Community Health Profiles

New York City Department of Health and Mental Hygiene
SECOND EDITION — 2006

TAKE CARE
Rockaways
Queens
Community Health Profile, Second Edition: The Rockaways

New York City is the most diverse city in the U.S. — a fact reflected in the distinct character of each neighborhood. The second edition of the Community Health Profiles uses Take Care New York (TCNY), the city’s health policy, to examine preventable causes of illness and death in all of NYC’s 42 neighborhoods. This report updates the 2002 profile (available at nyc.gov/health) by providing more recent and time-trend data, and a greater variety of health statistics. Key health issues in the Rockaways include:

- Both hospitalizations and deaths due to heart disease are more common in the Rockaways than in NYC overall (page 6).
- Mothers in the Rockaways are less likely to have had timely prenatal care than those in NYC overall, and the teen birth rate in this community is also higher (page 13).
- Hospitalizations for falls among older adults, as well as related hip fractures, are more common in the Rockaways than in New York City overall (page 14).

Methods: While this report provides important information, it is not intended to be an exhaustive examination of the health of Rockaways residents, as not all health problems and their causes could be covered. Only statistically significant findings are discussed in the text. For complete information on methods, see Technical Notes (page 15).

Take Care Rockaways

In 2004, the Health Department created a citywide health policy called Take Care New York (TCNY) to help improve the health of New Yorkers. TCNY identifies 10 key areas that cause significant illness and death but can be improved through intervention by individuals, health care providers, government agencies, and other organizations.

This report examines how well Rockaways residents are doing on health indicators for each of the 10 TCNY goals. It examines areas in which the community is a health leader, as well as areas that need improvement. The TCNY report card below shows where the Rockaways rank among all 42 New York City neighborhoods. (See Technical Notes for information about how neighborhoods were defined and ranked.)

How Residents Rate Their Own Health

Overall health
Almost one quarter of adults in the Rockaways consider themselves to be in fair or poor health

People are good at rating their own health. In general, when asked to rate their general health as excellent, very good, good, fair, or poor, those who say “fair” or “poor” are more likely to have health problems than those who report better health.

In the Rockaways, nearly 1 in 4 residents reports being in fair or poor health (24%).
Overall Death Rates in the Rockaways

Death rates
In the Rockaways, death rates are higher than in Queens and NYC overall

The death rate in the Rockaways has decreased by 10% in the past decade, mirroring the rate drop in New York City overall.

In 2003-2004, the average annual death rate in the Rockaways was 60% higher than in Queens and 35% higher than in New York City overall (972/100,000 vs. 610/100,000 in Queens and 718/100,000 in NYC).

Throughout this profile, cause-specific death rates are provided for TCNY goals.

Line graphs. All time-trend data are presented as annual averages with 2 or 3 years of data combined. For example, in this graph, the first point on each line represents the average annual death rate for 1995 and 1996 combined.

Premature death
People who die before age 75 can be thought of as dying early, or prematurely. If a person dies early, their years of potential life lost (YPLLs) can be calculated by subtracting their age at death from 75 years to get a measure of premature death.

The causes of premature death differ across communities. The primary cause of premature death in the Rockaways is heart disease, while in both Queens and New York City overall, the primary cause is cancer.

Top 5 causes of years of potential life lost
Heart disease causes the most years of potential life lost in the Rockaways

The death rate in the Rockaways has decreased by 10% in the past decade, mirroring the rate drop in New York City overall.

In 2003-2004, the average annual death rate in the Rockaways was 60% higher than in Queens and 35% higher than in New York City overall (972/100,000 vs. 610/100,000 in Queens and 718/100,000 in NYC).

Throughout this profile, cause-specific death rates are provided for TCNY goals.

*Other includes Homicide (4%), Accidents (4%), Congenital Conditions (3%), Diabetes (3%), Chronic Lower Respiratory Disease (3%), and Other (23%).

Data source: Bureau of Vital Statistics, NYC DOHMH, 2002-04
Access to good medical care helps people prevent illnesses, identify health conditions early, and treat health problems. Some conditions can and should be managed regularly outside the hospital. Higher rates of these avoidable hospitalizations can indicate reduced access to health care in a community.

Having a “medical home” — a personal doctor or other health care provider and a regular place of care other than the emergency department (ED) — is a critical component of good health care access. In the Rockaways, residents are more likely to be without a regular doctor than those in NYC overall (19% vs. 24%).

In addition, 7% of Rockaways residents go to the ED when they are sick or need health advice.

**Access to care**

Without a primary provider, people may seek routine health care in the emergency department (ED)

*Data Source: NYC Community Health Survey 2002-03-04*
GOAL 2  Be Tobacco-Free

Smoking is the leading cause of preventable death in New York City and the cause of many illnesses, including heart disease, stroke, emphysema, and lung cancer. More than one fifth of Rockaways residents currently smoke (22%). Many methods to quit smoking are available, and nearly 7 in 10 smokers in the Rockaways (69%) are trying to kick the habit.

Residents who smoke
More than 1 in 5 adults in the Rockaways smoke . . .

Attempts to quit smoking in the past year
. . . but most smokers are trying to quit

GOAL 3  Keep Your Heart Healthy

Heart disease can cause severe illness and death. Rockaways residents had an average annual heart disease hospitalization rate in 2003-2004 that was 30% higher than the Queens rate and 20% higher than the rate in NYC overall (2,237/100,000 vs. 1,727/100,000 in Queens and 1,856/100,000 in NYC). Despite a decrease from 2001-2002, the 2003-2004 heart disease death rate in the Rockaways (552/100,000) was more than 85% higher than the rates in Queens (288/100,000) and NYC overall (297/100,000).

Heart disease hospitalizations
The heart disease hospitalization rate is higher in the Rockaways

Deaths due to heart disease
Heart disease deaths are more common in the Rockaways

High blood pressure and high cholesterol. Both of these conditions contribute to heart disease. In the Rockaways, 33% of adults were told by a health care professional that they have high blood pressure (higher than 26% in Queens and NYC overall), and one quarter (25%) were told that they have high cholesterol (similar to 26% in Queens and NYC overall).

Percent are age-adjusted. Data Source: NYC Community Health Survey 2002
In addition to smoking, high blood cholesterol and high blood pressure, other factors that put people at risk for heart disease — lack of physical activity and obesity — can be prevented or controlled.

Obesity can lead to a variety of health problems, including heart disease and diabetes. Rates of obesity are increasing rapidly in New York City and across the U.S., making it a major public health concern. In the Rockaways, adults are more likely to be obese (26%) than in Queens (19%) and New York City overall (20%).

The increasing prevalence of obesity in the U.S. has contributed to an epidemic of diabetes. About 95% of diabetes cases are type 2 diabetes, which is strongly associated with obesity. Uncontrolled diabetes can worsen the harmful effects of high blood pressure, high cholesterol, and other risk factors for heart disease.

In the Rockaways, 9% of adults have diabetes.

Physical activity helps people maintain a healthy weight and strengthens the cardiovascular system. More than 4 in 10 Rockaways residents (44%) report not doing any physical activity. Only about one third of Rockaways residents (37%) report exercising at least 3 days a week.

Centers for Disease Control and Prevention Recommendations
Adults should do either 20 minutes of vigorous exercise 3 times per week or 30 minutes of moderate exercise 5 times per week.
GOAL 4  Know Your HIV Status

Wide disparities exist in HIV across New York City communities. In the Rockaways, the rate of HIV diagnoses and the rate of people living with HIV/AIDS in the community are higher than in Queens but lower than in NYC overall.

The death rate due to HIV disease has dropped by more than 70% during the past decade in this community. In 2003-2004, the average annual HIV-related death rate in the Rockaways was still twice the Queens rate but remained lower than the NYC overall rate (12/100,000 vs. 6/100,000 in Queens and 18/100,000 in NYC).

Death rate due to HIV
HIV-related death rates in the Rockaways have dropped dramatically in the past decade

HIV/AIDS in 2004
Total HIV diagnoses per 100,000 people* (13+)
Rockaways 41
Queens 30
New York City 55

% HIV diagnosed concurrently with AIDS** (13+)
Rockaways 41%
Queens 35%
New York City 29%

People living with HIV/AIDS per 100,000 people* (13+)
Rockaways 919
Queens 680
New York City 1,419

*Rates are age-adjusted.
**Within 31 days of HIV diagnosis – crude percents
Data Source and Analysis: HIV Epidemiology Program, NYC DOHMH, 2004

HIV/AIDS testing and prevention
Everyone should know their HIV status. However, an estimated one quarter of New Yorkers living with HIV do not know they are infected, delaying treatment and increasing the risk that they will transmit the disease to others. Only one fifth of Rockaways residents have been tested for HIV in the past year. In addition, more than 4 in 10 positive HIV test results (41%) are “late” diagnoses (HIV has already progressed to AIDS) in this community.

The most common way people get HIV is through sexual contact, and having multiple sex partners increases the risk of HIV. Condoms offer protection from HIV when engaging in sexual activities. Only about half (48%) of Rockaways adults who had more than 1 sex partner in the past year reported using a condom at their last sexual encounter.

Condom use at last sexual encounter
Less than half of Rockaways adults with multiple sex partners used a condom

Analysis limited to adults aged 18-64 who reported having >1 sex partner in the past year, excluding women who reported having sex only with women.
Percents are age-adjusted.
Data Source: NYC Community Health Survey 2002-03-04

HIV testing
Only 1 in 5 Rockaways adults has had an HIV test in the past year

Data Source: NYC Community Health Survey 2003
GOAL 5  Get Help for Depression

Psychological distress
One in 20 adults in the Rockaways suffers from serious psychological distress

Depression is a serious but treatable health condition that frequently goes undiagnosed. Serious psychological distress is associated with depression and other mental illnesses.

In the Rockaways, 5% of residents experience serious psychological distress.

Serious psychological distress can be identified in individuals using Kessler’s K6 scale, a validated measure consisting of 6 simple questions about mood. Percents are age-adjusted.

Data Source: NYC Community Health Survey 2002-03

Mental illness
Hospitalizations for mental illness are much higher in the Rockaways

Hospitalization rates are one way to look at serious mental illness in a neighborhood. Residents in the Rockaways have had a higher mental illness hospitalization rate over the past 10 years (excluding alcohol- or drug-related illness) than residents in Queens and in New York City overall. Also, the mental illness hospitalization rate has increased by more than 40% during the past decade.

In 2003-2004, the community’s average annual rate of mental illness hospitalizations (2,068/100,000) was more than double both the Queens rate (636/100,000) and the rate in New York City overall (813/100,000).

Understanding hospitalizations and access to health care. Hospitalization data are useful in understanding the burden that certain conditions place on the health care system, but not necessarily in measuring the exact extent of illness in a community. Variations in hospitalization rates may reflect not only differences in rates of illness, but also differences in access to health care. For example, the kinds of health institutions available to residents differ by community, as might the ability of residents to pay for those resources. If a community has a specialized residential institution for a certain type of disease, such as mental illness or stroke, people from outside that neighborhood may come to reside at this institution for care, resulting in an increase in reported hospitalizations for that disease in the community.
GOAL 6  Live Free of Dependence on Alcohol and Drugs

Binge drinking
More than 1 in 10 adults in the Rockaways engaged in binge drinking in the past month

The abuse of alcohol and drugs can lead to many preventable injuries, illnesses, and deaths, including injury in motor-vehicle crashes, liver disease, and violence.

Estimates of binge drinking represent the risk of immediate alcohol-related problems, such as alcohol-poisoning, injury and violence. In the Rockaways, 12% of adults report engaging in at least one episode of binge drinking (defined as consuming 5 or more drinks on one occasion) in the past month.

Alcohol-related hospitalizations reflect both acute and chronic (e.g., liver disease) consequences of alcohol abuse. In 2003-2004, the average annual alcohol-related hospitalization rate in the Rockaways was more than double the Queens rate and 40% higher than the rate in New York City overall (612/100,000 vs. 235/100,000 in Queens and 439/100,000 in NYC).

The drug-related hospitalization rate increased in the past decade, and the 2003-2004 rate was also more than 5 times (1,326/100,000) than in Queens (234/100,000) and more than double the New York City overall rate (595/100,000).

The death rate due to drugs in 2003-2004 was more than twice as high in the Rockaways as in Queens, but similar to the rate in NYC overall (13/100,000 vs. 6/100,000 in Queens and 10/100,000 in NYC).
Cancer screening can save lives by preventing disease, catching cancer in its early stages and providing opportunities for treatment. TCNY has set specific screening targets for cervical, breast, and colon cancers.

Women in the Rockaways are getting Pap tests for cervical cancer and mammograms for breast cancer at rates very close to the TCNY target of more than 85%, and the cervical cancer screening percent (84%) is higher than in Queens overall (76%). However, less than half of adults aged 50 and older in the Rockaways have had a colonoscopy in the past 10 years.

The death rate due to cancer has not changed much in the Rockaways during the past decade. The 2003-2004 average annual cancer death rate was similar to both the Queens rate and the rate in NYC overall (148/100,000 vs. 137/100,000 in Queens and 161/100,000 in NYC).

Preventing cancer and related deaths. Individuals can reduce their risk of the most common cancers. Never smoking or quitting the habit greatly reduces the risk of lung and other cancers. High colon and breast cancer death rates highlight the importance of getting recommended screenings so treatment can begin early.

The highest cancer-related death rates among men in the Rockaways are due to lung, blood-related (such as lymphoid), and colon cancers. Among women, lung, breast, and colon cancers are the top 3 causes of cancer-related death.
GOAL 8  Get the Immunizations You Need

Immunizations

Flu shot rates among older adults fall below the TCNY target and pneumococcal (pneumonia) immunizations are even lower

Immunizations are not just for kids. Of all the deaths that could have been prevented by vaccination, 99% occur in adults. Take Care New York has set a target that more than 80% of adults aged 65 and older will get an annual flu (influenza) shot by 2008. The Rockaways flu immunization rate among older adults falls short of the TCNY target by 35%.

Immunization rates for pneumonia are lower than those for flu across NYC. Less than half of older adults in the Rockaways have ever received the pneumococcal vaccine, which protects against one common cause of pneumonia.

GOAL 9  Make Your Home Safe and Healthy

Childhood lead poisoning

Childhood lead poisoning is a health problem that may be associated with decreased intelligence, learning and behavioral problems, and delayed growth and development. While the number of lead-poisoned children (0-17 years old) in New York City has declined dramatically over the past decade, the Health Department aims to eliminate lead poisoning by preventing children’s exposure to lead-based paint and other sources of lead.

In 2004, 42 children in the Rockaways (8/1,000) were newly identified with lead poisoning (defined as a blood lead level greater than or equal to 10 µg/dL).

Asthma in Adults and Children

Asthma

One in 20 adults in the Rockaways suffers from asthma

Conditions, or “triggers,” in the home environment, such as the presence of second-hand smoke or dust, can cause asthma attacks. Some housing conditions associated with asthma triggers, such as rodent or roach infestation, are more common in some neighborhoods than others.

The percent of self-reported asthma among adults in the Rockaways is the same as in New York City overall (5%).
Neighborhood asthma hospitalization rates depend in part on the percent of residents who have asthma. However, good medical management of asthma can prevent many asthma-related hospitalizations, and patients can work with health care providers to better control their asthma. Thus, the asthma hospitalization rate can also indicate poor access to health care.

The asthma hospitalization rate for adults in the Rockaways has decreased by almost half in the past decade. In contrast, the rate among children (0-17 years old) has increased, and the 2003-2004 average annual rate was higher than both the Queens and NYC overall rates (8/1,000 vs. 4/1,000 in Queens and 6/1,000 in NYC).

**Goal 10  Have a Healthy Baby**

The health of babies depends on the health of mothers. Good health care for pregnant women includes high quality prenatal care beginning in the first trimester of pregnancy. The 2003-2004 average annual percent of women who received late or no prenatal care in the Rockaways (40%) is higher than in Queens (36%) and in NYC overall (28%).

Teenage mothers and their babies face a number of risks. Pregnant teens are more likely to be poor and not complete high school than other teens, and they are more likely to have babies born with low birthweight than older women. The birth rate to teenage mothers has decreased over the past 10 years by more than 35% in the Rockaways. However, the average birth rate to teen moms in 2003-2004 in this community (94/1,000) was still 25% higher than in NYC overall (75/1,000).
Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in the Rockaways was 12% — higher than in Queens (8%) and NYC overall (9%). Infant mortality (the death of babies in the first year of life) has declined over the past 10 years in NYC. The 2002-2004 rate in the Rockaways was 9/1,000 — higher than in Queens overall and the TCNY target of 5/1,000.

**Low birthweight**

Babies in the Rockaways are more likely to be born with low birthweight.

**Infant mortality rate (IMR)**

The IMR in the Rockaways remains higher than the TCNY target.

**Neighborhood Health Highlight: Falls among Older Adults**

Every New York City neighborhood has different health concerns. Here we highlight falls among older adults in the Rockaways.

More than 1 in 3 adults aged 65 and older fall each year, and falls are the leading cause of injury deaths among older adults. In the Rockaways, the rate of hospitalizations from falls is more than 30% higher than the NYC overall rate (1,503/100,000 vs. 1,148/100,000).

Fractures are one consequence of falls, and hip fractures are the most serious type of fracture. One half of older adults who are hospitalized with a hip fracture cannot return home or live independently after the injury. In the Rockaways, more than a quarter (28%) of fall hospitalizations among older adults are for hip fractures. The fall-related hip fracture hospitalization rate in the Rockaways is more than 20% higher than the rate in NYC overall (562/100,000 vs. 454/100,000).

**TAKING ACTION**

Three modifiable risk factors for falls are (1) lower body weakness; (2) problems with balance and walking; and (3) taking 4 or more medications, or any psychoactive medication. Older adults should exercise regularly to reduce weakness and increase balance, and review their medications with a doctor or pharmacist. Environmental factors also increase risk of falls, and up to one half of all falls happen at home.

For more information on reducing fall hazards, go to [www.cdc.gov/ncipc/pub-res/toolkit/brochures.htm](http://www.cdc.gov/ncipc/pub-res/toolkit/brochures.htm), or call 311.
Technical notes

Analyses
All analyses were conducted by the Bureau of Epidemiology Services, NYC DOHMH, unless otherwise indicated. All estimates in this report were age standardized to the Year 2000 Standard Population, except for age-specific data and mother-child health indicators. All CHS analyses were done in SUDAAN to account for complex survey design and were weighted to the New York City population according to the U.S. Census 2000.

Data sources
NYS DOH hospitalization data: Includes hospitalizations of NYC residents that occurred anywhere in New York State. Patient zip code was used to classify hospitalizations into 42 neighborhoods. Data from 1995-2003 updated in April 2005; 2004 data updated in July 2005.
Vital Statistics data: Includes births and deaths of NYC residents that occurred within New York City. Data were combined across years to increase statistical stability and average annual rates are presented. In addition, infant mortality rates (IMR) were calculated as 3-year annual averages, and this statistic and others may differ from the presentation in “Summary of Vital Statistics” reports from the Bureau of Vital Statistics, NYC DOHMH.
Community Health Survey data: The NYC Community Health Survey (CHS) is an annual random-digit-dial telephone survey of approximately 10,000 adults in New York City. This profile uses the following datasets from this survey: NYC CHS 2002, NYC CHS 2003, NYC CHS 2004, NYC CHS 2002-03-04, NYC CHS 2002-03, NYC CHS 2002 & 2004, and NYC CHS 2003-04. The combined-year datasets increase statistical power, allowing for more stable analyses at the neighborhood level.

National data and information on falls among older adults were taken from the Centers for Disease Control and Prevention's National Center for Injury Prevention and Control at www.cdc.gov/ncipc/.

Neighborhood Definitions
The 42 NYC neighborhoods are based on the United Hospital Fund definitions of neighborhood, which are specified by zip code. For a complete listing of all 42 neighborhoods and their zip codes, go to nyc.gov/health. The zip codes included in analyses of the Rockaways are 11691, 11692, 11693, 11694, 11695, and 11697. Please note that some neighborhoods were combined for statistical purposes in the CHS 2002, CHS 2003 and CHS 2004 datasets to make a total of 33 (2002) or 34 (2003, 2004) neighborhoods.

Avoidable Hospitalizations
Data based on Ambulatory Care Sensitive Conditions (called “avoidable hospitalizations” in this report) were calculated using the Agency for Healthcare Research and Quality (AHRQ) classification of inpatient hospitalization data. Conditions in the overall measure include: Diabetes Short-term Complications Admission Rate, Diabetes Long-term Complications Admission Rate, Pediatric Asthma Admission Rate, Chronic Obstructive Pulmonary Disease Admission Rate, Pediatric Gastroenteritis Admission Rate, Hypertension Admission Rate, Congestive Heart Failure Admission Rate, Dehydration Admission Rate, Bacterial Pneumonia Admission Rate, Urinary Tract Infection Admission Rate, Angina without Procedure Admission Rate, Uncontrolled Diabetes Admission Rate, Adult Asthma Admission Rate, and Rate of Lower-extremity Amputation among Patients with Diabetes.

Significance Testing
For all data, 95% confidence limits were calculated for neighborhood, borough, and NYC estimates. If these ranges did not overlap, a significant difference was inferred. This is a conservative measure of statistical difference. This methodology also was used to examine differences between years in neighborhood trend data. Only robust findings found to be statistically significant are discussed in the text. In addition, all NYC CHS estimates were evaluated for statistical stability using the relative standard error (RSE). Those estimates with an RSE > .30 are flagged in graphs, “Estimate is unstable due to small sample size and should be interpreted with caution.”

TCNY report card
The neighborhood was classified according to where it ranked in comparison to the other 41 NYC neighborhoods with Above Average = rankings 1-10, Average = rankings 11-32, and Below Average = rankings 33-42 where 1 = the best neighborhood score. Rankings were computed by combining (or in some cases, using only one indicator) standardized measures (z-scores) of the following health indicators for each TCNY goal: TCNY#1 · primary care provider, insurance, ED visits; TCNY#2 · current smokers; TCNY#3 · diabetes, obesity, exercise, heart disease hospitalizations, heart disease mortality; TCNY#4 · HIV testing, AIDS mortality; TCNY#5 · serious psychological distress, mental illness hospitalizations; TCNY#6 · binge drinking, alcohol-related hospitalizations, drug-related hospitalizations, drug-related mortality; TCNY#7 · cervical cancer screening, breast cancer screening, colon cancer screening, cancer mortality; TCNY#8 · flu immunization; TCNY#9 · child lead poisoning, adult asthma rates; TCNY#10 · prenatal care, teenage mothers, low birthweight, infant mortality.

Community Health Profile for the Rockaways

This report is an updated, expanded second edition of the 2002 Community Health Profile for the Rockaways.

NEW IN THE SECOND EDITION:
- Take Care New York report card
- Time-trend data on births, hospitalizations, and deaths
- More neighborhood-specific health statistics
- Robust estimates from data through 2004

First and second edition reports on all 42 New York City neighborhoods are available from the New York City Department of Health and Mental Hygiene online or by mail.
