Community Health Profile, Second Edition: Port Richmond

New York City is the most diverse city in the U.S. — a fact reflected in the distinct character of each neighborhood. The second edition of the Community Health Profiles uses Take Care New York (TCNY), the city’s health policy, to examine preventable causes of illness and death in all of NYC’s 42 neighborhoods. This report updates the 2002 profile (available at nyc.gov/health) by providing more recent and time-trend data, and a greater variety of health statistics. Key health issues in Port Richmond include:

- More than 1 in 5 adults in Port Richmond smoke, and the heart disease hospitalization and death rates are higher in this community than NYC overall (page 6).
- Less than half of older adults in Port Richmond have had a colonoscopy in the past 10 years, and colon cancer is one of the top three cancer-related causes of death for both men and women (page 11).
- Port Richmond has a higher hospitalization rate for injuries due to motor vehicle traffic crashes than the rate in NYC overall (page 14).

Methods: While this report provides important information, it is not intended to be an exhaustive examination of the health of Port Richmond residents, as not all health problems and their causes could be covered. Only statistically significant findings are discussed in the text. For complete information on methods, see Technical Notes (page 15).

Take Care Port Richmond

In 2004, the Health Department created a citywide health policy called Take Care New York (TCNY) to help improve the health of New Yorkers. TCNY identifies 10 key areas that cause significant illness and death but can be improved through intervention by individuals, health care providers, government agencies, and other organizations.

This report examines how well Port Richmond residents are doing on health indicators for each of the 10 TCNY goals. It examines areas in which the community is a health leader, as well as areas that need improvement. The TCNY report card below shows where Port Richmond ranks among all 42 New York City neighborhoods. (See Technical Notes for information about how neighborhoods were defined and ranked.)

How Residents Rate Their Own Health

Overall health
More than 1 in 7 adults in Port Richmond consider themselves to be in fair or poor health

People are good at rating their own health. In general, when asked to rate their general health as excellent, very good, good, fair, or poor, those who say “fair” or “poor” are more likely to have health problems than those who report better health.

In Port Richmond, 16% of residents report being in fair or poor health.
**Overall Death Rates in Port Richmond**

Although New York City death rates have dropped over the past decade, the death rate in Port Richmond has remained fairly constant.

In 2003-2004, the average annual death rate in Port Richmond was similar to Staten Island and nearly 20% higher than in New York City overall (846/100,000 vs. 828/100,000 in Staten Island and 718/100,000 in NYC). Throughout this profile, cause-specific death rates are provided for TCNY goals.

### Premature Death

People who die before age 75 can be thought of as dying early, or prematurely. If a person dies early, their years of potential life lost (YPLLs) can be calculated by subtracting their age at death from 75 years to get a measure of premature death.

The causes of premature death differ across communities. The primary cause of premature death in Port Richmond is cancer, as well as in both Staten Island and New York City overall.

#### Top 5 causes of years of potential life lost

Cancer causes the most years of potential life lost in Port Richmond.

- Other* 39% (1,781 years lost)
- Heart Disease 20% (890 years lost)
- Accidents 5% (247 years lost)
- HIV-related 7% (305 years lost)
- Certain Perinatal Conditions 7% (300 years lost)

*Cancer 22% (996 years lost)

Data Sources: Bureau of Vital Statistics, NYC DOHMH, 2003-04; U.S. Census 2000/NYC Department of City Planning
Access to good medical care helps people prevent illnesses, identify health conditions early, and treat health problems. Some conditions can and should be managed regularly outside the hospital. Higher rates of these avoidable hospitalizations can indicate reduced access to health care in a community.

Having a “medical home”—a personal doctor or other health care provider and a regular place of care other than the emergency department (ED)—is a critical component of good health care access. In Port Richmond, 20% of residents do not have a regular doctor, nearly meeting the TCNY target. In addition, 1 in 10 Port Richmond residents goes to the ED when they are sick or need health advice.

**Access to care**

Without a primary provider, people may seek routine health care in the emergency department (ED)

![Graph showing percent of adults (18+) without a primary doctor and those who go to ED when sick or need health advice](image)

Percent of adults (18+)

- No personal doctor
- Go to ED when sick or need health advice

**TCNY Target:** <20% by 2008

Port Richmond
Staten Island
New York City

Percents are age-adjusted.

*Data Sources: NYC Community Health Survey 2002-03-04, NYC Community Health Survey 2003-04*

**Health insurance**

One in 4 adults in Port Richmond is uninsured or went without health insurance during the past year

![Graph showing percent of adults (18-64) insured now, insured now but uninsured some time in past year, uninsured now](image)

Percent of adults (18-64)

- Insured now, and for entire past year
- Insured now, but uninsured some time in past year
- Uninsured now

Port Richmond
Staten Island
New York City

Health insurance rates are calculated for adults aged 18-64 and age-adjusted.

*Data Source: NYC Community Health Survey 2002-03-04*

Health insurance is important for access to health care. A similar proportion of residents in Port Richmond (14%) and New York City overall (18%) are currently uninsured. In addition, another 11% of residents in this community went without health insurance at some time during the past year.
GOAL 2  Be Tobacco-Free

Smoking is the leading cause of preventable death in New York City and the cause of many illnesses, including heart disease, stroke, emphysema, and lung cancer. More than one fifth of Port Richmond residents (22%) currently smoke. Many methods to quit smoking are available, and more than half of smokers in Port Richmond (61%) are trying to kick the habit.

Residents who smoke
More than 1 in 5 adults in Port Richmond smoke . . .

Attempts to quit smoking in the past year
. . . but most smokers are trying to quit

GOAL 3  Keep Your Heart Healthy

Heart disease can cause severe illness and death. Port Richmond residents had an average annual heart disease hospitalization rate in 2003-2004 that was similar to the Staten Island rate but more than 20% higher than the rate in NYC overall (2,254/100,000 vs. 2,172/100,000 in Staten Island and 1,856/100,000 in NYC). The heart disease death rate in 2003-2004 (363/100,000) was also similar to the rate in Staten Island (371/100,000) but higher than in NYC overall (297/100,000).

Heart disease hospitalizations
Heart disease causes a higher hospitalization rate in Port Richmond than in NYC overall

Deaths due to heart disease
Port Richmond residents are more likely to die from heart disease than those in NYC overall

High blood pressure and high cholesterol. Both of these conditions contribute to heart disease. In Port Richmond, 23% of adults were told by a health care professional that they have high blood pressure (similar to 21% in Staten Island and 26% in NYC overall), and nearly one quarter (22%) were told that they have high cholesterol (similar to 26% in Staten Island and NYC overall).

Percent are age-adjusted. Data Source: NYC Community Health Survey 2002
In addition to smoking, high blood cholesterol and high blood pressure, other factors that put people at risk for heart disease — lack of physical activity and obesity — can be prevented or controlled.

Obesity can lead to a variety of health problems, including heart disease and diabetes. Rates of obesity are increasing rapidly in New York City and across the U.S., making it a major public health concern. In Port Richmond, one quarter of adults (24%) are obese.

The increasing prevalence of obesity in the U.S. has contributed to an epidemic of diabetes. About 95% of diabetes cases are type 2 diabetes, which is strongly associated with obesity. Uncontrolled diabetes can worsen the harmful effects of high blood pressure, high cholesterol, and other risk factors for heart disease.

In Port Richmond, 9% of adults have diabetes.

Physical activity helps people maintain a healthy weight and strengthens the cardiovascular system. More than 4 in 10 Port Richmond residents (42%) report doing no physical activity at all. Another 4 in 10 Port Richmond residents (39%) report that they exercise at least 3 days a week.
GOAL 4  Know Your HIV Status

Wide disparities exist in HIV across New York City communities. In Port Richmond, the rate of HIV diagnoses is lower than the NYC overall rate, and the rate of people living with HIV/AIDS in the community is higher than in Staten Island overall but half the rate in NYC overall.

The death rate due to HIV disease has dropped by 60% during the past decade in this community. In 2003-2004, the average annual HIVRELATED death rate in Port Richmond was similar to the Staten Island and NYC overall rates (16/100,000 vs. 8/100,000 in Staten Island and 18/100,000 in NYC).

Death rate due to HIV

HIV-related death rates in Port Richmond have dropped dramatically in the past decade.

**Within 31 days of HIV diagnosis – crude percents

HIV/AIDS testing and prevention

Everyone should know their HIV status. However, an estimated one quarter of New Yorkers living with HIV do not know they are infected, delaying treatment and increasing the risk that they will transmit the disease to others. Only about one fifth of Port Richmond residents have been tested for HIV in the past year. In addition, one quarter of positive HIV test results (24%) are “late” diagnoses (HIV has already progressed to AIDS) in this community.

The most common way people get HIV is through sexual contact, and having multiple sex partners increases the risk of HIV. Condoms offer protection from HIV when engaging in sexual activities. Fewer than 6 in 10 (56%) Port Richmond adults who had more than 1 sex partner in the past year reported using a condom at their last sexual encounter.

HIV testing

Only 1 in 5 Port Richmond adults has had an HIV test in the past year.

Condom use at last sexual encounter

Fewer than 6 in 10 Port Richmond adults with multiple sex partners used a condom.

Analysis limited to adults aged 18-64 who reported having >1 sex partner in the past year, excluding women who reported having sex only with women.
Percents are age-adjusted.
Data Source: NYC Community Health Survey 2002-03-04
GOAL 5  Get Help for Depression

Psychological distress
One in 20 adults in Port Richmond suffers from serious psychological distress

Serious psychological distress can be identified in individuals using Kessler's K6 scale, a validated measure consisting of 6 simple questions about mood. Percents are age-adjusted.

Data Source:  NYC Community Health Survey 2002-03

Mental illness
Hospitalizations for mental illness are higher in Port Richmond

Hospitalization rates are one way to look at serious mental illness in a neighborhood. Residents in Port Richmond have had a higher mental illness hospitalization rate over the past 10 years (excluding alcohol- or drug-related illness) than residents in Staten Island and New York City overall.

In 2003-2004, the community's average annual rate of mental illness hospitalizations (995/100,000) was higher than both the Staten Island rate (826/100,000) and the rate in New York City overall (813/100,000).

Understanding hospitalizations and access to health care. Hospitalization data are useful in understanding the burden that certain conditions place on the health care system, but not necessarily in measuring the exact extent of illness in a community. Variations in hospitalization rates may reflect not only differences in rates of illness, but also differences in access to health care. For example, the kinds of health institutions available to residents differ by community, as might the ability of residents to pay for those resources. If a community has a specialized residential institution for a certain type of disease, such as mental illness or stroke, people from outside that neighborhood may come to reside at this institution for care, resulting in an increase in reported hospitalizations for that disease in the community.
The abuse of alcohol and drugs can lead to many preventable injuries, illnesses, and deaths, including injury in motor-vehicle crashes, liver disease, and violence.

Estimates of binge drinking represent the risk of immediate alcohol-related problems, such as alcohol-poisoning, injury and violence. In Port Richmond, 13% of adults report engaging in at least one episode of binge drinking (defined as consuming 5 or more drinks on one occasion) in the past month.

Alcohol-related hospitalizations reflect both acute and chronic (e.g., liver disease) consequences of alcohol abuse. In 2003-2004, the average annual alcohol-related hospitalization rate in Port Richmond was lower than in Staten Island and higher than the New York City overall rate (684/100,000 vs. 795/100,000 in Staten Island and 439/100,000 in NYC).

The drug-related hospitalization rate has declined more than 30% during the past decade in Port Richmond. In 2003-2004, the rate was lower (381/100,000) than in Staten Island (503/100,000) and New York City overall (595/100,000).

In 2003-2004, the death rate due to drugs in Port Richmond was similar to the Staten Island and NYC overall rates (7/100,000 vs. 8/100,000 in Staten Island and 10/100,000 in NYC).
Cancer screening can save lives by preventing disease, catching cancer in its early stages and providing opportunities for treatment. TCNY has set specific screening targets for cervical, breast, and colon cancers.

Women in Port Richmond are getting Pap tests for cervical cancer at a rate very close to the TCNY target of more than 85%, but the rate of mammograms for breast cancer (79%) is lower. In addition, fewer than half of adults aged 50 and older in Port Richmond have had a colonoscopy in the past 10 years.

The highest cancer-related death rates among men in Port Richmond are due to lung, colon, and blood-related (such as lymphoid) cancers. Among women, lung, breast, and colon cancers are the top 3 causes of cancer-related death.

<table>

</tbody>
</table>

The death rate due to cancer has remained fairly steady in Port Richmond during the past decade. The 2003-2004 average annual cancer death rate was similar to the Staten Island rate but more than 20% higher than the NYC overall rate (200/100,000 vs. 197/100,000 in Staten Island and 161/100,000 in NYC).

Preventing cancer and related deaths. Individuals can reduce their risk of the most common cancers. Never smoking or quitting the habit greatly reduces the risk of lung and other cancers. High colon and breast cancer death rates highlight the importance of getting recommended screenings so treatment can begin early.
GOAL 8  Get the Immunizations You Need

Immunizations
Flu shot rates among older adults fall below the TCNY target and pneumococcal (pneumonia) immunizations are even lower

<table>
<thead>
<tr>
<th>Rate per 1,000 children (0-17) tested</th>
<th>Port Richmond</th>
<th>Staten Island</th>
<th>New York City</th>
</tr>
</thead>
<tbody>
<tr>
<td>13</td>

<td>9</td>
<td>10</td>
</tr>
</tbody>
</table>

TCNY Target: >80% by 2008

Flu shot rates among older adults fall below the TCNY target and pneumococcal (pneumonia) immunizations are even lower. Immunizations are not just for kids. Of all the deaths that could have been prevented by vaccination, 99% occur in adults. Take Care New York has set a target that more than 80% of adults aged 65 and older will get an annual flu (influenza) shot by 2008. The Port Richmond flu immunization rate among older adults falls short of the TCNY target by 25%.

Immunization rates for pneumonia are lower than those for flu across NYC. Only about half of older adults in Port Richmond have ever received the pneumococcal vaccine, which protects against one common cause of pneumonia.

Data Source: NYC Community Health Survey 2002-03-04

GOAL 9  Make Your Home Safe and Healthy

Childhood lead poisoning
Lead poisoning among young children continues to be a problem

Childhood lead poisoning is a health problem that may be associated with decreased intelligence, learning and behavioral problems, and delayed growth and development. While the number of lead-poisoned children (0-17 years old) in New York City has declined dramatically over the past decade, the Health Department aims to eliminate lead poisoning by preventing children’s exposure to lead-based paint and other sources of lead.

In 2004, 35 children in Port Richmond (13/1,000) were newly identified with lead poisoning (defined as a blood lead level greater than or equal to 10 µg/dL).

Data Source and Analysis: Lead Poisoning Prevention Program, NYC DOHMH, 2004

Asthma in Adults and Children

Asthma
One in 15 adults suffers from asthma in Port Richmond

Conditions, or “triggers,” in the home environment, such as the presence of second-hand smoke or dust, can cause asthma attacks. Some housing conditions associated with asthma triggers, such as rodent or roach infestation, are more common in some neighborhoods than others.

In Port Richmond, 7% of adults report having asthma.

Percents are age-adjusted.
Data Source: NYC Community Health Survey 2002-03-04

Data Source: NYC Community Health Survey 2002-03-04
Neighborhood asthma hospitalization rates depend in part on the percent of residents who have asthma. However, good medical management of asthma can prevent many asthma-related hospitalizations, and patients can work with health care providers to better control their asthma. Thus, the asthma hospitalization rate can also indicate poor access to health care.

The average annual hospitalization rate due to adult asthma in 2003-2004 was twice the Staten Island rate but one-third lower than the rate in NYC overall. Asthma hospitalization rates for children (0-17 years old) in Port Richmond fall between the rates in Staten Island and NYC overall. The rate among children has declined 33% in the past decade.

**Goal 10 Have a Healthy Baby**

The health of babies depends on the health of mothers. Good health care for pregnant women includes high quality prenatal care beginning in the first trimester of pregnancy. In Port Richmond, the average annual percent of women who received late or no prenatal care in 2003-2004 was higher than the Staten Island percent but lower than the NYC overall percent (21% vs. 16% in Staten Island and 28% in NYC).

Teenage mothers and their babies face a number of risks. Pregnant teens are more likely to be poor and not complete high school than other teens, and they are more likely to have babies born with low birthweight than older women. The average birth rate to teen moms in 2003-2004 in Port Richmond (106/1,000) was nearly twice the Staten Island rate (55/1,000) and 40% higher than in NYC overall (75/1,000).
Babies born with low birthweight tend to have more health problems than others. In 2003-2004, the average percent of babies born with low birthweight in Port Richmond was equal to the NYC overall percent (9%).

Infant mortality (the death of babies in the first year of life) has declined over the past 10 years in NYC. The 2002-2004 rate in Port Richmond was 6/1,000, similar to Staten Island and NYC overall, but still higher than the TCNY target.

Low birthweight

About 10% of babies in Port Richmond are born with low birthweight.

[Graph showing the percent of live births with low birthweight from 1995-96 to 2003-04 for Port Richmond, Staten Island, and New York City.]

Data Source: Bureau of Vital Statistics, NYC DOHMH, 1995-2004

Low birthweight is defined as <2,500 grams (5.5 pounds).

Infant mortality rate (IMR)

The IMR in Port Richmond is still higher than the TCNY target.

[Graph showing the deaths per 1,000 live births from 1993-95 to 2002-04 for Port Richmond, Staten Island, and New York City.]

TCNY Target: <5.0 per 1,000 by 2008

Data Source: Bureau of Vital Statistics, NYC DOHMH, 1993-2004

Neighborhood Health Highlight: Injury from Motor-Vehicle Crashes

Every New York City neighborhood has different health concerns. Here we highlight injury from motor-vehicle crashes in Port Richmond.

Motor-vehicle crashes are a major cause of injury and the leading cause of death among children in the U.S. In Port Richmond, there is an average of almost 85 hospitalizations due to injuries in motor-vehicle crashes each year, and 20% of those hospitalizations are among those younger than 19. The rate of adult hospitalizations for injuries due to traffic crashes is more than 75% higher in this community than in New York City overall (132/100,000 vs. 75/100,000).

Men are more likely than women to be involved in motor-vehicle crashes. In Port Richmond, men are almost 70% more likely to be hospitalized with injuries from crashes than women (167/100,000 vs. 100/100,000).

[Graph showing hospitalizations per 100,000 people for men and women in Port Richmond, Staten Island, and New York City.]

Rates are age-adjusted and include occupants, bicyclists, pedestrians, and others.

Data Sources: New York State Department of Health Statewide Planning and Research Cooperative System, 2003-04; U.S. Census 2000/NYC Department of City Planning

Men are more likely to be hospitalized due to motor vehicle crashes than women in Port Richmond.

[Graph showing the hospitalizations per 100,000 people for men and women in Port Richmond.]

Rates are age-adjusted and include occupants, bicyclists, pedestrians, and others.

Data Source: New York State Department of Health Statewide Planning and Research Cooperative System, 2003-04; U.S. Census 2000/NYC Department of City Planning

Taking Action

Following traffic laws is one easy way for drivers, bicyclists and pedestrians to reduce their risk of injury due to a motor-vehicle crash. Small children should ride in car safety seats; all occupants should wear seat belts; drivers should obey speed limits; and pedestrians and bicyclists should obey traffic signals. Alcohol- and drug-impairment can also lead to traffic crashes; drivers should only operate vehicles when sober.

For more information on road safety, call 311.
Technical notes

Analyses
All analyses were conducted by the Bureau of Epidemiology Services, NYC DOHMH, unless otherwise indicated. All estimates in this report were age standardized to the Year 2000 Standard Population, except for age-specific data and mother-child health indicators. All CHS analyses were done in SUDAAN to account for complex survey design and were weighted to the New York City population according to the U.S. Census 2000.

Data sources
NYSHospitalization data: Includes hospitalizations of NYC residents that occurred anywhere in New York State. Patient zip code was used to classify hospitalizations into 42 neighborhoods. Data from 1995-2003 updated in April 2005; 2004 data updated in July 2005.

Vital Statistics data: Includes births and deaths of NYC residents that occurred within New York City. Data were combined across years to increase statistical stability and average annual rates are presented. In addition, infant mortality rates (IMR) were calculated as 3-year annual averages, and this statistic and others may differ from the presentation in “Summary of Vital Statistics” reports from the Bureau of Vital Statistics, NYC DOHMH.

Community Health Survey data: The NYC Community Health Survey (CHS) is an annual random-digit-dial telephone survey of approximately 10,000 adults in New York City. This profile uses the following datasets from this survey: NYC CHS 2002, NYC CHS 2003, NYC CHS 2004, NYC CHS 2002-03-04, NYC CHS 2002-03, NYC CHS 2002 & 2004, and NYC CHS 2003-04. The combined-year datasets increase statistical power, allowing for more stable analyses at the neighborhood level.

Neighborhood Definitions
The 42 NYC neighborhoods are based on the United Hospital Fund definitions of neighborhood, which are specified by zip code. For a complete listing of all 42 neighborhoods and their zip codes, go to nyc.gov/health. The zip codes included in analyses of Port Richmond are 10302, 10303, and 10310. Please note that some neighborhoods were combined for statistical purposes in the CHS 2002, CHS 2003 and CHS 2004 datasets to make a total of 33 (2002) or 34 (2003, 2004) neighborhoods. Port Richmond statistics from these individual-year datasets include data from the neighboring communities of Stapleton and St. George.

Avoidable Hospitalizations
Data based on Ambulatory Care Sensitive Conditions (called “avoidable hospitalizations” in this report) were calculated using the Agency for Healthcare Research and Quality (AHRQ) classification of inpatient hospitalization data. Conditions in the overall measure include: Diabetes Short-term Complications Admission Rate, Diabetes Long-term Complications Admission Rate, Pediatric Asthma Admission Rate, Chronic Obstructive Pulmonary Disease Admission Rate, Pediatric Gastroenteritis Admission Rate, Hypertension Admission Rate, Congestive Heart Failure Admission Rate, Dehydration Admission Rate, Bacterial Pneumonia Admission Rate, Urinary Tract Infection Admission Rate, Angina without Procedure Admission Rate, Uncontrolled Diabetes Admission Rate, Adult Asthma Admission Rate, and Rate of Lower-extremity Amputation among Patients with Diabetes.

Significance Testing
For all data, 95% confidence limits were calculated for neighborhood, borough, and NYC estimates. If these ranges did not overlap, a significant difference was inferred. This is a conservative measure of statistical difference. This methodology also was used to examine differences between years in neighborhood trend data. Only robust findings found to be statistically significant are discussed in the text. In addition, all NYC CHS estimates were evaluated for statistical stability using the relative standard error (RSE). Those estimates with an RSE > .30 are flagged in graphs, “Estimate is unstable due to small sample size and should be interpreted with caution.”

TCNY report card
The neighborhood was classified according to where it ranked in comparison to the other 41 NYC neighborhoods with Above Average = rankings 1-10, Average = rankings 11-32, and Below Average = rankings 33-42 where 1 = the best neighborhood score. Rankings were computed by combining (or in some cases, using only one indicator) standardized measures (z-scores) of the following health indicators for each TCNY goal: TCNY#1 - primary care provider, insurance, ED visits; TCNY#2 - current smokers; TCNY#3 - diabetes, obesity, exercise, heart disease hospitalizations, heart disease mortality; TCNY#4 - HIV testing, AIDS mortality; TCNY#5 - serious psychological distress, mental illness hospitalizations; TCNY#6 - binge drinking, alcohol-related hospitalizations, drug-related hospitalizations, drug-related mortality; TCNY#7 - cervical cancer screening, breast cancer screening, colon cancer screening, cancer mortality; TCNY#8 - flu immunization; TCNY#9 - child lead poisoning, adult asthma rates; TCNY#10 - prenatal care, teenage mothers, low birthweight, infant mortality.
