Safety Tips for People Who Use or Inject Drugs
TIPS FOR SAFER USE

1. DON’T SHARE OR REUSE EQUIPMENT
2. GET NEW SYRINGES
3. PREPARE DRUGS CAREFULLY
4. TAKE CARE OF YOUR VEINS
5. PREVENT OVERDOSE
6. GET TESTED AND TREATED FOR HIV AND HEPATITIS C
7. REVERSE OVERDOSE
8. GET HELP
Hepatitis and HIV can spread between people who share drug use equipment. The hepatitis C virus can live on equipment for weeks, and can damage your liver if you don’t get treated and cured. There is no cure for HIV, and treatment involves taking medicines every day. Protect yourself.

+ If you smoke or snort drugs, avoid sharing pipes or straws.

If you inject, always use new equipment:

+ Use a new syringe, rinse water, cooker, cotton and tie, every time.
+ If someone helps you inject, make sure they use a new syringe.
+ Throw away used rinse water and old cottons.

If you must reuse a syringe, follow all of these steps:

1. Draw **cold** water into your syringe and shake the barrel. Squirt out the water. Do not reuse this water. Repeat.
2. Draw **bleach** into your syringe and shake the barrel. Squirt out the bleach. Repeat.
3. Draw **new cold** water into your syringe and shake the barrel. Squirt out the water. Repeat.
Where to get new syringes:

You can get free syringes and injection equipment anonymously from a syringe exchange program, or you can buy syringes at many pharmacies. Just ask the pharmacist.

Call 311 to find a syringe exchange program.

How to get rid of used syringes:

1. Put used syringes and other equipment in **sharps containers** from your syringe exchange program. To avoid a needle stick, do not try to break the tip or recap the syringe.

2. **Drop off** used syringes at a syringe exchange, syringe kiosk or medical clinic.

**Until you get a sharps container,** put used syringes in a thick plastic container, like a laundry soap bottle. Be sure to label it as hazardous waste.
• Clean your hands with soap and water or a hand sanitizer.

• Place any equipment on a clean surface.

If you inject:
  + Always use a clean, sterile syringe.
  + Use fresh tap water or sterile water tubes (from a syringe exchange program).
  + Don’t use your needle to poke a hole in your sterile water tube. This can make your needle blunt. A blunt needle can damage your skin and veins.
  + Draw water into your syringe from a clean container.
  + Use a new cooker every time, and avoid touching the inside of the cooker.
  + Drop the cotton directly into the cooker, and then leave it alone. Don’t touch it with your hands!
  + If you share drugs, use one syringe to split the drugs, and a second syringe to inject yourself.
Injecting correctly helps you avoid infections and collapsed veins. Follow these steps:

1. Wipe your skin in one direction with alcohol or an antiseptic wipe. Allow it to dry.

2. Find the vein before you shoot. To make your veins visible, tie off your arm above the point of injection.

3. Point the needle toward the heart when injecting.

4. Don’t dig for veins. When you’ve found a vein, you should see blood in the barrel of the syringe after pulling back slightly on the plunger. If you don’t see blood, pull out and try again.

5. Rotate injection sites to reduce damage to your skin and veins.

Injecting into your arms and legs is safer than injecting into your hands, feet, neck or groin.
Know your limits.
If you haven’t used in a while, you may need less. Use a small amount first to see how strong your drugs are and to see how much your body can handle. Remember, you can overdose whether snorting or shooting.

Mixing drugs increases your risk of overdose.
Most overdoses happen when heroin or painkillers are mixed with other drugs like benzos, methadone, anti-depressants or alcohol.

Carry an overdose rescue kit.
Kits include naloxone, a medication that reverses overdoses from heroin, prescription painkillers and other opioids (including methadone) if given in time.

To find out where you can get a free kit and naloxone training, call 888-NYC-WELL (1-888-692-9355), text WELL to 65173 or visit nyc.gov/health and search for “overdose.”
Anyone who has ever injected drugs should get tested for HIV and hepatitis C (Hep C).

Get tested for HIV every six months if you inject drugs, share works or have sex without condoms.

If you have HIV, get treated.

HIV medicines can keep you healthy and greatly reduce the chance of passing HIV to others.

+ If you think you may have been exposed to HIV, get PEP — Post-Exposure Prophylaxis — emergency medication that can stop HIV if started within 36 but not beyond 72 hours.

+ If you’re worried about getting HIV, ask a doctor about PrEP — Pre-Exposure Prophylaxis — a daily pill that helps you stay HIV-negative.

TEXT TESTNYC TO 877877 FOR TESTING. CALL 311 TO FIND HIV TESTING, TREATMENT AND PREVENTION SERVICES.
Get tested for Hep C every six months if you inject drugs or share works. There is a cure for Hep C.

There are two tests:
If you have ever tested positive for Hep C antibodies, you will need the Hep C RNA test to find out if you have Hep C now.

- If you have Hep C, get treated and cured.
  New treatments are short and have few side effects. Most people can be cured in two to three months with pills only.

- You can get infected again.
  If you share your drugs, use your own new works.
1. Watch out for any signs that someone is overdosing.
   + Little to no breathing
   + Blue lips or skin color
   + Passing out

2. Call 911.
   + If you think someone you are with is overdosing, call 911. The law provides protection to someone overdosing or anyone calling 911 to save a life, even if drugs are present, with some exceptions. For example, you may not be protected from arrest if you have a warrant, or are on probation or parole. For more information on the law and exceptions go to health.ny.gov and search for “Good Samaritan law.”

3. Give naloxone if you have it.
   + Spray nasal naloxone into the nostril
   + Inject intramuscular naloxone into the upper arm or thigh
   + If there is no response in two minutes, give a second dose.

4. If the person isn’t breathing, do rescue breathing or CPR, if you know how.
   ↓ Tilt the person’s head back
   ↓ Pinch their nose
   ↓ Give two quick breaths into their mouth
   ↓ Continue with one breath every five seconds until the person starts breathing

5. Lay the person on their side to prevent choking.
To stop or reduce your drug use:

+ **Ask a syringe exchange program** about your options. Some syringe programs offer treatment, and most can refer you to someone who does.

+ **Talk to your health care provider** about treatment or a referral. Buprenorphine (bupe) and methadone are medicines that can help you manage opioid addiction.

+ For information, support and connection to services, call **1-888-NYC-Well** (1-888-692-9355), text **WELL** to **65173** or visit **nyc.gov/nycwell**.

---

Get help if you are depressed or anxious.

+ Depression and/or anxiety can make it harder to deal with drug use and with other illnesses, including HIV or hepatitis.

+ **Get treated.** Many options are available. Ask a health care provider or visit **nyc.gov/nycwell** for help.

---

Get regular medical care.

+ Seeing a health care provider can help you stay healthy.

+ If you don’t have health insurance, you may qualify for free or low-cost insurance. Even if you don’t qualify for insurance, you can still get good health care, regardless of your immigration status or ability to pay.

+ For help finding a health care provider, call **311** or visit **nyc.gov/health** and search “**How to find a doctor.**”
If you use drugs, take care and take charge of your safety.

For support to stop using drugs and for other resources, call 1-888-NYC-Well (1-888-692-9355), text WELL to 65173 or visit nyc.gov/nycwell.
