Health is rooted in the circumstances of our daily lives and the environments in which we are born, grow, play, work, love and age. Understanding how community conditions affect our physical and mental health is the first step toward building a healthier New York City.

Note from Dr. Mary Bassett, Commissioner, New York City Department of Health and Mental Hygiene

New York City is a city of neighborhoods. Their diversity, rich history and people are what make this city so special.

But longstanding and rising income inequality, combined with a history of racial residential segregation, has led to startling health inequities between neighborhoods. Poor health outcomes tend to cluster in places that people of color call home and where many residents live in poverty. Life expectancy in Brownsville, for example, is 11 years shorter than in the Financial District. And this is not because residents of Brownsville are dying of unusual diseases, but because they are dying of the same diseases – mostly heart disease and cancer – at younger ages and at higher rates.

This is unfair and avoidable. A person’s health should not be determined by his or her ZIP code.

Reducing health inequities requires policymakers, health professionals, researchers and community groups to advocate and work together for systemic change. In One New York: The Plan for a Strong and Just City (OneNYC), Mayor Bill de Blasio has outlined a vision to transform this city, and every neighborhood, guided by the principles of growth, equity, sustainability and resiliency.

Our communities are not simply made up of individual behaviors, but are dynamic places where individuals interact with each other, with their immediate environments and with the policies that shape those environments. The Community Health Profiles include indicators that reflect a broad set of conditions that impact health.

Our hope is that you will use the data and information in these Community Health Profiles to advocate for your neighborhoods.
Navigating this document

This profile covers all of Bronx Community District 5, which includes Morris Heights, Mount Hope, South Fordham and University Heights, but the name is shortened to just Fordham and University Heights. This is one of 59 community districts in New York City (NYC).

Community districts are ranked on each indicator. The highest rank (#1) corresponds to the largest value for a given measure. Sometimes a high rank indicates a positive measure of health (e.g., ranking first in flu vaccination). Other times, it indicates a negative measure of health (e.g., ranking first in the premature death rate).

The following color coding system is used throughout this document:

- **FORDHAM AND UNIVERSITY HEIGHTS**
- **BEST-PERFORMING COMMUNITY DISTRICT**
- **THE BRONX**
- **NEW YORK CITY**

Housing quality

Poorly maintained housing is associated with negative health outcomes, including asthma and other respiratory illnesses, injuries and poor mental health. Fordham and University Heights has the fourth-highest percentage of homes with maintenance defects in the city.

Air pollution

Although NYC air quality is improving, air pollution, such as fine particles (PM$_{2.5}$), can cause health problems, particularly among the very young, seniors and those with preexisting health conditions. In Fordham and University Heights, levels of PM$_{2.5}$, the most harmful air pollutant, are 10.1 micrograms per cubic meter, compared with 9.1 in the Bronx and 8.6 citywide.

Retail environment

The prevalence of tobacco retailers in Fordham and University Heights is similar to the prevalence citywide. Supermarket access is limited, with only 93 square feet of supermarket space per 100 people.
**Adult educational attainment**

In **Fordham and University Heights**, only one in five adults has a college degree, and more than one-third of adults have not completed high school.

**Highest level of education attained (adults 25 years and older)**

Higher education levels are associated with better health outcomes.

**Income**

Living in poverty limits healthy lifestyle choices and makes it difficult to access health care and resources that can promote health and prevent illness. Unemployment and unaffordable housing are also closely associated with poverty and poor health. Almost one in five **Fordham and University Heights** adults ages 16 and older is unemployed, and nearly two-thirds of residents spend more than 30% of their monthly gross income on rent, the highest rate in the city.

One way to consider the effect of income on health is by comparing death rates among neighborhoods. Assuming that the death rates from the five neighborhoods with the highest incomes are achievable in **Fordham and University Heights**, it is estimated that 41% of deaths could have been averted.

**Economic stress**

Children and adolescents

The littlest New Yorkers all deserve the same opportunities for health. In **Fordham and University Heights**, the rate of preterm births, a key driver of infant death, is almost twice the rate in Midtown, and the teen birth rate is almost twice the citywide rate. The percentage of elementary school students who miss 20 or more school days is tenth-highest in the city.

### Preterm births (percent of all live births)

- **Fordham and University Heights** (RANKS 18th): 10.1%
- **Midtown** (RANKS 59th): 5.7%
- **Bronx**: 9.9%
- **NYC**: 9.0%

### Teen births (per 1,000 girls ages 15-19)

- **Fordham and University Heights** (RANKS 10th): 43.0 per 1,000 girls
- **Financial District** (RANKS 59th): 1.1 per 1,000 girls
- **Bronx**: 34.4
- **NYC**: 23.6

### Elementary school absenteeism (percent of students missing 20 or more school days)

- **Fordham and University Heights** (RANKS 18th): 30%
- **Financial District** (RANKS 59th): 4%
- **Bronx**: 29%
- **NYC**: 20%

### Incarceration

- **Jail incarceration** (per 100,000 adults ages 16 and older)

  - **Queens Village** 5* (RANKS 59th)
  - **Fordham and University Heights** 230 (RANKS 8th)
  - **Bronx**: 156
  - **NYC**: 93

Smoking, diet and physical activity
Smoking, poor quality diet and physical inactivity are risk factors for high blood pressure, diabetes and other problems. Adults in Fordham and University Heights smoke and are physically active at rates similar to residents of the Bronx and the city as a whole. However, adults in Fordham and University Heights are more likely to consume sugary drinks and less likely to eat fruits and vegetables than adults citywide.

NYC DOHMH, Community Health Survey, 2011-2013

42% of adults in Fordham and University Heights consume at least one sugary beverage per day, the highest rate in the city.
Obesity and diabetes

Obesity can lead to serious health problems, such as diabetes and heart disease. At 31%, the rate of obesity in Fordham and University Heights is almost four times the rate in Stuyvesant Town and Turtle Bay. The diabetes rate in Fordham and University Heights is 15%, five times the rate in Stuyvesant Town and Turtle Bay.

Substance use

Drug- and/or alcohol-related hospitalizations reflect acute and chronic consequences of substance misuse. In Fordham and University Heights such hospitalization rates are higher than the rates in Bronx and NYC; Fordham and University Heights has the sixth-highest rate of both alcohol- and drug-related hospitalizations in NYC.

Exercise is one way to maintain a healthy weight. Federal guidelines say that children should get 60 minutes of exercise per day, adults should get 150 minutes per week, and older adults should get 150 minutes per week as their physical abilities allow, with a focus on exercises to improve balance.
Access to health care

A lack of quality health care can lead to negative health outcomes and more intensive treatment, such as avoidable hospitalizations. In Fordham and University Heights, one in four adults has no health insurance, and one in seven goes without needed medical care, similar to citywide rates. The rate of late or no prenatal care is higher in Fordham and University Heights than in NYC overall.

Prevention and screening

Compared with teens citywide, teenaged girls from Fordham and University Heights are more likely to receive the full human papillomavirus (HPV) vaccine series. Fordham and University Heights has the highest rate of adults who get tested for HIV.

HEALTH CARE

Prior to 2014, 20% of adults in NYC had no health insurance; however, with implementation of the Affordable Care Act, this percentage decreased to 14% citywide in 2014. A similar decrease is expected in Fordham and University Heights.

HPV infection causes cancers that can be prevented by the HPV vaccine. Boys and girls should receive the vaccine at 11 to 12 years of age, prior to HPV exposure and when the vaccine is most effective.
New HIV diagnoses

Some people with HIV do not know that they are infected. Getting diagnosed is the first step in the treatment and care of HIV. Fordham and University Heights ranks sixth in the rate of new HIV diagnoses.

![Chart showing new HIV diagnoses](image)

Stroke

High blood pressure is the leading risk factor for stroke and the most important to control. The rate of stroke hospitalizations in Fordham and University Heights is higher than the citywide rate.

![Chart showing stroke hospitalizations](image)

Mental health

Variations in hospitalization rates may reflect differences in rates of illness, access to health care and other social and cultural factors. The rate of adult psychiatric hospitalizations in Fordham and University Heights is higher than the Bronx and NYC rates.

![Chart showing psychiatric hospitalizations](image)
Child asthma

Many hospitalizations for asthma among children could be prevented by addressing housing-related exposures to asthma triggers, including cockroaches, mice and secondhand smoke. Good medical management can prevent asthma symptoms. The rate of asthma hospitalizations among children ages 5 to 14 in Fordham and University Heights is lower than the Bronx rate, but higher than the citywide rate.

Adult hospitalizations for asthma

The rate of avoidable adult asthma hospitalizations in Fordham and University Heights is higher than the citywide rate.

Adult hospitalizations for diabetes

Fordham and University Heights has the sixth-highest rate of avoidable adult diabetes hospitalizations, almost twice the citywide rate.
Leading causes of death

The top causes of death for residents of Fordham and University Heights, as for most New Yorkers, are heart disease and cancer. The death rate due to HIV is more than three times the citywide rate.

NYC DOHMH, Bureau of Vital Statistics, 2009-2013

Infant mortality and premature death

Despite a decrease in infant mortality across the city, the rate in Fordham and University Heights is still more than five times the Upper East Side rate. Disparities in premature death (death before the age of 65) also persist among neighborhoods. The rate of premature death in Fordham and University Heights is higher than the Bronx and citywide rates and more than three times the rate in the Financial District.

*Interpret estimate with caution due to small number of events
NYC DOHMH, Bureau of Vital Statistics, 2011-2013

HIV is the third most common cause of death in Fordham and University Heights, but it is only the tenth leading cause citywide.
Technical notes

Neighborhood Definitions and Rankings
The 59 Community Districts (CDs) were established citywide by local law in 1975. For a complete listing of all CDs and their boundaries, go to nyc.gov/html/dcp/html/neigh_info/nhmap.shtml. The CDs correspond to New York City (NYC) Community Boards, which are local representative bodies. The names of neighborhoods within CDs are not officially designated. The names used in this document are not an exhaustive list of all known neighborhood names within this area. CDs were ranked on every indicator. If two CDs had the same value, they were considered to be tied and were given the same rank.

For American Community Survey (ACS) indicators, data were available by Public Use Microdata Areas (PUMAs), which are aggregated Census tracts designed to approximate CDs. For Housing and Vacancy Survey (HVS), data were available by sub-borough areas. The U.S. Census Bureau combined four pairs of CDs in creating these PUMA or sub-borough areas to improve sampling and protect the confidentiality of respondents. These pairs are Mott Haven/Melrose (BX 01) and Hunts Point/Longwood (BX 02) in the Bronx, Morrisania/Crotona (BX 03) and Belmont/East Tremont (BX 06) in the Bronx, the Financial District (MN 01) and Greenwich Village/Soho (MN 02) in Manhattan and Clinton/Chelsea (MN 04) and Midtown (MN 05) in Manhattan. For these four areas, the same estimate was applied to both CDs that comprised the PUMA or sub-borough area for data from ACS and HVS. For NYC Department of Health and Mental Hygiene (DOHMH) Community Health Survey (CHS) data, these same pairs of CDs were combined and the same estimate applied to both CDs in the pair.

Analyses
For most data, 95% confidence limits were calculated for neighborhood, borough and NYC estimates. If these ranges did not overlap, a significant difference was inferred. This is a conservative measure of statistical difference. Only robust findings found to be statistically significant are discussed in the text. In addition, most estimates were evaluated for statistical stability using the relative standard error (RSE). Those estimates with an RSE greater than 30% are flagged as follows: “Interpret estimate with caution due to small number of events or small sample size.” Where noted, estimates in this report were age standardized to the Year 2000 Standard Population.

Data Sources
U.S. Census/American Community Survey (ACS): The U.S. Census calculates intercensal population estimates which were used for overall population, age, race and ethnicity indicators. The ACS is an ongoing national survey conducted by the U.S. Census Bureau. Indicators include limited English proficiency, foreign born percentage, adult educational attainment, poverty, unemployment and rent burden. Three-year estimates (2011-2013) are used to improve reliability of the data.

NYC DOHMH Community Health Survey (CHS): The CHS is an annual random-digit-dial telephone survey of approximately 9,000 adults in NYC. Indicators include self-reported health, smoking, average daily sugary drink consumption, fruit and vegetable consumption, physical activity, obesity, diabetes, insurance coverage, went without needed care, flu vaccination and HIV testing. A combined-year dataset (2011-2013) was used to increase statistical power, allowing for more stable analyses at the Community District level. Community District level estimates were imputed based on participant’s ZIP code, age, race and ethnicity, sex and borough of residence. All indicators are age-adjusted; however crude estimates and rankings are available online in the complete dataset.

NYC DOHMH Vital Statistics: The Bureau of Vital Statistics analyzes data that it collects from hundreds of thousands of birth and death certificates issued in NYC each year by the Bureau of Vital Records. Indicators include preterm births, teen births, prenatal care, leading causes of death, infant mortality, premature mortality, avertable deaths and life expectancy. For some indicators, data sources were combined across three, five or ten years to increase statistical stability and average annual rates are presented. For this reason, these statistics may differ from the presentation in the “Summary of Vital Statistics” reports from the Bureau of Vital Statistics, NYC DOHMH. All rates are shown as crude rates, except leading causes of death and premature mortality rates, which are age-adjusted.

New York State (NYS) Department of Health Statewide Planning and Research Cooperative System (SPARCS): SPARCS is a statewide comprehensive all payer data reporting system established in 1979 currently collecting patient level detail on patient characteristics, diagnoses and treatments, services and charges for each hospital inpatient stay and outpatient visit (ambulatory surgery, emergency department and outpatient services); and each ambulatory surgery and outpatient services visit to a hospital extension clinic and diagnostic and treatment center licensed to provide ambulatory surgery services. Indicators include non-fatal assault...
hospitalizations, alcohol-related hospitalizations, drug-related hospitalizations, child asthma hospitalizations, avoidable adult asthma hospitalizations, avoidable adult diabetes hospitalizations, psychiatric hospitalizations and stroke hospitalizations. Hospitalization data are defined according to International Classification of Disease Clinical Modification, Version 9 (ICD-9-CM) codes. Most of these hospitalization indicators show 2012 data, updated in December 2014. For child asthma hospitalizations and non-fatal assault hospitalizations, data sources were combined across two and three years respectively to increase statistical stability and average annual rates are presented.

All indicators are age-adjusted, except child asthma hospitalizations, which is age-specific.

NYC Housing and Vacancy Survey (HVS): HVS data from 2011 were used to estimate the percent of renter-occupied homes with at least one maintenance issue (defect). Data were obtained from the NYC Housing Preservation and Development Report: Housing New York City 2011.

NYC Community Air Survey (NYCCAS): 2013 annual averages of micrograms of fine particulate matter per cubic meter were calculated from air samples collected at specific NYCCAS monitoring sites and were incorporated into a statistical model that predicted pollutant concentrations.

NYC Department of Consumer Affairs: 2014 tobacco retail density data were analyzed by the NYC DOHMH Bureau of Chronic Disease Prevention and Tobacco Control.

NYC Department of Education: Elementary school absenteeism data for the 2013-14 school year were analyzed from FITNESSGRAM data by the NYC DOHMH Bureau of Epidemiology Services.

NYC Department of Corrections: The average daily population of incarcerated persons in NYC jails ages 16 and older by CD of last known residence. Based on NYC Department of Corrections (DOC) bi-weekly in-custody files from July 1 to Oct 9, 2014.

NYC DOHMH Citywide Immunization Registry: 2014 HPV vaccination data were analyzed by the NYC DOHMH Bureau of Immunization.

NYC DOHMH HIV/AIDS Surveillance Registry: New HIV diagnosis data for 2013 were analyzed by the NYC DOHMH Bureau of HIV/AIDS Prevention and Control.
