This report details trends in childhood blood lead surveillance data in New York City, and has been updated to include data for the first three quarters of 2019 (January through September). The number and rate of children with elevated blood lead levels in New York City are at a historic low and continue to decline. Since 2005 we have seen a nearly 90% decrease in the number of children under 18 years of age with blood lead levels of 5 mcg/dL or greater.

While the decline in lead exposure has been observed in children associated with both public and private housing, children associated with public housing typically have lower rates of elevated blood lead levels than children associated with private housing. Between January and September 2019, the rate of children under 18 years of age associated with private housing with elevated blood lead levels was 11.3 per 1,000 children tested, and among children associated with public housing the rate was 5.4 per 1,000 children tested. Children associated with private housing are more than twice as likely to be exposed to lead in their environment as children associated with NYCHA housing.

---

*2019 data are preliminary.

**Note:** The data above represents unique children per year. Adding across years will result in duplicate counts of individual children over time. Between January 2010 and September 2019 there were 66,926 children under the age of 18 who had a blood lead level of 5 mcg/dL or greater; 2,138 (3%) of these children were associated with NYCHA.

†The US Centers for Disease Control and Prevention (CDC) now uses a reference level of 5 micrograms per deciliter (mcg/dL) to identify children ages 1-5 years who are in the highest 2.5% of children when tested for lead in their blood.
Comparison of each quarter in a given year to the corresponding quarter in each previous year shows a declining trend in the number of children with elevated blood lead levels from 2014 to 2018. This trend continued in the first three quarters of 2019.

From January to March 2019, there were 1,135 children under age 18 with blood lead levels of 5 mcg/dL or greater, a 12% reduction compared to 1,289 children during the same time period in 2018.

From April to June 2019, there were 934 children under age 18 with blood lead levels of 5 mcg/dL or greater, a 19% reduction compared to 1,152 children during the same time period in 2018.

From July to September 2019, there were 1,028 children under age 18 with blood lead levels of 5 mcg/dL or greater, a 21% reduction compared to 1,294 children during the same time period in 2018.

*2019 data are preliminary.

Note 1: Each color represents a quarter (Q) in the respective years (Orange = Q1, Yellow = Q2, Blue = Q3, Green = Q4). Note 2: The data above represent unique children per year. Adding across years will result in duplicate counts of individual children over time. Between January 2014 and September 2019 there were 27,471 unique children under the age 18 who had a blood lead level of 5 mcg/dL or greater; 806 (3%) of these children were associated with NYCHA.
Children under 6 years of age are at greatest risk for elevated blood lead levels because they are growing rapidly and because they explore the world with hand-to-mouth activity.

The decline in lead exposure among children under age 6 continues in the first three quarters of 2019, both among children associated with NYCHA housing and children associated with private housing. From January to September 2019, 2,529 children younger than 6 years old had a blood lead level of 5 mcg/dL or greater; 76 were associated with public housing. This represent a decline of 17% citywide and 14% among children associated with NYCHA compared to the same period in 2018 when there were 3,052 children with blood lead levels of 5 mcg/dL or greater citywide and 88 children associated with NYCHA.

The rate of elevated blood lead levels continues to decline, but it is more than twice as high for children associated with private housing as for children associated with NYCHA housing. Between January and September 2019, the rate of children under age 6 with elevated blood lead levels associated with private housing was 11.4 per 1,000 tested, down from 14.1 per 1,000 tested in 2018; and for children associated with public housing, the rate was 5.4 per 1,000 tested, down from 6.2 per 1,000 tested in 2018.
Between 2014 and 2018, there was a declining trend in the number of children under age 6 years exposed to lead across all blood lead level groups. This trend continued in the first three quarters of 2019.
Concerned about lead poisoning?
Here's what you can do:

**Lead poisoning is preventable. Avoid exposure.**
- Report peeling or damaged paint to your building owner. Building owners are required to safely fix peeling paint. If they do not fix peeling paint, or if work is being done in an unsafe manner (for example, creating dust that is not being contained), you should report them online or by calling 311.
  - NYCHA residents concerned about their home or their children can call 718-707-7771.
- Keep children away from peeling paint and home renovations.
- Wash floors and windowsills often. Wash children's hands and toys, too.
- Remove shoes before entering your home.
- Wash work clothes separately from the family laundry if someone in your household works in construction.
- Learn more about avoiding products that may contain lead, such as imported pottery, food and cosmetics, and traditional medicines. Visit nyc.gov/health.

**Get tested.**
- A blood test is the only way to find out if you or your child have an elevated blood lead level.
- In New York State, children must be tested for lead poisoning at ages 1 and 2, and screened for risk up to age 6.
- Ask your doctor about testing older children if you think they may have been exposed to lead.
- Pregnant women should be assessed for lead exposure at their first prenatal visit.
- Call 311 for help finding a doctor or clinic.

**Data Notes and Definitions**
- Data in this report were collected during routine childhood lead surveillance by the New York City Department of Health and Mental Hygiene between January 2010 and September 2019.
- Data for 2019 are preliminary. Numbers and categorization of children by blood lead level, borough and type of housing can change for a variety of reasons, including address change, misreported addresses and invalid blood tests.
- Each child is counted only once per year, but the data do not represent unique children if added over multiple years. NYCHA housing is categorized based on the address listed on the laboratory report of the child’s highest blood lead level in a given period. The child’s highest venous test is used first, and if not available, the finger-stick test or unknown test type is used.
