Upper East Side
Including Carnegie Hill, Lenox Hill, Roosevelt Island, Upper East Side and Yorkville

Health is closely tied to our daily environment. Understanding how our neighborhood affects our physical and mental health is the first step toward building a healthier and more equitable New York City.
Who We Are

**New York City**

- **Total Population**: 8,537,673
- **Population by Race and Ethnicity**^:
  - Asian: 15%
  - Black: 22%
  - Latino: 29%
  - White: 32%
  - Other: 2%

**Upper East Side**

- **Total Population**: 225,914
- **Population by Race and Ethnicity**^:
  - Asian: 10%
  - Black: 3%
  - Latino: 7%
  - White: 78%
  - Other: 2%

**Born Outside the US**

- New York City: 37%
- Upper East Side: 23%

**Have Limited English Proficiency**

- New York City: 23%
- Upper East Side: 6%

^White, Black, Asian and Other exclude Latino ethnicity. Latino is Hispanic or Latino of any race. Note: Percentages may not sum to 100% due to rounding.

Note from Oxiris Barbot, Commissioner, New York City Department of Health and Mental Hygiene

We are pleased to present the 2018 Community Health Profiles, a look into the health of New York City’s (NYC) 59 diverse community districts.

The health of NYC has never been better. Our city’s life expectancy is 81.2 years, 2.5 years higher than the national average.

However, not all residents have the same opportunities to lead a healthy life. A ZIP code should not determine a person’s health, but that’s the reality in so many cities, including our own.

The Community Health Profiles allow us to see how much health can vary by neighborhood. Policies and practices based on a history of racism and discrimination (often referred to as structural racism) have created neighborhoods with high rates of poverty and limited access to resources that promote health. The practice of removing funding or refusing to provide funding to communities of color has caused poor health outcomes to cluster in these communities.

The Community Health Profiles also show how important community resources, and funding to create and sustain these resources, are to health outcomes. For example, supermarkets provide more access to fresh foods than bodegas. However, in some neighborhoods with obesity rates higher than the citywide average, just 5% of food establishments are supermarkets, making it difficult for residents to make healthy choices.

Addressing these inequities may seem like a daunting task, but by working together, we can dismantle the unjust policies and practices that contribute to poor health in our communities. Through Take Care New York 2020 (TCNY 2020), and other New York City Health Department programs, we work with community partners to give every resident the same opportunity for good health. We are making progress, but there is more work to do.

Reducing health inequities requires policymakers, community groups, health professionals, researchers and residents to work together for change at every level. We look forward to working with you to improve the health of our city.

Sincerely,

Oxiris Barbot, MD

Take Care New York 2020 (TCNY 2020) is the City’s blueprint for giving everyone the chance to live a healthier life. For more information, visit nyc.gov/health and search for TCNY.
NAVIGATING THIS DOCUMENT

This profile covers all of Manhattan’s Community District 8, which includes Carnegie Hill, Lenox Hill, Roosevelt Island, Upper East Side and Yorkville. This is one of 59 community districts in NYC. The community district with the most favorable outcome in NYC for each measure is presented throughout the report. Sometimes this is the highest rate (e.g., physical activity) and sometimes this is the lowest rate (e.g., infant mortality). Some figures include an arrow to help readers understand the direction of the healthier outcome.

This profile uses the following color coding system:

- **UPPER EAST SIDE**
- **MANHATTAN**
- **NEW YORK CITY**
- **LOWEST/HIGHEST COMMUNITY DISTRICT**
Understanding Health Inequities in New York City

The ability to live a long and healthy life is not equally available to all New Yorkers. A baby born to a family that lives in the Upper East Side will live 11 years longer than a baby born to a family in Brownsville. This inequity is unacceptable.

Resources and opportunities are at the root of good health. These include secure jobs with benefits, well-maintained and affordable housing, safe neighborhoods with clean parks, accessible transportation, healthy and affordable food, and quality education and health care.1 In NYC, access to these resources and opportunities are not equitably distributed. Neighborhoods with residents of color often have fewer resources.

Since the 1600s—when NYC was established by colonization—racist policies and practices have shaped where New Yorkers live and go to school, what jobs they have and what their neighborhoods look like. Over time, these policies and practices have built on each other to create deep inequity.

For example, in the 1930s the federal government developed a policy known as redlining. As part of this policy, neighborhoods were rated based on the race, ethnicity and national origin of their residents. Neighborhoods that were home to people of color, like Central Harlem and Brownsville, were outlined in red on a map. They were labeled as "hazardous" and no home loans or other investments were approved there. The wealthiest and Whitest neighborhoods in NYC received, and continue to receive, more investment and opportunities for health.2

The denial of resources and opportunities that support good health contributes to the differences in life expectancy we see today. Experiencing racism is also a health burden, creating chronic stress that contributes to major causes of death, like diabetes and heart disease.3

To better understand the successes and challenges in each of NYC’s 59 neighborhoods, the Community Health Profiles present data on a range of measures. These data should be interpreted with an understanding that good health is not only determined by personal choices. Many other factors shape differences in health outcomes, including past and current discrimination based on race, ethnicity, national origin, gender, sexual orientation and other identities. We hope the Community Health Profiles support your efforts in making NYC more equitable for all. For more information on the New York City Health Department programs and services that are closing the gap in health outcomes, visit nyc.gov/health.

---

Social and Economic Conditions

Education

Higher education levels are associated with better health outcomes. Missing too many days of school can cause students to fall behind and increases their risk of dropping out. Upper East Side’s elementary school absenteeism rate is lower than the rate for NYC overall. Nine out of 10 high school students in the Upper East Side graduate in four years, higher than the citywide rate.

Four out of five adults in the Upper East Side have a college degree. Three percent of adults have not completed high school, a rate lower than the citywide rate.
Economic stress
Living in high-poverty neighborhoods limits healthy options and makes it difficult to access quality health care and resources that promote health. In the Upper East Side, 7% of residents live in poverty, compared with 20% of NYC residents. Access to affordable housing and employment opportunities with fair wages and benefits are also closely associated with good health. The Upper East Side’s unemployment rate is lower than the citywide average of 9%. Rent burdened households pay more than 30% of their income for housing and may have difficulty affording food, clothing, transportation and health care. Forty-one percent of Upper East Side residents are rent burdened, a lower rate than residents citywide.

Is your neighborhood gentrifying?
Gentrification transforms a low-income area into a high-income area through neighborhood redevelopment. It is often defined as changes in the racial and ethnic makeup, education level and average income of a neighborhood’s residents, as well as changes in housing and commercial businesses. While development may be beneficial, it is often inequitable, and can lead to displacement of long-time residents and businesses.

Gentrification can be measured in many ways. One measure that is used in NYC is to determine if a low-income neighborhood (those with the lowest 40% of average household income in 1990) saw higher than median rent growth over the past 20 years. Based on this definition, of the 24 neighborhoods that were considered low-income in 1990, 17 were considered to be gentrifying. The Upper East Side is one of 35 neighborhoods within the highest 60% of average household income in 1990 and was excluded from the measure.

Incarceration
Incarceration takes a toll on individuals, families and communities. Black and Latino New Yorkers experience higher policing compared with non-Latino White New Yorkers. This leads to higher rates of detention, which may include long periods of time spent in jail before trial. People who have been incarcerated are more likely to experience mental and physical health problems. They may also have trouble finding employment and housing and accessing healthy food.

Helpful neighbors
Strong social connections can have a positive impact on the health of community members. Feeling that our neighbors are willing to help each other is one aspect of community connection. In the Upper East Side, 62% of residents think that their neighbors are willing to help one another. This is lower than the rest of the city.

Housing and Neighborhood Conditions

The environment we live in can make it easier or more difficult for New Yorkers to lead healthy lives.

**Air conditioning**
Most heat stroke deaths in NYC occur in homes without air conditioning. Almost all households in the Upper East Side have working air conditioners.

**Air pollution**
Though air quality is improving in NYC in general, it varies by community district. In the Upper East Side, levels of the most harmful air pollutant, fine particulate matter (PM2.5), are 9.1 micrograms per cubic meter.

**Housing quality**
Every resident has the right to live in housing that is safe and pest-free. Poorly maintained housing is associated with poor health outcomes, including worsened asthma and other respiratory illnesses. In the Upper East Side, 64% of renter-occupied homes are adequately maintained by landlords – free from heating breakdowns, cracks, holes, peeling paint and other defects. Twelve percent of Upper East Side households report seeing cockroaches, which is a potential asthma trigger.

**HOMES WITHOUT MAINTENANCE DEFECTS**
(percent of renter-occupied homes)

- Upper East Side: 64%
- Manhattan: 48%
- NYC: 44%
- Highest: Tottenville and Great Kills: 75%

**HOMES REPORTING COCKROACHES**
(percent of households)

- Upper East Side: 12%
- Manhattan: 20%
- NYC: 23%
- Lowest: Tottenville and Great Kills: 0%

Note: Maintenance defects include water leaks, cracks and holes, inadequate heating, presence of mice or rats, toilet breakdowns or peeling paint.

Housing and Neighborhood Conditions

**Bicycle network coverage**
Thirty percent of roads in the **Upper East Side** have bike lanes, which is higher than NYC overall.

**BICYCLE NETWORK COVERAGE**
(percent of streets with bike lanes)

- **Upper East Side**: 30%
- **Manhattan**: 29%
- **NYC**: 10%

Highest: Crown Heights and Prospect Heights

**Access to bike lanes can make it easier and safer to ride a bike more often.**

Source: NYC Department of Transportation, 2017

**Pedestrian injury**
**Upper East Side** residents have a lower pedestrian injury hospitalization rate than NYC overall.

**PEDESTRIAN INJURY HOSPITALIZATIONS**
(per 100,000 people)

- **Upper East Side**: 19
- **Manhattan**: 21
- **NYC**: 23

Lowest: Greenwich Village and Soho

**Food environment**
Bodegas are less likely to have healthy food options than supermarkets. The lowest ratio among NYC community districts is one supermarket for every three bodegas (healthier); the highest is one supermarket for every 57 bodegas (less healthy). The **Upper East Side** is home to two of NYC’s farmers markets, another source of healthy food.

**SUPERMARKET TO BODEGA RATIO**
For every one supermarket in the **Upper East Side**, there are five bodegas.

- **Supermarket**: 1
- **Bodegas**: 5

It is easier to make healthy choices when healthy, affordable food is readily available.
Maternal and Child Health

Pregnancy outcomes
In the Upper East Side, the rate of expectant mothers receiving late or no prenatal care is lower than the citywide rate. One in 14 births to Upper East Side residents is preterm (three or more weeks before the due date), lower than the citywide rate.

Maternal and Child Health

Childhood obesity
One out of 17 Upper East Side children in grades K through 8 has obesity. This is lower than the citywide rate of one in five.

Avoidable hospitalizations among children

“Avoidable hospitalizations” are those that could be prevented with timely access to quality outpatient care. The rate of avoidable pediatric hospitalizations among children ages 4 and younger in the Upper East Side is lower than the citywide rate.

Many childhood asthma emergency department visits could be prevented by reducing the presence of pests, mold, secondhand smoke and other asthma triggers, and by taking daily medication. The asthma emergency department visit rate among children ages 5 to 17 in the Upper East Side is less than a quarter of the citywide rate. The TCNY 2020 goal is to have fewer than 210 asthma emergency department visits per 10,000 children across the entire city.

Avoidable hospitalizations among children (per 100,000 children ages 4 and younger)

Child asthma emergency department visits (per 10,000 children ages 5 to 17)

Take Care New York 2020 (TCNY 2020) is the City’s blueprint for giving everyone the chance to live a healthier life.
For more information, visit nyc.gov/health and search for TCNY.
Healthy Living

Self-reported health
How residents feel about their own health can be a good measure of overall mental and physical health. Eighty-nine percent of Upper East Side residents rank their health as “excellent,” “very good” or “good,” higher than the rest of NYC. The TCNY 2020 goal for the city is at least 82%.

Physical activity, diet and smoking
Eighty-seven percent of Upper East Side adults report getting any physical activity in the past 30 days, higher than New Yorkers overall. The percentage of Upper East Side adults who report eating at least one serving of fruits or vegetables in the past day is higher than the citywide average of 87%.

Sugary drink consumption can increase the risk of type 2 diabetes, heart disease, cavities, weight gain and obesity. Industry marketing can affect behavior and sugary drinks are heavily marketed to youth and communities of color. While sugary drink consumption has decreased to 23% in NYC, the TCNY 2020 goal is to reduce sugary drink consumption to less than 19% citywide. Thirteen percent of Upper East Side adults drink at least one sugary drink a day.

The adult smoking rate in the Upper East Side is lower than the rest of the borough and other parts of NYC. The City is committed to reducing the citywide adult smoking rate to 12% by 2020.

Federal guidelines recommend that adults get 150 minutes of moderate exercise each week. People who are physically active are more likely to live longer, healthier lives.

Take Care New York 2020 (TCNY 2020) is the City’s blueprint for giving everyone the chance to live a healthier life. For more information, visit nyc.gov/health and search for TCNY.
Health Care

Access to health care
Citywide, the percentage of uninsured New Yorkers decreased in the last five years from 20% to 12%. In the **Upper East Side**, 4%* of adults are uninsured, lower than the rest of NYC, and 7% report going without needed medical care in the past 12 months, similar to the rest of NYC. The TCNY 2020 goal is to have less than of 9% of New Yorkers going without needed medical care.

Health Outcomes

Obesity, diabetes and hypertension
The Upper East Side’s adult obesity rate is 11%, which is lower than the rest of NYC. The TCNY 2020 goal is to reduce the obesity rate to less than 23% citywide. More than 700,000 adult New Yorkers have been told they have diabetes. An additional 164,000 are estimated to have diabetes but not be aware. Four percent of Upper East Side adults have been diagnosed with diabetes and 15% have been told they have hypertension. Rates for both are lower than the rest of NYC.

New HIV diagnoses
Getting an HIV test is the first step to accessing treatment if you are positive or developing an HIV prevention strategy if you are negative.

NEW HIV DIAGNOSES (per 100,000 people)

- Obesity can lead to diabetes, high blood pressure and other health conditions.
- Hypertension, also known as high blood pressure, is a leading risk factor for heart disease and stroke.

Take Care New York 2020 (TCNY 2020) is the City’s blueprint for giving everyone the chance to live a healthier life. For more information, visit nyc.gov/health and search for TCNY.
New hepatitis C reports

Hepatitis C is a virus that damages the liver. New Yorkers born between 1945 and 1965 and people who have ever injected drugs should be tested because hepatitis C can be cured.

NEW HEPATITIS C REPORTS (per 100,000 people)

Binge drinking

Binge drinking is linked to high-risk behaviors and chronic health problems. The binge drinking rate in the Upper East Side is higher than the rest of NYC. The TCNY 2020 goal is to reduce binge drinking to less than 17% citywide.

BINGE DRINKING (percent of adults)

Psychiatric hospitalizations

The rate of adult psychiatric hospitalization in the Upper East Side is less than half the citywide rate.

High psychiatric hospitalization rates likely reflect the challenges residents in underresourced neighborhoods face, including difficulty accessing preventive services and early care, greater exposure to stressors and interruptions in health insurance coverage.

PSYCHIATRIC HOSPITALIZATIONS (per 100,000 adults)

Source: New York State Department of Health, Statewide Planning and Research Cooperative System, 2015
Health Outcomes

Infant mortality
NYC’s infant mortality rate has declined in recent years. In the Upper East Side the infant mortality rate is lower than the citywide rate. The TCNY 2020 goal is a citywide rate of less than 4.4 per 1,000 live births.

<table>
<thead>

Premature death
Cancer and heart disease are the leading causes of premature death (death before the age of 65) in the Upper East Side, similar to the rest of NYC. However, Upper East Side residents die prematurely at a disproportionately lower rate. Lung cancer, breast cancer (among women) and pancreatic cancer are the three leading causes of cancer-related premature death in the Upper East Side.

NYC’s premature mortality rate (death before age 65) decreased 19% from 2006 to 2015. However, longstanding disparities persist. People living in high-poverty neighborhoods and Black New Yorkers are dying before age 65 at higher rates.

TOP CAUSES OF PREMATURE DEATH
rate of death before age 65 per 100,000 people (number of deaths)

Note: NYC rate includes premature deaths among NYC residents only and will differ from other published sources.

Note: Take Care New York 2020 (TCNY 2020) is the City’s blueprint for giving everyone the chance to live a healthier life.
For more information, visit nyc.gov/health and search for TCNY.
Neighborhood Definitions

The 59 Community Districts (CDs) were established citywide by local law in 1975. For a complete listing of all CDs and their boundaries, visit communityprofiles.planning.nyc.gov. The CDs correspond to NYC Community Boards, which are local representative bodies. The names of neighborhoods within CDs are not officially designated. The names used in this document are not an exhaustive list of all known neighborhood names within this area.

Analyses

For most data, 95% confidence intervals were calculated for CD, borough and NYC estimates. If the confidence intervals did not overlap, a significant difference was inferred. This is a conservative measure of statistical difference. For most population-level data, if a CD rate was within 5% of the NYC estimate, the CD was considered similar to NYC, otherwise the CD rate was considered higher or lower than the NYC estimate. For Community Health Survey data, a t-test comparing the CD with the rest of NYC and the rest of the borough was conducted where p-values ≤0.05 were considered an indication of statistical significance. Report text highlights significant findings but does not include all significant results. The public use dataset contains additional data.

For a complete dataset including numbers, rates and confidence intervals, as well as more technical notes on neighborhood definitions, analyses and data sources with complete citations, visit nyc.gov/health and search for Community Health Profiles or visit on.nyc.gov/chp.

Most estimates were evaluated for statistical stability. Estimates with a relative standard error (RSE) > 30% or with a small sample size or small numbers of events (≤ 10) are flagged as follows: “Interpret estimate with caution due to small number of events or small sample size.”

Acknowledgements

Life Expectancy by Community District

The Upper East Side’s average life expectancy is **4.7 years longer** than NYC overall.

Unpopulated areas

- 75.1-79.6 years
- 79.7-81.4 years
- 81.5-83.8 years
- 83.9-85.9 years

**85.9**

Life Expectancy
