2018 HEALTH ADVISORY #9
HELP PREVENT HEAT-RELATED ILLNESS AND DEATH AMONG AT-RISK PATIENTS

May 31, 2018

Dear Colleagues,

This summer, you can protect your at-risk patients from heat-related illness or death by providing anticipatory guidance about heat-health risks and preventive measures to patients and their caregivers.

Heat waves kill more New Yorkers, on average, than any other extreme weather event. Hot weather can cause hyperthermia or, more commonly, exacerbate chronic medical conditions. Most hyperthermia victims are overcome by heat in their homes and do not have or use air conditioners. Fans do not provide sufficient cooling during extremely hot weather. Air conditioning is the most effective protection during a heat wave.

Provide anticipatory guidance to at-risk patients and their caregivers throughout the summer

- Use the checklist to identify patients at increased risk for heat-related illness and death.
- Advise at-risk patients to use their air conditioners or go to air-conditioned places on hot days. Call 311 or go to www.nyc.gov/oem to find a cooling center during a heat wave.

YOUR PATIENT COULD QUALIFY FOR A FREE AIR CONDITIONER

Patients without air conditioners can call the Human Resources Administration at 1-800-692-0557 or 311 to determine if they qualify and request an application. (See “Cooling Assistance” on next page for details)

C H E C K L I S T
Identifying Patients At Risk for Heat-Related Illness and Death

☐ People who do not have or use air conditioning
AND have one or more of these risk factors:
☐ Aged ≥ 65 years
☐ Chronic health conditions including:
  ☐ Cardiovascular, respiratory, or renal disease
  ☐ Obesity (BMI > 30)
  ☐ Diabetes
  ☐ Psychiatric illness such as schizophrenia or bipolar disorder
  ☐ Cognitive or developmental disorder that impairs judgment or self-care
☐ Taking medications that can impair thermoregulation, including:
  ☐ Diuretics
  ☐ Anticholinergics
  ☐ Neuroleptics
☐ Drug or alcohol misuse
☐ Socially isolated or with limited mobility
• Suggest setting air conditioners to 78°F or “low” cool to provide comfortable relief, reduce electricity costs, and conserve energy.

• Advise at-risk patients to increase fluid intake during hot weather.

• Recommend self-monitoring of hydration, such as body weight measurement, for patients who have health conditions sensitive to fluid balance or who use medications that can impair thermoregulation or cause dehydration.¹

• Engage caregivers, family, and other support networks to frequently check on and help at-risk patients – especially those who cannot care for themselves – stay cool and well-hydrated before and during hot weather.

• Remind patients and caregivers to be alert to the signs and symptoms of heat-related illness or exacerbation of chronic medical conditions. For more information on heat illness, visit www.nyc.gov/health/heat.

• Immediately report deaths where heat exposure is suspected as a direct or contributing cause to the NYC Office of Chief Medical Examiner at 212-447-2030.

Thank you for your continued dedication to protecting the health of New Yorkers.

Sincerely,

Carolyn Olson          Amita Toprani
