit

GOAL 3  Keep Your Heart Healthy

Heart disease can cause severe illness and death. Southern Brooklyn residents had an average annual heart disease hospitalization rate in 2003-2004 that was slightly higher than the Brooklyn rate and 10% higher than the rate in NYC overall (2,074/100,000 vs. 2,001/100,000 in Brooklyn and 1,856/100,000 in NYC). The heart disease death rate has decreased by nearly 15% in the past decade in this community. However, the 2003-2004 rate in Southern Brooklyn (355/100,000) was still higher than the rates in Brooklyn (326/100,000) and NYC overall (297/100,000).

Heart disease hospitalizations

The heart disease hospitalization rate is higher in Southern Brooklyn

Deaths due to heart disease

The heart disease death rate has decreased but remains higher in Southern Brooklyn

High blood pressure and high cholesterol. Both of these conditions contribute to heart disease. In Southern Brooklyn, 31% of adults were told by a health care professional that they have high blood pressure (similar to 28% in Brooklyn and 26% in NYC overall), and more than 1 in 3 (34%) were told that they have high cholesterol (higher than 26% in Brooklyn and NYC overall).
In addition to smoking, high blood cholesterol and high blood pressure, other factors that put people at risk for heart disease — lack of physical activity and obesity — can be prevented or controlled.

Obesity can lead to a variety of health problems, including heart disease and diabetes. Rates of obesity are increasing rapidly in New York City and across the U.S., making it a major public health concern. In Southern Brooklyn, one fifth of adults are obese (20%).

The increasing prevalence of obesity in the U.S. has contributed to an epidemic of diabetes. About 95% of diabetes cases are type 2 diabetes, which is strongly associated with obesity. Uncontrolled diabetes can worsen the harmful effects of high blood pressure, high cholesterol, and other risk factors for heart disease.

In Southern Brooklyn, 10% of adults have diabetes.

Physical activity helps people maintain a healthy weight and strengthens the cardiovascular system. Nearly half of Southern Brooklyn residents (46%) report not doing any physical activity at all. Only just over one third of residents in this community (38%) report exercising at least 3 days a week.

Centers for Disease Control and Prevention Recommendations
Adults should do either 20 minutes of vigorous exercise 3 times per week or 30 minutes of moderate exercise 5 times per week.
GOAL 4  Know Your HIV Status

Wide disparities exist in HIV across New York City communities. In Southern Brooklyn, the rate of HIV diagnoses (18/100,000) is one third of the NYC overall rate, and the rate of people living with HIV/AIDS in the community (439/100,000) is also one third of the rate in NYC overall.

The death rate due to HIV disease has dropped by 75% during the past decade in this community. In 2003-2004, the average annual HIV-related death rate in Southern Brooklyn was more than 70% lower than both the Brooklyn and NYC overall rates (5/100,000 vs. 20/100,000 in Brooklyn and 18/100,000 in NYC).

Death rate due to HIV

HIV-related death rates have dropped dramatically in the past decade and remain lower in Southern Brooklyn.

HIV/AIDS in 2004

Total HIV diagnoses per 100,000 people* (13+)
- Southern Brooklyn 18
- Brooklyn 50
- New York City 55

% HIV diagnosed concurrently with AIDS** (13+)
- Southern Brooklyn 37%
- Brooklyn 31%
- New York City 29%

People living with HIV/AIDS per 100,000 people* (13+)
- Southern Brooklyn 439
- Brooklyn 1,183
- New York City 1,419

*Rates are age-adjusted.
**Within 31 days of HIV diagnosis — crude percents

Rates are age-adjusted.

HIV/AIDS testing and prevention

Everyone should know their HIV status. However, an estimated one quarter of New Yorkers living with HIV do not know they are infected, delaying treatment and increasing the risk that they will transmit the disease to others. Southern Brooklyn adults are less likely to be tested for HIV than those in New York City overall (16% vs. 23%). In addition, more than one third of positive HIV test results (37%) are “late” diagnoses (HIV has already progressed to AIDS) in Southern Brooklyn.

The most common way people get HIV is through sexual contact, and having multiple sex partners increases the risk of HIV. Condoms offer protection from HIV when engaging in sexual activities. Only 4 in 10 (40%) Southern Brooklyn adults who had more than 1 sex partner in the past year reported using a condom at their last sexual encounter.

HIV testing

Adults are less likely to have had an HIV test in the past year in Southern Brooklyn than in NYC overall.

8  TAKE CARE SOUTHERN BROOKLYN
GOAL 5  Get Help for Depression

Psychological distress
More than 1 in 20 adults in Southern Brooklyn suffer from serious psychological distress

Depression is a serious but treatable health condition that frequently goes undiagnosed. Serious psychological distress is associated with depression and other mental illnesses.

In Southern Brooklyn, 6% of residents experience serious psychological distress.

Mental illness
Hospitalizations for mental illness are lower in Southern Brooklyn

Hospitalization rates are one way to look at serious mental illness in a neighborhood. In Southern Brooklyn, the mental illness hospitalization rate (excluding alcohol- and drug-related illnesses) has decreased by more than 10% during the past decade.

In 2003-2004, the community's average annual rate of mental illness hospitalizations (679/100,000) was lower than both the Brooklyn rate (769/100,000) and the rate in New York City overall (813/100,000).

Understanding hospitalizations and access to health care. Hospitalization data are useful in understanding the burden that certain conditions place on the health care system, but not necessarily in measuring the exact extent of illness in a community. Variations in hospitalization rates may reflect not only differences in rates of illness, but also differences in access to health care. For example, the kinds of health institutions available to residents differ by community, as might the ability of residents to pay for those resources. If a community has a specialized residential institution for a certain type of disease, such as mental illness or stroke, people from outside that neighborhood may come to reside at this institution for care, resulting in an increase in reported hospitalizations for that disease in the community.
The abuse of alcohol and drugs can lead to many preventable injuries, illnesses, and deaths, including injury in motor-vehicle crashes, liver disease, and violence.

Estimates of binge drinking represent the risk of immediate alcohol-related problems, such as alcohol-poisoning, injury and violence. In Southern Brooklyn, 12% of adults report engaging in at least one episode of binge drinking (defined as consuming 5 or more drinks on one occasion) in the past month.

Alcohol-related hospitalizations reflect both acute and chronic (e.g., liver disease) consequences of alcohol abuse. The alcohol-related hospitalization rate in Southern Brooklyn has increased by more than 35% in the past decade.

However, in 2003-2004, the average annual alcohol-related hospitalization rate in this community was still lower than in Brooklyn and in New York City overall (275/100,000 vs. 394/100,000 in Brooklyn and 439/100,000 in NYC).

Similarly, the drug-related hospitalization rate increased by about 40% in the last 10 years, but the 2003-2004 rate (478/100,000) remained lower than in Brooklyn (547/100,000) and New York City overall (595/100,000).

The 2003-2004 death rate due to drugs in Southern Brooklyn was similar to the Brooklyn and NYC overall rate (8/100,000 vs. 10/100,000 in Brooklyn and NYC).

The drug-related death rate is similar in Southern Brooklyn, Brooklyn, and NYC overall.
Cancer screening can save lives by preventing disease, catching cancer in its early stages and providing opportunities for treatment. TCNY has set specific screening targets for cervical, breast, and colon cancers.

Women in Southern Brooklyn are less likely to get regular Pap tests for cervical cancer than women in Brooklyn and NYC overall. Also, their rate of getting mammograms for breast cancer is well below the TCNY target of more than 85%. In addition, less than half of adults aged 50 and older in Southern Brooklyn have had a colonoscopy in the past 10 years.

The death rate due to cancer has decreased slightly in Southern Brooklyn during the past decade. The 2003-2004 average annual cancer death rate was lower than the Brooklyn and NYC overall rates (148/100,000 vs. 160/100,000 in Brooklyn and 161/100,000 in NYC).

The highest cancer-related death rates among men in Southern Brooklyn are due to lung, colon, and blood-related (such as lymphoid) cancers. Among women, breast, lung, and colon cancers are the top 3 causes of cancer-related death.
Immunizations

Flu shot rates among older adults fall below the TCNY target and pneumococcal (pneumonia) immunizations are even lower.

Immunizations are not just for kids. Of all the deaths that could have been prevented by vaccination, 99% occur in adults. Take Care New York has set a target that more than 80% of adults aged 65 and older will get an annual flu (influenza) shot by 2008. The Southern Brooklyn flu immunization rate among older adults falls short of the TCNY target by more than 25%.

Immunization rates for pneumonia are lower than those for flu across NYC. Less than half of older adults in Southern Brooklyn have ever received the pneumococcal vaccine, which protects against one common cause of pneumonia.

GOAL 9  Make Your Home Safe and Healthy

Childhood lead poisoning

Lead poisoning among young children continues to be a problem.

Childhood lead poisoning is a health problem that may be associated with decreased intelligence, learning and behavioral problems, and delayed growth and development. While the number of lead-poisoned children (0-17 years old) in New York City has declined dramatically over the past decade, the Health Department aims to eliminate lead poisoning by preventing children’s exposure to lead-based paint and other sources of lead.

In 2004, 109 children in Southern Brooklyn (11/1,000) were newly identified with lead poisoning (defined as a blood lead level greater than or equal to 10 µg/dL).

Asthma in Adults and Children

Asthma

Fewer than 1 in 20 adults suffers from asthma in Southern Brooklyn.

Conditions, or “triggers,” in the home environment, such as the presence of second-hand smoke or dust, can cause asthma attacks. Some housing conditions associated with asthma triggers, such as rodent or roach infestation, are more common in some neighborhoods than others.

The percent of adults who report having asthma is similar in Southern Brooklyn (3%), Brooklyn (5%), and New York City overall (5%).
Neighborhood asthma hospitalization rates depend in part on the percent of residents who have asthma. However, good medical management of asthma can prevent many asthma-related hospitalizations, and patients can work with health care providers to better control their asthma. Thus, the asthma hospitalization rate can also indicate poor access to health care.

Asthma hospitalization rates for both adults and children (0-17 years old) in Southern Brooklyn are lower than in Brooklyn and NYC overall. In addition, the rate among children in this community has declined by half in the past decade.

**Adult asthma hospitalizations**
Rates of asthma hospitalization are lower in Southern Brooklyn

**Child asthma hospitalizations**
The child asthma hospitalization rate has decreased and remains lower in Southern Brooklyn

Goal 10 Have a Healthy Baby
The health of babies depends on the health of mothers. Good health care for pregnant women includes high quality prenatal care beginning in the first trimester of pregnancy. The average annual percent of women who received late or no prenatal care has declined by more than 40% in Southern Brooklyn, and the 2003-2004 percent (20%) was lower than in Brooklyn (27%) and NYC overall (28%).

Teenage mothers and their babies face a number of risks. Pregnant teens are more likely to be poor and not complete high school than other teens, and they are more likely to have babies born with low birthweight than older women. The teen birth rate has decreased over the past 10 years by more than 25% in Southern Brooklyn. Also, the average teen birth rate in 2003-2004 in this community (61/1,000) was lower than in Brooklyn (73/1,000) and NYC overall (75/1,000).

**Prenatal care**
Mothers in Southern Brooklyn are now less likely to receive late or no prenatal care

**Teenage mothers**
The birth rate to teenage mothers (15-19 years) is lower in Southern Brooklyn

Data Sources: New York State Department of Health Statewide Planning and Research Cooperative System, 1995-2004; U.S. Census 1990 and 2000/NYC Department of City Planning

Data Source: Bureau of Vital Statistics, NYC DOHMH, 1995-2004
Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

The IMR is similar in Southern Brooklyn, Brooklyn and NYC overall

**Infant mortality rate (IMR)**

Deaths per 1,000 live births

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Deaths per 1,000 live births

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Southern Brooklyn was 8% — the same as in Brooklyn and lower than in NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined in the past 10 years in NYC overall. The 2002-2004 rate in Southern Brooklyn was 5/1,000, similar to Brooklyn and NYC overall.

**Low birthweight**

Fewer than 1 in 10 babies in Southern Brooklyn is born with low birthweight

Babies born with low birthweight tend to have more health problems than others. Technical notes

Analyses
All analyses were conducted by the Bureau of Epidemiology Services, NYC DOHMH, unless otherwise indicated. All estimates in this report were age standardized to the Year 2000 Standard Population, except for age-specific data and mother-child health indicators. All CHS analyses were done in SUDAAN to account for complex survey design and were weighted to the New York City population according to the U.S. Census 2000.

Data sources
NYS DOH hospitalization data: Includes hospitalizations of NYC residents that occurred anywhere in New York State. Patient zip code was used to classify hospitalizations into 42 neighborhoods. Data from 1995-2003 updated in April 2005; 2004 data updated in July 2005.

Vital Statistics data: Includes births and deaths of NYC residents that occurred within New York City. Data were combined across years to increase statistical stability and average annual rates are presented. In addition, infant mortality rates (IMR) were calculated as 3-year average annual rates, and this statistic and others may differ from the presentation in “Summary of Vital Statistics” reports from the Bureau of Vital Statistics, NYC DOHMH.

Community Health Survey data: The NYC Community Health Survey (CHS) is an annual random-digit-dial telephone survey of approximately 10,000 adults in New York City. This profile uses the following datasets from this survey: NYC CHS 2002, NYC CHS 2003, NYC CHS 2004, NYC CHS 2002-03-04, NYC CHS 2002-03, NYC CHS 2002 & 2004, and NYC CHS 2003-04. The combined-year datasets increase statistical power, allowing for more stable analyses at the neighborhood level.

National data and information on falls among older adults were taken from the Centers for Disease Control and Prevention’s National Center for Injury Prevention and Control at www.cdc.gov/ncipc/.

Neighborhood Definitions
The 42 NYC neighborhoods are based on the United Hospital Fund definitions of neighborhood, which are specified by zip code. For a complete listing of all 42 neighborhoods and their zip codes, go to nyc.gov/health. The zip codes included in analyses of Southern Brooklyn are 11223, 11224, 11229, and 11235. Please note that some neighborhoods were combined for statistical purposes in the CHS 2002, CHS 2003 and CHS 2004 datasets to make a total of 33 (2002) or 34 (2003, 2004) neighborhoods.

Avoidable Hospitalizations
Data based on Ambulatory Care Sensitive Conditions (called “avoidable hospitalizations” in this report) were calculated using the Agency for Healthcare Research and Quality (AHRQ) classification of inpatient hospitalization data. Conditions in the overall measure include: Diabetes Short-term Complications Admission Rate, Diabetes Long-term Complications Admission Rate, Pediatric Asthma Admission Rate, Chronic Obstructive Pulmonary Disease Admission Rate, Pediatric Gastroenteritis Admission Rate, Hypertension Admission Rate, Congestive Heart Failure Admission Rate, Dehydration Admission Rate, Bacterial Pneumonia Admission Rate, Urinary Tract Infection Admission Rate, Angina without Procedure Admission Rate, Uncontrolled Diabetes Admission Rate, Adult Asthma Admission Rate, and Rate of Lower-extremity Amputation among Patients with Diabetes.

Significance Testing
For all data, 95% confidence limits were calculated for neighborhood, borough, and NYC estimates. If these ranges did not overlap, a significant difference was inferred. This is a conservative measure of statistical difference. This methodology also was used to examine differences between years in neighborhood trend data. Only robust findings found to be statistically significant are discussed in the text. In addition, all NYC CHS estimates were evaluated for statistical stability using the relative standard error (RSE). Those estimates with an RSE > .30 are flagged in graphs, “Estimate is unstable due to small sample size and should be interpreted with caution.”

TCNY report card
The neighborhood was classified according to where it ranked in comparison to the other 41 NYC neighborhoods with Above Average = rankings 1-10, Average = rankings 11-32, and Below Average = rankings 33-42 where 1 = the best neighborhood score. Rankings were computed by combining (or in some cases, using only one indicator) standardized measures (z-scores) of the following health indicators for each TCNY goal: TCNY#1 - primary care provider, insurance, ED visits; TCNY#2 - current smokers; TCNY#3 - diabetes, obesity, exercise, heart disease hospitalizations, heart disease mortality; TCNY#4 - HIV testing, AIDS mortality; TCNY#5 - serious psychological distress, mental illness hospitalizations; TCNY#6 - binge drinking, alcohol-related hospitalizations, drug-related hospitalizations, drug-related mortality; TCNY#7 - cervical cancer screening, breast cancer screening, colon cancer screening, cancer mortality; TCNY#8 - flu immunization; TCNY#9 - child lead poisoning, adult asthma rates; TCNY#10 - prenatal care, teenage mothers, low birthweight, infant mortality.

Community Health Profile for Southern Brooklyn

This report is an updated, expanded second edition of the 2002 Community Health Profile for Southern Brooklyn.

NEW IN THE SECOND EDITION:
- Take Care New York report card
- Time-trend data on births, hospitalizations, and deaths
- More neighborhood-specific health statistics
- Robust estimates from data through 2004

First and second edition reports on all 42 New York City neighborhoods are available from the New York City Department of Health and Mental Hygiene online or by mail.
