Community Health Profiles

New York City Department of Health and Mental Hygiene
SECOND EDITION — 2006

Take Care

Gramercy Park and Murray Hill

Manhattan
New York City is the most diverse city in the U.S. — a fact reflected in the distinct character of each neighborhood. The second edition of the Community Health Profiles uses Take Care New York (TCNY), the city’s health policy, to examine preventable causes of illness and death in all of NYC’s 42 neighborhoods. This report updates the 2002 profile (available at nyc.gov/health) by providing more recent and time-trend data, and a greater variety of health statistics.

Key health issues in Gramercy Park and Murray Hill include:

- Cancer is the leading cause of years of potential life lost in Gramercy Park and Murray Hill (page 4).
- While the death rate due to HIV disease and the rate of people living with HIV is similar to the rate in NYC overall, less than one fifth of Gramercy Park and Murray Hill adults have had an HIV test in the past year (page 8).
- Binge drinking is more than 60% higher in Gramercy Park and Murray Hill than in New York City overall, and heavy drinking is also more common in this community (page 10, 14).

**Methods:** While this report provides important information, it is not intended to be an exhaustive examination of the health of Gramercy Park and Murray Hill residents, as not all health problems and their causes could be covered. Only statistically significant findings are discussed in the text. For complete information on methods, see Technical Notes (page 15).

---

TAKE CARE GRAMERCY PARK AND MURRAY HILL
Take Care Gramercy Park and Murray Hill

In 2004, the Health Department created a citywide health policy called Take Care New York (TCNY) to help improve the health of New Yorkers. TCNY identifies 10 key areas that cause significant illness and death but can be improved through intervention by individuals, health care providers, government agencies, and other organizations.

This report examines how well Gramercy Park and Murray Hill residents are doing on health indicators for each of the 10 TCNY goals. It examines areas in which the community is a health leader, as well as areas that need improvement. The TCNY report card below shows where Gramercy Park and Murray Hill rank among all 42 New York City neighborhoods. (See Technical Notes for information about how neighborhoods were defined and ranked.)

How Residents Rate Their Own Health

Overall health
Adults in Gramercy Park and Murray Hill are less likely to consider themselves to be in fair or poor health

People are good at rating their own health. In general, when asked to rate their general health as excellent, very good, good, fair, or poor, those who say “fair” or “poor” are more likely to have health problems than those who report better health.

In Gramercy Park and Murray Hill, residents are much less likely to report being in fair or poor health (9%) than those in Manhattan (18%) and in New York City overall (21%).

Percents are age-adjusted.
Data Source: NYC Community Health Survey 2002-03-04
Overall Death Rates on Gramercy Park and Murray Hill

The death rate in Gramercy Park and Murray Hill has decreased by more than 15% in the past 10 years, mirroring the rate drop in New York City overall, and has remained consistently lower than both the Manhattan and NYC overall rates.

In 2003-2004, the average annual death rate in Gramercy Park and Murray Hill was more than 20% lower than in Manhattan and New York City overall (532/100,000 vs. 697/100,000 in Manhattan and 718/100,000 in NYC). Throughout this profile, cause-specific death rates are provided for TCNY goals.

Premature death

People who die before age 75 can be thought of as dying early, or prematurely. If a person dies early, their years of potential life lost (YPLLs) can be calculated by subtracting their age at death from 75 years to get a measure of premature death.

The causes of premature death differ across communities. The primary cause of premature death in Gramercy Park and Murray Hill is cancer, as well as in both Manhattan and New York City overall.

Top 5 causes of years of potential life lost

Cancer causes the most years of potential life lost in Gramercy Park and Murray Hill

*Other includes Accidents (2%), Pneumonia and Influenza (2%), Certain Perinatal Conditions (2%), Diseases of the Nervous System (2%), Diabetes (2%), and Other (19%).

Data Source: Bureau of Vital Statistics, NYC DOHMH, 2002-04
Access to good medical care helps people prevent illnesses, identify health conditions early, and treat health problems. Some conditions can and should be managed regularly outside the hospital. Higher rates of these avoidable hospitalizations can indicate reduced access to health care in a community.

Having a “medical home”—a personal doctor or other health care provider and a regular place of care other than the emergency department (ED)—is a critical component of good health care access. In Gramercy Park and Murray Hill, 25% of residents do not have a regular doctor, compared to the TCNY target of less than 20%. Gramercy Park and Murray Hill residents are less likely to go to the ED when they are sick or need health advice (2%) than those in Manhattan (6%) and NYC overall (8%).

Health insurance

Gramercy Park and Murray Hill residents are less likely to be uninsured than those in New York City overall.

Health insurance is important for access to health care. Residents in Gramercy Park and Murray Hill are nearly 40% less likely than those in NYC overall to be uninsured (11% vs. 18%). In addition to the currently uninsured, another 12% of residents in this community went without health insurance at some time during the past year.
GOAL 2  Be Tobacco-Free

Smoking is the leading cause of preventable death in New York City and the cause of many illnesses, including heart disease, stroke, emphysema, and lung cancer. Gramercy Park and Murray Hill residents are less likely to be current smokers than adults in NYC overall (12% vs. 18%). Many methods to quit smoking are available, and more than half of smokers in Gramercy Park and Murray Hill (60%) are trying to kick the habit.

Residents who smoke
Adults in Gramercy Park and Murray Hill are less likely to smoke than those in NYC overall

![Graph showing smoking rates in Gramercy Park, Murray Hill, Manhattan, and New York City. TCNY Target: <18% by 2008.]

Attempts to quit smoking in the past year
Most smokers are trying to quit

![Graph showing attempts to quit smoking in Gramercy Park, Murray Hill, Manhattan, and New York City.]

GOAL 3  Keep Your Heart Healthy

Heart disease can cause severe illness and death. The heart disease hospitalization rate in Gramercy Park and Murray Hill has remained fairly constant in the past decade, and the average annual heart disease hospitalization rate in 2003-2004 was lower than both the Manhattan and NYC overall rates (1,190/100,000 vs. 1,489/100,000 in Manhattan and 1,856/100,000 in NYC). Similarly, the heart disease death rate in 2003-2004 (172/100,000) was 25% lower than the rate in Manhattan (234/100,000) and more than 40% lower than the NYC overall rate (297/100,000).

Heart disease hospitalizations
Heart disease causes a lower hospitalization rate in Gramercy Park and Murray Hill

![Graph showing heart disease hospitalizations rates for Gramercy Park & Murray Hill, Manhattan, and New York City from 1995-96 to 2003-04.]

Deaths due to heart disease
Gramercy Park and Murray Hill residents are less likely to die from heart disease

![Graph showing heart disease death rates for Gramercy Park & Murray Hill, Manhattan, and New York City from 1995-96 to 2003-04.]

High blood pressure and high cholesterol. Both of these conditions contribute to heart disease. In Gramercy Park and Murray Hill, 14% of adults were told by a health care professional that they have high blood pressure (lower than 22% in Manhattan and 26% in NYC overall), and one quarter (27%) were told that they have high cholesterol (the same as Manhattan and similar to 26% in NYC overall).

Percent of adults (18+):

- High blood pressure: 14% in Gramercy Park & Murray Hill, 22% in Manhattan, and 26% in NYC overall.
- High cholesterol: 27% in Gramercy Park & Murray Hill, 27% in Manhattan, and 26% in NYC overall.

Percent of adult smokers (18+):

- Gramercy Park & Murray Hill: 12%
- Manhattan: 17%
- New York City: 18%
In addition to smoking, high blood cholesterol and high blood pressure, other factors that put people at risk for heart disease — lack of physical activity and obesity — can be prevented or controlled.

Obesity can lead to a variety of health problems, including heart disease and diabetes. Rates of obesity are increasing rapidly in New York City and across the U.S., making it a major public health concern. Gramercy Park and Murray Hill adults are less likely to be obese than those in Manhattan and NYC overall (8% vs. 15% in Manhattan and 20% in NYC).

The increasing prevalence of obesity in the U.S. has contributed to an epidemic of diabetes. About 95% of diabetes cases are type 2 diabetes, which is strongly associated with obesity. Uncontrolled diabetes can worsen the harmful effects of high blood pressure, high cholesterol, and other risk factors for heart disease.

In Gramercy Park and Murray Hill, only 2% of adults have diabetes, compared to 7% in Manhattan and 9% in New York City overall.

Physical activity helps people maintain a healthy weight and strengthens the cardiovascular system. Gramercy Park and Murray Hill residents are much more likely to report doing some physical activity during the week (84%) than adults in Manhattan (68%) and New York City (57%). About 6 in 10 Gramercy Park and Murray Hill residents (60%) report exercising at least 3 days a week.
GOAL 4  Know Your HIV Status

Wide disparities exist in HIV across New York City communities. The rate of HIV diagnoses in Gramercy Park and Murray Hill is slightly lower than the NYC overall rate, but the rate of people living with HIV/AIDS in the community is higher than the citywide rate.

The death rate due to HIV disease has dropped by 75% during the past decade in this community. In 2003-2004, the average annual HIV-related death rate in Gramercy Park and Murray Hill was similar to the Manhattan and NYC overall rates (15/100,000 vs. 22/100,000 in Manhattan and 18/100,000 in NYC).

Death rate due to HIV
HIV-related death rates in Gramercy Park and Murray Hill have dropped dramatically in the past decade

HIV/AIDS testing and prevention
Everyone should know their HIV status. However, an estimated one quarter of New Yorkers living with HIV do not know they are infected, delaying treatment and increasing the risk that they will transmit the disease to others. Fewer than 1 in 5 Gramercy Park and Murray Hill residents (17%) has been tested for HIV in the past year. In addition, nearly one quarter of positive HIV test results (25%) are “late” diagnoses (HIV has already progressed to AIDS) in this community.

The most common way people get HIV is through sexual contact, and having multiple sex partners increases the risk of HIV. Condoms offer protection from HIV when engaging in sexual activities. Less than half (45%) of Gramercy Park and Murray Hill adults who had more than 1 sex partner in the past year reported using a condom at their last sexual encounter.

HIV testing
Fewer than 1 in 5 adults in Gramercy Park and Murray Hill has had an HIV test in the past year

Condom use at last sexual encounter
Less than half of Gramercy Park and Murray Hill adults with multiple sex partners used a condom

HIV/AIDS in 2004

GOAL 5 Get Help for Depression

Psychological distress
One in 25 adults in Gramercy Park and Murray Hill suffers from serious psychological distress

Depression is a serious but treatable health condition that frequently goes undiagnosed. Serious psychological distress is associated with depression and other mental illnesses.

In Gramercy Park and Murray Hill, 4% of residents experience serious psychological distress.

Mental illness
Hospitalizations for mental illness are higher in Gramercy Park and Murray Hill

Hospitalization rates are one way to look at serious mental illness in a neighborhood. Residents in Gramercy Park and Murray Hill have had a higher mental illness hospitalization rate over the past 10 years (excluding alcohol- or drug-related illness) than those in Manhattan and in New York City overall. In addition, the mental illness hospitalization rate in this community increased slightly in the past decade.

In 2003-2004, the community’s average annual rate of mental illness hospitalizations (1,298/100,000) was more than 25% higher than the Manhattan rate (1,011/100,000) and 60% higher than the rate in New York City overall (813/100,000).

Understanding hospitalizations and access to health care. Hospitalization data are useful in understanding the burden that certain conditions place on the health care system, but not necessarily in measuring the exact extent of illness in a community. Variations in hospitalization rates may reflect not only differences in rates of illness, but also differences in access to health care. For example, the kinds of health institutions available to residents differ by community, as might the ability of residents to pay for those resources. If a community has a specialized residential institution for a certain type of disease, such as mental illness or stroke, people from outside that neighborhood may come to reside at this institution for care, resulting in an increase in reported hospitalizations for that disease in the community.
The abuse of alcohol and drugs can lead to many preventable injuries, illnesses, and deaths, including injury in motor-vehicle crashes, liver disease, and violence.

Estimates of binge drinking represent the risk of immediate alcohol-related problems, such as alcohol-poisoning, injury and violence. Gramercy Park and Murray Hill adults are more likely than adults in NYC overall to report engaging in at least one episode of binge drinking (defined as consuming 5 or more drinks on one occasion) in the past month.

Alcohol-related hospitalizations reflect both acute and chronic (e.g., liver disease) consequences of alcohol abuse. In 2003-2004, the average annual alcohol-related hospitalization rate in this community was higher than in Manhattan and in New York City overall (694/100,000 vs. 595/100,000 in Manhattan and 439/100,000 in NYC).

In contrast, the drug-related hospitalization rate in 2003-2004 was lower (416/100,000) than in Manhattan (643/100,000) and New York City overall (595/100,000).

The Gramercy Park and Murray Hill death rate due to drugs in 2003-2004 was similar to the Manhattan and NYC overall rates (9/100,000 vs. 11/100,000 in Manhattan and 10/100,000 in NYC).
Cancer screening can save lives by preventing disease, catching cancer in its early stages and providing opportunities for treatment. TCNY has set specific screening targets for cervical, breast, and colon cancers.

Women in Gramercy Park and Murray Hill are getting Pap tests for cervical cancer and mammograms for breast cancer at rates meeting or very close to the TCNY target of more than 85%. In addition, adults aged 50 and older in Gramercy Park and Murray Hill are more likely to have had a colonoscopy in the past 10 years than those in NYC overall.

The death rate due to cancer has remained fairly steady in Gramercy Park and Murray Hill during the past decade. The 2003-2004 average annual cancer death rate was similar to the Manhattan and NYC overall rates (162/100,000 vs. 171/100,000 in Manhattan and 161/100,000 in NYC).

The highest cancer-related death rates among men in Gramercy Park and Murray Hill are due to lung, prostate, and blood-related (such as lymphoid) cancers. Among women, lung, breast, and blood-related cancers are the top 3 causes of cancer-related death.
GOAL 8  Get the Immunizations You Need

**Immunizations**

Flu shot rates among older adults fall below the TCNY target and pneumococcal (pneumonia) immunizations are even lower

Immunizations are not just for kids. Of all the deaths that could have been prevented by vaccination, 99% occur in adults. **Take Care New York** has set a target that more than 80% of adults aged 65 and older will get an annual flu (influenza) shot by 2008. The Gramercy Park and Murray Hill flu immunization rate among older adults falls short of the TCNY target by more than 10%, although they are among the highest in the city.

Immunization rates for pneumonia are lower than those for flu across NYC. Only just over half of older adults in Gramercy Park and Murray Hill have ever received the pneumococcal vaccine, which protects against one common cause of pneumonia.

GOAL 9  Make Your Home Safe and Healthy

**Childhood lead poisoning**

Lead poisoning among young children continues to be a problem

Childhood lead poisoning is a health problem that may be associated with decreased intelligence, learning and behavioral problems, and delayed growth and development. While the number of lead-poisoned children (0-17 years old) in New York City has declined dramatically over the past decade, the Health Department aims to eliminate lead poisoning by preventing children’s exposure to lead-based paint and other sources of lead.

In 2004, 24 children in Gramercy Park and Murray Hill (13/1,000) were newly identified with lead poisoning (blood lead level greater than or equal to 10 µg/dL).

**Asthma in Adults and Children**

**Asthma**

Fewer than 1 in 5 adults in Gramercy Park and Murray Hill suffers from asthma

Conditions, or “triggers,” in the home environment, such as the presence of second-hand smoke or dust, can cause asthma attacks. Some housing conditions associated with asthma triggers, such as rodent or roach infestation, are more common in some neighborhoods than others.

In Gramercy Park and Murray Hill, 3% of adults report having asthma.
Neighborhood asthma hospitalization rates depend in part on the percent of residents who have asthma. However, good medical management of asthma can prevent many asthma-related hospitalizations, and patients can work with health care providers to better control their asthma. Thus, the asthma hospitalization rate can also indicate poor access to health care.

The asthma hospitalization rates for adults in Gramercy Park and Murray Hill are lower than in Manhattan and NYC overall. The rate among children (0-17 years old) decreased in the past decade, and in 2003-2004, the average annual rate was lower than both the Manhattan and NYC overall rates (3/1,000 vs. 6/1,000 in Manhattan and NYC).

Goal 10  Have a Healthy Baby

The health of babies depends on the health of mothers. Good health care for pregnant women includes high quality prenatal care beginning in the first trimester of pregnancy. The 2003-2004 average annual percent of women who received late or no prenatal care is lower in Gramercy Park and Murray Hill (14%) than in Manhattan (22%) and NYC overall (28%).

Teenage mothers and their babies face a number of risks. Pregnant teens are more likely to be poor and not complete high school than other teens, and they are more likely to have babies born with low birthweight than older women. The average birth rate to teen moms in 2003-2004 in Gramercy Park and Murray Hill (6/1,000) was 90% lower than both the Manhattan rate (59/1,000) and the rate in NYC overall (75/1,000).
Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Gramercy Park and Murray Hill was the same as in Manhattan and NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined over the past 10 years in NYC. The rate in Gramercy Park and Murray Hill has also decreased in the past decade by more than 60%, and the 2002-2004 rate was below the NYC overall rate, meeting the TCNY target of less than 5/1,000.

### Low birthweight

Fewer than 1 in 10 babies in Gramercy Park and Murray Hill is born with low birthweight

- **Percent of live births**
  - 1995-96: 12.5%
  - 1997-98: 10.5%
  - 1999-00: 9.5%
  - 2001-02: 9.0%
  - 2003-04: 9.0%

- **Deaths per 1,000 live births**
  - 1995-96: 1.3
  - 1997-98: 1.2
  - 1999-00: 1.1
  - 2001-02: 1.0
  - 2003-04: 0.9

- **Data Source**: Bureau of Vital Statistics, NYC DOHMH, 1995-2004

Low birthweight is defined as <2,500 grams (5.5 pounds).

### Infant mortality rate (IMR)

The IMR in Gramercy Park and Murray Hill meets the TCNY target

- **TCNY Target**: <5.0 per 1,000 by 2008

- **Data Source**: Bureau of Vital Statistics, NYC DOHMH, 1993-2004

---

**Neighborhood Health Highlight: Alcohol Abuse**

Every New York City neighborhood has different health concerns. Here we highlight alcohol abuse in Gramercy Park and Murray Hill.

Binge drinking is defined as the consumption of 5 or more drinks on one occasion, and it can be used to measure the misuse of alcohol in a community. Gramercy Park and Murray Hill residents are 64% more likely to have engaged in binge drinking in the past month than those in New York City overall (see page 10).

Younger adults are most likely to binge drink. In Gramercy Park and Murray Hill, 18- to 29-year-olds are 7 times more likely to binge drink than residents aged 50 and older (48% vs. 6%). While binge drinking measures acute alcohol abuse, chronic alcohol abuse can be measured with average daily consumption — more than 2 drinks/day for men and more than 1 drink/day for women is considered “heavy drinking.” Gramercy Park and Murray Hill residents are twice as likely to drink heavily as residents in New York City overall (11% v. 5%).

### Heavy drinking is also more common in Gramercy Park and Murray Hill than in New York City overall

- **Percent of adults (18+) who drink heavily**
  - Gramercy Park & Murray Hill: 11%
  - Manhattan: 7%
  - New York City: 5%

- **Data Source**: NYC Community Health Survey 2002-03-04

*Estimate is unstable due to small sample size and should be interpreted with caution.

---

**Taking Action**

Abuse of alcohol can lead to alcohol dependence. When drinking causes trouble in relationships, school or work, social activities, or thinking or feeling, then drinking has become a problem. Drinking problems should be discussed with a health care professional. For more information, call 311.
Technical notes

Analyses
All analyses were conducted by the Bureau of Epidemiology Services, NYC DOHMH, unless otherwise indicated. All estimates in this report were age standardized to the Year 2000 Standard Population, except for age-specific data and and mother-child health indicators. All CHS analyses were done in SUDAAN to account for complex survey design and were weighted to the New York City population according to the U.S. Census 2000.

Data sources
NYS DOH hospitalization data: Includes hospitalizations of NYC residents that occurred anywhere in New York State. Patient zip code was used to classify hospitalizations into 42 neighborhoods. Data from 1995-2003 updated in April 2005; 2004 data updated in July 2005.

Vital Statistics data: Includes births and deaths of NYC residents that occurred within New York City. Data were combined across years to increase statistical stability and average annual rates are presented. In addition, infant mortality rates (IMR) were calculated as 3-year annual averages, and this statistic and others may differ from the presentation in “Summary of Vital Statistics” reports from the Bureau of Vital Statistics, NYC DOHMH.

Community Health Survey data: The NYC Community Health Survey (CHS) is an annual random-digit-dial telephone survey of approximately 10,000 adults in New York City. This profile uses the following datasets from this survey: NYC CHS 2002, NYC CHS 2003, NYC CHS 2004, NYC CHS 2002-03-04, NYC CHS 2002-03, NYC CHS 2002 & 2004, and NYC CHS 2003-04. The combined-year datasets increase statistical power, allowing for more stable analyses at the neighborhood level.

Neighborhood Definitions
The 42 NYC neighborhoods are based on the United Hospital Fund definitions of neighborhood, which are specified by zip code. For a complete listing of all 42 neighborhoods and their zip codes, go to nyc.gov/health. The zip codes included in analyses of Gramercy Park and Murray Hill are 10010, 10016, 10017, 10022, 10166, 10167, and 10171. Please note that some neighborhoods were combined for statistical purposes in the CHS 2002, CHS 2003 and CHS 2004 datasets to make a total of 33 (2002) or 34 (2003, 2004) neighborhoods. Gramercy Park and Murray Hill statistics from these individual-year datasets include data from the neighboring community of the Upper East Side.

Avoidable Hospitalizations
Data based on Ambulatory Care Sensitive Conditions (called “avoidable hospitalizations” in this report) were calculated using the Agency for Healthcare Research and Quality (AHRQ) classification of inpatient hospitalization data. Conditions in the overall measure include: Diabetes Short-term Complications Admission Rate, Diabetes Long-term Complications Admission Rate, Pediatric Asthma Admission Rate, Chronic Obstructive Pulmonary Disease Admission Rate, Pediatric Gastroenteritis Admission Rate, Hypertension Admission Rate, Congestive Heart Failure Admission Rate, Dehydration Admission Rate, Bacterial Pneumonia Admission Rate, Urinary Tract Infection Admission Rate, Angina without Procedure Admission Rate, Uncontrolled Diabetes Admission Rate, Adult Asthma Admission Rate, and Rate of Lower-extremity Amputation among Patients with Diabetes.

Significance Testing
For all data, 95% confidence limits were calculated for neighborhood, borough, and NYC estimates. If these ranges did not overlap, a significant difference was inferred. This is a conservative measure of statistical difference. This methodology also was used to examine differences between years in neighborhood trend data.

TCNY report card
The neighborhood was classified according to where it ranked in comparison to the other 41 NYC neighborhoods with Above Average = rankings 1-10, Average = rankings 11-32, and Below Average = rankings 33-42 where 1 = the best neighborhood score. Rankings were computed by combining (or in some cases, using only one indicator) standardized measures (z-scores) of the following health indicators for each TCNY goal: TCNY#1 - primary care provider, insurance, ED visits; TCNY#2 - current smokers; TCNY#3 - diabetes, obesity, exercise, heart disease hospitalizations, heart disease mortality; TCNY#4 - HIV testing, AIDS mortality; TCNY#5 - serious psychological distress, mental illness hospitalizations; TCNY#6 - binge drinking, alcohol-related hospitalizations, drug-related hospitalizations, drug-related mortality; TCNY#7 - cervical cancer screening, breast cancer screening, colon cancer screening, cancer mortality; TCNY#8 - flu immunization; TCNY#9 - child lead poisoning, adult asthma rates; TCNY#10 - prenatal care, teenage care, low birthweight, infant mortality.
