Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Judy Fedie

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 7:17:31 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Janet Maker

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 7:48:11 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a long time New York City resident, and someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction. While not limiting the amount anyone can drink, it does put into place reasonable serving sizes for drinks of no nutritional value.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the

Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Barbara Sklar

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

In Philadelphia, the mayor tried to tax soda. The soda industry protested and City Council caved in. City Council made a mistake but Maybe Mayor Bloomberg's health-focused approach is more effective.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Glenavie Norton

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

If someone really wants more than 16 oz of a sugary drink, that person can always buy 2 drinks, or even 3 drinks! So, please, Members of the Board of Health, don't give in to the soft drink industry's lobbying on this issue - we all will still have the "freedom" to drink as much as we like and can pay for!!!!

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. S. H. Savitt

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Joan Pariseau

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 1:53:28 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing to say that the proposal by Mayor Bloomberg is representative of marked government overreach. There are obviously no studies to demonstrate that banning sixteen ounce sodas will decrease the obesity epidemic in any significant way. I am sure that the enforcement of such a nonsensical law will cost the taxpayers a significant amount of money for no particular return.

Please spend your time and efforts in some other way. This sort of 'law' or ban is something that I would expect more from California but government mandates on people's behavior seems to be sweeping the country.

Cordially, C.Tye

Sincerely,

Dr. C. Tye

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 9:48:05 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I want to thank the City of New York for its leadership on public health issues and implementing sound public health policy aimed at curbing the very serious problems of obesity, Type II diabetes, and heart disease, among other health concerns. In keeping with this effort, I encourage the Board to support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

As a health professional working to address public health concerns, I believe this step will be a crucial one, which will further improve the health of New York residents and will set an example for the rest of the country.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Fifty years ago Americans were satisfied with an 8 oz soda at a restaurant. Over time, increasing sizes were introduced as a money-making strategy for restaurants and Americans got used to and acquired a taste for larger quantities of sugary drinks. This rising tide must shift and it is the action of this Board of Health that will make it happen.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Ameena Batada

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Jill Ficarotta

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a doctor very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a former NYC resident, I truly miss being a part of a proactive city that is willing to take REAL steps to help the next generation. If people want to drink 32 ounces of soda, allow them to purchase two drinks. Dont make it cheaper for them to "supersize" their waistline while supersizing the cost of obesity.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Suzanne Bellezza

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

Thanks to Mayor Bloomberg for taking a leadership role with this issue!

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Jan Casner

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 10:47:53 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Myra Flores

Dear Members of the Board of Health: Board of Health,

This initiative will reduce calories in for a substantial population that would benefit from that reduction. I strongly support it and will work for its adoption by other communities.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

I am concerned about the obesity epidemic and health care in this country. However, I do not feel it is the responsibility of the government to decide what we eat/drink or how much. That is still a personal choice and freedom.

I strongly encourage the Board of Health to leave that choice to the individual and not dictate the size of a drink.

Thank you.

Sincerely,

Ms. Ann Cantu

Dear Members of the Board of Health: Board of Health,

As a nutritionist and counselor working with people of all ages, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides an amazing model for other jurisdictions to follow. My patients and most Americans are consuming far too many sugary drinks. They aren't even aware that a 60 oz drink is oversized. They desperately need us to start helping them set limits, to think before they guzzle. My clients can't play actively with their children so their children don't learn to be active...they sit and use screens and ddrink and drink more. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Debra Roberts

While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Cassie Boles

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Ingrid Vidal

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,
Denise Mason

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. dan cappello

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 1:53:32 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. Mayor Bloomberg's proposal is a step in the right direction.

Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of being overweight in children. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions. Container sizes have grossly expanded over the past 50 years. It seems today's new standard is the 20-ounce bottle of Coke or the 7-Eleven 64-ounce Double Gulp

We need to restore an understanding among consumers of more reasonable serving sizes.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Sue McReavy

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your

response.

Sincerely,
Lulu Cook, RD

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Dear Members of the Board of Health: Board of Health,

I am very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

I find that limiting a serving of soda to 8, 10, or 12 ounces is not a hardship for anyone. Those big bottles of soda were meant for many servings for many people. The obesity of the members of our society pose a huge cost to all of us, and a huge health risk for them personally.

Sincerely,

Mrs. Alison Schiff

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Ayala Laufer-Cahana

More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Robert J. Catanzaro

Dear Members of the Board of Health: Board of Health,

I work very hard in trying to teach my children how to eat healthy. It is not easy to overcome media advertising and our culture that promotes and lives on so much junk food. I applaud the mayor for this move on his part in opening the conversation on making healthier choices.

I recently watched a documentary called Food Beware: The French Organic Revolution. In it a town mayor made the move to only serve organic food in the town's school. While not everyone supported the move initially, it made people start discussing their way of eating that would never have thought about it before. By the end of a year, almost the whole town had adopted organic eating.

The point being, this is a great first step of awareness and I support it wholeheartedly. I hope that it can be passed and that New York is blazing the way for future cities to follow suit.

Sincerely,

Ms. Amy Case

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. Also, I would like to suggest that you also TAX sugary drinks and high fat junk food to help pay for the health problems directly related to obesity and diabetes. It's a perfect way to tax people because they don't NEED sugary drinks or high fat junk food. I think they call it a "FAT TAX" in Europe. We could call it a "SUGAR AND FAT TAX" here in America!

Sincerely,
Dawn

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Paula Kreissler

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:22:57 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

New York can be a model for the rest of the country, helping to address the obesity epidemic so well explained in the recent HBO series Weight of the Nation. Please take this leadership role!

Sincerely,

Ms. Susan Blachman

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:23:01 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a writer of books and article on healthful foods and recipes, and as the editor and founder of an online magazine on the same, I support Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades.

I'm sure that by now, you know that more than two-thirds of adults and one in three children are overweight or obese in this country.

While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars.

One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. And there is an epidemic of these diseases in the U.S.

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once soft drinks were consumed in relatively small quantities, usually as a treat, but now sugary drinks come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines.

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today. And if they really need more, they can buy two of the 16 ounce ones to quell their addiction.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Judy Pokras

Dear Members of the Board of Health: Board of Health,

As a nutritionist, I am writing to encourage you to support Mayor Bloomberg's proposal to limit serving sizes of sugary drinks.

Consumption of sugary drinks has been directly linked to the development of obesity. And we know that large serving sizes encourage overconsumption. The mayor's proposal, a model for other jurisdictions, will help citizens regain perspective on more reasonable serving sizes and will be a step in the right direction towards the complex problem of weight gain and obesity.

I enthusiastically urge the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and look forward to your response.

Sincerely,

Dr. Lora Wilder

More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

This is a step in the right direction to assist Americans to resize their servings of beverages. We are especially concerned about the rates of overweight and obesity in low-income populations, at higher risk of chronic disease. The change would help all of us to have improved health outcomes and reduced health care costs. This alone will not do this, but it is one of many needed steps.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Rachel Hynd

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Elyse Carson

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a nutritarian who is very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

This weekend I was with my sisters at the United Methodist Women's School of Christian Mission. You can usually pick us out because of the obesity factor. I managed to convince one woman who went out with me to lunch to purchase a salad and to drink water instead of soda. Hurrah!

The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Not only do sugary drinks contribute to obesity, but the cups in which they are served contribute to the plastic mess in oceans and other waterways. And I pick up enough of those containers during my daily walks in the Cook County forest preserves.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Barbara Dailey

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

PS - what would be even better would be to heavily tax or ban soft drinks completely! But this is a great step in the right direction.

Sincerely,

Ms. Judith JosephJudithJoseo

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:23:32 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Nadege Schoenfeld

As someone who has dealt with OBESITY my ENTIRE lifetime - and unfortunately it took a RNY Gastric Bypass to help me get from 389 LBS down to a manageable 150 LBS. I also believe that my drinking LOTS of Sodas was a contributing factor. I only hope that this proposal carries through to ALL states.

Sincerely,

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Christine Mitchell

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:23:34 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Michael Brown

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a mother to a special needs child and daughter to a grandmother who loves 'treating' my son, I have watched the introduction of 'sodas' INVADE my son's preferences. These drinks are EMPTY calories that do nothing but decrease physical well-being. With the Super-Size marketing tactic, those of us who prefer suitable serving sizes get cheated and those who are apt to overindulge are encouraged to do so in the name of some corporate interest adding an extra quarter to its pockets. The truth of the matter is it costs SOCIETY a LOT more than the greedy quarter per victim gain the corporate interests gain.

WE PAY - for the detriment to the health of our population. Every American pays for the discounted health of each of us who are bombarded with capitalistic gains pushing us to spend and consume MORE THAN WE NEED, WANT or should to pump them up.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. Dear Members of the Board of Health: Board of Health,

My cousin, who lives at 5 Riverside Drive, informed me of the proposal to limit serving sizes of soda and other sugary drinks. We both wholeheartedly support this initiative.

Obesity is the leading cause of illness and a major contributor to rising health care costs. Sugary drinks are the only food or beverage source that has been directly linked to obesity. It's a no-brainer. The right to buy at one fell swoop huge quantities of a product that cause public health problems should not be considered a fundamental liberty. The proposal isn't even very limiting - people can still buy and drink huge amount of sugary beverages - just not in over-sized portions.

We strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Susan Fendell

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Amy Pippi

While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Heather Bloom

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Lisa Harris

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Claude Lopez

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:24:09 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Michael Pollard

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:24:24 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Greg Fuess

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a health coach, I am very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Kathleen O'Meara

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:53:25 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. kiva wyandotte

Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. daisy fischtrom

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:53:30 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! Dear Members of the Board of Health: Board of Health,

How can you serve under the arrogant fraud , M. Bloomberg ? He stands for humiliating and incarcerating tens of thousands of young people of color . While he jets off to his various estates in Bermuda , Southampton , etc. , the youth of our city are persecuted by this man whose only interest seems to be to enrich his cronies and to make the hyper-rich secure in the knowledge that their exclusive neighborhoods are off limits to non-whites . Resigning en masse would be an honorable course . I look forward to your response.

Sincerely,

While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Mary DeBusman

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Cheryl Axelrod

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Marjorie Picard

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:53:44 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Jeff Axelrod

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 2:53:46 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Rita Hale

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Sugary drinks now come in gargantuan proportions. Today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! More reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But many of them will be satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. lorre_arnold

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Brian Olzinski

Dear Members of the Board of Health: Board of Health,

" Give a hoot, don't pollute," "Why do you think they call it dope?" "Cross at the green, not in-between" "It's 10pm, do you know where your children are?" These slogans helped to set a public standard of behavior as do realistic expectations.

Public health and citizenship are part of a healthy population. Look around. There are a lot of unhealthy people. Let's help them and our country. This is a public health crisis. The time to act is now.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

Consumers are susceptible to the lure of sugary drinks that directly cause obesity, and we need help in resisting the temptation of these ersatz foods. If citizens expect the government to fund Medicare for their future health problems of diabetes, heart disease, stroke and cancer, then they must allow government to control the behavior that causes those health problems in the first place.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Julie Messina

Please drink mineral water!

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear wonderful Board Members!

Please drink mineral water!

Thank you, wonderful Board Members!

Sincerely,

Mr. John Hilb

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a public health professional, the Vice President of the NYS Public Health Association, and someone who visits New York City frequently, I am very concerned about the obesity epidemic and health care costs in the state. I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. I do recommend that the policy intervention, if implemented, be rigorously evaluated to assess its impact and inform obesity prevention efforts elsewhere.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your

response.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Stephen Phillips

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. ZAKIYYAH LUQMAN

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Beau Poppen-Abajian

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. John Kautzman

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 3:23:09 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Eric Farrow

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Stephanie Weiss

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Health care costs are spiraling out of control and this is one very simple thing we can do to help make things better for the next generation. As the mother of a 5-month-old boy who I hope will NEVER choose to drink pop, I feel that we need to look out for those who have been incessantly marketed to and who are unaware of the horrible health effects of consuming so much sugar and high fructose corn syrup.

Let's do the right thing. We'll regret it if we don't, but then it will be too late for millions of kids.

Sincerely,

Mrs. Erika Olson

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. John Potter

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

We know sugary drinks are a major contributor to the obesity epidemic--they are the single largest contributor of calories to the American diet. Soft drink consumption is associated with a 60-percent increased risk of overweight in children. We know excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on soda consumption and help slow down weight gain in New Yorkers. Helping keep people healthy saves money on health care costs.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Elisabeth Waugaman

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Potentially restricting the amount of refills a person can get on sugary beverages is also a good idea, for even if people are not allowed to get sugary drinks bigger than 16-oz, they might still get refills, defeating the purpose of the 16-oz limit. 16-oz is already above and beyond the serving size for many drinks - can we support actions that get us closer to the would-be-normal serving size outside of an obesogenic world?

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines.

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Katy Heneghan

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Carolyn Dolen

More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Priscilla Nelson

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Jean Kilbourne

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Marissa Burgermaster

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

People typically purchase the huge size because it often costs less or provides greater "value." As a result, they end up drinking the entire cup. This is less an issue about freedom to buy any size and more about the psychology of getting the most for your money. We also know that sugar is addictive. The more we consume, the more accustomed our taste buds and bodies become to having greater amounts. Please support Mayor Bloomberg's proposal.

Sincerely,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Stephen Murray

Dear Members of the Board of Health: Board of Health,

As a physician I see both the complications of obesity (diabetes, high blood pressure, arthritis) and the patients struggling to lose weight. There is no question that personal choice plays a role. However; we are biologically engineered to often make the wrong choices given the wrong environment. There is no question that the obesity epidemic seen in the US is partly caused by what some have called our "toxic environment" which has numerous high calorie, low cost food choices that are abundant in our society. Though sugar containing beverages are not the only cause, they are a start. The Mayor's proposal is a bold step in the right direction if we are going to reverse the trend that will eventually lead to obesity being the leading preventable cause of death in the US. There is no reason any adult or child needs to drink more than 16 oz of Coke or Pepsi.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Matthew Mintz

The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your

response.

Sincerely,

Miss Andrea O'Brien

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 3:53:39 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Richard Grano

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 3:53:56 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Daniel Vice

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 4:23:07 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. James Sommer

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

Although I am very concerned about the obesity epidemic and health care costs in this country, I am writing to STRONGLY OPPOSE Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's position on the soda issue is an example of confusing the educational function of government with the unwarranted limitation of the freedom of choice of the citizenry.

It would be entirely appropriate for the City government to point out to the public that scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. It would also be appropriate to educate the public on the relationship between consumption of sugary drinks and other health maladies.

We should never forget however that the most important value we share is that of freedom of the individual; the power of the government should be exercised with caution and only where necessary. It should in no event act to impose choices on individuals, such as what and when to eat, or in what quantities. Those are choices best left to the individual adult citizen.

Sincerely,
Roger A. Gerber
26 Sage Terrace
Scarsdale NY 10583

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. roger gerber

Dear Members of the Board of Health: Board of Health,

I am quite concerned about the obesity epidemic and related health care costs we are facing in this country; I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks available in specific venues. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal will not alone solve our obesity problem, it is a positive measure toward control of this issue.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity and they are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help reduce soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller serving size amounts instead of the unnecessarily large sized sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes in specific venues.

Thank you for your time and concern and I look forward to your response.

Sincerely,

Mr. Brian Kaye

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Tamsen Benson

The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Robin Heggum

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 4:23:13 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Judy Wilson

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I have published wellness-related material summarizing health research for more than 20 years. By reducing consumption of caloric beverages, we would see more health benefit than by any other single action.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Our nation needs NYC to lead the way!

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts

instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Jaime zillmer

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 4:23:39 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Ramon Aniban

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 4:24:09 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Ron Golan

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Aviva Musicus

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Lauri Dean-Barnes

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Clea Senneville

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Zsanett Denes

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 4:54:09 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. Dear Members of the Board of Health: Board of Health,

As a mother, grandmother, nurse practitioner and someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Barbara Corgiat

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 6:01:53 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 6:02:03 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. William Currie

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in opposition to Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor has already intervened too much and too often in the choices New Yorkers and other citizens make about their foods and beverages -- many make unwise choices, but it is not ours and certainly not the Mayor's prerogative to either force or limit legal, legitimate nutrition choices of our citizenry. I realize that groups like CSPI regard this as a fundraising opportunity -- that is unseemly and not a wise basis for making public policy.

I urge the Mayor to reconsider his ill-advised plan to force his eating and other lifestyle habits and behaviors on people who are already struggling enough.

I strongly encourage the Board of Health to vote in opposition to the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Nick Alexander

Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Charles Savinar

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Carol Collier

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion. I seriously doubt if soda drinkers would even notice that they are drinking less soda--they drink what is given to them. And if they want more, most places will give refills (especially fast food restaurants).

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

ChopChop The Fun Cooking Magazine for Families supports Mayor Bloomberg's ban on the sale of huge sodas. Desperate times call for desperate measures: as everyone now knows, obesity is a complicated puzzle, and soda consumption is one of the pieces. The privilege to buy and sell what we like is not insignificant--but we take children's right to healthy lives to be of paramount importance. As a non-profit cooking magazine with an anti-obesity mission, we'd love to see even more and more nuanced solutions: we'd like, for example, to encourage kids to make their own sparkling drinks with a few tablespoons of juice in a glass of fizzy water; we'd like to see evolving tastes and a growing appetite for health. But Mayor Bloomberg's ban acknowledges the problem of obesity and tries to fix it, and we're grateful for that.

Warmly,
Sally Sampson

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. GERALDINE Maslanka

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Eric Schrimshaw

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 6:02:43 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Emily Newell

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Alexa Diaz

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Sue Lewis

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I support Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. I am hoping that California will pass a similar law. Obesity mirrors the growth of soda serving sizes over the past five decades. This is a step in the right direction.

Sugary drinks are the only food or beverage that has been directly linked to obesity, which is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, dental problems and more.

A 20-ounce bottle of Coke, contains 16 teaspoons of sugar! 7-Eleven offers a 64-ounce Double Gulp - more than 50 teaspoons of sugar!

Restoring an understanding among consumers of what is a reasonable serving size is very important. I think simply passing this proposal will help people realize that bigger is not always better.

Please vote in support of the Mayor's proposal and let New York become a model for the rest of the U.S. I look forward to your response.

Sincerely,

Ms. Diane Clement

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

This isn't about personal freedom of choice -- consumers are not given a choice because they are manipulated by the corporations and their accompanying advertising that make so-called "food".

The food industry needs to be held accountable for their disregard for the health of the people who buy their products -- these companies are only interested in the bottom line profit, and then their compatriot companies in the health industry get to profit from all the illness that consuming this unhealthy food brings on.

So cudos to Mayor Bloomberg for taking a stand and starting a conversation about this problem.

Sincerely,

Ms. Robin Mitchell

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. JLYNN INGLEBY

More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Ksenia Koudriachova

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Dear Members of the Board of Health: Board of Health,

I am as concerned about the obesity epidemic and health care costs in this country as anyone. However, I am writing against Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

The Mayor's concept on the soda issue provides another example of government stepping too far over the line. I realize that a lot of adults and children are overweight or obese in this country. While Mayor Bloomberg's proposal may seem to be a step in the right direction, it is not. It is not up to the government to restrict business or individual choices of legal goods.

Restoring an understanding among consumers of more reasonable serving sizes will help cut down on some consumption. This should be done by education and by parental influence.

I strongly encourage the Board of Health to not support of the Mayor's proposal to limit serving sizes.

Sincerely,

Ms. Sharon Kimmy

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Sharon Peariso

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Autumn Howard

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Susan Michele Rody

Dear Members of the Board of Health: Board of Health,

As a public health nutritionist and a parent of a teenager, I am very concerned about the obesity epidemic and its consequent effect on the current and future health of our state and nation. I am well aware of the studies associating the consumption of sugar sweetened beverages with obesity. In addition, research has shown that when presented with a large portion of a food or beverage, most persons have a tendency to over consume and have great difficulty stopping, even when they are no longer hungry or thirsty. Most persons are unable to compensate for excess calories consumed in liquid.

The current obesity epidemic has been caused by numerous changes to our environment which includes the 'supersizing' of soft drinks. I agree with Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks and I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes.

Thank you and I look forward to your response.

Sincerely,

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Jessica Hull

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 7:31:30 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. In fact, I think it should be revised to limit the AMOUNT OF SUGAR in any beverage instead of the size of the cup. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

I got fat, in part because I ate and drank too much sugary and fatty foods and it's taken me years of "dieting" to return to a "normal" weight. I did that in part by giving up soda and other sugary drinks and never stepping foot into a fast-food place.

Most Americans don't have the willpower to do the same so we need more measures like that proposed by the Mayor to help us help each other.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Stewart Holmes

Dear Members of the Board of Health: Board of Health,

As a physician in NYC and being very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Bradley Flansbaum

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

In addition, as a nutritionist and diabetes educator working in a large health center/physician's practice, I see every day the negative impact that soda and sugary drink consumption has on obesity and chronic health conditions. Individuals appear to need all the help they can get to support their health improvement.

Sincerely,

Ms. Marjorie Sobil

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Jonathan Zahos

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Dina D'Alessandro

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Karen Aroian

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 8:31:24 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 8:31:48 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

Please support Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. This proposal provides a good model for other jurisdictions to follow, because overweight and obese individuals have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. Here in the U.S., more than two-thirds of adults and one third of children are overweight or obese. Mayor Bloomberg's proposal may not solve our nation's obesity problem on its own, but it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for Type 2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, plus they are available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar. The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp, which contains more than 50 teaspoons of sugar.

Restoring an understanding among consumers of more reasonable serving sizes--even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards--will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes, and I look forward to your response.

Sincerely,

Ms. Kate Flores

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 8:31:49 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Jessica Balukas

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Lynn Cardiff

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 9:01:31 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Lucy Gonzalez

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Charlie Glinche

Dear Members of the Board of Health: Board of Health,

While I am concerned about the obesity of many in our population, I believe an "educational" approach, coupled perhaps with financial incentives via health care deductibles or co-pays, is a better way to address this issue than a Government MicroManagement Mandate.

I strongly encourage the Board of Health to vote to DENY the Mayor's proposal to limit serving sizes.

Sincerely,

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Purnima Barve

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 9:31:33 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I am a business executive who has lost 113 pounds, without surgery or drugs, just diet and exercise. Weight and its negative impact on self image have been my lifelong struggle. I was raised by good parents but who did not understand there even was a connection between health and diet. Those eating patterns established by my parents have been difficult to alter and overcome as they were imprinted at an early age.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines.

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal will not solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Standard container sizes have grossly expanded over the past 50 years, and our waistlines have followed suit.

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines.

Unfortunately, no measure would be perfect or fully effective. This will not "ban" consumers from buying as much soda as they want. But, in all likelihood, that satiety of many will adapt to smaller amounts, and the babies following this proposal will likely drink reduced amounts of sugary drinks as well. But this is absolutely not deprivation of any human rights. I cannot see how this takes away from the quality of life.

I urge the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. JoNise Caleb

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. pam drake

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 9:31:53 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's plan may not solve the problem, it is a step in the right direction.

Sugary drinks are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. The limitation on size should help restore an understanding among consumers of soda as an occasional treat.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes.

Thank you for your consideration.

Sincerely,

Ms. Hope Carr

Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Venalda Gupta

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!
