## TABLE OF CONTENTS (1)

**OVERALL**

5. HIV IN BROOKLYN, 2018

**NEW DIAGNOSIS**

6. NEW HIV DIAGNOSES IN BROOKLYN, 2014-2018
7. NUMBER OF NEW HIV DIAGNOSES BY GENDER IN BROOKLYN, 2014-2018
8. NUMBER OF NEW HIV DIAGNOSES BY RACE/ETHNICITY IN BROOKLYN, 2014-2018
9. NUMBER OF NEW HIV DIAGNOSES BY AGE IN BROOKLYN, 2014-2018
10. NUMBER OF NEW HIV DIAGNOSES BY RACE/ETHNICITY AND AGE IN BROOKLYN, 2018
11. NUMBER OF NEW HIV DIAGNOSES BY TRANSMISSION RISK IN BROOKLYN, 2014-2018
12. NUMBER OF NEW HIV DIAGNOSES BY AREA-BASED POVERTY LEVEL IN BROOKLYN, 2014-2018
13. PERCENTAGE OF NEW HIV DIAGNOSES AMONG PEOPLE BORN OUTSIDE THE US BY REGION OF BIRTH, BROOKLYN, 2018
### PEOPLE NEWLY DIAGNOSED WITH HIV

14. TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV IN NYC AND BROOKLYN, 2014-2018

15. TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV BY GENDER IN BROOKLYN, 2018

16. TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV BY RACE/ETHNICITY IN BROOKLYN, 2018

17. TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV BY AGE IN BROOKLYN, 2018

18. TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV BY TRANSMISSION RISK IN BROOKLYN, 2018

19. TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV BY AREA-BASED POVERTY IN BROOKLYN, 2018

20. TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV BY COUNTRY OF BIRTH IN BROOKLYN, 2018

21. MAP OF TIMELY INITIATION OF CARE AMONG PEOPLE NEWLY DIAGNOSED WITH HIV BY UHF NEIGHBORHOOD IN NYC, 2018

22. VIRAL SUPPRESSION WITHIN 3 AND 6 MONTHS OF NEW HIV DIAGNOSIS IN NYC AND BROOKLYN, 2018

23. VIRAL SUPPRESSION WITHIN 3 MONTHS AMONG PEOPLE NEWLY DIAGNOSED WITH HIV IN NYC AND BROOKLYN, 2014-2018
### TABLE OF CONTENTS (3)

#### PEOPLE LIVING WITH HIV (PLWH)

- 24. Viral Suppression Among Diagnosed PLWH in NYC and Brooklyn, 2014-2018
- 25. Viral Suppression Among Diagnosed PLWH by Gender in Brooklyn, 2018
- 26. Viral Suppression Among Diagnosed PLWH by Race/Ethnicity in Brooklyn, 2018
- 27. Viral Suppression Among Diagnosed PLWH by Age in Brooklyn, 2018
- 28. Viral Suppression Among Diagnosed PLWH by Transmission Risk in Brooklyn, 2018
- 29. Viral Suppression Among Diagnosed PLWH by Area-Based Poverty Level in Brooklyn, 2018
- 30. Viral Suppression Among Diagnosed PLWH by Country of Birth in Brooklyn, 2018
- 31. Map of Viral Suppression by UHF Neighborhood in NYC, 2018
- 32. Proportion of PLWH in Brooklyn Engaged in Selected Stages of the HIV Care Continuum, 2018

#### DEATHS

- 33. Age-Adjusted Death Rates Among PLWH in NYC Overall and by Borough, 2014-2018
- 34. Causes of Death Among PWH in Brooklyn, 2017

#### HOW TO FIND OUR DATA

- 35. How to Find Our Data
- 36-37. Appendix: Definitions and Statistical Notes
- 38. Technical Notes: HIV Care Continuum
31% of all New Yorkers live in Brooklyn

558 new HIV diagnoses
  - 29% of all HIV diagnoses in NYC
  - Includes 113 HIV diagnoses concurrent with an AIDS diagnosis (20%)

312 new AIDS diagnoses

374 deaths among people with HIV
  - 8.1 deaths per 1,000 people with HIV\(^1\)

\(^1\)Death rate is age-adjusted to the NYC Census 2010 population. Death data for 2018 are incomplete. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
The number and rate of new HIV diagnoses decreased in Brooklyn between 2014 and 2018. The HIV diagnosis rate was higher in NYC overall than in Brooklyn.

Between 2014 and 2018, the number of new HIV diagnoses among both men and women decreased in Brooklyn but remained stable among transgender people.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Between 2014 and 2018, HIV diagnoses decreased among all racial/ethnic groups except for among multiracial people. Black people accounted for the most new diagnoses in Brooklyn.
Between 2014 and 2018, people ages 20 to 29 years had the highest numbers of new HIV diagnoses in Brooklyn. New diagnoses decreased among most age groups.
Black people ages 20 to 59 years and Latino/Hispanic people ages 20 to 29 years accounted for the largest proportion of new HIV diagnoses in Brooklyn in 2018.
Between 2014 and 2018, the number of new HIV diagnoses decreased among all transmission risk groups in Brooklyn except among transgender people with sexual contact risk.
Between 2014 and 2018, the number of new HIV diagnoses was highest in neighborhoods with medium and high poverty in Brooklyn.

FPL = Federal Poverty Level.

Unknown poverty category is not shown and includes people newly diagnosed with HIV and missing ZIP code at diagnosis. There were no new diagnoses in Brooklyn in 2018 among people with an unknown ZIP code. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
People born outside the US accounted for 30% of new HIV diagnoses in Brooklyn in 2018. People born in the Caribbean\(^1\), Mexico and Central America, and South America accounted for 70% of these new HIV diagnoses.

\(^1\)Excludes Puerto Rico and the US Virgin Islands. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Between 2014 and 2018, timely initiation of care among people newly diagnosed with HIV increased in Brooklyn and in NYC overall.

Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among people newly diagnosed with HIV in Brooklyn in 2018, a smaller proportion of transgender people and women were linked timely to care than men.

Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among people newly diagnosed with HIV in Brooklyn in 2018, a larger proportion of multiracial people were linked timely to care.

Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded. Native Americans not shown. There were no new diagnoses among Native Americans in Brooklyn in NYC in 2018. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among people newly diagnosed with HIV in Brooklyn in 2018, people ages 30 to 39 years and 40 to 49 years had the lowest proportion with timely initiation of care.

Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among people newly diagnosed with HIV in Brooklyn in 2018, transgender people with sexual contact had the smallest proportion with timely initiation of care.

MSM = men who have sex with men; IDU = history of injection drug use; TG-SC = transgender people with sexual contact.

Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded. New diagnoses with unknown transmission risk (N=144) not displayed.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among people newly diagnosed with HIV in Brooklyn in 2018, those living in low poverty areas had the largest proportion timely linked to care.

FPL=Federal Poverty Level.
Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded. New diagnoses without area-based poverty information not displayed. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among people newly diagnosed with HIV in Brooklyn in 2018, people born in the US and born outside the US had the same proportion timely linked to care.

Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Brooklyn neighborhoods with the smallest proportions of people timely linked to care in 2018 were Greenpoint (75%), East Flatbush-Flatbush (80.2%), and Bedford Stuyvesant-Crown Heights (81.6%).

Timely initiation of care is defined as first CD4, viral load, or genotype drawn within 30 days of HIV diagnosis. People diagnosed at death have been excluded. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among people newly diagnosed with HIV in 2018, a similar proportion of Brooklyn residents achieved viral suppression within 3 months and 6 months of diagnosis than for NYC overall.

Viral suppression is defined as first viral load after HIV diagnosis was <200 copies/mL. People diagnosed at death have been excluded. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Between 2014 and 2018, viral suppression within 3 months among people newly diagnosed with HIV increased in Brooklyn and in NYC.

Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL. People diagnosed at death have been excluded.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Between 2014 and 2018, viral suppression among all diagnosed PLWH increased in Brooklyn and in NYC overall.

Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
VIRAL SUPPRESSION AMONG DIAGNOSED PLWH BY GENDER IN BROOKLYN, 2018

Among diagnosed PLWH in Brooklyn, a smaller proportion of transgender people were virally suppressed compared to men and women.

Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
VIRAL SUPPRESSION AMONG DIAGNOSED PLWH BY RACE/ETHNICITY IN BROOKLYN, 2018

Among diagnosed PLWH in Brooklyn, Asian/Pacific Islander people and White people had the largest proportion virally suppressed among all racial/ethnic groups.

Viral suppression (%)

- Black: 79%
- Latino/Hispanic: 83%
- White: 90%
- API: 90%
- Native American: 79%
- Multiracial: 76%

API=Asian/Pacific Islander.
Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL.
Unknown race/ethnicity not shown. There were 11 people whose race/ethnicity was unknown in Brooklyn in 2018.
As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among diagnosed PLWH in Brooklyn, people ages 13 to 19 years had the smallest proportion virally suppressed and people ages 60 years and older had the largest.

Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among diagnosed PLWH in Brooklyn, people with perinatal transmission risk had the smallest proportion virally suppressed followed by people with TG-SC transmission risk.

Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among diagnosed PLWH in Brooklyn, smaller proportions of people living in higher poverty neighborhoods were virally suppressed.

FPL=Federal Poverty Level.
Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL.
PLWH without area-based poverty information not displayed.
As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Among diagnosed PLWH in Brooklyn, a smaller proportion of people born in the US were virally suppressed compared to people born outside the US or in a US Dependency.

Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Brooklyn neighborhoods with the smallest proportion of virally suppressed PLWH in 2018 were Bedford Stuyvesant-Crown Heights (79.4%), Sunset Park (80.3%), and East New York (80.4%).

Viral suppression is defined as most recent viral load in 2018 was <200 copies/mL.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Of approximately 23,100 PLWH in Brooklyn in 2018, 76% had a suppressed viral load.

For definitions of the stages of the continuum of care, see Technical Notes.
As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
The age-adjusted death rate among people with HIV decreased in Brooklyn between 2014 and 2018. Brooklyn was the borough with the second highest rate in 2018.

Age-adjusted to the NYC Census 2010 population.

1The overall rate includes people with unknown cause of death. Death data for 2018 are incomplete.

As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
In 2017, 67% of deaths among people with HIV in Brooklyn were due to non-HIV-related causes. Among these, the top causes were non-HIV-related cancers (27%), cardiovascular diseases (31%), and accidents (11%).

1Cause of death data are not yet available for 2018.
2ICD10 codes B20-B24 were used to denote HIV-related deaths. For technical notes on cause of death by the NYC DOHMH’s Office of Vital Statistics see: https://www1.nyc.gov/assets/doh/downloads/pdf/vs/2014sum.pdf. As reported to the New York City Department of Health and Mental Hygiene by March 31, 2019.
Our program publishes annual surveillance reports, slide sets, and statistics tables:

Other resources:

- HIV Care Status Reports (CSR) system: [https://www1.nyc.gov/site/doh/health/health-topics/aids-hiv-care-status-reports-system.page](https://www1.nyc.gov/site/doh/health/health-topics/aids-hiv-care-status-reports-system.page)

For surveillance data requests, email: HIVReport@health.nyc.gov

- 2 weeks minimum needed for requests to be completed
Definitions:

- “HIV diagnoses” include diagnoses of HIV (non-AIDS) and HIV concurrent with AIDS (AIDS diagnosed within 31 days of HIV), unless otherwise specified.
- “New HIV diagnoses” include individuals diagnosed in NYC during the reporting period and reported in NYC.
- “Death rates” refer to deaths from all causes, unless otherwise specified.
- Data presented by “Transmission risk” categories include only individuals with known or identified transmission risk, except when an “unknown” category is presented.
- “PWH” refers to people with HIV during the reporting period (note: includes people with HIV who remained alive or died during the reporting period); “PLWH” refers to people living with HIV during the reporting period.
- Surveillance collects information about individuals’ current gender identity, when available. These slides display the following gender categories: men, women, transgender (if applicable). People whose current gender identity differs from their sex assigned at birth are considered transgender. Classifying transgender people in surveillance requires accurate collection of both sex assigned at birth and current gender identity. Sex and gender information are collected from people’s self-report, their diagnosing provider, or medical chart review. This information may or may not reflect the individual’s self-identification. Transgender status has been collected routinely since 2005 for newly reported cases. Reported numbers of new transgender HIV diagnoses and transgender PLWH are likely to be underestimates. For more information, see the “HIV among Transgender people in New York City” surveillance slide set available at: www1.nyc.gov/assets/doh/downloads/pdf/dires/hiv-in-transgender-persons.pdf.
- Surveillance collects information on other gender identity categories, including “Non-binary/Gender non-conforming.” In these slides, data for these individuals (N=7 at time of publication) are displayed by sex at birth.
Definitions continued:

- Risk information is collected from people’s self-report, their diagnosing provider, or medical chart review. “Heterosexual contact” includes people who had heterosexual sex with a person they know to be HIV-positive, an injection drug user, or a person who has received blood products. For women only, also includes history of sex work, multiple sex partners, sexually transmitted disease, crack/cocaine use, sex with a bisexual man, probable heterosexual transmission as noted in medical chart, or sex with a man and negative history of injection drug use. “Transgender people with sexual contact” includes people identified as transgender by self-report, diagnosing provider, or medical chart review with sexual contact reported and negative history of injection drug use. “Other” includes people who received treatment for hemophilia, people who received a transfusion or transplant, and children with a non-perinatal transmission risk.
- The MSM risk category does not include people known to surveillance to be transgender.

Statistical notes:

- UHF boundaries in maps were updated for data released in 2010 and onward. Non-residential zones are indicated, and Rikers Island is classified with West Queens.
• “People living with HIV”: calculated as “HIV-diagnosed” divided by the estimated proportion of people living with HIV (PLWH) who had been diagnosed (92.8%), based on a CD4 depletion model.
  

• “HIV-diagnosed”: calculated as PLWH “received care” plus the estimated number of PLWH who were out of care, based on a statistical weighting method. This estimated number aims to account for out-migration from NYC, and therefore is different from the number of PLWH published elsewhere.
  

• “Received care”: PLWH with ≥1 VL or CD4 count or CD4 percent drawn in 2018, and reported to NYC HIV surveillance.
  
  Source: NYC HIV Surveillance Registry.

• “Prescribed ART”: calculated as PLWH “received care” multiplied by the estimated proportion of PLWH prescribed ART in the previous 12 months (96.3%), based on the proportion of NYC Medical Monitoring Project participants whose medical record included documentation of ART prescription.
  

• “Virally suppressed”: calculated as PLWH in care with a most recent viral load measurement in 2018 of <200 copies/mL, plus the estimated number of out-of-care 2018 PLWH with a viral load <200 copies/mL, based on a statistical weighting method.
