NEW YORK CITY DEPARTMENT OF HEALTH AND MENTAL HYGIENE

Mary T. Bassett, MD, MPH

Commissioner

Dear Fellow New Yorker:

Each year, the New York City Department of Health and Mental Hygiene's *Summary of Vital Statistics* presents data on important health indicators, such as premature mortality, life expectancy, infant mortality, and leading causes of death, which are used to monitor the health of New Yorkers, track our progress, and prioritize areas that need additional attention.

The life expectancy of New Yorkers continues to increase and mortality rates continue to fall. Although these trends are seen across racial/ethnic groups and neighborhoods, disparities still exist. For example, there are neighborhoods where life expectancy is at least 10 years less than other neighborhoods just a few miles away. Addressing these persistent disparities is core to the Agency's mission of providing all New Yorkers with the opportunity to live long and healthy lives.

Highlights from our 2014 report, which begins on the next page, include:

- Citywide, life expectancy is 81.1 years, representing a two year, one month increase since 2004.
- Overall, life expectancy in NYC remains higher than in the US, which was 78.8 in 2013. In NYC, Non-Hispanic blacks have the lowest life expectancy among racial/ethnic groups at 77.3 years while Hispanics have the highest, at 82.3 years.
- Life expectancy also varies by community district. Residents of Battery Park have the longest life expectancy (85.9) whereas residents of Brownsville have the shortest life expectancy (74.4).
- From 2005 to 2014, all-cause age-adjusted death rates declined 18.9% to 580.4 deaths per 100,000 population. Declines were seen for each racial/ethnic group: 20.2% among non-Hispanic blacks, 16.9% among non-Hispanic whites, 16.6% among Hispanics, and 12.5% among Asians and Pacific Islanders.
- New York City's age-adjusted premature death (age <65 years) also declined 21.2% since 2005. Decreases are evident among all racial ethnic groups.
- The 2014 infant mortality rate has reached a historic low of 4.2 infant deaths per 1,000 live births, a 30.0% decline from 6.0 in 2005 and a 8.7% decline from 4.6 in 2012. However, among non-Hispanic black New Yorkers, the infant mortality rate is 2.9 times higher than among non-Hispanic whites, an increase since 2005.
- For the first time since 2007, the citywide crude birth rate increased, rising to 14.4 births per 1,000. This represents a 0.7% increase from 2013.

We share these data with you to raise awareness of the most fundamental vital events that describe the health of New Yorkers, and to track our progress in advancing the health of all New Yorkers.

Sincerely.

Mary T. Bassett, MD, MPH

Many I Horasells

Commissioner

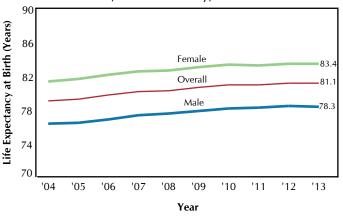

KEY FINDINGS

- New York City's 2013 life expectancy at birth was 81.1 years (preliminary data for latest year available), a 2.1 year (two year, one month) increase since 2004 (page 8).
- New York City's 2014 age-adjusted death rate was 5.8 deaths per 1,000 population, with 53,034 deaths in 2014, reflecting a statistically significant decrease of 2.5% since 2013. This was an 18.9% decline from 2005 (page 10).
- Age-adjusted all-cause death rates decreased across all racial/ethnic groups from 2005 to 2014, narrowing the non-Hispanic black and non-Hispanic white gap by 39.9% and indicating some reduction in racial/ethnic health disparities (page 10).
- Heart disease, cancer, and influenza/pneumonia continue to rank as the three leading causes of death in 2014; crude death rates for all three declined since 2005, down 30.8%, 5.1%, and 28.1%, respectively (page 12).
- New York City's 2014 age-adjusted premature death rate (age <65 years) was 186 per 100,000, a 21.2% decline since 2005. Decreases were evident among all racial ethnic groups, narrowing the non-Hispanic black and non-Hispanic white gap by 30.5% and indicating some reduction in racial/ethnic health disparities (page 16).
- The three leading causes of premature death (age <65 years) in 2014 were cancer, heart disease, and drug use/poisoning. Respective crude premature death rates declined 12.2%, 20.5%, and 8.1% since 2005 (page 18).
- New York City's 2014 infant mortality rate reached a historic low of 4.2 infant deaths per 1,000 live births, a 30.0% decline from 6.0 in 2005 and a 8.7% decline from 4.6 in 2013. The Healthy People 2020 goal of 6.0 was met in 2005. However, Puerto Rican and non-Hispanic black New Yorkers have infant mortality rates that are nearly twice the citywide rate (page 22).
- From 2005 to 2014, the infant mortality rate increased 13.4% among Puerto Ricans. It declined 22.7% among non-Hispanic blacks, 29.7% among Asian and Pacific Islanders, 45.8% among non-Hispanic whites, and 10.9% among other Hispanics (page 23).
- New York City's 2014 crude birth rate was 14.4 births per 1,000 population, a 0.7% increase since 2013. The rate decreased 5.9% from 15.3 births per 1,000 population in 2005 (page 28).
- In 2014, the teen birth rate continued its steady decline to a new low of 19.4 births per 1,000 females age 15-19 years, representing a 41.0% decline since 2005. Decreasing rates among all racial/ethnic groups resulted in a 53.3% narrowing of the non-Hispanic black and non-Hispanic white gap, indicating some reduction in racial/ethnic disparities (page 32).

For more detailed information, including additional data and details on how to submit data requests, please visit http://www1.nyc.gov/site/doh/data/data-sets/vital-statistics-data.page, or email vsdata@health.nyc.gov.

LIFE EXPECTANCY

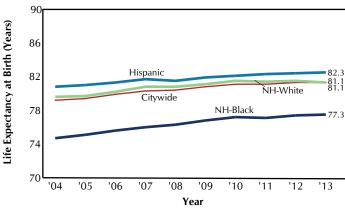

Figure 1. Life Expectancy at Birth, Overall and by Sex, New York City, 2004-2013

- New York City's 2013 life expectancy at birth was 81.1 years (preliminary data for latest year available), a 2.1 year (two year, one month) increase since 2004.
- Among males, this reflects a 2.0 year increase to 78.3 years, and among females, a 2.1 year increase to 83.4 years since 2004.

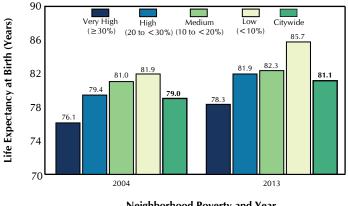

- The New York City 2013 life expectancy at birth was 82.3 years among Hispanics, 81.1 years among non-Hispanic whites, and 77.3 years among non-Hispanic blacks.
- From 2004 to 2013, life expectancy increased 1.7 years for Hispanics, 1.7 years for non-Hispanics whites, and 2.8 years for non-Hispanic blacks. From 2012 to 2013, life expectancy increased approximately 1 month for Hispanics and non-Hispanic blacks but decreased 2 months for non-Hispanic whites.

Figure 2. Life Expectancy at Birth by Racial/Ethnic* Group, New York City, 2004-2013

*Life expectancy among Asians and Pacific Islanders is not displayed because the required single year age population denominators are too small to produce reliable estimates (Appendix B, Technical Notes: Population, Life Expectancy).

Figure 3. Life Expectancy at Birth by Neighborhood Poverty, New York City, 2004 and 2013

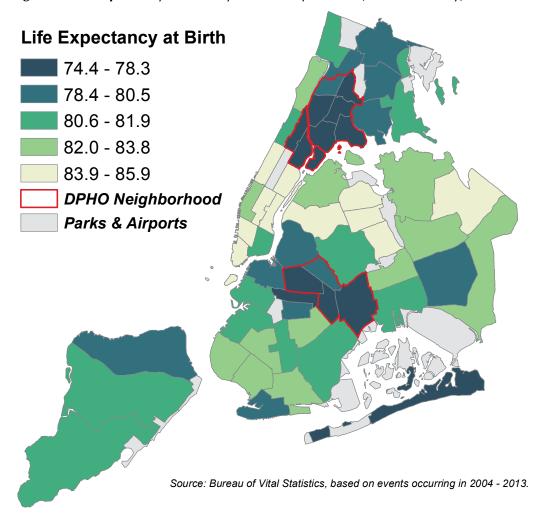

Neighborhood Poverty and Year

- Life expectancy has increased across all categories of neighborhood poverty between 2004 and 2013. For very high poverty areas, life expectancy has increased by 2.2 years as compared to 3.8 years for low poverty areas.
- The difference in life expectancy between very high and low poverty areas in 2013 was 7.4 years as compared to 5.8 in 2004, indicating a widening income-related health disparity.

LIFE EXPECTANCY

Figure 4. Life Expectancy at Birth by Community Districts, New York City, 2004-2013

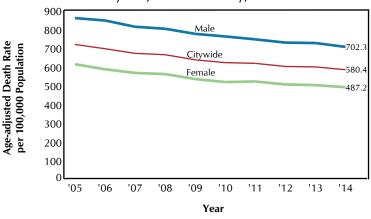

- In 2013, New York City's life expectancy at birth was the highest in Battery Park/Tribeca at 85.9 years, followed by 85.6 years in Murray Hill, 85.4 years in the Upper East Side, 85.0 years in Greenwich Village/SOHO, and 84.9 years in Elmhurst/Corona.
- In 2013, life expectancy at birth was lowest in Brownsville at 74.4 years, followed by 75.6 years in Bedford Stuyvesant, Central Harlem, and Morrisania, and 76.1 years in The Rockaways.

CITYWIDE MORTALITY

Figure 5. Age-adjusted Death Rates, Overall and by Sex, New York City, 2005–2014

- The citywide age-adjusted death rates declined by 2.5% between 2013 and 2014. In the past 10 years, the rate has decreased by 18.9%.
- From 2005 to 2014, age-adjusted all-cause death rates declined 18.0% among males and 20.2% among females.

- Age-adjusted all-cause death rates declined among all racial/ethnic groups from 2005 to 2014: 20.2% among non-Hispanic blacks, 16.9% among non-Hispanic whites, 16.6% among Hispanics, and 12.5% among Asians and Pacific Islanders.
- The gap between non-Hispanic blacks and non-Hispanic whites continues to close. In 2014, the difference of age-adjusted death rate was 73.2 per 100,000 population as compared to 88.2 in 2013.

Figure 6. Age-adjusted Death Rates by Racial/Ethnic Group, New York City, 2005–2014

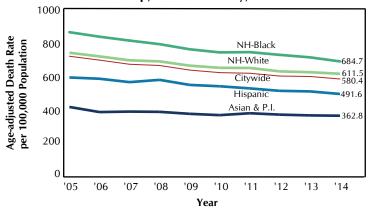

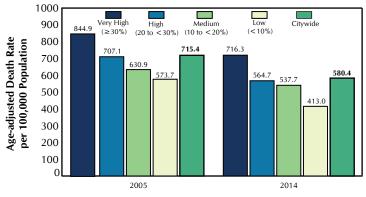

Figure 7. Age-adjusted Death Rates by Neighborhood Poverty, New York City Residents, 2005 and 2014

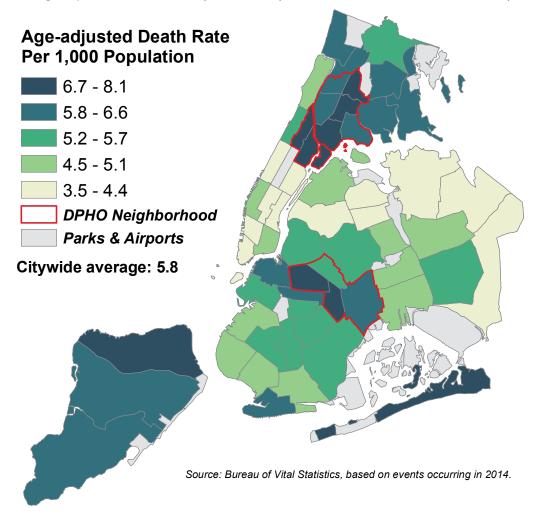

Neighborhood Poverty and Year

- Since 2005, the age-adjusted death rate has decreased across all categories of neighborhood poverty with a 15.2% decrease for the very high poverty areas and a 28.0% decrease for the low poverty areas.
- The age-adjusted all-cause death rate was 1.7 times greater in areas with very high poverty compared to areas with low poverty in 2014 as compared to 1.5 times in 2005.

NEIGHBORHOOD MORTALITY

Figure 8. Age-adjusted Death Rates by Community District of Residence, New York City, 2014

- In 2014, New York City's age-adjusted death rate was the highest in Morrisania at 8.1 deaths per 1,000 population, followed by 8.0 in Brownsville, 7.8 in both Central Harlem and East Harlem, and 7.6 in East Tremont.
- In 2014, age-adjusted death rate was lowest in Bayside at 3.5 deaths per 1,000 population, followed by 3.6 in Greenwich Village/SOHO, 3.8 in Elmhurst/Corona, 3.9 in Murray Hill, and 4.0 in both Midtown Business District and Queens Village.

^{*}See the 2010 Summary of Vital Statistics: Mortality – Special Section: Cause of Death Quality Improvement Initiative for information on the recent trends in cause of death reporting, particularly heart disease.

- Heart disease, malignant neoplasms (cancer), and influenza/pneumonia continued to rank as the three leading causes of death; crude death rates for all three declined since 2005, down 30.8%, 5.1%, and 28.1%, respectively.
- Chronic Lower Respiratory Diseases ranked fourth at 21.5 deaths per 100,000 population, up 9.7% since 2005 but 1.8% lower than in 2013; followed by Diabetes Mellitus, which ranked fifth, at 21.2 deaths per 100,000 population, down 5.8% since 2005; and cerebrovascular diseases (mostly stroke), sixth, at 21.0 deaths per 100,000 population, up 2.4% since 2005. The rate of essential hypertension and hypertensive renal disease death shifted from seventh to eighth and increased 23.2% from 2005 to 2014. Most of that increase occurred prior to 2009, and rates have decreased by 7.1% since 2013.
- Use of or poisoning by psychoactive substance (drug-related deaths) ranked ninth, up 1.0%, since 2013 but down 7.1% since 2005.
- Alzheimer's disease again ranked tenth among the top ten leading causes, at 9.3 deaths per 100,000 population, up 181.8% since 2005. The sharp increase in Alzheimer's disease occurred since 2008, coinciding with efforts to improve cause of death reporting accuracy in New York City.*

[†]Appendix B Technical Notes: Drug-Related Deaths.

^{*} Decedents of other or multiple races or with unknown ethnicities are not shown.

- OneNYC, Mayor De Blasio's plan for a strong and just city, seeks a 25% reduction in premature deaths by 2040 and a dramatic decrease in disparities among racial/ethnic groups.
- The age-adjusted premature death rate has declined to 186 per 100,000 population which represents a 21.2% decrease since 2005 and a 2.7% decrease since 2013.

Figure 9. Age-adjusted Premature Death (Age < 65 years) Rates, Overall and by Sex, New York City, 2005–2014

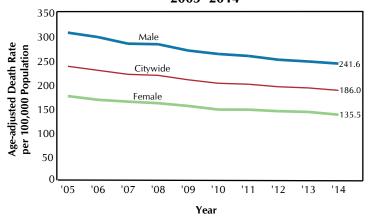

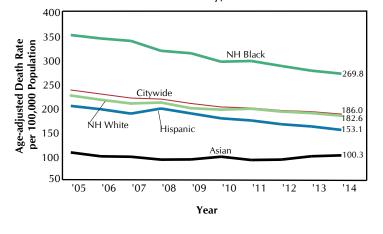

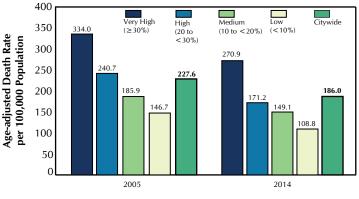

Figure 10. Age-adjusted Premature Death (Age < 65 years) Rates by Racial/Ethnic Group,
New York City, 2005–2014

- From 2005 to 2014, age-adjusted premature death (age <65 years) rates declined 22.9% among non-Hispanic blacks, 24.5% among Hispanics, 18.7% among non-Hispanic whites and 5.7% among Asians and Pacific Islanders.
- Similar to 2013, the age-adjusted premature death rate for non-Hispanic blacks was 1.5 times the rate for non-Hispanic whites.

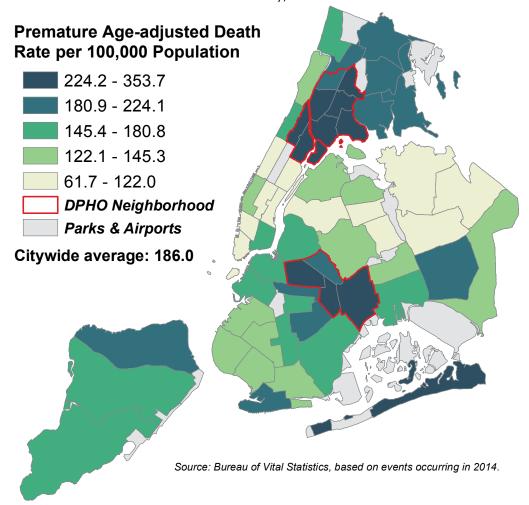

- The age-adjusted premature mortality rate has decreased across all categories of neighborhood poverty since 2005. In the very high poverty areas, the premature mortality rate decreased by 18.9% as compared to 25.8% in 2014 for low poverty areas.
- The age-adjusted premature death rate was 2.5 times greater in areas with very high poverty as compared to areas with low poverty in 2014, as compared to 2.3 in 2005.

Figure 11. Age-adjusted Premature Death (Age < 65 years) Rates by Neighborhood Poverty, New York City Residents, 2005 and 2014

Neighborhood Poverty

Figure 12. Age-adjusted Premature Death (Age < 65 years) Rates by Community District of Residence, New York City, 2014

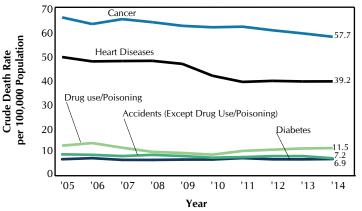

- In 2014, New York City age-adjusted premature death rate was the highest in East Tremont at 353.7 deaths per 100,000 population, followed by 351.7 in Brownsville, 318.7 in East Harlem, 312.3 in Morrisania and 309.8 in Mott Haven.
- In 2014, age-adjusted premature death rate was lowest in Greenwich Village/SOHO at 61.7 deaths per 100,000 population, followed by 80.5 in Bayside, 92.6 in Murray Hill, 94.7 in Elmhurst/Corona and 95.6 in the Upper East Side.

Crude Death Rate

Figure 13. Leading Causes of Premature Death (Age < 65 Years), New York City, 2005–2014

*See the 2010 Summary of Vital Statistics: Mortality – Special Section: Cause of Death Quality Improvement Initiative.

- In 2014, the five leading causes of premature death (age <65 years) were cancer, down 12.2% since 2005, heart disease, down 20.5%, use of or poisoning by psychoactive substance (drug use/poisoning), down 8.1%, accidents except drug use/poisoning, down 18.4%, and diabetes, up 1.3%.
- The sharper decline in heart disease death rates from 2008 to 2011 is partly due to efforts to improve the accuracy of cause of death reporting.*

- Lung, breast, and lymphoid, hematopoietic and related tissue (lymph and blood) cancers were the top three leading causes of premature cancer death in 2014. Since 2005, the crude rate of these cancers have decreased 23.1%, 21.3%, and 22.0%, respectively.
- The remaining two leading causes of premature cancer deaths, colon and liver, have increased 5.4% and 5.9%, respectively, since 2005.

Figure 14. Leading Causes of Premature Cancer Deaths (Age < 65 years), New York City, 2005-2014

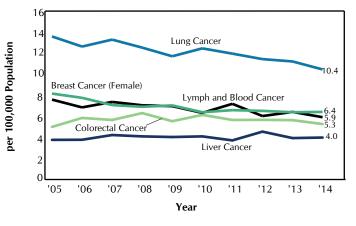

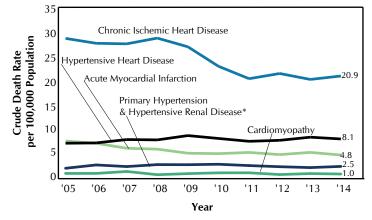

Figure 15. Leading Causes of Premature Heart Disease Deaths (Age < 65 years), New York City, 2005-2014

- *Essential (Primary) Hypertension and Hypertensive Renal Disease.
- †See the 2010 Summary of Vital Statistics: Mortality Special Section: Cause of Death Quality Improvement Initiative.

- The crude rate of the leading cause of premature heart disease deaths, chronic ischemic heart disease, decreased 26.8% since 2005. The sharper decline from 2008 to 2011 is partly due to efforts to improve the accuracy of cause of death reporting.†
- Since 2005, hypertensive heart disease increased by 12.0% since 2005 to 8.1 deaths per 100,000 population and acute myocardial infarction declined 37.2% to 4.8 deaths per 100,000 population.

EXTERNAL CAUSES OF DEATH

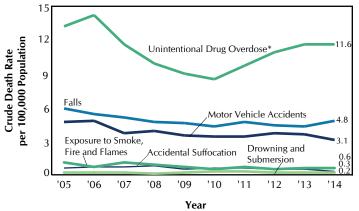

- Among external causes of death, the rate of deaths due to accidents is consistently higher than homicide, suicide, or other external causes†.
- Between 2005 and 2010 accidental death rates declined 25.5% to 17.5% but increased slightly since to 20.6% in 2014.
- Since 2005, homicide rates declined 41.7% to 4.2 deaths per 100,000 population, and suicides rates increased 11.7% to 6.7 deaths per 100,000 population.
- Death rates from other external causes have stayed between 3.2 and 3.4 deaths per 100,000 population since 2011.

Figure 16. Crude Death Rates for External Causes of Death*, New York City, 2005–2014

^{*}Appendix B. Technical Notes: Deaths, Cause of Death International Classification of Disease (ICD) Coding.

Figure 17. Crude Death Rates for Selected Accidental Causes of Death, New York City, 2005–2014

*Appendix B. Technical Notes: Drug-Related Deaths.

- The three leading causes of accidental deaths continue to be unintentional drug overdose*, falls, and motor vehicle accidents.
- Since 2005 crude death rates for all three declined: 12.4% for unintentional drug overdose, 18.5% for falls and 34.1% for motor vehicle accidents.
- Rates of accidental death due to smoke, fire and/or flame exposure, suffocation, and drowning and submersion were all less than one death per 100,000 population in 2014.

• Deaths due to suicide were highest among the age group 45-64 years old, at 9.7 deaths per 100,000 population.

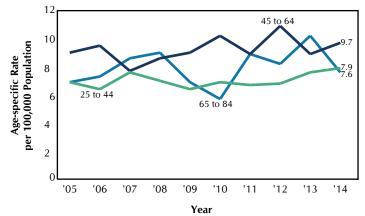

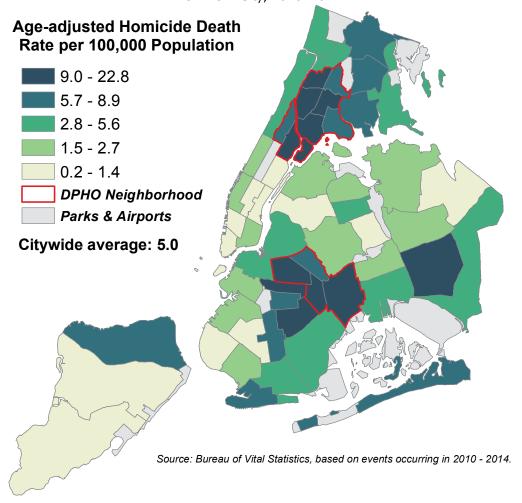

Figure 18. Age-specific Suicide Death Rates, New York City, 2005-2014

[†]Other external causes include medical and/or surgical care complications and deaths due to undetermined intent.

EXTERNAL CAUSES OF DEATH

Figure 19. Age-adjusted Homicide Death Rates (Five-year-averages) by Community District of Residence, New York City, 2010–2014

- The five-year average age-adjusted homicide rate was highest in Brownsville at 22.8 deaths per 100,000 population, followed by Mott Haven with 14.3, Bedford Stuyvesant with 13.8, Morrisania with 12.9, and Flatbush/Midwood with 11.3.
- Some community districts had very low homicide death rates. Community districts with fewer than 1 death per 100,000 population over the five years include Battery Park/Tribeca, Bayside, Upper East Side, Rego Park/Forest Hills, Bay Ridge District, and Murray Hill.

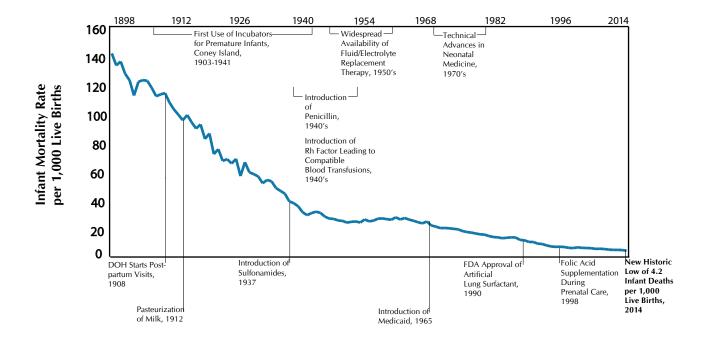

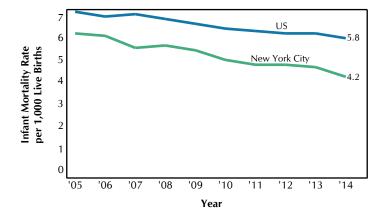

Figure 1. Infant Mortality Rate, New York City and United States, 2005-2014

- OneNYC, Mayor De Blasio's plan for a strong and just city, proposes achieving an historic low of 3.7 infant deaths
 per 1,000 live births citywide by 2040, and dramatically decreasing the racial/ethnic disparities. The city will achieve
 this by targeting key neighborhoods with high infant mortality rates and implementing social and structural supports
 before, during, and after pregnancy.
- The 2014 New York City infant mortality rate reached a historic low of 4.2 infant deaths per 1,000 live births, a 30.0% decline from 6.0 in 2005 and a 8.7% decline from 4.6 in 2013. The Healthy People 2020 goal of 6.0 was met in 2005.
- The New York City infant mortality rate was 27.6% lower than the US rate of 5.8 per 1,000 live births. In 2005, the New York City rate was just 13.0% lower than the US rate.

- Although infant mortality rates have declined among all racial/ethnic groups, disparities persist. In 2014, the infant mortality rate among non-Hispanic blacks was 2.9 times higher than among non-Hispanic whites, an increase from 2.0 in 2005. However, these rates will fluctuate due to small numbers of infant deaths.
- From 2005 to 2014, the infant mortality rate increased 13.4% among Puerto Ricans. It declined 22.7% among non-Hispanic blacks, 29.7% among Asian and Pacific Islanders, 45.8% among non-Hispanic whites, and 10.9% among other Hispanics.

Figure 2. Infant Mortality Rate by Mother's Racial/Ethnic Group, New York City, 2005–2014

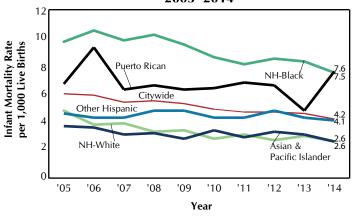

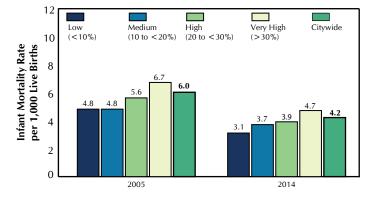

Figure 3. Infant Mortality Rate by Neighborhood Poverty*, New York City Residents, 2005 and 2014

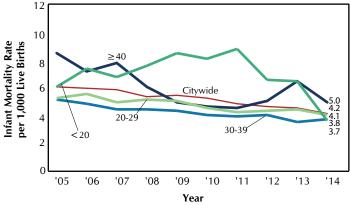

Neighborhood Poverty*

- *Neighborhood poverty (based on mother's NYC resident census tract) defined as percent of residents with incomes below 100% of the Federal Poverty Level, per American Community Survey (ACS) 2005-2009 for 2005 data and per ACS 2009-2013 for 2014 data.
- In 2014, the infant mortality rate was highest among infants born to the oldest mothers (≥40 years of age), at 5.0 infant deaths per 1,000 live births. It was 4.1 among infants born to mothers 20 to 29 years of age, 3.8 infant deaths per 1,000 live births among mothers 30 to 39 years of age, and 3.7 infant deaths per 1,000 live births among mothers less than 20 years of age.
- Infant mortality rates have decreased among infants born to mothers in all age groups since 2005: 39.3% among mothers ages younger than 20, 22.6% among mothers ages 30 to 39, 26.9% among mothers ages 20 to 29, and 41.2% among mothers ages 40 and older.

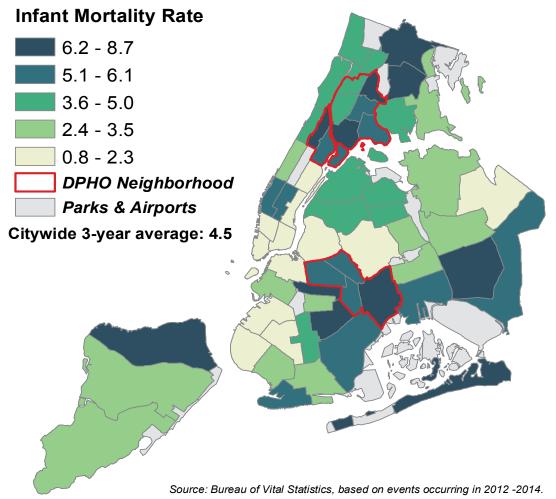

- In 2014, infant mortality rates were 1.5 times higher in areas with very high poverty compared to areas with low poverty (4.7 infant deaths per 1,000 live births vs. 3.1, respectively). The relative difference in rates fluctuate due to small numbers.
- From 2005 to 2014, the infant mortality rate declined in all groups: by 35.7% in low poverty areas, 29.6% in high poverty areas, 29.2% in very high poverty areas and 23.6% in medium poverty areas (data not shown).

Figure 4. Infant Mortality Rate by Mother's Age*, New York City, 2005–2014

*The fluctuation in the infant mortality rate among infants born to mothers <20 and ≥40 is likely due to small numbers.

Figure 5. Average* Infant Mortality Rate by Community District of Residence and DPHO+, New York City, 2012–2014

^{*}Due to instability in the infant mortality rates by community district, rates are presented as three-year averages. +See Technical Notes Community Districts, Boroughs, and District Public Health Offices.

- The three-year average infant mortality rate was highest in East Tremont at 8.7 deaths per 1,000 live births, followed by 8.5 in Crown Heights North, 8.4 in Williamsbridge, 7.5 in Jamaica/St. Albans, and 7.4 in East New York.
- The lowest three-year average infant mortality rate was in Greenwich Village/SOHO and the Upper East Side with 0.8 deaths per 1,000 live births, followed by 1.0 in Murray Hill, 1.8 in Sunset Park, and 1.9 in both Borough Park and Bayside.

PREGNANCY OUTCOMES

^{*1898-1914} Birth counts are estimated as number reported was determined to be incomplete.

PREGNANCY OUTCOMES OVERVIEW

Figure 1. Crude Birth Rate, New York City, and United States, 2005-2014*

- The 2014 citywide crude birth rate was 14.4 births per 1,000 population. Since 2005, the rate decreased 5.9% from 15.3 births per 1,000 population; since 2013, the rate increased 0.7% from 14.3. More detailed information on current birth rates can be found in Table 1 and Figures 4, 5, and 6.
- New York City's 2014 crude birth rate was 14.4 births per 1,000 population, 15.2% greater than the United States rate.

- The 2014 citywide crude rate of spontaneous terminations of pregnancy (miscarriages and stillbirths) was 5.8 terminations per 1,000 female aged 15 to 44 years, the rate has remained between 5.8 and 7.8 since 2005.
- Changes in rates of spontaneous terminations of pregnancy are likely due to variations in reporting facilities' responsiveness to legal reporting requirements rather than true changes in such events. DOHMH continues to conduct outreach and education of targeted medical facilities about legal reporting requirements.
- More detailed information on spontaneous terminations of pregnancy rates can be found in Table 1.

Figure 2. Crude Spontaneous Termination of Pregnancy Rate, New York City, 2005–2014

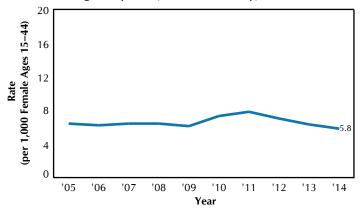

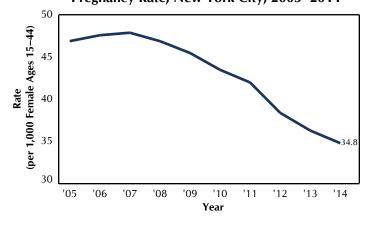

Figure 3. Crude Induced Termination of Pregnancy Rate, New York City, 2005–2014

- The 2014 citywide crude rate of induced terminations of pregnancy was 34.8 terminations per 1,000 females aged 15 to 44 years, continuing its decline, down 4.1% since 2013.
- This rate decreased each year since 2007, when it neared 48 terminations per 1,000 female ages 15 to 44 years. It has declined 25.8% since 2005.
- More detailed information on induced terminations of pregnancy rates can be found in Table
 1.

PREGNANCY OUTCOMES OVERVIEW

 $Note: Population \ data \ used \ to \ calculate \ rates \ are \ 2014 \ estimates \ from \ US \ Census \ Bureau. \ See \ Technical \ Notes: Population.$

 $[\]hbox{*See Technical Notes: Population, Vital Event Rates}.$

[†]The denominators for total rates are females ages 15-44 except for total birth rates which are all population.

[‡]Counts for females age 15 to 19 are the number of events to females age < 20; counts for females age 40 to 49 are the number of events to females age 40 and over. See Technical Notes: Vital Event Rates.

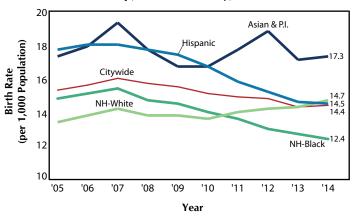

[§]Includes all events occurring in NYC regardless of residence.

Other/unknown ethnicities are excluded.

Numbers and rates are limited to events occurring in NYC to NYC residents only.

BIRTH RATE

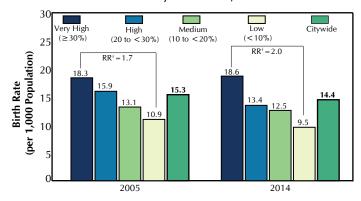

Figure 4. Birth Rate by Mother's Racial/Ethnic Group, New York City, 2005–2014

- In 2014, the birth rate was the highest among Asians and Pacific Islanders at 17.3 births per 1,000 population, followed by 14.7 among non-Hispanic whites, 14.5 among Hispanics, and 12.4 among non-Hispanic blacks.
- From 2005 to 2014, birth rates increased among non-Hispanic whites (9.7%) and decreased among Hispanics (18.1%) and non-Hispanic blacks (16.2%).

- Birth rates are the highest in the city's poorest neighborhoods at 18.6 births per 1,000 population as compared to 9.5 for the low poverty neighborhoods. In 2014, birth rates were 2.0 times greater in the city's very high poverty neighborhoods compared to the city's low poverty neighborhoods, as compared to 1.7 in 2005.
- Since 2005, birth rates increased 1.6% in the very high poverty neighborhood. The birth rate decreased since 2005 by 15.7% in the high poverty, 4.6% in medium poverty and 12.8% in the low poverty neighborhoods (data not shown).

Figure 5. Birth Rate by Neighborhood Poverty*, New York City Residents, 2005 and 2014

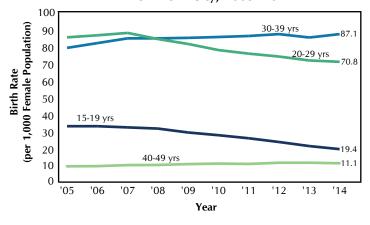

Neighborhood Poverty and Year

*Neighborhood poverty (based on mother's NYC resident census tract) defined as percent of residents with incomes below 100% of the Federal Poverty Level, per American Community Survey (ACS) 2005-2009 for 2005 data and per ACS 2009-2013 for 2014 data.

†Rate Ratio.

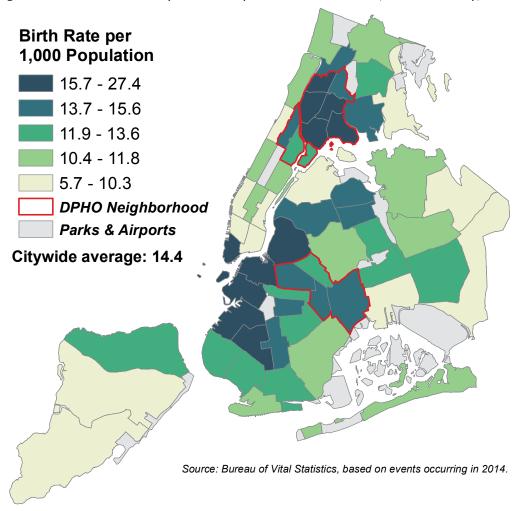

Figure 6. Birth Rate by Mother's Age Group, New York City, 2005–2014

- In 2014, the birth rate among women aged 30 to 39 years of age continued to be highest in New York City, at 87.1 births per 1,000 female population followed by women 20 to 29 at 70.8, then women 15 to 19 years old and 40 to 49 years old with birth rates of 19.4 and 11.1, respectively.
- Since 2005, the teen birth rate (15-19 years of age) decreased 41.0% from 32.9 to 19.4 births per 1,000 women. Since 2013, the rate decreased 8.5% from 21.2.

BIRTH RATE

Figure 7. Crude Birth Rate by Community District of Residence, New York City, 2014

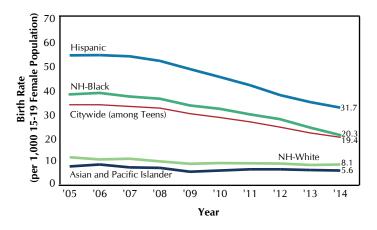

- For 2014, the community district with the highest crude birth rate was Borough Park with 27.4 births per 1,000 population, followed by 20.7 in both Sunset Park and Williamsburg/Greenpoint, 18.7 in Battery Park/Tribeca and 17.9 in Morrisania.
- The community district with the lowest crude birth rate was Bayside with 5.7 births per 1,000 population, then Throgs Neck with 8.1, Greenwich Village/SOHO with 8.3, the Lower East Side with 8.5, and Queens Village with 8.6.

TEEN BIRTHS

Figure 8. Teen Birth Rate by Mother's Racial/ Ethnic Group, New York City, 2005-2014

 Teen birth rates were the highest in the city's poorest neighborhoods. In 2005 and 2014, teen birth rates were 3.6 and 5.9 times greater in the city's very high poverty neighborhoods

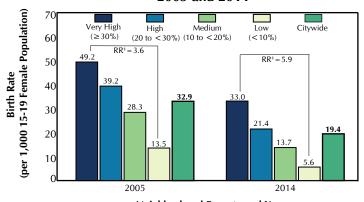

compared to the low poverty neighborhoods,

Between 2005 and 2014, teen birth rates declined across all poverty levels: 32.9% in the city's very high poverty neighborhoods, 45.4% in high poverty neighborhoods, 51.6% in medium poverty neighborhoods, and 58.5% in low poverty neighborhoods.

respectively.

- From 2005 to 2014, teen birth rates declined 41.0% overall and among all racial/ethnic groups: 40.6% among Hispanics, 45.4% among non-Hispanic blacks, 27.0% among non-Hispanic whites and 23.3% among Asian Pacific Islanders.
- In 2014, the teen birth rate among non-Hispanic blacks was 2.5 times higher than among non-Hispanic whites reflecting a narrowing of the 2005 difference, which was 3.3 times higher.
- The teen birth rate disparity between Hispanics and non-Hispanic whites also narrowed. Rates for Hispanics were 4.8 times higher than whites in 2005, and 3.9 times higher in 2014.

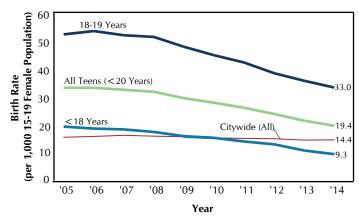

Figure 9. Teen Birth Rate by Neighborhood Poverty*, New York City Residents, 2005 and 2014

Neighborhood Poverty and Year
*Neighborhood poverty (based on mother's NYC resident census tract) defined as percent of residents with incomes below 100% of the Federal Poverty Level, per American Community Survey (ACS) 2005-2009 for 2005 data and per ACS 2009-2013 for 2014 data.

†Rate Ratio

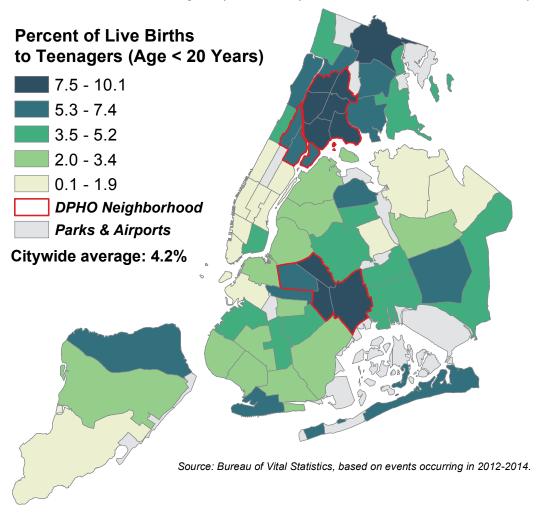

Figure 10. Teen Birth Rate by Age, New York City, 2005-2014

- Birth rates for teens 18-19 years old is 2.3 times the citywide birth rate.
- The birth rates for teens less than 18 is about 35.4% lower then the citywide birth rate and half the birth rate for women 20 years or older.
- Birth rates have fallen for all teenagers regardless of age. For teens less than 18 years of age, the birth rate has declined by 51% from 19.1 births per 1,000 female population in 2005 to 9.3 in 2014.

TEEN BIRTHS

Figure 11. Percent of Live Births to Teenagers by Community District of Residence, New York City, 2012-2014

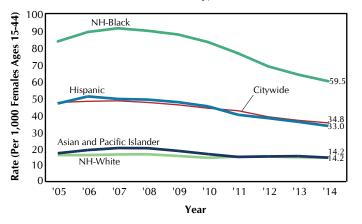

- The community district with highest percentage of live births to teenagers (<20 years) was East Tremont with 10.1%, followed by Morrisania with 9.5%, Hunts Point with 9.2%, Mott Haven with 9.0%, and Brownsville with 8.9%.
- The following community districts had less than 1% of live births to teenagers: Battery Park/Tribeca, Murray Hill, Greenwich Village/SOHO, Upper East Side, and Rego Park/Forest Hills.

INDUCED TERMINATION OF PREGNANCY

Figure 12. Age-adjusted Induced Termination of Pregnancy Rate by Mother's Racial/Ethnic Group, New York City, 2005-2014

- The 2014 citywide crude rate of induced terminations of pregnancy, at 34.8 terminations per 1,000 female aged 15 to 44 years, declined 25.8% since 2005 (Figure 3). Similarly, age-adjusted rates among each racial/ethnic group declined: 28.7% among Hispanics, 28.4% among non-Hispanic blacks, 15.5% among Asian and Pacific Islanders and 9.6% among non-Hispanic whites.
- The disparity between non-Hispanic white and non-Hispanic black induced termination of pregnancy rate has narrowed since 2005; the rate was 4.2 times greater among non-Hispanic blacks than non-Hispanic whites (63.4 per 1,000 females age 15-44 vs. 14.4) in 2014, compared to 5.3 in 2005.

- Since 2005, the crude rate of induced termination of pregnancy has declined 49.1% among teens from 58.9 terminations per 1,000 female 15 to 19 years of age in 2005 to 30.0 in 2014, followed by a 25.8% decline for women 20 to 29 years of age, 17.2% among women 30 to 39 years of age and 9.6% among women 40 and older.
- Rates remain the highest among women 20 to 29 years of age, followed by teens, then women 30 to 39 years of age and women 40 and over.

Figure 13. Age-specific Induced Termination of Pregnancy Rate by Mother's Age, New York City, 2005–2014

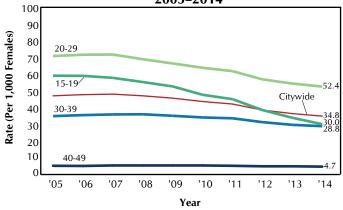

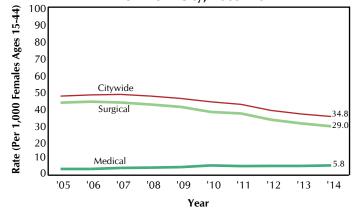

Figure 14. Crude Induced Termination of Pregnancy Rate by Medical vs. Surgical Procedure, New York City, 2005–2014

- Medication-induced abortion, using mifepristone in combination with misoprostol is termed a "medical abortion" and may be performed up to nine weeks gestation, rather than a surgical procedure, to terminate a pregnancy. Medical abortion is not to be confused with the morning-after pill, also known as emergency contraception, used to prevent pregnancy.
- Since 2005, the crude rate of medical abortion in New York City has increased 56.8%, to 5.8 terminations per 1,000 females age 15-44, while the rate of surgical abortion has decreased 32.6% to 29.0%.

[†] The following cause groups are not ranked as leading causes nationally, but are eligible to be ranked as leading causes in New York City because of the number of deaths and their public health importance: "Mental and behavioral disorders due to use of psychoactive substances excluding alcohol and tobacco", and "Accidents", which in NYC excludes poisoning by psychoactive substances (excluding alcohol and tobacco").

^{*}Populations for calculating rates vary by year. See Technical Notes: Population, Citywide.
†See Technical Notes: Vital Events Rates.
‡AIDS was first reported as a cause of death in 1982. See the Technical Notes and Historical Technical Notes: Deaths, HIV and AIDS Mortality.

§Data for 1982-1985.

[Nate less than 0.05.

Motor vehicle accident codes are listed in Table M1.

**World Trade Center (WTC) disaster deaths are not included in 2001. See Special Section on WTC deaths in the 2002 Summary of Vital Statistics for detailed statistics.

†Beginning January 2007, causes of death coding was changed. See Technical Notes: Deaths, Cause of Death Coding.

‡# Codes following causes in parenthesis are the International Classification of Diseases, Tenth Revision.

§§Data are not available or not applicable.

^{||||}See Technical Notes: Maternal Death and Maternal Mortality.

Firearm injuries	< 1	< 1	(
Homicide	156	135	21
Hypothermia	5	5	
Motor-vehicle nontraffic crashes	1	1	< 1
Motor-vehicle traffic crashes	78	63	15
Occupational and machine injuries	< 1	< 1	(
Other road vehicle crashes	8	6	2
Poisoning (not alcohol)	210	154	57
Suicide	129	90	39
	< 1		
Water transport Subtotal	824	< 1 611	213

Note: Alcohol prevalence data are provided by the Bureau of Epidemiology Services. The definition of alcohol consumption levels was changed in 2014. See Technical Notes: Deaths, Alcohol and Smoking Attributable Mortality.

^{*} IUGR = Intrauterine growth restriction.

Table M15. Smoking-attributable Deaths and Age-adjusted Death Rates, Age ≥ 35 Years, New York City, 2014

Disease Category		Deaths		_	-adjusted Ra 0,000 Popul	
	Male	Female	Total	Male	Female	Total
Total	4,587	3,343	7,930	246.7	127.4	177.6
Cerebrovascular disease	54	56	111	3.1	2.2	2.6
Chronic obstructive pulmonary disease (ages 65+)	515	584	1,100	31.5	22.4	25.9
Coronary heart disease	1,478	1,083	2,560	79.4	41.7	58.1
Diabetes mellitus	63	30	93	3.2	1.1	2.0
Influenza, pneumonia, Tuberculosis, and COPD (ages 35-64)	215	121	336	9.0	4.3	6.5
Influenza, pneumonia, and tuberculosis (ages 65+)	186	98	284	11.2	3.8	6.7
Lung cancer	1,134	909	2,043	60.3	34.3	45.0
Other cancers	619	251	870	32.9	9.4	19.1
Other cardiovascular diseases (ages 35-64)*	191	60	250	8.3	2.4	5.1
Other heart disease (ages 65+)†	69	86	155	4.0	3.3	3.6
Other vascular diseases (ages 65+)‡	64	64	128	3.7	2.5	3.0

Notes:

Smoking prevalence rates are from New York City Community Health Survey and calculated by Bureau of Epidemiology Services, New York City Department of Health and Mental Hygiene.

Beginning 2014, smoking-attributable death calculation uses CDC updated method. As a result, the smoking-attributable deaths are much higher than prior years. See Technical Notes: Deaths, Alcohol-and Smoking-attributable Mortality for methodology.

^{*} Other cardiovascular diseases are comprised of other heart disease, cerebrovascular disease, other vascular diseases and diabetes mellitus.

[†] Other heart disease comprised of rheumatic heart disease, pulmonary heart disease, and other forms of heart disease.

[‡] Other vascular diseases are comprised of atherosclerosis, aortic aneurysm, and other arterial diseases.

^{*}Source Bureau of Labor Statistics: Fatal Occupational Injuries in New York City http://www.bls.gov/iif/oshwc/cfoi/tgs/2013/iiffw68.htm

§Includes all fatal occupational injuries meeting this ownership criterion across all specific years, regardless on industry classification system. |Persons identified as Hispanic or Latino may be of any race. The individual race categories shown other than Hispanic exclude data for Hispanic and Latino workers.

⁺Based on the BLS Occupational Injury and Illness Classification System (OIICS) 2.01 implemented for 2011 data forward.

[‡]Empty cells are either zero or censored fatalities; rows or columns may not sum to totals.

Note: Three-year average death data are used to estimate above decennial life expectancy to smooth the outcome. See Technical Notes: Life Expectancy.

^{*} US Census population data for 2000 and 2010 are used to calculate 1999-2001 and 2009-2011 life expectancy, respectively. See Technical Notes: Population.

[†] World Trade Center (WTC) disaster deaths are excluded. See Special Section in 2002 Summary of Vital Statistics, Table WTC10, for the impact of WTC deaths on life expectancy in New York City.

Note: Life expectancy for year 2014 is not presented since national data are required and are not yet available.

^{*} Population data from 2002-2009 are interpolated based on 2000 and 2010 Census counts. Population data for 2011-2013 are extrapolated from 2000 and 2010 US Census since the life tables are derived from complete life table which require single year of age population data. See Technical Notes: Population.

Table M26. Years of Potential Life Lost (YPLL) Before Age 75 Overall and by Sex and Selected Causes of Death, New York City, 2014

^{*}The infant mortality rate is listed only for countries with 500 or more live births in any year of 2008-2014.

[†]Foreign countries are listed according to the descending order of infant mortality rates in the most current period.

[‡]As of 2006, US Virgin Islands and Guam are included in the US. Puerto Rico is a US territory, but is not included as a birthplace in the United States due to the large number of births to Puerto Rican-born women.

Note: Borough totals may be higher than the sum of the community districts, as they may include some live births whose community district could not be determined. Map of percent of live births to teenagers by community district of residence is presented on page 33 (Map PO11).

^{*}Three years of data were combined because of the relatively small number of live births per year for teenage mothers.

[†] Due to revision of the birth certificate, since 2008, "On Medicaid" also includes Family Health Plus, Other government, and Child Health Plus B.

Note: Population data used to calculate rates are 2014 estimates from US Census Bureau. See Technical Notes: Population.

^{*}See Technical Notes: Population, Vital Event Rates.

 $[\]dagger$ The denominators for total rates are females ages 15-44 except for total birth rates which are all population.

[‡]Counts for females age 15 to 19 are the number of events to females age < 20; counts for females age 40 to 49 are the number of events to females age 40 and over. See Technical Notes: Vital Event Rates.

 $^{{}^\}S{}{}$ Includes all events occurring in NYC regardless of residence.

Other/unknown ethnicities are excluded.

Numbers and rates are limited to events occurring in NYC to NYC residents only.

SUMMARY OF VITAL STATISTICS 2014 THE CITY OF NEW YORK Appendix B

Technical Notes and New York City Vital Event Certificates

POPULATION

CITYWIDE POPULATION

The 2014 NYC population estimates used in tables and figures are based on the US Census Bureau 2014 Vintage population estimate as extracted from http://www.census.gov/popest/data/counties/asrh/2014/CC-EST2014-ALLDATA.html. The 2014 US Census population estimate for New York City (NYC) is 8,491,079. (See table on next page for 2014 NYC population estimates by age, race/ethnicity and sex). Population data used to compute rate trends (2005-2014), regardless of NYC geography presented, was estimated by DOHMH, Epidemiology Services, using the methodology found below under Community District Population Estimates.

RACE/ETHNICITY CATEGORIES

Beginning with the 2000 Census, respondents could describe themselves and household members as being of more than one race, selecting at least one of six race categories: white, black, American Indian and Alaska Native, Asian, Native Hawaiian and Other Pacific Islander, and some other race(s). These categories yield 63 possible combinations. Respondents also were asked if they were of Hispanic origin. The resulting responses could be organized into 64 groups. New York City's Department of City Planning collapses these groups into seven categories: (1) Hispanic origin, (2) non-Hispanic white, (3) non-Hispanic black, (4) non-Hispanic Asian or Pacific Islander, (5) non-Hispanic American Indian and Alaska Native, (6) non-Hispanic of some other race, and (7) non-Hispanic of two or more races, which the Department of City Planning refers to as "mutually exclusive race and Hispanic categories. The first four of these categories are reflected in the Vital Statistics Summary variable "ethnic group" with a 5th that combines non-Hispanic American Indian and Alaska Native, non-Hispanic of some other race, non-Hispanic of two or more races and other or multiple race. For more information, see "Race, Ancestry, and Ethnic Group."

COMMUNITY DISTRICT POPULATION ESTIMATES

Community districts were established by City Charter in 1969 for the delivery of city services. Population figures for these districts are compiled by Department of City Planning from census tract and census block data. The sum of the community district populations in each borough may not equal the borough population or the citywide population because community districts may cross borough boundaries.

2014 Community District estimates

The 2014 Community District estimates were calculated based on the Census postcensal estimate for 2014 released in July 2015 (See Historical Technical Notes for previous years' methods).

LIFE EXPECTANCY

For life expectancy computations, single-year age group populations were based on decennial census counts. Life expectancies for 2001-2009 have been updated from the previous Summary using linear interpolation of single-year age group populations based on 2000 and 2010 census counts. Citywide life expectancies by sex and race/ethnicity for 2010 are calculated based on 2010 census population. Population data for life expectancies for 2011-2013 were extrapolated based on single-year age groups of Census population, 2000 and 2010. Life expectancy for Asians and Pacific Islanders is not displayed because the required single year of age population denominators are too small to produce reliable estimates. Also See Technical Notes: Deaths, Life Expectancy.

AGE CATEGORIES

Since 2010, rates of teen events (ages 15-17, 18-19) require population data with 22 age groups as opposed to the standard 18 provided by the census. As a result, 22-age group population estimates are calculated and provided by Bureau of Epidemiology Services based on Census Bureau's estimates.

DEMOGRAPHICS/CHARACTERISTICS OF VITAL EVENTS

AGE AT DEATH

For ages greater than one year, decedent's age is based on age at last birthday. Unknown ages are recoded to mean age at death but are very rare.

RACE, ANCESTRY, AND ETHNIC GROUP

Race and ancestry are two separate items on the certificates. A relative of the decedent usually reports this information to the funeral director for the death certificate. As of 2003 and 2008, the death and birth certificates respectively allow for the selection of multiple races. Responses are coded following rules from the National Center for Health Statistics (NCHS). The ordered selection rules for defining ethnic group first assign Puerto Rican or other Hispanic ethnicities based on ancestry, regardless of race. Then, those of other or unknown ancestries are classified by race as Asian and Pacific Islander, non-Hispanic white, non-Hispanic black, or other/multiple race/unknown.

NCHS defines ancestry as the nationality, lineage, or country where the subject's ancestors were born before their arrival in the United States. If a religious group is reported, NCHS instructions are to ask for the country of origin or nationality. New York City receives enough

certificates reporting Jewish or Hebrew ancestry to warrant inclusion in these tables, notwithstanding the religious meaning of the terms. Persons whose race is black and whose ancestry is American are classified as being of African American ancestry.

Infant Mortality

Infant's ethnic group is determined from mother's ancestry and race reported on the infant's birth certificate. In the absence of corresponding birth certificate for an infant death, the infant's race and ancestry information on the infant's death certificate is used to assign an ethnic group.

When rates are computed by infant characteristics (e.g. sex of infant or hospital/location of death), such characteristics are drawn from the death certificate, except for those characteristics that are either not indicated on the death certificate or only available on the child's birth certificate (e.g. mother's prenatal care, infant's birth weight, and gestational age). In the absence of a birth certificate, demographics are limited to those available on the death certificate. Infants who died in New York City who were born elsewhere are classified as unmatched in Appendix A: Tables IM2 and IM7.

GEOGRAPHICAL UNITS

RESIDENCY STATUS IN DATA PRESENTATION

Tables that stratify by location of residence (e.g., borough) separate data for nonresidents and residence-unknown categories. See Appendix A: Table M1 as an example. Tables that do not stratify by location of residence combine all deaths registered in New York City, regardless of residence.

Vital events that occurred to New York City residents while outside of New York City are not included in this report, with the exception of Life Expectancy (Report: Figures 1–4; Appendix A Tables M24, M25). Life expectancy calculations use national data from the NCHS, including deaths to New York City residents that occurred outside of New York City. For more information, see Life Expectancy.

BIRTHPLACE PRESENTATION

Mortality Data

Decedent's birthplace is reported by country. American Samoa, Northern Mariana Islands, US Virgin Islands and Guam are included in United States.

Mother's Birthplace (used for births and infant mortality data)

Starting in 2007, mother's birthplace is categorized as: "United States, including its territories" (Puerto Rico, the US Virgin Islands, American Samoa, Northern Marianas Islands, and Guam), "Foreign," and "Not Stated." When mother's birthplace is classified by country-specific categories, Puerto Rico is categorized apart from the United States.

BOROUGH OF RESIDENCE

Borough of residence and other geographic classifications are based on the usual residence reported on the certificate.

COMMUNITY DISTRICT (CD)

Community districts were established by City Charter in 1969 for the delivery of city services. There are 59 Community Districts in New York City. Since 1985, assignments to geographic areas smaller than borough, such as community district, are made through the Geosupport Program, which is developed and maintained by the Department of City Planning. Additional information on community district geography can be found at www.nyc.gov/dcp.

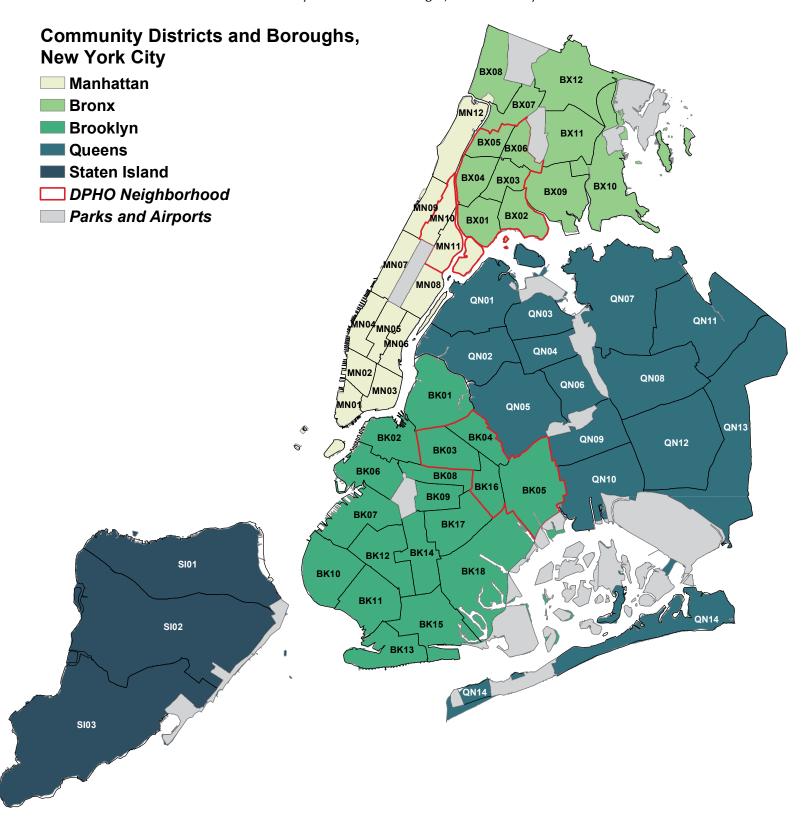

NEIGHBORHOOD POVERTY INDICATOR

Since 2012, neighborhood poverty disparities have been presented in the Summary of Vital Statistics. The neighborhood poverty indicator is the agency-recommended indicator for monitoring socioeconomic health disparities. The summary reports poverty at the census tract level. Each census tract is assigned to a neighborhood poverty category based on the percent of the census tract population living below the federal poverty level. The four neighborhood poverty categories are:

Low:	Medium:	High:	Very High:
<10% of the population	10-19% of the population	20-29% of the population	≥30% of the population
below poverty	below poverty	below poverty	below poverty

The denominator of any rate by neighborhood poverty category contains the combined populations of census tracts falling within a category. The numerator contains the summed number of vital events occurring to residents of the census tracts falling within a category. Additional information on poverty indicator can be found at http://www.hsph.harvard.edu/thegeocodingproject/.

Community Districts and Boroughs, New York City

VITAL EVENT RATES

DEATH RATES

Death Rate, all causes per 1,000 population	Death Rate, specified causes per 100,000 population		
$\frac{\textit{Deaths All Causes}}{\textit{Population}} x1,000$	$\frac{\textit{Deaths due to Specific Cause (specified ICD10 codes)}}{\textit{Population}} x 100,000$		
Death Rate, age and sex specific per 1,000 population	Death Rate, age, sex and race-adjusted per 100,000 population		
$\frac{\textit{Deaths to persons of specificed age group and sex}}{\textit{Population, specified age group and sex}} x1,000$	The number of deaths per 100,000 US standard population. Age, sex and race/ethnicity specific death rates are applied to a standard population age distribution eliminating the effect of differences in population age composition, and allowing comparisons over time and between geographic areas.		
Maternal Mortality Ratio – World Health Organization Definition (A	Appendix M13)		
Deaths due to complications of pregnancy, childbirth and the puerperium occurring within 42 days of delivery *			
Live births			
*Deaths of a woman while pregnancy or within 42 days of termination of pregnancy from any cause related to or aggravated by pregnancy			
or its management (ICD10 codes: O00-O95, O98-O99, A34)			
Perinatal Mortality Ratio			
Fetal Deaths 28 Weeks and Over + Infant Deaths Under 7 days			
Fetal Deaths 28 Weeks and Over + Live Births			

INFANT **MORTALITY RATES**

Infant Mortality Rate	Neonatal Mortality Rate
$\frac{\textit{Deaths to infants} < 1 \textit{ year old}}{\textit{Number of live births}} x1,000$	$\frac{\textit{Deaths to infants} < 28 \textit{ days of life}}{\textit{Number of live births}} x1,000$
Early Neonatal Mortality Rate	Late Neonatal Mortality Rate
$\frac{\textit{Deaths to infants} < 7 \textit{ days of life}}{\textit{Number of live births}} x1,000$	$\frac{\textit{Deaths to infants 7} - 27 \textit{ days of life}}{\textit{Number of live births}} x1,000$

Infant deaths counted in the numerator and live births counted in the denominator are defined by the same calendar year. Some infants counted in the numerator were born in the preceding year and some counted in the denominator may die in the following year.

PREGNANCY OUTCOME RATES

Fertility Rate	Pregnancy Rate	
Live births x1,000	Σ (Births, Spontaneous, Induced Terminations) $x1.000$	
Female population aged 15 – 44 years 1,000	Female population of specific age group	

Birth Rates	
Total birth rate	Age-specific birth rate
Total births $x1,000$	Births among specific age group Towards around this of manific are group x1,000
Total population regardless of age or sex	Female population of specific age group x1,000

Total spontaneous termination rate	Age-specific spontaneous termination rate	
Total spontaneous terminations x1.000	Spontaneous terminations among specific aged females $x1,000$	
Female population ages 15 to 44 years x1,000	Female population of specified age group	

Total induced termination of pregnancy rate	Age-specific induced termination of pregnancy rate
Total induced terminations x1.000	Induced terminations among specific aged females x1,000
Female population ages 15 to 44 years x1,000	Female population of specified age group

*Pregnancy Outcome Counts and Rates

Pregnancy outcome (birth, spontaneous termination, or induced termination) counts and rate numerators use the number of events to women of all ages. For example, the birth rate includes all births in a population, regardless of the mother's age. The denominator for these rates differs by event, consistent with national standards. The birth rate denominator is the number of males and females of all ages. The denominator for spontaneous or induced termination rates is the number of females ages 15-44 years. The counts and numerator used in age-specific pregnancy outcome rates for the youngest age category (teens 15-19), is the number of events to women in the population under age 20, relative to the denominator of women in the population ages 15 to 19 (Table 1. Pregnancy Outcomes Report). Similarly, the numerator of the oldest age category (40-49) includes events to all women in the population over the age of 40, relative to the denominator of women in the population ages 40-49. NYC first reported these age-specific rates in the 2011 Pregnancy Outcomes Report and applied a denominator of women in the population ages 40-49 as opposed to 40-44 due to the increased number of events occurring among women ages 45-49. The numerator used for the youngest age category for teen pregnancy outcomes (15-17 in Table PO10 Appendix A) is the number of events to women in the population under age 17, relative to the denominator or women in the population ages 15-17.

DEATHS

DEATH CERTIFICATE (see copies in back of Appendix B)

There are two forms, one for natural causes and one for medical examiner cases. The current revisions of the death certificate, implemented in 2003, is based on the recommended 2003 US Standard Certificate of Death http://www.cdc.gov/nchs/data/dvs/DEATH11-03final-ACC.pdf

- Natural cause practitioner certificates Most deaths are due to natural causes.
- Medical examiner certificate of death When the cause of death is an accident, homicide, suicide, or is unattended or due to certain
 other circumstances (approximately 15% of deaths), the New York City Office of the Chief Medical Examiner (OCME) completes the
 medical examiner certificate of death and supplementary report.

For natural cause certificates, the Electronic Vital Events Registration System's (EVERS) Electronic Death Registration System (EDRS) became available for voluntary use by hospitals in 2005. In January 2010, EDRS reporting became mandatory for medical examiner certificates. In April 2010, EDRS reporting became mandatory for hospitals reporting > 25 deaths/year.

The two forms are similar. Both collect important information pertaining to the fact of death (person, place, and time of death). Both collect "personal particulars" which include items such as decedent's Social Security number, address, birth place, education, marital status, informant's information, and place of disposition. The personal particulars are typically provided by a family member of the decedent through the funeral home. Both collect cause of death, which is completed by the physician or a medical examiner. On the natural cause certificate, the cause of death is entered on the confidential medical report, the OCME certificate and on the death certificate itself. In addition to cause of death, the OCME certificate collects information on the circumstances of external causes of death. The OCME certificate indicates manner of death: natural, accident, homicide, suicide, or undetermined. The confidential medical report information is for the compilation of public health statistics and scientific purposes only.

DEATH REPORTING

The death events reported are based on certificates filed with the New York City Department of Health and Mental Hygiene (DOHMH) for vital events occurring in or in-route to New York City, regardless of individual residency status, in a particular year. Any events registered after file closure (typically occurring within 5 months of year-end) are excluded from this report. Such late registrations are rare.

Death certificates must be filed within 72 hours of death or finding the body. During 2013, 93% of death certificates were filed electronically using the Electronic Vital Events Registration System (EVERS). Additional information on EVERS is available at: www.nyc.gov/evers. Since the June 1993 revision of the death certificate, decedent race and ancestry information is reported by funeral directors.

DEATH RATES

See Vital Event Rates

TYPE OF PLACE OF DEATH

"Hospital" includes residential units and other special facilities within the hospital. "Nursing home" includes only sites licensed as Extended Care Facilities by New York State. "Home" refers to the decedent's residence, and includes private houses and apartments, group quarters for special populations, homes for adults, and other long-term residential sites.

CAUSE OF DEATH REPORTING

The cause of death on the death certificate is completed by a physician, medical examiner or, as of January 16, 2012, by a nurse practitioner. The clinician is required to provide the complete sequence of events and/or medical conditions leading to the death. These include the following:

immediate cause - the specific condition that directly preceded the death.

intermediate cause(s) - the significant condition(s) that preceded and gave rise to the immediate cause of death.

underlying cause - the disease or condition that set off the chain of events leading to death.

For further information on how cause of death should be documented, visit www.nyc.gov/evers.

CAUSE OF DEATH-QUALITY IMPROVEMENT INITIATIVE

The Office of Vital Statistics initiated a program to improve quality of cause of death data in 2009, affecting mortality trends. See the NYC Summary of Vital Statistics 2010, Special Section, for more information.

CAUSE OF DEATH CODING

Since 2008, the reported causes of death are coded using the NCHS automated coding software package SuperMICAR, which classifies conditions according to the International Classification of Diseases (ICD) published by the World Health Organization. A single underlying cause is assigned based on the reported chain of events leading to death. Standardized codes allow for national and international comparisons. Causes of death that cannot be coded by SuperMICAR are investigated and coded by nosologists.

Prior to 2007, a large proportion of accidental drug related deaths (X40-X42, X44) were miscoded as chronic drug use (F11-F16, F18-F19). For a full explanation, see the 2007 Annual Summary of Vital Statistics-Special Report: NYC Changes from Manual to Automated Cause of Death Coding, pages 73-75.

Table M1 is based on the NCHS List of 113 Selected Causes of Death. Some causes have been added to or dropped from these tables based on their number and importance in New York City.

Death trends across ICD code revision years may change as an artifact of the change in ICD codes and coding rules. These should be interpreted with caution.

COMPARABILITY RATIO

National comparability ratios, last updated in 2003, reflect discontinuities in trends for the cause of death when a new version of the ICD is implemented. They are presented in the Appendix A Table M1 to explain changes in following the implementation of the ICD-10 coding system in January 1999.

Comparability ratios measure the net effect of ICD-10 on each cause of death. NCHS determined the causes of death under ICD-10 and ICD-9 for more than 2.3 million 1996 US mortality records and calculated the ratio:

 $\frac{\textit{Deaths from cause } \cancel{\textit{ICD}} - 10}{\textit{Deaths from cause } \cancel{\textit{ICD}} - 9}$

More information on the ICD-10/ICD-9 comparability ratio can be found at http://www.cdc.gov/nchs/nvss/mortality/comparability_icd.htm

SMOKING- AND ALCOHOL-ATTRIBUTABLE MORTALITY

Smoking- and alcohol-attributable deaths represent the number of New York City deaths attributed to exposure to smoking and alcohol respectively. These statistics were computed using similar methodologies.

SMOKING-ATTRIBUTABLE MORTALITY (SAM)

SAM was calculated using CDC's Adult SAMMEC (Smoking-Attributable Mortality, Morbidity, and Economic Costs) program using an attributable fraction formula. New York City sex-specific smoking prevalence was estimated from the New York City DOHMH Community Health Survey (CHS) and computed by the Bureau of Epidemiology. The relative risks (RR) of death for current and former smokers \geq 35 years of age for 19 smoking-related diseases was estimated from American Cancer Society's Cancer Prevention Study. The smoking-attributable fraction (SAF) for each smoking-related disease and sex is calculated using the following formula:

$$SAF = [(p_0 + p_1(RR_1) + p_2(RR_2)) - 1] / [p_0 + p_1(RR_1) + p_2(RR_2)],$$

where p_0 is the percentage of adult never-smokers in New York City; p_1 is the percentage of adult current smokers in New York City; p_2 is the percentage of adult former-smokers in New York City; RR_1 is the relative risk of death for adult current smokers relative to adult never-smokers; and RR_2 is the relative risk of death for adult former-smokers relative to adult never-smokers.

To estimate the SAM, the age- and sex-specific SAFs are multiplied by the number of deaths for each smoking-related disease. Specifically, the number of deaths for each sex and 5-year age category was multiplied by the SAF:

SAM = Number of deaths x SAF

Summing across age categories provides the sex-specific estimate of SAM for each disease. Total SAM is the sum of the sex-specific SAM estimates. A detailed description of the methodology is available at http://apps .nccd.cdc.gov/sammec.

Beginning 2014, substantial changes in SAM calculation were made based on 2014 Surgeon General Report using more age strata and using updated relative risks. Four new conditions were also added – colorectal cancer (C18-C20), liver cancer (C22), diabetes (E10-E14) and tuberculosis (A16-A19). In addition, C66 (cancer of ureter) to kidney cancer was added – this was inadvertently omitted when CDC analyses began being based on ICD-10 several years ago. See chapter 12 of 2014 Surgeon General Report at following link:

http://www.surgeongeneral.gov/library/reports/50-years-of-progress/sgr50-chap-12.pdf

ALCOHOL-ATTRIBUTABLE MORTALITY (Appendix A Table M14)

Alcohol-attributable deaths in Appendix A Table M14 represent the number of New York City deaths attributed to alcohol. Alcohol-attributable mortality (AAM) was calculated using the Alcohol-Related Disease Impact (ARDI) program using an alcohol-attributable fraction (AAF). For conditions that, by definition, are caused by alcohol use, the AAF was set equal to 1.0. For other conditions, especially injuries, ARDI directly estimated the AAF based on direct observations about the relationship between alcohol and a given health outcome. For most chronic conditions, the AAF was indirectly estimated using New York City alcohol prevalence data from the CHS combined with pooled risk estimates from large meta-analyses using the following formula:

AAF = [p(RR - 1)] / [1 + (p(RR - 1)]

where p is the percentage of New York City men and women age 20 years and older who consume alcohol at a specified level of average daily alcohol consumption within a given year, and RR is the likelihood of death from a particular condition at a specified level of average daily alcohol consumption. To estimate AAM, AAFs were multiplied by the number of New York City deaths for specific causes defined by the CDC's National Center for Chronic Disease Prevention and Health Promotion. Detailed description of the methodology is available at http://nccd.cdc.gov/DPH_ARDI/default/default.aspx.

Beginning in 2014, the cut points of average drinks per day to define alcohol consumption as "Low", "Medium", and "High" were revised slightly based on Ridolfo and Stevenson's study in 2001 and Bagnardi et al. study in 2001. See Alcohol Related Disease Impact (ARDI) Custom Data User Manual at the following link for details.

http://nccd.cdc.gov/DPH ARDI/Info/ARDI Custom Data User Manual 2014.pdf

COMPLICATIONS OF MEDICAL AND SURGICAL CARE (Appendix A Table M22)

With the 10th revision of the ICD coding system, complications of medical and surgical care are no longer classified as accidents and are now shown separately from accidents.

DRUG-RELATED DEATHS

Two definitions of drug-related deaths are presented in this report. The first, "Mental and behavioral disorders due to the use of or poisoning by psychoactive substance excluding alcohol and tobacco" is based on NCHS standard cause of death definitions using underlying causes as a basis for categorizing deaths and presented among the leading causes of death. The second definition, "Accidental/unintentional Drugrelated Overdose Deaths" is presented in the Executive Summaries of Summary of Vital Statistics, starting in 2009 and in 2012 Mortality Report.

Mental and behavioral disorders due to use of or accidental poisoning by psychoactive substance excluding alcohol and tobacco (2013 Mortality Tables 1-5, Figures 13-16, Appendix A Tables M1, M7-M12 and M26): also called "Use of or poisoning by psychoactive substance" or "Drug Use/Poisoning" combines underlying chronic drug-use ICD codes (F11-F16, F18-F19) and accidental (unintentional) drug-poisoning ICD-10 codes (X40-X42, X44) to estimate overall drug-related deaths. This definition is found in Mortality Tables 1-5 Figures 9-12, Appendix A Tables M1, M7-M12 and M26. "Accidental poisoning by psychoactive substances, excluding alcohol and tobacco," the "accidental" subset of underlying codes (X40-X42, X44) are reported in Appendix A Tables M1 and M18. "Mental and behavioral disorders due to the use of psychoactive substance excluding alcohol and tobacco," the "chronic" subset of underlying codes (F11-F16, F18-F19) is found in Appendix A Table M1. However, please use "accidental" (unintentional) and "chronic" subset trend data with caution as changes from manual to automated ICD coding resulted in a redistribution of chronic causes to acute in 2007 and going forward. For more information on coding error, please see Cause of Death Coding.

EXTERNAL CAUSES OF DEATH (2014 Mortality Figures 16-19; Appendix A Tables M18-M23)

External causes of death include accidents, suicide, assault, legal intervention, events of undetermined intent, operations of war and their sequelae, and complications of medical and surgical care. The Office of Chief Medical Examiner determines the cause and manner of death in such cases. For the purpose of statistical analysis, whether a cause is defined as external depends on the ICD code assigned as the underlying cause of death and may not agree with the manner of death reported.

Sometimes a cause of death has not been established when the statistical file is closed. Such deaths are classified as "pending final determination" and may later be classified.

Deaths classified as "events of undetermined intent" are considered due to external causes for the purpose of statistical analysis.

Information on errors in coding external causes of death prior to 2007 are described above: Cause of Death Coding.

FATAL OCCUPATIONAL INJURIES (2014 Appendix A Table M17)

Appendix A, Table M17 is based on US. Department of Labor's Bureau of Labor Statistics. These deaths, unlike NYC Vital statistics, are based on the location of the injury, regardless of the residence of the decedents or location of the death. Note that these deaths may or may not occur at the time of injury, they can occur subsequently. The industry in which the decedent worked and was injured is coded based on the North American Industry Classification System (NAICS). Comparisons by industry before and after 2003 are discouraged because of the substantial coding differences.

For all NYC occurring deaths due to external causes, the Bureau of Vital Statistics (BVS) reviews autopsy and other reports to determine if the injury occurred at work. Definitions and terminology are based on US Department of Labor's Bureau of Labor Statistics, which may differ from other definitions used in vital statistics.

HEART DISEASE DEATHS: See 2010 Mortality – Special Section: Cause of Death Quality Improvement Initiative for information on the initiative's impact on cause of death reporting, particularly heart disease reporting.

HIV AND AIDS MORTALITY (2014 Mortality Tables 2-3; Appendix A M16)

Beginning 1999, with the 10th revision of the ICD code, deaths due to HIV disease (ICD-10 codes B20-B24) are characterized by the resulting disease or condition, replacing AIDS and other HIV infections in ICD 9th revision.

HOMICIDE (2014 Mortality Figure 19; Appendix A Table M20)

A homicide is defined as the action of one person causing the death of another regardless of intent (e.g., whether self-defense or justifiable legal intervention). Annual counts of homicides reported by the New York City Police Department (NYPD) differ from those of the Bureau of Vital Statistics (BVS) for a number of reasons outlined below. Nonetheless, reported trends are similar. All homicides are medical examiner (ME) cases.

NYPD reports homicides as counts of Murder and Non-Negligent Manslaughter using rules and procedures from the Federal Bureau of Investigation's Uniform Crime Reporting System (UCR). The count includes deaths determined to be both criminal and satisfying the UCR guidelines. NYPD judges some homicides as justifiable and reports these separately to the FBI. BVS reports a death as a homicide based on the ICD-10 system. ICD-10 defines legal intervention as "including injuries inflicted by police or other law-enforcing agents ... in the course of arresting or attempting to arrest ... and other legal action." Since 2003, deaths from legal intervention have been reported separately in Appendix A, Tables M1 and M20 and are excluded from the homicide counts in Tables M11 and M12.

NYPD Murder and Non-Negligent Manslaughter statistics count all murder crimes known to have been committed in New York City regardless of where the death occurred. Note, the crime may or may not have occurred at the time of death; death can occur subsequently and therefore potentially in a different jurisdiction than the murder crime. BVS reports all homicide deaths known to have occurred in New York City regardless of where the crime was committed.

In its annual count, the NYPD includes homicides known to have occurred within that calendar year by the second week of January of the following year. Any death determined to be a criminal murder outside of that period will be counted in the year that the determination is made. BVS reports homicide by the date of the death and the annual count includes any cases reported until the file closes for the year (approximately 5 months after the end of the year).

Sometimes death results from a crime many years after the crime was committed. Other times, a death may be determined a crime years after the death. In either situation, the ME may determine the death a homicide. If classified as a criminal homicide, NYPD will count the death in the year that the determination is made. However BVS will report the homicide by the date of death. In cases where a death is reclassified a homicide after the file closes, the death will be recorded as a homicide on the death certificate, but this change will not be reflected in any counts of homicides for the year of death or any other years.

LIFE EXPECTANCY (2014 Mortality Figures 1-4; Appendix A Tables M24, M25)

Life expectancy tables summarize the effect of mortality rates prevailing at a specific time on persons being born or living at that time. Tables may be computed for population subgroups, most often males, females, and race groups. The calculation requires counts and mortality figures for the desired subgroups. Life expectancy is estimated by ethnic group instead of race to ascertain differences among Hispanics, non-Hispanic whites and non-Hispanic blacks. Life expectancy tables by race/ethnicity for New York City are generally presented for census years when accurate population data are available. The mortality experience for the census year, the year before, and the year after is used to smooth statistical variation (Table M24). Life expectancies in Figures 1-2 are calculated by complete life tables (for a single year of age). Life expectancies in Figures 3-4 are calculated by abridged life tables (age groups). The number of Asian and Pacific Islander deaths is too small to generate reliable life expectancies and therefore are not presented either in Mortality Figure 2 or Appendix A. Table M24.

The World Trade Center disaster deaths are not included in calculation of life expectancy.

Appendix A, Table M25 presents annual life expectancy by age and sex providing trend information. Annual life expectancy is estimated using single-year of age death data. Table M25 does not include life expectancy for 2014 because national data on deaths to New York City residents occurring outside of New York City are required and not yet available.

Historical Hispanic ancestry data and life expectancy estimates should be interpreted with caution. In addition to changes in collection of Hispanic ancestry information, Hispanic immigration patterns may result in overestimated life expectancy if Hispanics move out of the US before death at a greater rate than other ethnic groups. The Hispanic population tends to be younger than other ethnic groups, which may lead to underestimates of Hispanic death rates and overestimates of Hispanic life expectancy.

MATERNAL DEATH AND MATERNAL MORTALITY (Appendix A M13)

Deaths due to "Maternal Causes" meet the World Health Organization's definition of maternal mortality: "death of a woman while pregnant or within 42 days of termination of pregnancy from any cause related to or aggravated by the pregnancy or its management" With the 10th revision of the ICD coding system, this category includes codes O00-O95, O98-O99 and A34 (obstetrical tetanus). "Pregnancy, childbirth and the puerperium" (O00-O99) includes deaths to women that occur outside of the time limitation defined by the World Health Organization (WHO).

MOTOR VEHICLE DEATHS (2014 Mortality: Figure 17, Appendix A Table M18)

The Bureau of Vital Statistics (BVS) methodology for counting Motor Vehicle Deaths differs from that of the Department of Transportation (DOT) and NYPD in two ways. First, DOT and NYPD do not include deaths resulting from illness while operating a motor vehicle in their traffic fatality count, while BVS does, as this is the standardized NCHS approach. Second, in cases where serious injury suffered during a motor vehicle accident results in subsequent death (e.g., one month later) the fatality will be counted by DOT and NYPD for the month in which the accident occurred. However, BVS reports deaths by date of death.

PREMATURE DEATHS (2014 Mortality: Figures 9-15, Table 4; Appendix A Table M9-10)

Premature deaths are deaths that occur before a person reaches an expected age, for instance, age 65 or age 75. Premature death rates in the NYC Annual Summary of Vital Statistics use 65 as the expected age. The number of deaths or deaths by select cause(es) relative to the \leq 65 population in the same geographic area result in the rate of premature deaths. In addition, see Years of Potential Life Lost (YPPL).

WORLD TRADE CENTER (WTC) DEATHS

Since 2008, any deaths during the reporting year identified as late-effect WTC deaths are counted in the year of the confirmed death report and in Appendix A, Table M1 under Assault (homicide): ICD-10 Code U02. The total number of WTC deaths is 2,752. The number does not include 3 deaths that occurred outside of NYC. Unless otherwise specified, WTC deaths occurring in 2001 are generally not included in Summary tables and figures due to the effect this large number would have on year-to-year trends.

YEARS OF POTENTIAL LIFE LOST (2014 Mortality Appendix A Table M26)

Years of potential life lost (YPLL) measures years lost due to premature death. In contrast to mortality measures, YPLL emphasizes the effect of premature mortality on a population. YPLL is often calculated using a cutoff age, 65 or 75, as follows:

YPLL = \sum [(cutoff age - i)] x di

where i is the midpoint of the grouped year of age at death and disthenumber of deaths at grouped year of age i. YPLL can be calculated for specified causes of death. In Table M26, age 75 is used as the cut off age and single year of age is used in calculation. Therefore i is single year of age younger than 75. See also Premature Deaths.

PREGNANCY OUTCOMES

BIRTHS

BIRTH CERTIFICATE (see copy in back of Appendix B)

The birth certificate comprises two parts: the certificate of birth and the confidential medical report of birth. The current revision of the birth certificate, implemented in 2008, is based on the recommended 2003 US Standard Certificate of Live Birth http://www.cdc.gov/nchs/data/dvs/birth11-03final-ACC.pdf. The 2008 revision coincided with the January 2008 electronic filing requirement.

The certificate of birth is the legal record. Each certificate is authenticated by the medical provider (physician or midwife) or his or her representative and filed with the New York City Department of Health and Mental Hygiene.

The confidential medical report, used for the compilation of public health statistics and scientific purposes, includes parents' demographic information, mother's prenatal history and care, information on financial coverage, maternal morbidity, labor and delivery, and condition and treatment of the infant during, and immediately after, birth. These data are collected from the mother, the mother's and infant's medical records, and medical providers.

BIRTH REPORTING

The birth events reported are based on certificates filed with the New York City Department of Health and Mental Hygiene (DOHMH) for vital events occurring in or in-route to New York City, regardless of individual residency status, in a particular year. Births must be filed within five business days of the event. Birth data are generally collected using two worksheets: mother/parent and facility worksheets. Guides for the completion of the birth certificate and data entry can be found at http://www.nyc.gov/evers. Effective January 2008, BVS requires all hospitals registering more than 100 births per year to use the Electronic Vital Events Registration System (EVERS). In 2013, more than 99% of all births were registered electronically through the Electronic Vital Events Registration System (EVERS). Any events registered after file closure (typically occurring within 5 months of year-end) are excluded from this report. Such late registrations are rare.

BIRTH RATES

See Vital Event Rates

DATA PRESENTATION

Starting with the 2007 summary, items with unknown/not stated values are excluded from the denominator when calculating percentages. This affects Appendix A Tables PO6, PO7, PO11, PO12 and Map PO Figure 11.

BREAST FEEDING

Breast feeding has been reported on the birth certificate since 2008. It includes infant feeding practices through the first 5 days of life. New York City births must be filed with the Department within five business days of the event.

PLACE OF BIRTH

Since 1996, home births in Appendix A Tables PO4 and PO5 include all events for which "Home" was selected as the "Type of Place" regardless of whether the certificate was filed through a hospital. Home births in Table PO1 include events for which "home" was selected as "Type of Place" and the certificate was not filed by an institution; typically, these events were filed by the person who attended to the birth at home.

Appendix A: Table PO1 describes the live births according to the borough in which the birth occurred. Prior to 2010, Table PO1 reported births according to the borough in which the reporting office was located. This primarily affects the frequency of "places other than a hospital or home" and "home births," which occur citywide but are frequently reported by the Bureau of Vital Statistics in Manhattan.

MOTHER'S MARITAL STATUS

The New York City DOHMH is prohibited by local law from recording mother's marital status on the record or report of birth. As a result, marital status is estimated and should be interpreted with caution. Since 1997, marital status is computed using the following algorithm: certificates without the father's name and those with the father's name that are accompanied by an Acknowledgment of Paternity are categorized as non-married; all others are categorized as married. Married parents have a right to have both their names on their child's birth certificate. This applies equally to married opposite-sex parents and same-sex parents. Some hospitals require proof of marriage. If the mother is not married, a father's name may be added through an Acknowledgment of Paternity or court order.

TEEN BIRTHS

See Age-specific birth rate under VITAL EVENT RATES, above.

GESTATIONAL AGE

Gestational age, or clinical estimate of gestation, is defined as the best obstetric estimate of the infant's gestation in completed weeks based on the birth attendant's final estimate of gestation. Characteristics of live births and/or infant deaths in the Appendix A, Tables PO4-PO7, PO11, and PO12, respectively, include either gestational age categories or a dichotomous indicator of preterm (<37 weeks gestation) birth.

Beginning 2007, the range for valid gestational age was changed from 20-44 weeks to 17-47 weeks.

SPONTANEOUS AND INDUCED TERMINATIONS OF PREGNANCY REPORTING

SPONTANEOUS TERMINATION OF PREGNANCY CERTIFICATE (see copy in back of Appendix B)

Like the birth certificate, the spontaneous termination of pregnancy certificate has two parts, the certificate and the confidential medical report. The certificate is available to the mother. The confidential medical report information is collected for the compilation of public health statistics and scientific purpose.

INDUCED TERMINATION OF PREGNANCY CERTIFICATE (see copy in back of Appendix B)

Induced termination of pregnancy certificates are not issued. Data are collected for the compilation of public health statistics and scientific purpose.

The spontaneous and induced termination of pregnancy events reported are based on certificates filed with the New York City Department of Health and Mental Hygiene (DOHMH) for vital events occurring in or in-route to New York City, regardless of individual residency status, in a particular year. By law, all terminations of pregnancy are to be reported within 5 business days of the event, unless a permit to dispose of the conceptus is required (\geq 24 week gestation) or requested (any gestational age). In such a case, the event must be reported within 24 hours. However, the number of induced and spontaneous terminations filed depends to some extent on the outreach conducted by BVS. Effective January 1, 2011, all facilities that report births electronically to the Department pursuant to Public Health Law 203, are required to report spontaneous terminations electronically via the Electronic Vital Events Registration System (EVERS); the Chief Medical Examiner and all facilities reporting 100 or more induced terminations of pregnancy per year also are required to file electronically via EVERS; all facilities that have commenced reporting electronically, regardless of number of events reported are required to do so electronically. In 2011, 99.8% of induced terminations of pregnancy and 99.7% of spontaneous terminations of pregnancy were filed electronically. Otherwise, paper forms, authorized by the department may be used for reporting such events.

SPONTANEOUS AND INDUCED TERMINATION OF PREGNANCY RATES

See Vital Event Rates

HISTORICAL TECHNICAL NOTES

POPULATION		
Technical Note Section	Description	Summary Year Affected
	Tables and figures with 2013 data use intercensal population estimates determined by Census Bureau in 2013 vintage file. Tables and figures with 2001-2012 data use intercensal population estimates determined by Census Bureau released as of September 2012.	2011, 2012
	Tables and figures with single-year data use 2010 Census population count. Tables and figures with 2001-2010 data use intercensal population estimates determined by NYC Department of City Planning as of July 1, 2010.	2010
	The 2007-2009 Annual Summaries used the respective year's pre-challenged US Census Bureau's population estimates. As a result, city and borough-wide estimates overall and by age, ethnicity and sex may vary from those presented in prior summaries.	2007-2009
	The 2005-2006 Annual Summaries used post 2000 census estimates for citywide, county (borough), 5-year age group, ethnic group and sex population counts. The Summary year population counts used pre-challenged census estimates; prior year population counts presented in the Summaries used post-challenged census estimates in addition to Census 2000 data.	2005-2006
	Population counts used US Census citywide decennial population counts.	2000–2004
	Intercensal counts were estimated using an exponential formula, which assumes that the growth rate was the same throughout the decade: $\frac{pop(t1)}{pop(t0)} = ert$	Intercensal years between 1990 and 2000
	(where r is a constant growth rate and t is the time interval).	
	Intercensal counts were estimated using a linear interpolation.	Intercensal years through 1989
	The population counts for years 1960, 1970, 1980, 1990 and 2000 were US Census counts.	1960, 1970, 1980, 1990, 2000
Community District	Community District population estimates for 2013 were based on Census intercensal estimates by county, age, race, and sex, 2013 vintage, and interpolated by Bureau of Epi Services. See following description of 2012 data for details.	2013

	TECHNICAL NOTES, 2014
Community District	Community District population estimates for the year 2010-2012 are based on population estimates from 2010 to 2012. Census intercensal estimates by county, age, race, and sex. The 2010 number is adjusted to account for undercount in Brooklyn and Queens as documented by the Department of City Planning. To calculate individual year's Community District estimates beginning with July 1st, 2000, an interpolation by Community District, age, race, and sex was adjusted to the county, age, race, and sex numbers using an iterative proportional fitting procedure. Each year through 2009 was constructed from an interpolation based on the previous year, the modified Census 2010, and the intercensal numbers for that year. The July 1st, 2010 numbers were then extrapolated using July 1st, 2009 and Census 2010 and then adjusted to the July 1st intercensal numbers. These estimates differ from the 2001-2011 estimates used in the 2010 and 2011 Summary because the 2010 and 2011 Summary estimates were adjusted to official intercensal estimates consistent with Census 2010 released in October 2012.
	Community District population estimates for the years 2000-2010 use population estimates from Census 2000 and Census 2010 and the official Census intercensal estimates by county, age, race, and sex. To calculate individual year's Community District estimates beginning with July 1 st , 2000, an interpolation by Community District, age, race, and sex was adjusted to the county, age, race, and sex numbers using an iterative proportional fitting procedure. Each year through 2009 was constructed from an interpolation based on the previous year and Census 2010. The July 1 st , 2010 numbers were then extrapolated using July 1 st , 2009 and Census 2010 and then adjusted to the July 1 st intercensal numbers. These estimates differ from the 2000-2010 estimates used in the 2010 Summary because they are adjusted to official intercensal estimates consistent with Census 2010 released in October 2012.
	Community district population estimates by sex and 18 age groups were derived by the New York City Department of City Planning. For community district data by race/ethnicity and 22 age groups for the same period, DOHMH Bureau of Epi Services constructed estimates from the Department of City Planning data and available Census 2000 and 2010 data, ensuring consistency with marginal totals from the Census Intercensal Estimates program. Postcensal estimates as well as the official 2010 modified race summary files were used. Because the 2010 modified race summary file was not available from the Census for single-year age by modified race groups, DOHMH used Census summary file 1 and adjusted the dataset to match the Census modified race summary file. To create the modified race groups, the "some other race" group was removed and race is imputed. While the modified race summary file created by the Census used information from other members of the same household, the DOHMH used race information from the corresponding Census tract. The race distribution was then modified to match the 2010 modified race summary file.

	Community District population estimates for intercensal years use United States Census Bureau Population Estimate Program and housing unit data from the New York City Department of City Planning. The "housing unit method" of estimation allocates the population to Community Districts. The method multiplies the estimated number of households in a given area by an estimate of the population per household. In the intercensal context, housing unit growth, measured by housing permit data, determines the locations of growth. Because these estimates are calibrated to equal United States Census-borough-specific population totals, the borough population per household is fixed. New population estimate are derived using the iterative proportional fitting procedure (IPFP) implemented in SAS® Version 9.2. The validity of these estimates depends on vacancy rates, housing unit loss rates, percentage of permits actually constructed, and time to complete construction, which are assumed consistent at the borough level and thus have no effect on the allocation of growth. The method is sensitive to the quality of the housing permit data, which does not identify residential conversions to multiple units. Demographic characteristics are allocated assuming those at the location of growth. Therefore, this approach does not capture intercensal demographic changes at the neighborhood level including change due to migration.	2008-2009	
	Year 2000 census counts were used for defining smaller geographic units such as Community Districts or single-year age groups.	2005-2006	
Health Center District	Population estimates for Health Center District (HCD) were not computed in time for the release of 2008 report and have not been presented since 2007. As a result, Health Center District tables were either replaced (Table 7) or did not present rates (Table 34).	Through 2007	
	Health Center district data were presented in Summary Reports. Populations for geographic area smaller than borough were based on decennial census data.	Through 2007	
Race/Ethnic Group	Census data were used to define race and ethnic distribution; in 2002, the Census Bureau issued the modified Race File resulting in a 65% reduction in Other and Multiple Race, a 6% increase in Asian and Pacific Islander, and 3% increases for non-Hispanic white and non-Hispanic black. There was no change for Hispanic population.	2000-2001	
DEMOGRAPHIC CHARACTERISTICS OF VITAL EVENTS			
Race, Ancestry and Ethnic Group	The death certificate allowed the selection of one race category	Through 2002	
	The birth certificate allowed the selection of one race category.	Through 2007	
	The meaning of ancestry was clarified with hospitals, resulting in a notable increase in Hebrew and Jewish ancestry and a decrease in American ancestry.	1999	

	Mother's birthplace was reported in four categories: United States other than Puerto Rico, Puerto Rico, Foreign and Not Stated. US Virgin Islands and Guam are included in the "Foreign" category.	1991-2006
Birthplace	Decedent's birthplace was first reported by country in 2000. US Virgin Islands and Guam were included in the "Other" category.	2000 - 2006
	GEOGRAPHICAL UNITS	<u> </u>
Community District	Community districts were referred to by number through 2002 and by name after.	Prior to 2003
Place of Birth	Through 1995, all reports of home births included only events filed outside the hospital.	Through 1995
	DEATHS	
Death Reporting	Medical certifier provided race and ancestry information.	Through 1992
Race/Ethnicity	The death certificate was revised in June 1993 to require funeral directors to provide ancestry information, presumably from decedents' family members.	1993 - present
	Medical certifier provided ancestry information.	Through 1992
Cause of Death Coding	ICD-coding was conducted manually by an NCHS certified nosologist.	Through 2006
Alcohol-related Deaths: ICD Coding	Following increasing deaths due to binge drinking, the ICD codes for alcohol-related deaths were reevaluated by the World Health Organization's Mortality Reference Group and coding was implemented in 2008. Core changes included recoding acute alcoholism, previously coded as F10.2, to X45 (alcohol poisoning) and retiring F100 and going forward coding such cases as X45. This resulted in an increase in alcohol liver disease and alcohol poisoning and a decrease in alcohol dependence syndrome. A subsequent decrease in alcohol liver disease between 2008 and 2009 is, in part, a result of further corrections to coding applied in 2009. Similar changes are seen in US data.	2008 - present
HIV and AIDS	In 1987, NCHS introduced code 042 for AIDS and 043-044 for other HIV disease deaths. Additional information on historical HIV coding can be found in the 1997 and 1998 Annual Summaries.	1987 to 1999
	AIDS was recognized as a cause of death and coded as ICD-9 code 279.1.	1983 to 1986
External Causes	External Causes were not shown separately.	Through 1999
Drug-related Deaths: ICD Coding	Through 2006, a large proportion of accidental drug related deaths (X40-X42, X44) were miscoded as chronic drug use (F11-F16, F18-F19). For a full explanation, please see the 2007 Annual Summary of Vital Statistics-Special Report: NYC Changes from Manual to Automated Cause of death Coding, pg 73-75. NCHS coded data is often substituted when presenting external causes of death trends that span 2006 to 2007.	Through 2006
Maternal Deaths and Maternal Mortality	Currently labeled "Maternal deaths" were "Complications of pregnancy, childbirth and the puerperium" through 1998.	Through 1998

Accidents (Unintentional)	The site of accidents (home and public place) has been dropped due to unreliable reporting.	Through 1998
	Complications of medical care and surgical care were classified as accidents per ICD-9.	Through 1999
Smoking-Attributable Mortality (SAM)	SAM was calculated using CDC's Adult SAMMEC (Smoking-Attributable Mortality, Morbidity, and Economic Costs) program using an attributable fraction formula. New York City sex-specific smoking prevalence was estimated from the New York City DOHMH Community Health Survey (CHS) and computed by the Bureau of Epidemiology. The relative risks (RR) of death for current and former smokers ≥35 years of age for 19 smoking-related diseases were estimated from the American Cancer Society's Cancer Prevention Study. The smoking-attributable fraction (SAF) for each smoking-related disease and sex is calculated using the following formula:	
	$SAF = [(p_0 + p_1(RR_1) + p_2(RR_2)) - 1] / [p_0 + p_1(RR_1) + p_2(RR_2)],$	
	Where po is the percentage of adult never-smokers in New York City; p1 is the percentage of adult current smokers in New York City; p2 is the percentage of adult former smokers in New York City; RR1 is the relative risk of death for adult current smokers relative to adult never-smokers; and the RR2 is the relative risk of death for adult former-smokers relative to adult never-smokers.	
	To estimate the SAM, the age- and sex-specific SAFs are multiplied by the number of deaths for each smoking-related disease. Specifically, the number of deaths for each sex and 5-year age category was multiplied by the SAF:	
	SAM = Number of deaths x SAF	
	Summing across age categories provides the sex-specific estimate of SAM for each disease. Total SAM is the sum of the sex-specific SAM estimates. A detailed description of the methodology is available at http://apps .nccd.cdc.gov/sammec.	
World Trade Center Deaths	See Technical Notes, 2009 regarding late effect WTC-deaths.	2008-present
	In 2007, a 2002 death was reclassified as a WTC death.	2007, 2008
	In 2008, a 2001 death was reclassified as a 2001 WTC death.	
	In 2008, a missing person was classified as a 2001 WTC death per New York State Supreme Court.	
	In 2002, the number of WTC deaths included in 2001 deaths was updated from 2,740 to 2,749. This new number included six additional death certificates filed through October 31, 2003 and three deaths that occurred outside of New York City (See 2002 Special Section for details).	2002
Fatal Occupational Injuries	The industry in which the decedent worked and was injured was coded based on the Standard Industrial Classification (SIC).	Through 2002
World Trade Center Deaths and Life Expectancy	Impact of World Trade Center deaths on life expectancy.	2002 (Special Section)

BIRTHS									
Age-specific Birth Rates	Until, 2011, youngest and oldest age-specific birth rates included events within the specific age range (e.g. age-specific birth rates to females 15 to 19 include births to females in that age group. Age-specific births to females 15-17 include births to females in that age group. See current technical notes for change in 2011.	Through 2010							
Age-specific Birth Rates	Until 2011, the oldest age-specific birth rate presented was 40 to 44. See current technical notes for change in 2011.	Through 2010							
Trimester of First Prenatal Care Visit (Late or no Prenatal care).	Following the 2008 transition to EVERS, the magnitude of births registered without information used to calculate Trimester of First Prenatal Care Visit was great and data were suppressed. By 2010 reporting improved such that data could be released and included in the Summary.	2008-2009							
Ancestry, Other	Following the 2008 transition to EVERS, the number of births registered with an "other" or unknown ancestry increased.	2008-2010							
Mother's Marital Status	Mother's Marital Status was computed using an algorithm developed by NCHS. A 1996 review of marital status indicated that the number of non-marital births was being overestimated. See Special Note on Mother's Marital Status in the 1997 Annual Summary for details.	Through 1996							
2008 Revised NYC Birth Certificate	For comprehensive information on the 2008 revision of the NYC birth certificate, please see the Technical Notes from the 2008 Summary of Vital Statistics http://www.nyc.gov/html/doh/downloads/pdf/vs/2008sum.pdf.	2008							
I	NDUCED AND SPONTANEOUS TERMINATION OF PREGNANCY	1							
Reporting	Induced and spontaneous terminations of pregnancies registered after the annual file closed were added to the following year's data.	Through 2007

VR 15 (Rev. 01/09)

THE CITY OF NEW YORK – DEPARTMENT OF HEALTH AND MENTAL HYGIENE

CONFIDENTIAL MEDICAL REPORT

VR 15 (Rev. 01/09)

CAUSE OF DEATH–Enter the chain of events—diseases, complications or abnormalities—that directly caused the death. DO NOT enter terminal events such as cardiac arrest, respiratory arrest, or ventricular fibrillation without showing the etiology.

IMMEDIATE CAUSE FINAL disease or condition resulting in death.

Sequentially list conditions, if any, leading to the cause listed on line a. Enter the UNDERLYING CAUSE (disease that initiated the events resulting in death) LAST.

OPERATION-Enter in Part II information on operation or procedure related to disease or conditions listed in Part I.

SUBSTANCE USE Include the use of tobacco, alcohol or other substance if this caused or contributed to death. SPECIFY IN PART I or PART II.

23. Ancestry (Check one box and specify) Hispanic (Mexican, Puerto Rican, Cuban, Denrincian, etc.) Unit Hispanic (Mexican, Puerto Rican, Cuban, Denrincian, etc.) Unit Hispanic (Mexican, Puerto Rican, Cuban, Denrincian, etc.) Unit Hispanic (Italian, African, American, Haitan, Pakistani, Ukrainan, Nigerian, Takwanese, etc.) Unit Hispanic (Italian, African, American, Haitan, Pakistani, Ukrainan, Nigerian, Takwanese, etc.) Unit Hispanic (Italian, African, American, Haitan, Pakistani, Ukrainan, Nigerian, Takwanese, etc.) Unit Hispanic (Italian, African, American, Haitan, Pakistani, Ukrainan, Nigerian, Takwanese, etc.) Unit Hispanic (Italian, African, American) Unit Hispanic (Italian, African, American) Unit Hispanic (Italian, African, American, Haitan, Pakistani, Ukrainan, Nigerian, Takwanese, etc.) Unit Hispanic (Italian, African, American) Unit Hispanic (Italian, African, American,	1	to be filled in by FUNERAL DIR	ECTOR or, in case of City Burial, by Physician	Certificate No.

Total Number of Other Pregnancy Outcomes ____ Other..... ☐ Hypertension – Gestational (Spontaneous or Induced losses or ectopic pregnancies) Specify ☐ Hypertension – Eclampsia Do not include this fetus (Mother/Parent) (Father/Parent) Previous Preterm Birth i. Date of Last Other Pregnancy Outcome _____Unknown Other previous poor pregnancy outcome (mm/yyyy) ___ ☐ Infertility Treatment – Fertility-enhancing drugs, 27. PARENT'S LENGTH OF TIME IN U.S. Artificial/Intrauterine insemination 30. MOTHER/PARENT HEALTH ☐ Infertility Treatment – Assisted Reproductive Technology Never lived in United States...... ☐ Mother had a Previous Cesarean Delivery If born outside of the United States, how long lived in U.S.? a. Height inches ___ years __ If yes, how many? _____ Other (Father/Parent) b. Pre-Pregnancy Weight (Mother/Parent) ___ pounds None or if <1 yr, months c. Weight Immediately Prior to Event Unknown

VR-17 (REV. 01/10)

THE CITY OF NEW YORK – DEPARTMENT OF HEALTH AND MENTAL HYGIENE

(Each question MUST be answered)

CONFIDENTIAL MEDICAL REPORT OF SPONTANEOUS TERMINATION OF PREGNANCY (2 of 2)

Only for scientific purposes approved by the Commissioner. Not subject to compelled disclosure.

FOR GESTATION OF 20 WEEKS OR MORE: ALL ITEMS BELOW MUST BE COMPLETED (except OCME cases).

Mother/Parent Medical Record No. ______ CERTIFICATE NO.

A. B. B. B. B. B. B. B. B. B. B. B. B. B.					
31. PREGNANCY	FACTORS (cont.)				
b. Infection Present and/or Trea (Check all that apply)	ated During Pregnancy		Maternal Morbidity (Check all that apply) mplications associated with labor and delivery)		e. Were autopsy or histological placental examination results used in determining the cause of fetal death?
☐ Gonorrhea	☐ Tuberculosis		Maternal transfusion		☐ Yes ☐ No ☐ Unknown
Syphilis	☐ Rubella	□т	Third or fourth degree perineal laceration		
☐ Herpes Simplex (HSV)	☐ Cytomegalovirus	□F	Ruptured uterus		f. Congenital Anomalies of the Fetus
Chlamydia	☐ Parvovirus	□L	Inplanned hysterectomy		(Check all that apply)
☐ Bacterial Vaginosis	☐ Toxoplasmosis	□A	Admission to intensive care unit		Anencephaly
☐ Hepatitis B	☐ Other	□L	Unplanned operating room procedure following delivery		☐ Meningomyelocele/Spina bifida
☐ Hepatitis C	□ None	□⊦	Hemorrhage		Cyanotic congenital heart disease
Listeria	Unknown	□P	Postpartum transfer to a higher level of care		Congenital diaphragmatic hernia
☐ Group B Strep			Other		☐ Omphalocele
			None		Gastroschisis
32. DEL	IVERY		Jnknown		Limb reduction defect (excluding congenital amputation and dwarfing syndromes)
a. Method of Delivery		c. V	Was mother transferred for maternal medical or fetal		☐ Cleft lip with or without cleft palate
1. Was delivery with forceps atter		ir	ndication prior to delivery?		☐ Cleft palate alone
☐ Attempted and successful	Attempted and unsuccessful		Yes No Unknown		☐ Down syndrome
☐ Forceps were not used	Unknown	If	f yes, name of facility transferred from:		☐ Karyotype confirmed
2. Was delivery with vacuum extrunsuccessful?	raction attempted but				☐ Karyotype pending ☐ Suspected chromosomal disorder
	Attempted and unsuccessful				☐ Karyotype confirmed
☐ Vacuum extraction was not	used Unknown				☐ Karyotype pending
					☐ Hypospadias
3. Fetal presentation at delivery		\	33. FETAL ATTRIBUTES		☐ Other
☐ Cephalic		a. V	Weight of Fetus (grams preferred, specify unit)		None
Breech					Unknown
Other					
Unknown			☐ Ib/oz ☐ grams		
4. Final route and method of deliv (Check one)	very	b. F	Estimated Time of Fetal Death		
☐ Vaginal/Spontaneous			Death at time of first assessment, no labor ongoing		
☐ Vaginal/Forceps			Death at time of first assessment, labor ongoing		
☐ Vaginal/Vacuum			☐ Died during labor, after first assessment		
Vaginal delivery after a prev ☐ Yes ☐ No ☐ Unkno			Unknown time of fetal death		
	own		Onknown time of letal death		
☐ Primary Cesarean☐ Repeat Cesarean			Mar and and a second and a second a sec		
If cesarean, was a trial of la	bor attempted?		Was an autopsy performed?		
☐ Yes ☐ No ☐ Unkno	own		☐ Yes ☐ No ☐ Planned		
5. Hysterotomy/Hysterectomy		d. V	Was a histological placental examination performed?		
☐ Yes ☐ No ☐ Unknowr	1		☐ Yes ☐ No ☐ Planned
