Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Jennifer Martin

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a Registered and Licensed Dietitian, I am very concerned about the obesity epidemic and health care costs in this country. I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar! These larger portion sizes, which reach beyond sugar-sweetened beverages, have bombarded our sense of perceptions and portion sizes. 64 ounces is shockingly large, but scarily it is not longer so today due to desensitization.

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards (that's technically 2 servings!) - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today. This is not an infringement on individual

rights as people may by as much as they please. Rather, this proposal is helping to change the environment, a major player in the obesity epidemic.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Stephanie Hoban

They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Jin Park

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Rosemary Graham-Gardner

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:17:31 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

Having family members living and paying taxes in NYC, I would think this could save lives and welfare monies spent on many diseases related to obesity and non-nutritional carb. input.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Alvin Kaplan

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Suzie Meres

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. ellen rothschild-taube

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

Access is everything. If we can curb access, we can change behaviors, norms, and culture. If we begin to let people know what's reasonable from a health-perspective, parents will begin to set limits. It's not

unlike the drinking laws which regulate age and alcohol consumption limits based on what's safe. Laws and policies are designed to guide people to do what's safe. If we don't tell parents that it's not safe to give your child a giant soda, we can only blame ourselves for creating an environment that supports and promotes obesity, diabetes, and whole host of diseases resulting from over-consumption of sugared drinks.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dear Members of the Board of Health: Board of Health,

We live in the United States of America. We are free to purchase as much or as little soft drinks as we want. The mayor of NY is way off base with this proposed ban. By all means do everything you can to educate New Yorkers about the health hazards of drinking sugary drinks but to make a law that tells you what size drink you can have is kind of stupid. i hope you guys are not as stupid.

I strongly encourage the Board of Health to tell the mayor to get a life and to remind him what it means to be an American.

Sincerely,
Jimmy Tassios

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Joseph Phillips

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a student of Nutrition and Dietetics and an American, I am inspired by the action your department is taking against these corporations. My hope is that it will not be an act of reducing freedom but an act of preserving health in America, regardless of economic status. We know that soda is more frequently sold in areas of poverty and minority groups, it is our job to educate and market the reasons behind these decisions and policies, to gain much needed support.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Dear Members of the Board of Health: Board of Health,

I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

Mayor Bloomberg's pushback to the giantism of food portions is a stating a very valuable principle
The ever increasing size of beverages, portions, and plates (China) is contributing to our rising health costs.

Sugary drinks are the single largest contributor of calories to the American diet. The 20-ounce bottle of Coke contains 16 teaspoons of sugar! The 7-Eleven chain offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

I hope that the Board of Health will vote to support of the Mayor's proposal to limit serving sizes of soda. Thank you.

Sincerely,

Dr. Elona Vaisnys

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Robert Packer

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I strongly support limiting the size of sugary drinks not just for the reasons below, but because sugar has been found to increase cholesterol and because the sugar used in "soft drinks" is empty calories devoid of the antioxidants that help prevent a variety of diseases. Soft drinks are also devoid of the vitamins, minerals and both soluble and insoluble fibers crucial to good health. Thus I feel limiting the size of soft drinks is a step in the right direction.

Thank "god" we have a mayor who has the guts to fight the huge lobbyist groups who are only concerned about their own profits at the expense of everyone else's health.

Thank you

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. Dear Members of the Board of Health: Board of Health,

I'm very concerned with the obesity epidemic in this country, and think Mayor Bloomberg is leading the way for the rest of country in limiting serving sizes of soda and sugary drinks. These drinks have calories which are hidden to the calorie control centers of the human body. Children are terribly vulnerable. Adults are too.

I completely support the position of the Center for Science in the Public Interest on this matter:

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Susanna Sibitsky

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:46:48 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Alan Geier

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:46:52 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. John Carmody

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:46:55 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

Large soda drinks, not only deliver too much sugar, but also deliver too much fluoride since NYC's fluoridated water is used to make these products.

As someone very concerned about the tooth decay and fluorosis epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Carol Russo

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a community advocate with a focus on obesity and disease prevention and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction. The super-sizing of sugary drinks and junk food items has clearly contributed to obesity, disease and health care inflation.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the

Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

We all know that Obesity is an out of control epidemic. I support Mayor Bloomberg's proposal to set limits on sugary soft drinks size and encourage the Board of Health to do likewise.
Mayor Bloomberg's leadership is a role model for our nation's obesity epidemic and while it's only the beginning, it is a step in the right direction.

Scientific studies have shown that sugary drinks, are a major contributor to obesity, especially in children. It also has been documented that this excess weight increases their risk of type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and contributes to osteoporosis, tooth decay, and dental erosion.

The original coke bottle was only 6oz but today's portions are 4 to 6 times that amount. By today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar and 7-Eleven offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar?????

The Board of Health's vote to support Mayor's Bloomberg's proposal to set limits on soft drinks serving size, sends a powerful message to our nation's children that the adults-in-charge really care about their future.

Sincerely,

Mrs. Barbra McWms

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Hayley Figueroa

Dear Members of the Board of Health: Board of Health,

I am a diabetes and obesity specialist in Mississippi. I see first hand the death and destruction from caloric beverages. These are the #1 cause of obesity, diabetes, heart attack, stroke, heart failure and #2 preventable cause of cancer (especially breast).

You can be a hero by encouraging change and changing the paradigm about this clear and present danger.

Soft drink makers do almost as well with diet beverages so they will not lose in this battle.

THERE ARE NO LOSERS--only WIN WIN.

Please vote with the Mayor.

Dear Members of the Board of Health: Board of Health,

I avidly support limiting the size of sugary drinks not just for the reasons below, but because sugary drinks increase payments for people who have to go to hospitals due to the diseases caused, directly and indirectly, by consuming large amounts of sugar. Sugar has been found to increase cholesterol and increases the risk of diabetes. Also, the sugar used in "soft drinks" is empty calories devoid of the antioxidants that help prevent a variety of diseases.

Thank God we have a mayor who has the guts to fight the huge lobbyist groups who are only concerned about their own profits at the expense of everyone else's health.

Thank you

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Elaine Becker

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:46:59 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Tamar Hurwitz

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:47:00 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

"Sugary" drinks contain large amounts of high fructose corn sugars, which have been shown to cause serious health and eating habits in people.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Deborah Brooks

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:47:03 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Michael & Kathryn Kevany

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Margie Solovay

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly urge the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Niles Kaplan

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 1:47:07 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Bill Ziegler

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. James Mitchell

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I also strongly urge Congress to pass a law that sugary drinks of any type shall be banned from school campuses K-12th Grade and that also teachers will not have access and will not bring it in to the schools

to tease and be of bad role model to the students in all grade levels!

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes in restaurants or stores - and most of all - no such drinks on school campuses K-12th grade and I look forward to your response.

Sincerely,

Mrs. Daniela Kunz

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. David Triantos

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Susan Davidson

Dear Members of the Board of Health: Board of Health,

No one needs a sugary beverage the size of a small swimming pool! No one.

It's not about taking away choice -- quite the contrary. Eliminating huge cup sizes will give freedoms people do not even realize they will be enjoying -- like looking and feeling better.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Charles Dupree

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 2:17:24 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your

response.

Sincerely,

Mrs. Carole Mohr

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 2:17:34 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. I spent about 10 years drinking large sodas every day for lunch and gained more than 50 pounds -- not realizing the soda was the biggest problem. I no longer touch any kind of soft drink, but to this day, I have failed to take all the weight off despite substantial effort with Weight Watchers and other organizations.

The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Lauren Cook

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 2:18:02 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Brian Sandmann

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Kathleen Morris

Dear Members of the Board of Health: Board of Health,

I work with minority children from low-income neighborhoods and when I show them how much sugar is in so-called healthy juice drinks and soda they are shocked. Many change their soda drinking habits when they learn how sugar damages their bodies. Most are unaware as to what a serving size actually means.

I am sick and tired as to how the sugar and soda industry exploits minority kids! Regretfully, these young people are literally "sick and tired" from sugar.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

You'll send a tremendous public health message nationwide!

Sincerely,

Dr. Linda Rhodes

Dear Members of the Board of Health: Board of Health,

As a health educator working with morbidly obese patients I commend your efforts to make changes in our nutritionally toxic environment.

Humans are wired to gorge when sugars and fats are available, but will limit themselves to available portion sizes. Health education can only go so far in assisting in behavior change. We also need to adjust the world we live in because individuals often make unhealthy choices (ie. not wearing motorcycle helmets). We elect our representatives in government to help make our world a safer place, which sometimes must include limiting (through taxes or portion control) access to harmful substances, which clearly include non-nutritive beverages.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Barbery Byfield

More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Steve Weiss

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

New York City's proposed limit on the size of sugary beverages is like a speed limit or a stop sign. Excess sugar, like excess speed, can be deadly. Scientific studies that are independent of the beverage industry show clear connections between dramatic increases in sugary beverage container sizes, consumption levels and increases in obesity. Medical studies show clear connections between obesity and morbidity due to serious illnesses such as diabetes, heart disease, and even cancer. A government that signals to its residents that they need to slow down -- whether their vehicle speed or their sugar consumption -- is fulfilling an important obligation to the public. This portion control proposal alone may not end the obesity epidemic and rein in all of our health care costs, but it is an important step along a journey we must begin to save ourselves, both in terms of physical and financial health. Therefore, the New York State Association of County Health Officials (NYSACHO), whose mission is to support and empower local health departments in their work to promote health and wellness and prevent disease, disability and injury throughout New York State, supports this measure.

Sincerely,

Ms. Linda Wagner

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Jamie Bialor

2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Susan Klein

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As the creator of www.candyexperiments.com, I grow more and more concerned about the amount of sugar people are consuming, and the way it contributes to the obesity epidemic. I do an experiment called "Find Hidden Candy," in which I show children how to look for hidden candy in other foods by checking the sugar contents. The highest amount of sugar is found in sodas--for instance, one 16 oz bottle of orange soda has as much sugar as 10 rolls of Smarties candy.

Because of this, I urge you to pass Mayor Bloomberg's proposal to limit serving sizes of sugary sodas. It would be very interesting to see if this would improve public health, and provide a model for other areas to follow. Since soda companies spend so much time and money promoting their product, I think there is a role for the government in supporting the opposite message: that too much sugar soda is bad for you. Over the long run, it may even provide a savings in public health spending, which is growing out of control.

Sincerely,

Ms. Loralee Leavitt

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

When I first heard of the Mayor's proposal I was not for it. I had a reaction like "who is he to tell us how to live". On reflection however, I am very for it. America is out of control in a society that worships more as better. Clearly this does not work. The health of our country both physically and also financially is at stake. If nothing more, this is an important first step to at least start the conversation moving in the right direction. We must start moving into an age of health preservation rather than illness management for all of our sakes. That means better nutrition, exercise and finding time for peace to break through our hectic days.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Valentine Njike

Dear Members of the Board of Health: Board of Health,

perhaps encouraging businesses to reduce the size of sweet drinks is something a board of health would feel comfortable doing plus educating young people on the consequences of obesity--health complications, social relationship complications, wallet implications.

i think you need to have more than one approach to reducing obesity--but taking a stand in favor of curbing drink sizes could be important.

Sincerely,

Ms. sharlya gold

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your

response.

Sincerely,

Dr. Ted Labuza

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Lisa Geismar

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, June 26, 2012 1:53:23 PM

Jun 26, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Susan Smith

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 2:47:38 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

A long list of scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

The problem is that when people "upsized" their drink, they don't downsize their food consumption correspondingly, leading to an increase in calories consumed. This is particularly worrisome when children are concerned. Weight, once gained, is very hard to lose.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts

instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Sigrid Jakob

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the

Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Paul Taylor

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! Dear Members of the Board of Health: Board of Health,

Rather than limiting the size of sugary drinks, which only means someone has to waste a second disposable cup if they want more, I propose nutrition facts be posted on the wall along with menu items so that consumers may make their own decisions about whether or not to purchase these products, which are so devoid of nutrients and full of sugar and empty calories.

Sincerely,

Ms. Melissa Logan

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Jessica Baltmanas

More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Joanne McGrath

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

The Mayor's effort is a beginning. I ask you to please stand behind him and all humankind. Do not be swayed by the power of the soft drink industry. They are driven by profit and are blind to the health of consumers. As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of a revised approach to curb and at the same time pay for the consequences of excess sugar and fat intake; to wit, tax the sale of sugar and fat by at least 1 cent per ounce. This proposal goes further than, but is in the same spirit as Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership in bringing the soda issue to light is critical because overweight and obesity have become much too commonplace throughout America. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As member of the board of directors of the American Board of Physician Nutrition Specialists, I'm very concerned about the diabetes epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our diabetes and metabolic syndrome epidemics, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to diabetes and excess body fat. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the

Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Tom Rifai

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in slight support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today. I believe that government should not be so imposing as to limit soda sizes... but perhaps encouraging a big benefit to customers who order smaller sizes of soda would be better. For instance, get a coupon for a free burger or other food, a toy comes with smaller sizes of drinks but

not the bigger size, or have healthy drink and fruit options instead of only fries and a soda with a meal! Us adults would like healthy options (without having to pay extra) as well as children. Phasing out the big size cups would be nice but I don't think it should really be a law. It should be encouraged as a free choice for better health, not forced upon us as if we were children needing a forcing hand
I encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. margaret heninger

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 3:17:03 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction. I actually believe that you should have to be 'of age' to drink sugary drinks just like you need to be 21 to consume alcohol.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

****As New York goes, so follows the nation. I have bold public health initiatives that started in New York to thank for the fact that I am no longer exposed to secondhand smoke in the workplace or public establishments and that fried foods are now cooked in healthier oils. I hope that the Board of Health will take another bold step. I try to teach my children about proper portion control. Even if they learn the lessons, there are few properly portioned options available in the marketplace. I think this proposal will actually expand consumer choice. I would love to be able to go to a restaurant or movie and not order something of "Big Gulp" proportions. I would like to be offered healthier drink choices. I don't want to pay for over-sized products and feel guilt throwing 75% away just to make a healthy choice.****

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Maggie Hinders

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Steffi Berne

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

In addition to the reasons cited below and compiled by CSPI, I was incensed to see a quote this morning in the NYT by a movie theater executive complaining that a lot of people who go to movies want enormous jugs of soda. In fact, among my peer group, the great majority of people complains that the movie theaters do not give customers any other option but the big vat. If you go to our neighborhood Regal Cinema, the ONLY way to get anything resembling a small soda is to be under 12 AND order the nacho platter. It's like being on the other side of the mirror. I cannot for the life of me understand how the theater companies ought to have any say in this matter with that history.

In NYC, the Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Peter Insalaco

Dear Members of the Board of Health: Board of Health,

I don't drink these drinks. I don't smoke. I don't eat fast food. I don't do drugs. I like to buy local. I avoid sugar when possible.

That being said, I'll never support bans on sodas, smoking, fast food, etc...

Mayor Bloomberg has proved time and time again that his appetite for control of the behaviors of the people in his jurisdiction is limitless. His infringement on their personal liberties is appalling and dangerous.

I would never support his agenda. I have no idea why I was sent an email asking for support of his proposals.

Whoever formulated the criteria used to target the people to receive this email isn't very good at their job.

Have a good day.

Gary

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks to no more than 16 oz.

Consumption of sugary soft drinks has been linked to obesity, yet serving sizes seem to grow ever larger. Even at 16 oz., an average soft drink contains about 1/4 cup of sugar - that's 4 tablespoons, or 12 teaspoons, and 192 calories. One 16 oz. soda a day provides the caloric equivalent of over 20 pounds a year.

I urge to Board of Health to vote in favor of Mayor Bloomberg's proposal to cap the soft drink serving size to 16 ounces.

Sincerely,

Ms. Carol Schulz

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Donald Allen

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

Let me preface the rest of this message to say that we are doing the next generation of Americans harm in so many ways that this is just one step, but it needs to be done.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Glenn Destatte

Dear Members of the Board of Health: Board of Health,

I normally am a huge fan of the Daily Show with John Stewart, but recently he's taken to making jokes about the "sugary drink proposal." Obesity in this country is no joke and this is one area John and I do not agree on. As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. MARJORIE CARTER

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about our children and the public's health with the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction. Doing nothing is simply stupid, so I applaud him in standing up to and against the forces of the greedy corporations and the ignorance of the people who continue to buy into the non-sense and then complain about being sick and broke.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. And this does not only effect those who are obese! The ingrediant in these drinks harm all humans in one way or another! Sugary drinks are the only food or beverage source that has been directly linked to obesity, and some studies might even suggest cancer! They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars and artificial colorings which has a whole different negative health effect on children! One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.....and ACNE!

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar! This is simply ridiculous and if more people were educated properly on this data, I bet a good portion of them would consider cutting back or even switching what they drink.

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today. And if the consumer wants more than he/she can simply spend more money and buy two, three or four! This law will not stop anyone from drinking as much junk as they want, but I'm certain it will cause a decrease in the amount a person consumes in one sitting; and this alone will begin to get people's attention when they notice they lost weight without trying.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response and to this becoming a National ban!

PS: Banning soda from our schools would be a win too!

Sincerely,

Ms. Sharon Carroll

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. amy axler

Dear Members of the Board of Health: Board of Health,

The obesity problem in this country is out of control and it is pretty clear that people who've let themselves go need help. One of the things we can do is limit serving sizes of soda and other sugary drinks. Go to any airport in America and you see overweight and obese people everywhere you look. This is not the case in Europe, where people don't walk around mindlessly sipping giant sugary drinks.

We are all paying the price for obesity in higher health care costs for diabetes, cancer and heart disease. Therefore this is a good example of where the government needs to step in. Vote YES!!!!

Sincerely,

Mrs. CARRIE LAZARUS

The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. paul alexander

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 3:47:57 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not be enough by itself to solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp--which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes--even a 16-ounce maximum, as the Mayor has proposed, is very generous by historical standards--will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want; they'd just need to buy more of the smaller containers. But in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes, and I look forward to your

response.

Sincerely,

Ms. Amy Fass

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Carla Huizenga

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 3:48:20 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Linda Newmark

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

What gets me very frustrated is that people claim that the proposed limitations limit their choices. This is simply not the case. You still have the choice to drink more than 16oz of soda, but you also have the

opportunity to decide that 16oz is enough, instead of just being handed a soda based on a size label like medium or large, without actually knowing how much soda you are ingesting. So in fact, the limitations enhance peoples' abilities to choose what to put in their bodies. Except now they can make that decision with the relevant information.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Miss Leah Reiss

Dear Members of the Board of Health: Board of Health,

Do not support Mayor Bloomberg's Sugary Drink Proposal. People have a right to drink them if they want to. Before we take away rights, let educate people, show them what it does to them. Let them make informed and educated choices. Maybe then the soda pop business will go out of business but not forced to because big brother is watching, but because the consumer is making well educated decisions about their health.

Let freedom ring.

Sincerely,

Mrs. Michelle Burke

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Ann Cummings

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

I work as a Nutrition Educator, and it's disheartening to see my client with soda in the first place, but doubly hard when I realize that they see the extra large drinks as being a bargain, not a detriment to their health. This is a small step to making people realize how horrible they are being to themselves

Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Andrea Page

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 4:47:17 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Please also consider extending the ban to places like Seven Eleven which the ban does not apply to. While people are concerned that the ban may go too far, my argument is that it does not go far enough. This is a good start to helping change the consumption habits of New Yorkers.

Sincerely,

Ms. Erica Lewis

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of every parent to limit serving sizes of soda and other sugary drinks. Any State University Extension Service provides a good model to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While every parent wishes to lessen the obesity problem, it is a step in the right direction to let them decide what direction to take.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are not the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Brian Crowe

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 4:47:21 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

Hello,

Is it really necessary to have all this excess sugar in our diets? The children will do whatever they want to do on their own time, but as someone who grew up in the city and went to the PS schools, I would have loved someone intervening on my behalf, kids can't decide for themselves we as the adults have to step up and tell them what they need to do!

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. Joseph Joseph

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Dear Members of the Board of Health: Board of Health,

I, too, am very concerned about the obesity epidemic and health care costs in this country and I am in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. His proposal may not by itself solve our obesity problem but it is a step in the right direction.

The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere.

Restoring an understanding among consumers of more reasonable serving sizes will help cut down on the over-consumption of soda and slow the expansion of New Yorkers' waistlines. Many folks don't realize how harmful the huge tubs of sugary drinks they consume today are. Smaller portions can be just as satisfying.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Jodi Thomas

Dear Members of the Board of Health: Board of Health,

I am a Registered Dietitian who recently retired from working for many years with dialysis patients at an outpatient dialysis facility. The leading cause of kidney failure resulting in the need for costly dialysis treatments is diabetes, very often associated with obesity. I am very concerned about the obesity epidemic and health care costs including the rise in kidney failure in this country and am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. David Constantine

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I am very concerned about the obesity epidemic and health care costs in this country. Therefore, I support Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow. Overweight and obesity have become commonplace; more than two-thirds of adults and one in three children in America are overweight or obese. The growth of soda serving sizes over the past five decades has been a contributing factor. While Mayor Bloomberg's proposal alone will not solve our obesity problem, it is definitely a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. They are the single largest contributor of calories to the American diet, the only food or beverage source that has been directly linked to obesity, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies have indicated that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

I'm 85, and when I was young these drinks came in very small bottles. Are any of you old enough to remember the small old classic Coke bottle? Sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even the Mayor's proposal of a 16-ounce maximum is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes. I look forward to your response.

Sincerely,

Mrs. Rose Lernberg

Dear Members of the Board of Health: Board of Health,

This is an absurd proposal.

New York, Illinois, and California are birds of a feather.
Anti-American, anti-liberty and pro-everything that breeds a negative
environment for freedom and the Constitution.

This does not make me hate New York, I already did.
I don't want anything to do with state, and I refuse to go to New York
for my job.

The fact that I believe expressing my opinion about this puts me on
some kind of watch in New York says it all.

You people are insane if you let Bloomberg.continue to get away with
things like this..

Dear Members of the Board of Health: Board of Health,

It is a sad, embarrassing day in our country's history when it's come to the point where government has to help people regain self-control to such an extent. But unfortunately, the undisciplined and ill-informed, and frankly ignorant, behavior of many Americans is also impacting other Americans.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Catherine Schweiger

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response. Small steps in the right direction will make big differences

over the long run. Most people aren't aware of calories and sugar content in fast food items. Studies show that when people know these things they eat and drink less. Limiting serving sizes is a good idea.

Sincerely,

Ms. Laura Ely

One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Dr. David McIntosh

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Linda Thompson

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I wholeheartedly support Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. Our city is OBESE - every day it seems more and more of the people around me on the subway CANNOT fit in a seat, cannot walk up the subway stairs, cannot easily get out of their seats. The kids are eating CHIPS and SODA for breakfast!!!

What more do we need to see before we act??

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic.

Common sense is no longer common. Sugar and these products from "food" companies are KILLING us.

The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Elizabeth Golluscio

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I believe that we should make people think about both what they are ingesting into their bodies, and the waste created when they use disposable materials to do so.

Rather than limiting serving sizes of soda and other sugary drinks, I believe that allowing large sizes only if people bring their own reusable container will both force people to reconsider their purchasing of large size sodas and other drinks, and reduce waste. Additionally, a fee for disposable cups of all sizes will require further consideration of soda consumption by consumers, and further reduce solid waste.

"Banning" large sizes seems to me, as a lawyer, to be somewhat of a free market issue. However, requiring the use of non-disposable cups brought by the consumer removes any free market issue, but forces the issue of soda consumption into the spotlight.

I strongly support, rather than limiting serving sizes, instead requiring consumers to bring their own reusable cup for large sizes, and instituting a fee for all disposable cups of all sizes. This will make consumers reconsider their soda consumption, and also reduce waste.

I look forward to your response.

Sincerely,

Ms. Lauryn Slotnick

Dear Members of the Board of Health: Board of Health,

Given what we know now about decision architecture in human psychology, limits on the serving size of soda and other sugary drinks is smart choice. I support of Mayor Bloomberg's proposal to limit serving sizes of soda as means of combating the obesity epidemic and health care costs in this country. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because the overweight and obese have become commonplace throughout America, mirroring the growth of all serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Jessica Mattoon

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the health care costs in this country related to preventable health issues, such as obesity, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of sugary drinks. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Sugary drinks are the single largest contributor of calories to the American. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar!

Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving size.

Sincerely,

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Francheska Santiago Medina

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

The limits proposed entail nothing more than forcing a person who desires more sugar-drenched soda to return for a second container, and thereby to think consciously about that choice. Conscious thought and rational decisions are the sworn enemy of food marketers, and it is therefore unsurprising that they would adamantly oppose such a requirement. The soda sellers are poisoning America, and doing it through the power of subconscious persuasion, contrary to what politicians assume about choice in a free-market system. This is a fully justified place in the market for government to set sane standards for the nature of a product, to limit the death toll from sugar.

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

I am a family physician and try to deal with the downstream effects of obesity every day. I can provide advice, but what I can't do is help people make good decisions essentially at the point of sale. Mayor Bloomberg's proposal does this, people can still choose the unhealthy drink, but in moderation, at a dose that is more reasonable. I see it like many of the over the counter prescriptions, they have some benefit (although in the case of soda this is largely relegated to taste alone) and have real harms. Moderation is the key and this allows for people to make healthier choices without being overly restrictive.

I urge the Board of Health to vote in support of the Mayor's proposal to limit serving sizes.

Sincerely,

Dr. Cat Livingston

Subject: Support Mayor Bloomberg's Sugary Drink Proposal
Date: Tuesday, July 24, 2012 6:47:24 PM

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. tony osusky

Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As a public health nutritionist, I feel that Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks is a great step in helping reduce the rapid weight gain New Yorkers have been experiencing.

Sugary drinks are a major contributor the the excess calories people are consuming and they come with no nutritive value. In a large analysis of studies, sugary drinks were the only food or beverage found to be linked directly with obesity. They have also been linked with diabetes and heart disease.

When portion sizes were smaller -- 6 - 12 ounces -- and people had them occasionally as a treat, they didn't have much of an impact on health. With the gigantic portion sizes served today and the ubiquity of these drinks, simply put, people are consuming too much and their health is suffering for it.

People have lost understanding of the place for these sugary drinks in the diet - as an occasional drink, to be consumed in small servings. The 16-ounce maximum as the Mayor has proposed will help people relearn how to consume sugary drinks in reasonable amounts. They can still drink soda excessively, if they so choose. But the need to request another serving will help people think about whether they really want all those empty calories.

This is a bold move for the health of New Yorkers and could set the precedent for many communities across the country. I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Amy Jesaitis

Jul 24, 2012

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mrs. Kristen Wilck

Dear Members of the Board of Health: Board of Health,

Dear Mayor Bloomberg,

Good for you! There is a certain amount of stupidity that will always reside in the human population. If we can put measures into effect that will help limit the tremendous impact obesity has on our hospitals and health care system, I support it.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes.

Dear Members of the Board of Health: Board of Health,

As a Dietitian who is very concerned about the obesity epidemic and health care costs in this country, I am writing in FULL SUPPORT of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks.

Some think that limiting soda sizes to 16oz max per serving size container somehow takes away our freedom, are denying the FACT that a) soda is a black and white issue--there is no grey: sugary soda provides NO nutritional value, promotes many health problems including but not limited to OBESITY, DIABETES, HEART DISEASE, DENTAL CARRIES. These health care problems are a burden on those that develop them, certainly, but these problems are promoted in a large way by high amounts of sugar consumption, especially among low income people. The people of the lowest income who are more likely to consume high amounts of this liquid candy are also likely to make use of tax-payer subsidized health care. If this program GIVES ME BACK freedom, by SAVING TAXPAYER MONEY.

If people are too embarrassed to purchase more than one serving container of soda at a time, and end up drinking less soda, so be it. Have they lost freedom? Certainly not. There IS NO LIMIT on the number of sodas anyone can purchase.

PLEASE act with PUBLIC HEALTH as the crucial factor in this decision. Drinking less soda will result in better health for the populace. On a population level, lower soda consumption will save tax-payer money in the long term--also very important in the time of sever budget cuts in many areas of government.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. Daniel Keough

New York City Department of Health and Mental Hygiene Board of Health
2 Gotham Center, 14 th Floor, Room 14-15, Box 31
Long Island City, NY 11101-4132

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Ms. Allegra Azulay

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

I am especially concerned about children who model their parents' behavior and who have no understanding of the effects of a sugary drink on their well-being. Their trusting attitude is that if a store sells it, it must be ok; whereas, in actual fact, such sales are guilty of endangering a minor.

Sincerely,

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.

Once consumed in relatively small quantities, usually as a treat, sugary drinks now come in gargantuan proportions, available almost everywhere. Container sizes have grossly expanded over the past 50 years, and today's new standard, the 20-ounce bottle of Coke, contains 16 teaspoons of sugar! The 7-Eleven chain of convenience stores even offers a 64-ounce Double Gulp - which contains more than 50 teaspoons of sugar!

Restoring an understanding among consumers of more reasonable serving sizes - even a 16-ounce maximum as the Mayor has proposed is very generous by historical standards - will help cut down on some soda consumption and slow the expansion of New Yorkers' waistlines. Unfortunately, no measure would be perfect or fully effective, and consumers will still be able to buy as much soda as they want. But, in all likelihood, many of them will be as satisfied with smaller amounts instead of the huge tubs of sugary beverages they consume today.

I strongly encourage the Board of Health to vote in support of the Mayor's proposal to limit serving sizes and I look forward to your response.

Sincerely,

Mr. George Thompson

Dear Members of the Board of Health: Board of Health,

As someone very concerned about the obesity epidemic and health care costs in this country, I am writing in support of Mayor Bloomberg's proposal to limit serving sizes of soda and other sugary drinks. The Mayor's leadership on the soda issue provides a good model for other jurisdictions to follow, because overweight and obesity have become commonplace throughout America, mirroring the growth of soda serving sizes over the past five decades. More than two-thirds of adults and one in three children are overweight or obese in this country. While Mayor Bloomberg's proposal may not alone solve our obesity problem, it is a step in the right direction.

We are watching here in Wisconsin! I would love to see my home town be able to do this. It will take a big city leader to break the ice!

Numerous scientific studies have demonstrated that sugary drinks, both carbonated and non-carbonated, are a major contributor to the obesity epidemic. Sugary drinks are the only food or beverage source that has been directly linked to obesity. They are the single largest contributor of calories to the American diet, as well as a leading source of added sugars. One study found that each extra soft drink consumed per day was associated with a 60-percent increased risk of overweight in children. Countless studies document that excess weight is a prime risk factor for type-2 diabetes, heart attacks, strokes, cancer, sleep apnea, and many other problems. Frequent consumption of soft drinks also contributes to osteoporosis, tooth decay, and dental erosion.
