OLMSTEAD CENTER PARK AND RECREATION CENTER, QUEENS, NEW YORK (PERMEABLE PAVERS)
Riparian zones are the narrow strips of land that border creeks, rivers, and other bodies of water characterized by wetland vegetation. Although riparian zones may occupy only a small percentage of a watershed, they represent an extremely important component of the landscape's ecology. Riparian zones are significant in ecology due to their role in soil conservation, biodiversity, and the influence they have on aquatic ecosystems.
